1. Provide identification of purpose for each switch and/or pushbutton station furnished. Identification may be either engraved plastic sign permanently mounted to wall below switch, or stamping on switch cover proper. All such identification signs and/or switch covers in finished areas shall match other hardware in the immediate area.

F. Control Voltage:

1. Maximum allowable control voltage 120V. Fully protect control circuit conductors in accordance with National Electrical Code.

G. DDC Control Interface:

1. Fully coordinate the requirements of each division with regard to supplying a complete DDC Control System prior to submitting bid.

2. All power to controllers and controlled equipment shall be furnished via dedicated line voltage circuits.
3. Dedicated control circuits from electrical panelboards to DDC control panels and from electrical panelboards to dedicated DDC J-boxes (for distributed control components such as VAV boxes), and control transformer line voltage connections shall be provided by HVAC Contractor where required.
   a. Exceptions: Where power wiring has been shown on Electrical Drawings.
4. Low voltage wiring from J-boxes to distributed control components, all low voltage connections, all control panels and all control transformers (not part of unitary equipment) shall be provided under Division 23 or 25.
5. Any additional power requirements shall be the responsibility of the Division 23 or Contractor requiring same, and provided at no additional cost to the owner.

1.6 CEILING AND CHASE CAVITY PRECEDENCE

A. Coordinate ceiling cavity space carefully with all trades. In the event of conflict, install mechanical and electric systems within the cavity space allocation in the following order of precedence. A system with higher precedence may direct that systems of lower precedence be relocated from space, which is required for expedient routing of the precedent system.

1. Plumbing waste/sanitary, cooling coil drain piping, and roof drain mains and leaders.
2. Plumbing vent piping.
3. Supply, return and exhaust ductwork.
4. Electrical conduit greater than 3" diameter.
5. Hydronic branch and mains (greater than 2", but less than 12").
6. Domestic water mains piping.
7. Fire sprinkler mains and leaders.
8. Hydronic branch piping (2" and less).
9. Domestic water branches.
10. Electrical conduit branch feeders.
11. Fire sprinkler branch piping and sprinkler runouts.

B. Light fixtures have precedence in a zone, extending from the face of the ceiling to an elevation 2" above the height of the light fixtures.

C. Examine the contract documents of all trades (e.g. all Divisions 21, 22, 23, 25, 26 and 28 the architectural floor plans, reflected ceiling plans, elevations and sections, structural plans and sections, etc.).

D. Coordinate necessary equipment, ductwork and piping locations so that the final installation is compatible with the materials and equipment of the other trades.

E. Prepare shop drawings for installation of all new work before installation to verify coordination of work between trades.

F. Provide access doors for all equipment, valves, clean-outs, actuators and controls which require access for adjustment or servicing and which are located in otherwise unaccessible locations.

1. For equipment located in "accessible locations" such as lay-in ceilings: Locate equipment to provide adequate service clearance for normal maintenance without removing architectural, mechanical, electrical or structural elements such as the ceiling support system, electrical fixtures, etc. "Normal maintenance" includes, but is not limited to: filter changing; greasing of bearings; using p/t ports for pressure or temperature measurements; and replacement of ballasts, fuses, etc.
2. All system components requiring access shall be grouped together to reduce the quantity of access doors required.

G. See "Basic Mechanical Materials and Methods" for additional access door requirements if section has been included in this specification.

PART 2 – PRODUCTS

2.1 MOTOR HORSEPOWER

A. In general, all motors ½ HP and above shall be three phase, all motors below ½ HP shall be single phase.

B. Voltage and phase of motors as scheduled on the electrical drawings shall take precedence in the case of a conflict between the mechanical and electrical drawings or general condition 2.1. A., above.

C. Work under Divisions 21, 22 and 23 includes coordinating the electrical requirements of all mechanical equipment with the requirements of the work under Divisions 26, 27 and 28, before ordering the equipment.

1. If motor horsepowers are changed under the work of Divisions 21, 22 or 23 without a change in duty of the motor's driven device, coordination of additional electrical work (if any) and additional payment for that work (if any) shall be provided under the section of Divisions 21, 22 or 23 initiating the change. Increases or decreases in motor horsepower from that specified shall not be made without written approval from the Architect/Engineer.

PART 3 - EXECUTION - (Not Used)

END OF SECTION

SECTION 23 05 02

BASIC MECHANICAL REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. This Section supplements Division 1 - General Requirements.

B. Where contradictions occur between this Section and Division 1, the more stringent of the two shall apply. Architect/Engineer shall decide which is more stringent.

C. Provisions of this section shall also apply to all sections of Divisions 21, 22 and 23.

1.2 DEFINITIONS

A. The definitions of Division 1 and the General Conditions of this specification also apply to Divisions 21, 22, 23 and 25 Contract.

B. “Contract Documents” constitute the drawings, specifications, general conditions, project manuals, etc., prepared by Engineer (or other design professional in association with Engineer) for contractor’s bid or contractor’s negotiations with the Owner. Divisions 21, 22, 23 and 25 drawings and specifications prepared by the Engineer are not construction documents.

C. “Construction Documents”, “construction drawings”, and similar terms for Divisions 21, 22, 23 and 25 Work refer to installation diagrams, shop drawings and coordination drawings prepared by the contractor using the design intent indicated on the Engineer’s contract documents. These specifications detail the contractor’s responsibility for “Engineering by Contractor” and for preparation of construction documents.

D. “(E)” indicates "existing" equipment on site which may or may not need to be relocated as a part of this work.

E. “(R)” indicates existing equipment to be relocated as part of this work.

F. "Furnish" means to "supply" and usually refers to an item of equipment.

G. "Install" means to "set in place, connect and place in full operational order".

H. "Provide" means to "furnish and install".

I. “Equal” or "Equivalent" means "meets the specifications of the reference product or item in all significant aspects." Significant aspects shall be as determined by the Architect/Engineer.

J. "Work by other(s) divisions"; "re:_____ Division", and similar expressions means work to be performed under the contract documents, but not necessarily under the division or section of the work on which the note appears. It is the contractor’s sole responsibility to coordinate the work of the contract between his/her suppliers, subcontractors and employees. If clarification is required, consult Architect/Engineer before submitting bid.

K. By inference, any reference to a “contractor” or “sub-contractor” means the entity, which has contracted with the Owner for the work of the Contract Documents.

L. "Engineer" means the design professional firm, which has prepared these contract documents. All questions, submittals, etc. of this division shall be routed to the Engineer (through proper contractual channels).

M. "Piping" includes, in addition to pipe, all fittings, valves, hangers and other accessories related to such piping.

N. "Concealed" means hidden from sight as in chases, furred spaces shafts, hung ceilings, or embedded in construction.

O. "Exposed" means, "not concealed" as defined above. Work in trenches, crawl spaces, and tunnels shall be considered "concealed" unless otherwise specifically noted.

P. "Governmental" means all municipal, state and federal governmental agencies.

Q. Where any device or part of equipment is herein referred to in the singular number (such as "the pump"), such reference shall be deemed to apply to as many such devices as are required to complete the installation as shown on the Drawings.

R. "HVAC" means Heating, Ventilating and Air Conditioning.

S. "Plumbing Contractor" means the Contractor doing Plumbing work.

T. "Fire Protection Contractor" means the Contractor doing Fire Protection work.

1.3 COORDINATION

A. Contract Documents:

1. General: The Contract Documents are diagrammatic showing certain physical relationships, which must be established within the Division's work and its interface with other work. Such establishment is the exclusive responsibility of the Contractor. Drawings shall not be scaled for the purpose of establishing material quantities.
2. Supplemental Instructions: The exact location for some items in this Specification may not be shown on the Drawings. The location of such items may be established by the Architect/Engineer during the progress of the work. Make reasonable modifications in the layout as needed to prevent conflict with work of other trades.
3. Discrepancies:
    a. Examine Drawings and Specifications of all Divisions of the work.
    b. Report any discrepancies to the Architect/Engineer and obtain written instructions before proceeding.
    c. Should there be a conflict within or between the Specifications or Drawings, the most stringent or higher quality requirements shall apply.
    d. Items called for in either specifications or drawings shall be required as if called for in both.
4. Constructability:
    a. Examine Drawings and Specifications of all Divisions of the work.
    b. Report any issues to the Architect/Engineer which may prevent installation of Divisions 21, 22, 23 and 25 work in accordance with the Contract Documents and the original construction contract.
    c. Report all issues within 30 days after contract.

B. Be responsible for providing proper documentation of equipment product data and shop drawings to all entities providing service. This coordination shall include, but not be limited to, the following:

1. Fire Protection Contractor shall provide shop drawings to HVAC and Plumbing Contractors.
2. Automatic Temperature Controls, Building Management and Test-Adjust-Balance Contractors shall be provided with equipment product data and shop drawings as appropriate from all other contractors, and shall furnish the same information about control devices (such as valves, test wells, etc.) to the appropriate Contractors.

C. Coordination Drawings:

1. Submit coordination drawings for all HVAC, Plumbing, Fire Protection and Electrical work. The drawings shall be fully coordinated and signed off by all affected trades prior to submission. The coordination drawings shall include the following at a minimum:
   a. All major ductwork, piping, conduit and equipment.
   b. Reflected ceiling plans with light fixtures.
   c. Current architectural floor plans.
   d. Major structural elements.
   e. Elevations of piping ductwork or equipment.
   f. Sections through critical spaces.
2. The drawings shall be at a suitable scale (3/8"=1'-0" minimum) to clearly show information.
3. Any work installed without approved coordination drawings is done at the Contractor's risk.

D. CAD Drawings:

1. Electronic Auto Cad drawings are available from M-E Engineers. The service charge for the delivery of these files is $200 per floor plan per trade. Contractor will be required to execute a file transfer agreement.

E. Existing Conditions:

1. Inspect existing conditions prior to bidding.
2. Provide proper coordination of mechanical work with existing conditions.

F. Utility Connections:

1. Coordinate the connection of mechanical and electrical systems with the Civil drawings and utility companies.
2. Comply with regulations of utility suppliers.
3. The Contract Documents indicate the available information on existing utilities and services, and on new services (if any) to be provided to the project by utility companies and agencies.
   a. Notify Architect/Engineer immediately if discrepancies are found.

4. Coordinate mechanical utility interruptions one week in advance with the Owner and the Utility Company. Plan work so that the duration of the interruption is kept to a minimum. This shall include premium time, shift labor and multiple crews to accelerate the work and lessen the impact on facility operations.

G. If the project is constructed under multiple bid packages each Contractor shall coordinate their work with the progress of the other contractors performing similar or unrelated work.

H. Coordinate ceiling cavity space carefully with all trades.

I. Coordinate with Electrical Work.

J. Cutting and patching as specified.

K. Chases, Inserts and Openings:

1. Provide measurements, drawings, and layouts so that openings, inserts and chases in new construction can be built in as construction progresses.
2. Check sizes and locations of openings provided. Any cutting and patching made necessary by failure to provide measurements, drawings, and layouts at the proper time shall be done at no additional cost to the Owner.
3. Coordinate roof openings for all roof-mounted equipment. Openings on documents are diagrammatic and do not represent manufacturer specific requirements. Actual opening size, orientation and location, as well as

structural coordination, is the responsibility of the mechanical contractor. Provide transitions on ductwork to accommodate actual roof openings.

L. Support Dimensions: Provide dimensions and drawings so that concrete bases and other equipment supports to be provided under other Sections of the Specifications can be built at the proper time.

M. The work throughout shall be executed as quickly as conditions permit in the best and the most thorough manner under the direction of and to the satisfaction of the Engineers, Owners and Architects, who will jointly interpret the meaning of the Drawings and Specifications, and shall have the power to reject any work and materials which, in the judgment, are not in full accordance therewith.

N. The work called for under this contract shall be carried on simultaneously with the work of other trades in a manner such as not to delay the overall progress of the work. Furnish promptly to other trades involved at the project, all information and measurements relating to the work which they may require. Cooperate with them in order to secure the harmony necessary in the interest of the project as a whole.

O. Keep a competent superintendent in charge of the work at all times. Such superintendent shall be replaced if unsatisfactory to the Owner.

P. Upon award of contract, consult with the Architect and negotiate with subcontractors and manufactures, and within thirty (30) days submit five (5) copies of a preliminary list of major equipment, for approval, complete with name of manufacturer, dates of purchase orders, and delivery dates to the site. Also submit within thirty (30) days, five (5) copies of a preliminary schedule of installation of the various systems. The list shall be revised monthly and five (5) copies shall be submitted. The second submittal shall contain the names of manufacturers of scheduled equipment (with names, addresses, and telephone numbers of local representatives).

Q. Maintain a complete file of shop drawings at all times available to the Owner's representatives.

R. Every facility shall be provided to permit inspection of the work by the Owner's representatives during the course of construction.

S. Where items of equipment and/or materials are indicated in the Specifications as being furnished by other trades for installation, assume responsibility for the unloading of such equipment and/or materials from the delivery trucks, and for providing safe storage for same as required pending installation.

T. Where the work is to be installed in close proximity to work of other trades, or where there is evidence that the work is to interfere with work of other trades, assist in working out space conditions to make a satisfactory adjustment.

Prepare composite working drawings and sections at a suitable scale not less than 3/8" = 1'-0" clearly showing how the work is to be installed in relation to the work of other trades. If the installation is made before coordinating with other trades, make all necessary changes in the work without extra charge to the Owner.

1.4 ENGINEERING BY CONTRACTOR

A. The construction of this work requires the Contractor to perform certain design activities with regard to several of the Contract Mechanical systems or subsystems that can only be fully ascertained with regard to the prevailing site field conditions during construction activities. All such designs and related activities shall be the complete responsibility of the Contractor. Where these design activities require engineering, it is the responsibility of the Contractor to engage the service of a licensed New York State Professional Engineer experienced in the areas related to the design activities performed by the Contractor.

B. Systems or subsystems which require engineering responsibility by the contractor include, but are not limited to:

1. Any system not fully detailed on the drawings.
2. Fire sprinkler.
3. Geothermal field arrangement, well location and total capacity

4. Equipment supports, not fully detailed in the drawings.
5. Pipe hangers and anchors not specified in these documents, or cataloged by the manufacturer.
6. Vibration isolators and seismic restraints.
7. Duct supports, hangers and miscellaneous steel as required.
8. Temperature controls.
9. Refrigeration systems.
10. Piping expansion and contraction provisions.
11. Equipment supports, hangers.
12. Ductwork support systems.

C. Contractor's design responsibility shall include system design, any required calculations to support system design, any compliance documents or certifications by any governing body up to and including replacement of design engineer with a different engineer of record, retained and paid by the contractor, as determined by authorities or original design engineer.

D. Contactor shall complete all controlled or special inspections and file all required paperwork in a timely manner. Professional engineer retained by contractor to serve as "special inspector" shall meet all requirements for special inspector as determined by the authority having jurisdiction.

E. Where the contract documents indicate "Verify in Field" or "Contractor to Verify" or other similar terms, the contractor shall be responsible for verifying the extent of the work by performing field investigations prior to submitting their bid. All costs associated with performing the complete scope of work, as determined by the contractor's field verification, shall be included in the contractor's bid price.

1.5 REGULATORY REQUIREMENTS

A. Codes: Comply with the latest editions of the following:

1. New York State Mechanical Code.
2. New York State Plumbing Code.
3. Building Code of the State of New York.
4. ASHRAE 90.1-2013 (As allowed by C401.2 of the New York State Energy Conservation Code)
5. International Building Code.
6. International Mechanical Code.
7. International Plumbing Code.
8. National Electric Code.
9. ASME Boiler and Pressure Vessel Code.
10. Local Modifications to above Codes.

B. Applicable NFPA Standards.

C. Requirements of Local Utility Companies:

1. Comply with rules and regulations of local utility companies. Include in bid the cost of all valves, valve boxes, meter boxes, meters and such accessory equipment which will be required for the project.

D. Other Regulations: Comply with the latest editions of the following:

1. U.S. and State Department of Labor Safety Regulations pertaining to the completed project.
2. Requirements of Fire Departments serving the project.
3. Regulations of the Health Department having jurisdiction. Including New York State D.O.H.
4. Regulations of the Fire Marshal.
5. ASHRAE Energy Conservation Standard 90A.
6. ASHRAE Ventilation Standard 62.1
7. ASHRAE 13

8. ASHRAE 135
9. Americans with Disabilities Act (ADA).
10. Clean Air Act.
11. Clean Water Act.
12. NFPA National Fire Protection Association
13. ANSI American National Standards Institute
14. ASTM American Society for Testing Materials
15. AWWA American Water Works Association
16. IBR Institute of Boiler and Radiator Manufacturers
17. NEMA National Electric Manufacturers Association
18. SMACNA Sheet Metal and Air Conditioning National Association, Inc.
19. ARI Air Conditioning and Refrigeration Institute
20. UL Underwriters' Laboratories
21. AMCA Air Moving and Conditioning Association
22. ADC Air Diffusion Council
23. AABC Associated Air Balance Council
24. Local Water Company Rules and Regulations
25. Vassar Design Standards.

E. Additional Regulations: Follow additional regulations, which appear in individual Sections of these Specifications.

F. All piping shall be domestically manufactured and shall be by the same manufacturer.

G. All equipment and materials shall complete with Vassar College Standards.

H. Contradictions: Where codes are contradictory, follow the most stringent, unless otherwise indicated in Plans or Specifications. Architect/Engineer shall determine which is most stringent.

I. Contract Documents Not in Compliance:

1. Where the Drawings and Specifications do not comply with the minimum requirements of the Codes, either notify the Architect/Engineer, in writing during the Bidding Period, of the revisions required to meet Code requirements, or provide an installation which complies with the Code requirements. After entering into contract, Contractor will be held to complete all work necessary to meet these requirements without additional expense to the Owner.
2. Follow Drawings and Specifications where they are superior to Code requirements.

J. Contractor as Technical Expert

1. When the contractor declares himself to be an expert with regard to how a system must be constructed or what will be required to gain code official approval, it shall be assumed that the contractor was an expert at the time of bid and has included all costs associated with proclaimed "required" work in his base bid.

K. The Contractors bid shall be based on the execution of all work required to allow the contractor to self-certify the work of the project. Self-certification shall be performed if requested by the Owner. Submitting a bid for the contract work shall be considered confirmation by the contractor that he is in good standing with the department of buildings with respect to self-certification.

L. Work of contract shall be bid as described in contract document including all details, notes, plans, routing, etc. Contractor's intentional or unintentional exclusion of scope or assumptions about alternate construction methods, configurations, materials or testing shall be at the contractors risk and the engineer reserves the right to require that the work be constructed per plans. Statements such as "I did not bid it that way", or "I don't have that in my price", shall be understood to be an admission of the contractors error but will have no effect in reducing the contract requirements or increasing the cost to the Owner.

M. Permits

1. Obtain all permits required by authorities and agencies having jurisdiction for the work of this Division.
2. Post permits as required.
3. Obtain all approvals, including controlled inspections, prior to request for final payment.

N. Tap and Connection Fees:

1. Pay fees charged by Utilities for making connections, bringing service to property line, or to meter and similar services.
2. Investment fees or plant development fees, which are charges levied by Utilities to cover the cost of the utility system to be borne by this project, are not part of the work of this Division.

O. Inspections and Tests:

1. Arrange for all required inspections and tests.
2. Pay all charges.
3. Notify Architect/Engineer 48 hours before tests.
4. Submit one copy for Owners records of permits, licenses, inspection reports and test reports.

1.6 RECORD DRAWINGS

A. General Recording Procedure:

1. Maintain a blue-line set of Sprinkler, Plumbing and HVAC Contract Drawings in clean, undamaged condition, for mark-up of installations, which vary, from the Contract Drawings.
2. Record changes drawn to scale and fully dimensioned.
    a. Work concealed behind or within other work, in an inaccessible arrangement.
    b. Mains and branches of piping systems:
        1) with valves and control devices located and numbered.
        2) with concealed unions located.
        3) with items requiring maintenance located (traps, strainers, expansion compensators, tanks, etc.).
    c. Underground piping and ducts, both exterior and interior.
    d. Ductwork layouts, including locations of coils, dampers, filters, boxes and similar units.
    e. Concealed control system devices and sensors.

B. Corrected Drawings:

1. Obtain a set of contract drawings on CAD.
2. Update the CAD files to reflect as-built conditions.
3. Transmit corrected CAD files and plots as a submittal to the Architect/Engineer for Owner’s use and record.

C. Temperature Control Drawings:

1. Provide as-built Drawings of work under this contract including:
    a. Ladder wiring diagram.
    b. Pneumatic schematic diagrams.
    c. One line system diagram.
    d. Control schematic of equipment with control devices located and identified.
    e. Wiring or tubing termination diagrams.
    f. List of materials.
    g. Floor plan indicating all device locations.
    h. Control sequences.
    i. Indicate electrical power source for each point of connection to the electrical system.

2. Reproducible temperature control drawings and computer files shall be delivered to the Architect/Engineer prior to Owner's acceptance of project.

1.7 OPERATING AND MAINTENANCE DATA

A. Submission:

1. Submit typed and bound copies of Operating and Maintenance Manuals prior to scheduling systems demonstration for the Owner.
2. Bind each Maintenance Manual in one or more vinyl covered, 3-ring binders, with pockets for folded drawings. Mark the back spine of each binder with system identification and volume number.

B. Required Contents:

1. Manuals shall have index with tab dividers for each major equipment section to facilitate locating information on specific piece of equipment.
2. Identify data within each section with drawing code numbers as they appear on Drawings and Specifications. Include as a minimum the following data:
    a. Alphabetical list of system components, with the name, address and 24 hour telephone number of the company responsible for servicing each item during the first year of operation. Include point of contact for company.
    b. Operating instructions for complete system including:
        1) Emergency procedures for fire and failure of major equipment.
        2) Major start, operation and shut-down procedures.
    c. Maintenance Instructions for each piece of equipment including:
        1) Equipment lists.
        2) Proper lubricants and lubricating instructions for each piece of equipment.
        3) Necessary cleaning, replacement and/or adjustment schedule.
        4) Product Data.
        5) Installation instructions.
        6) Parts lists.
        7) Complete wiring diagrams.
    d. Temperature control diagrams and O&M information as specified above (as-built).
    e. Marked or changed prints locating concealed parts and variations from the original system design (as-built drawings).
    f. Balancing Report.
    g. Valve schedule and associated piping schematics. See "Identification" specification sections.
    h. Copies of any extended equipment warranties, which are greater than one year.

1.8 WARRANTIES

A. The warranty period is one year after Date of Acceptance.

1. During this period, provide labor and materials as required to repair or replace defects in the mechanical system at no additional cost to the Owner. Provide certificate with O&M manual submittal which guarantees same-day service response to Owners call for all such warranty service.
2. Provide certificates for such items of equipment which have warranties in excess of one year. Insert copies in O&M manuals. Such equipment shall include, but not be limited to:
   a. Temperature Control Valves five (5) years.
   b. Chiller compressors five (5) years.
3. Provide extended manufacturers warranties to cover one full year from date of acceptance if standard warranty starts any time prior to that date.
4. Provide factory trained service personnel for all warranty work on the following equipment:
   a. Building Management System
   b. VRF Systems
   c. Air Handlers
   d. Packaged Equipment
   e. Geothermal System
   f. Solar PV and Solar Thermal Systems

B. Refer to Division 1 for additional requirements.

1.9 INDEMNIFICATION

A. Pay all royalties and defend all suits or claims for infringement of any patent rights and save the Owner harm from loss on account thereof.

B. If process or article specified is an infringement of patent, promptly notify the Architect in writing, and any necessary changes shall be as provided in the Contract for changes in the work. If the Contractor performs any work specified knowing it to be an infringement of patent, he shall bear all costs arising therefrom.

C. Take out all necessary insurance, free of extra charge, and agree to indemnify and save harmless the party contracting for services against loss or expense, by reason of the liability imposed by law upon such party for damages because of bodily injuries, including death at any time resulting therefrom, accidentally sustained by any person or persons or on account of damage to property arising out of or consequence of the performance of this Contract, whether such injuries to persons or damaged property are due or claimed to be due by any negligence in the performance of the Contract, the party contracting for services, employees or agents, or any other person.

1.10 SCOPE

A. The Contractor shall:

1. Supply all labor, transportation, materials, apparatus, light, and tools necessary for the completion of the mechanical work.
2. Install, maintain, and remove all construction equipment.
3. Be responsible for safe, lawful, and proper construction execution.
4. Construct, in the best and most workmanlike manner, a complete project and everything properly incidental thereto, as shown on the Drawings, as stated in the Specifications, or reasonably implied therefrom, all in accordance with the Contract documents.

B. Work Included

The Work includes the providing of all labor, materials, equipment, accessories, services and tests necessary to complete and make ready for operation by the Owner, all Heating, Ventilating and Air Conditioning Work, as shown on the Drawings and hereinafter specified, including, but not limited to the following.

1. All motor starters and controllers for equipment furnished by this Contractor. Packaged type units shall be furnished completely pre-wired with panels mounted on the units as specified. All other motor starters and controllers will be turned over to the Electrical Contractor for installation and wiring.
2. Provide a complete vertical-bore geothermal system, including well drilling, grouting, piping distribution, manifold, etc.
3. Pumps
4. Filters.
5. Fans.
6. Heat exchangers.
7. Electric boilers.
8. Cabinet and unit heaters, electric baseboard radiation, trench heaters, etc.
9. Packaged ground-source heat pumps units complete with compressors, controls, enthalpy wheels, electric coils where specified.
10. Condensate pumps and piping to floor drain, drain main, or janitor sink.
11. Hydronic specialties such as expansion tanks, air vents, air separators, reducing and safety valves, etc.
12. Accessories such as V-belt drives, flow measuring devices, draft gauges, machinery guards, thermostats, pressure gauges.
13. Water treatment for closed-loop hydronic systems including: ground source water system, condenser water system, solar thermal water system.
14. Inertia blocks and vibration isolation equipment.
15. Piping, fittings, and valves.
16. Sheet metal ductwork and accessories, including dampers, access doors, etc.
17. Grease exhaust system including fire-wrap, cleanouts, access doors, connections to food service equipment, etc.
18. Registers, grilles and diffusers.
19. Fire dampers, smoke dampers and fire/smoke dampers.
20. Installation of smoke detectors in ductwork.
21. Acoustical duct lining, where specified or shown on drawings.
22. Pipe, duct and equipment insulation.
23. Energy Recovery Units
24. Split systems.
25. Water-cooled VRF systems, including heat recovery units where specified.
26. Air-cooled VRF systems.
27. Constant and variable volume air terminals.
28. Temperature Control: A complete system of temperature control shall be installed in connection with the HVAC systems, including all thermostats, air piping, damper motors, etc. All control wiring for automatic temperature controls, including interlocking wiring for fans, chillers, pumps, etc. by this Contractor, unless otherwise shown on the electrical Drawings.
29. Integrated Room Automation System
30. Excavation and backfill as specified under “Special Requirements for Mechanical and Electrical Work”.
31. Painting and pipe identification for all work by this Contractor is previously specified under “Special Requirements for Mechanical and Electrical Work”.
32. Test and balancing.
33. Sleeves, pipe inserts and anchor bolts, escutcheons, prefabricated roof curbs, etc., as hereinafter specified.
34. Identification, name plates, tags and charts.
35. Cutting and rough patching.
36. Furnishing and setting of electric motors.
37. Furnishing of starters and motor control devices as specified under “Special Requirements for Mechanical and Electrical Work”.

38. Templates and anchor bolts for equipment bases.
39. Cap flashing for pipe and duct passing through roof.
40. Removal, relocation and/or demolition of existing HVAC work in conjunction with the existing buildings in order to erect the new buildings as indicated on the Contract Drawings.
41. Furnishing of access doors.
42. Energy management (building automation) system.
43. Concrete pads for all HVAC work.

1.11 SPECIAL INSPECTIONS

A. Contactors shall provide all required special inspections for all work performed. Contractor shall retain a third party Architect or Engineer, independent of the primary design team and contractor, to complete all required inspections and execute all required TR-1 documents and any additional documents that may supplement or replace these documents in the future.

B. Contractors' special inspection engineer shall be in good standing with the Department of Buildings and shall meet all requirements and qualifications established by the Department of Buildings. This shall include education, formal training, in-service training, corporate structure, certifications, professional development, etc. If, at any time, the Architect or Engineer shall fail to meet the qualification requirements of the Department of Buildings the contractor shall replace the Architect or Engineer with another qualified professional.

C. If at any time the Architect or Engineer shall fail to produce required inspections and associated documentation in a timely manner, the contractor shall replace the Architect or Engineer with another qualified professional.

D. All inspections shall be completed in strict accordance with the requirements established by the Department of Buildings. Records of inspections shall be maintained in accordance with good practice, but in no case less than 6 years from time of filing. Documentation shall be in accordance with requirements established by NYSDOB.

E. The work of the project will be phased and completed on an accelerated schedule. This will create a need for multiple inspections and inspection documentation filings. Architect and Engineers performing inspections shall fully understand the phasing of the work and be prepared to complete inspections and provide filing documents in accordance with the established schedule. The inspector shall expect that multiple inspection visits may be required to support a single inspection filing.

F. Special inspector shall have no financial interest in the construction, installation, maintenance of structures or components that they inspect.

G. Special inspector shall cooperate with any audits or inquiries initiated by NYSDOB or other authorities having jurisdiction.

H. Special inspectors shall limit the scope of their inspections to systems and installations that their education, experience, certifications, etc., qualify them to inspect.

I. Special inspectors shall report any discrepancies or deficiencies to the contractor immediately upon detection and shall follow-up with contractor to confirm that conditions have been corrected or repaired.

J. Special inspection agencies shall carry insurance in the coverage limits established by NYSDOB. At a minimum, this shall be a $500,000 professional liability policy, $1,000,000 general liability and other statutory insurance at statutory limits.

K. Special inspection agencies shall have a full time director in responsible charge that does not serve as an inspector or director for any other testing agencies.

L. Controlled/special inspections shall be provided as follows:

1.	Fire Dampers, Fire Smoke Dampers, Smoke Dampers	BC 1704.15
2.	Fire Stopping	BC 1704.25
3.	Emergency Lighting	BC 1704.13, BC 2702
4.	Emergency Power System (Generators)	BC 1704.13, BC 2702
5.	Ventilation System	BC 1704.15
6.	Smoke Control System	BC 1704.14
7.	Sprinkler Systems	BC 1704.21
8.	Standpipe Systems	BC 1704.22
9.	Fire Alarm	BC 907, BC 1704.13
10.	Refrigeration System	BC 1704.15
11.	Mechanical Demolition	BC 1704.19, BC 3306.6
12.	Heating Systems	BC 1704.23
13.	Seismic Isolation	BC 1707.8

1.12 MANDATORY GOVERNING PROVISION

A. Omissions of words or phrases, such as “the Contractor shall,” “in conformity with,” “shall be,” “as noted on the Drawings”, “according to the Drawings”, “an”, “the”, and “all”, may or may not be intentional.

B. Omitted words or phrases shall be supplied by inference.

1.13 PROTECTION OF PROPERTY AND MATERIALS

A. Provide protection against dust migration, rain, wind, storms, frost, or heat, so as to maintain all work, materials, apparatus, and fixtures free from injury or damage.

B. At end of each day’s work, cover all new work likely to be damaged.

C. Do not interrupt the integrity of the building security during periods when the project is staffed or during periods where the project isn’t staffed.

1.14 OWNER FURNISHED EQUIPMENT

A. All equipment called out in the Specifications or shown on the Drawings as “Owner-Furnished Equipment” shall be installed and connected under this Contract. Provide rough-ins, and final connections for all equipment.

B. Kitchen and sterilization equipment will be furnished and set in place under other Sections of the Specifications.

C. Furnish and install all shutoff valves and traps and piping for each item of equipment. Any additional pipe and fittings required for kitchen and sterilization equipment, made necessary by roughing outlets not being located where shown on the manufacture’s approved Drawings, shall be furnished and installed by the Contractor.

D. All such work that is not concealed in the construction or in base cabinets or compartments, shall be polished nickel and chromium plated red brass pipe, with cast brass fittings, cast brass escutcheons, valves, and traps all finished with polished chromium plating over nickel plating.

E. All work in connection with such equipment shall be done under the supervision of the manufacturer and the Contractor shall be responsible for any damage to any of the equipment that may result from his work in connection therewith.

1.15 TEMPORARY FACILITIES

A. Light, Heat, Power, etc.

1. Temporary power and lighting shall be provided by the electrical contractor.
2. Temporary heat shall be provided by the HVAC Contractor.
3. The contractor shall be responsible for maintaining acceptable indoor air quality in adjacent occupied spaces.

B. Use of Permanent Building Equipment for Temporary Heating or Cooling.

1. Permanent building equipment shall not be used without written permission from the Owner. If this equipment is used for temporary heating or cooling, it shall be adequately maintained per manufacturer's instructions and protected with filters, strainers, controls, reliefs, etc. The contractor shall protect all equipment and systems as directed by the engineer. The warranty period shall not start until the equipment is turned over to the Owner for his use. The contractor shall provide extended warranties for parts and labor for all such equipment. Equipment shall not be turned over to the Owner until the temperature controls have been tested and accepted by the Owner and Engineer. Equipment shall be prepared and turned over to owner in as-new condition.

1.16 ROUGH-IN FOR FUTURE CONNECTION

A. Provide rough-in services for all systems which shall extend to future equipment or spaces as shown on the drawings.

1. Provide sufficiently sized branch plumbing lines with isolation valves to serve future equipment.
2. Provide sufficiently sized BMS/ATC master control panel(s) to accommodate a 20% increase in the number of equipment unit controllers and/or connected control points.

1.17 INSTALLATION GENERAL REQUIREMENTS

A. Furnish, apply, install, connect, erect, clean, and condition manufactured materials and equipment as recommended in manufacturer's printed directions (maintained on job site during installation).

B. Provide all attachment devices and materials necessary to secure materials together or to other materials. Erect, install, and secure components in a structurally sound and appropriate manner.

C. Make allowance for ample and normal expansion and contraction for all building components and piping systems that are subject to such.

D. Install materials only when conditions of temperature, moisture, humidity, and conditions of adjacent building components are conducive to achieving the best installation results.

E. Where necessary, temporarily brace, shore, or otherwise support members until final connections are installed. Leave all temporary bracing, shoring, or other structural supports in place as long as practical for safety and to maintain proper alignment.

F. Store and handle materials in a manner to prevent scratching, abrading, distortion, chipping, breaking, rusting, or other disfigurement. Materials damaged for these reasons shall be replaced at no additional cost to Owner.

G. Conduct work in a manner to avoid injury or damage to previously placed work. Any work so impaired or damaged shall be replaced at no expense to Owner.

H. Fabricate and install materials true to line, plumb, and level.

I. Leave finished surfaces smooth and flat, free from wrinkles, warps, scratches, dents, and other imperfections.

J. Furnish materials in longest practical lengths and largest practical sizes to avoid all unnecessary jointing.

K. Make all joints secure, tightly fitted, and as inconspicuous as possible by the best accepted practice in joinery and fabrication.

L. Consult Engineer for mounting height or position of any unit not specifically indicated or located on Drawings or specified in Specifications.

M. Job mixed multi-component materials used in the work shall be mixed in such regulated and properly sized batches that material can be used before it begins to "set". Mixing of a partially "set" batch with another batch of fresh materials will not be accepted and entire batch shall be discarded and removed from site. Clean all mixing tools and appliances that can be contaminated prior to mixing of fresh materials.

N. In addition to the above refer to each Section of the Specifications for additional installation requirements for the proper completion of all work.

O. Piping or ductwork connected to equipment may require different size connection than indicated on the Drawings. The Contractor shall provide transition pieces as required at the equipment, at no additional cost.

1.18 SCAFFOLDING, RIGGING AND HOISTING

A. Provide all scaffolding, rigging, hoisting and services necessary for erection and delivery into the premises of all equipment and materials furnished under this Section of the Specifications, and remove same from premises when no longer required.

B. In the event that supplementary bracing of the basic building structure is required to assure a secure rigging procedure and a secure route for the equipment being handled, assume full responsibility for such supplementary bracing.

1.19 TOOLS

A. All specified tools for proper operation and maintenance of the equipment shall be delivered to the Owner's representative and a receipt requested for the same at no additional cost to the Owner.

1.20 QUIET OPERATION

A. All equipment and material shall operate under all conditions of load without any sound or vibration which, in the opinion of the Architect, is objectionable. Where sound or vibration conditions arise which are considered objectionable by the Architect, eliminate same in a manner approved by the Architect.

1.21 RUBBISH REMOVAL

A. Clean all parts of the building exterior spaces and adjacent roads, sidewalks, and pavement, free from material and debris resulting from the execution of the work. Debris resulting from interior construction shall be neatly stacked on each floor near elevators, material hoists and rubbish chutes, as directed by the Architect or his representative. Debris resulting from exterior construction shall be similarly stacked. The General Contractor will remove all debris so stacked. Excess material will not be permitted to accumulate either on the interior, exterior or on the sidewalk.

1.22 DELIVERY OF MATERIAL

A. Deliver the material and store same in spaces indicated by the Architect and assume full responsibility for damage to structure caused by any overloading of the material or storage in spaces exposed to moisture, humidity, or other environmental conditions.

B. Hoods which will be duct-connected in the field shall be received and set in place by HVAC Contractor.

1.23 PAINTING

A. Paint all unpainted, non-insulated, non-galvanized, ferrous metal surfaces of pipes, conduits, ducts, equipment, fixtures, hangers, supports and accessories as follows:

1. Exposed and Concealed - one prime coat of primer and one coat of oil varnish based paint, color selected by Architect.
2. Underground - two coats of black asphaltum paint.
3. The inside of all ductwork where visible through openings shall be painted with two prime coats of dull black paint.

B. Nameplates on all equipment shall be cleaned and left free of paint. One finish coat of enamel color to be identified by architects.

PART 2 – PRODUCTS

2.1 QUALITY CONTROL

A. Manufacturers of equipment or materials will fall into one of the following categories:

1. "Basis of Design" - The manufacturer of equipment or materials listed on the Drawings or first named in the Specifications. If the Drawings and Specifications are in conflict, the drawings shall take precedence.

2. "Approved Equal" - Manufacturers whose products are listed in the Specifications under "Approved Equal"

3. "Substitution" - Manufacturers whose products are not listed in the Specifications.

B. Requirements applicable to all submittals:

1. Refer to Section 230502 / 2.2 - General Submittal Requirements

2. Provide Specification Compliance with all Submittals:

a. Contractor/Manufacturer shall submit the all relevant specification sections within the submittal indicating that they comply with each line item of each of the relevant specification section(s). For any item that doesn't comply, the contractor/manufacture shall clearly indicate why not and how their product meets or exceeds the requirement of that line item.

C. Requirements applicable to submission of "Approved Equals":

1. The submittal shall include a cover sheet indicating the following, signed by the contractor:

a. The proposed product will not affect dimensions shown on Drawings.
b. The contractor will pay for changes to the building design, including engineering design, detailing, and construction costs caused by the submission.
c. The proposed product will have no adverse effect on other trades, the construction schedule, operation and maintenance, and specified warranty requirements.
d. Maintenance and service parts will be locally available for the proposed product.

2. The contractor shall be responsible for coordinating the required dimensions, clearances, access points and other service locations such that the submitted product properly fits in the available space allocated for the Basis of Design.

3. Provide all features which are standard on the Basis of Design, whether or not specifically specified or scheduled.

D. Requirements applicable to submission of "Substitutions":

1. Products by manufacturers not listed in the specifications may not be used as the basis of the bid price.

2. Substitution Request Form: Use Architect's Substitution Request Form, if one is not provided by the architect, utilize CSI Standard Form 13.1A.

3. Documentation: Show compliance with requirements for substitutions and the following, as applicable:

   a. Statement indicating why specified material or product cannot be provided.
   b. Coordination information, including a list of changes or modifications needed to other parts of the Work and to construction performed by Owner and separate contractors that will be necessary to accommodate proposed substitution.
   c. Detailed comparison of significant qualities of proposed substitution with those of the Work specified. Significant qualities may include attributes such as performance, weight, dimension, durability, visual effect, and specific features and requirements indicated.
   d. Product Data, including drawings and descriptions of products and fabrication and installation procedures.
   e. Operation, maintenance, and efficiency difference.
   f. Samples, where applicable or requested.
   g. List of similar installations for completed projects with project names and addresses and names and addresses of architects and owners.
   h. Material test reports from a qualified testing agency indicating and interpreting test results for compliance with requirements indicated.
   i. Research/evaluation reports evidencing compliance with building code in effect.
   j. Detailed comparison of Contractor's Construction Schedule using proposed substitution with products specified for the Work, including effect on the overall Contract Time. If specified product or method of construction cannot be provided within the Contract Time, include letter from manufacturer, on manufacturer's letterhead, stating lack of availability or delays in delivery.
   k. Cost information, including a proposal of change, if any, in the Contract Sum.
   l. Contractor's certification that proposed substitution complies with requirements in the Contract Documents and is appropriate for applications indicated.
   m. Contractor's waiver of rights to additional payment or time that may subsequently become necessary because of failure of proposed substitution to produce indicated results.

4. A/E will review Substitution Request and indicate one of the following actions:

   a. Substitution Request Approved as Noted - Make submittals in accordance with "Approved Equal" Requirements.
   b. Substitution Request Rejected - Use specified materials.

5. Under no circumstances should the substitution result in added cost to the project.

E. Shop drawings shall not be submitted prior to approval of all equipment submittals.

F. The materials, workmanship, design, and arrangement of all work installed under the Contract shall be subject to the approval of the Architect or Engineer.

G. If material or equipment is installed before it is approved, each trade installing same shall be liable for the removal and replacement at no extra charge to the Owner if, in the opinion of the Architect or Engineer, the material or equipment does not meet the intent of the Drawings and Specifications.

H. It is the intent of these Specifications that wherever a “Basis of Design” manufacturer of a product is specified, the submitted item must conform in all respects to the “Basis of Design” specified item. Consideration will not be given to claim that the substituted item meets the performance requirements with lesser construction (such as lesser heat exchange surface, reduced horsepower, etc.). Performance as delineated in schedules and in the Specifications shall be interpreted as minimum performance.

I. Being listed in the specifications as a “Basis of Design” or “Approved Equal” manufacturer does not permit the manufacturer to provide standard manufactured equipment which does not comply with the performance and/or physical characteristic requirements of the Contract Documents.

J. All equipment and materials required for installation under these Specifications shall be new and without blemish or defect. All electrical equipment shall bear labels attesting to Underwriter's Laboratories approval. Where no specific indication as to the type or quality of the material or equipment is indicated, a first class standard article shall be furnished.

K. Where it is proposed to use an item of equipment other than specified “Basis of Design” which requires any redesign of the structure, partitions, foundations, piping, wiring, or of any other part of the mechanical, electrical, or architectural layout, all such redesign, and all new drawings and detailing required therefore shall, with the approval of the Architect or Engineer, be prepared at no additional cost to the Owner. On multiple prime contracts the substituting contractor shall negotiate with other prime contractors to have alternate work performed without cost to the owner.

L. All equipment of one type (such as fan coil units, etc.) shall be the product of the same manufacturer.

M. Note that the approval of shop drawings or other information submitted in accordance with the requirements hereinbefore specified does not assure that the Engineer, Architect, or any other Owner's representative attests to the dimensional accuracy or dimensional suitability of the material or equipment involved or the mechanical performance of equipment. Approval of shop drawings does not invalidate the Plans and Specifications if the shop drawings are in conflict with the Plans and Specifications.

N. With regard to proprietary or partially proprietary systems, including but not limited to building automation, automatic temperature controls, fire alarm, signaling, monitoring, data center alarm systems, etc., the specification of system components by a single manufacturer shall not be questioned. No discussion about inter-operability or open protocols will be considered. Contractor shall assume that engineer has previously considered substitutions of non-proprietary systems or open protocols and rejected this option.

2.2 GENERAL SUBMITTAL REQUIREMENTS

A. Coordination and Sequencing:

1. Coordinate submittals 2 weeks (min.) prior to expected order date so that work will not be delayed by submittals.
2. No extension of time will be allowed because of failure to properly coordinate and sequence submittals.
3. Do not submit product data, or allow its use on the project until compliance with requirement of Contract Documents has been confirmed by Contractor.
4. Submittal is for information and record, unless otherwise indicated, and is not a change order request. Approval of alternate equipment or notations on shop drawings shall not be considered to be approval of additional cost.
5. Submitting contractor is responsible for routing reviewed submittals to all parties affected including but not limited to electrical, temperature control, and test and balance subcontractors.
6. All submittals requiring expedited review shall be made at the start of the project. Submittals requiring expedited review due to delay of submission will be reviewed on engineering premium time which will be back-charged to the contractor.

B. Preparation of Submittals:

1. Refer to Division 1 requirements.
2. Provide permanent marking on each submittal to identify project, date, Contractor, Subcontractor, Supplier, submittal name and similar information to distinguish it from other submittals.
3. Indicate any portions of work which deviate from the Contract Documents.
   a. Explain the reasons for the deviations.
   b. Show how such deviations coordinate with interfacing portions of other work.
4. Show Contractor's executed review and approval marking.
5. Provide space for Architect's/Engineer's "Action" marking.
6. Submittals which are received from sources other than through Contractor's office will be returned "Without Action".
7. Submittals shall be presented in a neat and legible fashion and shall be returned "Without Action" if presented in any other fashion.
8. Electronic submittals shall be subject to a minimum $50 document processing charge per submittal up to 50 letter size pages or 15 sq. ft. of wide format printing. Larger quantities will be subject to increased charges. Charges shall be deducted from payments to the Contractor by the owner.
9. Contractor is responsible for submission of shop drawings in accordance with plans and specifications for compliance with the system description and manufacturer. Shop drawings submitted, which are not in substantial compliance requires additional and unnecessary review time by the Engineer and Architect. Shop drawings submitted more than once, which are not in substantial compliance, shall be reviewed at a rate of $225 per hour and charged to the contractor. Charges shall be deducted from payment to the contractor by the owner.

C. Quantities: Unless otherwise indicated in Division 1, submit six copies.

1. Refer to Division 1 requirements.
2. Multiple System Items: Where a required submittal relates to an operation or item of equipment used in more than one system, increase the number of final copies as necessary to complete the Maintenance Manuals for each system.
3. Preliminary Submittal: Provide a preliminary, two-copy submittal for automatic temperature controls and when product data is required (or desired by Contractor) for selection of options by Architect/Engineer.
4. General Distribution:
   a. Provide additional distribution of submittals (not included in foregoing copy submittal requirements) to Subcontractors, Suppliers, Fabricators, Installers, Governing Authorities and others as necessary for proper performance of the work.
   b. Include such additional copies in transmittal to Architect/Engineer where required to receive "Action" marking before final distribution.
      1) Show such distributions on transmittal forms.

D. Response to Submittals: Where standard product data have been submitted, it is recognized:

1. That the Submitter has determined that the products fulfill the specified requirements.
2. That the submittal is for the Architect's or Engineer's information only, but will be returned with appropriate action where observed to be not in compliance with the requirements.

E. If more than two submissions (either for shop drawings, as-built drawings, or test and balance reports) are made by the contractor, the Owner reserves the right to charge the contractor for subsequent reviews by their consultants. Such extra fees shall be deducted from payments by the Owner to the contractor.

2.3 SPECIFIC CATEGORY SUBMITTAL REQUIREMENTS

A. Manufacturer's Data:

1. Where pre-printed data covers more than one distinct product, size, type, material, trim, accessory group or other variation, mark submitted copy with black pen to indicate which of the variations is to be provided.
2. Delete or mark-out significant portions of pre-printed data which are not applicable.
3. Where operating ranges are shown, mark data to show portion of range required for project application.
4. For each product, include the following:
    a. Sizes
    b. Weights
    c. Speeds
    d. Capacities
    e. Piping and electrical connection sizes and locations.
    f. Statements of compliance with the required standards and regulations.
    g. Performance data.
    h. Manufacturer's specifications and installation instructions.
    i. Certified performance curves for all pumping and fan equipment shall be submitted for approval.
    j. Samples of materials or equipment, when requested by the Architect, shall be submitted for approval.
    k. Samples, drawings, specifications, catalogs, etc., submitted for approval, shall be properly labeled indicating project name, specific service for which material or equipment is to be used, Section and Article number of Specifications.
    l. Catalogs, pamphlets, or other documents submitted to describe items on which approval is being requested, shall be specific and identification in catalog, pamphlet, etc., of item submitted shall be clearly made in ink. Data of a general nature will not be accepted.
    m. Approval rendered on shop drawings shall not be considered as a guarantee of measurements or building conditions. Where drawings are approved, said approval does not in any was relieve responsibility, or necessity, of furnishing material or performing work as required by the Contract Drawings and Specifications.
    n. Prior to submission of shop drawings, thoroughly check each shop drawing, reject those not conforming to the Specifications, and indicate (by signature) that the shop drawings submitted meet Contract Requirements.
    o. All shop drawings showing routing of ductwork, piping and conduit, shall be not less than 3/8" = 1'0" scale.

B. Shop Drawings:

1. Prepare Mechanical Shop Drawings, except diagrams, to accurate scale.
    a. Show clearance dimensions at critical locations.
    b. Show dimensions of spaces required for operation and maintenance.
    c. Show interfaces with other work, including structural support.

C. Test Reports:

1. Submit test reports which have been signed and dated by the firm performing the test.
2. Prepare test reports in the manner specified in the standard or regulation governing the test procedure (if any) as indicated.

D. Required equipment and shop drawing submittals:

1. Provide a submittal schedule with bid.
2. Provide equipment submittals for each item of equipment specified or scheduled in the contract documents.
3. Submittal Schedule shall show each item of equipment, applicable Section of the specifications where it is described, applicable Drawing number and schedule name where it is scheduled, date of Contractor's proposed submittal to Architect, required date to receive submittal from Architect and schedule order date.
4. Provide a Mechanical Shop Drawing Schedule for submission to the Architect with the Submittal Schedule.
5. Before request for acceptance and final payment for the work, write a letter to the Architect stating that all shop drawings are brought to a condition "Reviewed" or "Exception as Noted ". Any outstanding shop drawings must be cleared with the Engineer.

E. Submit shop drawings covering the following items:

1. Coordination drawings.
2. Internal cleaning and treating of piping.
3. Sleeve and ductwork penetration drawings.
4. Identification schedule and samples.
5. Air handling units, Energy recovery units, heat pumps.
6. Air filters and draft gauges.
7. Coils.
8. Humidifiers.
9. Heat exchangers.
10. Electric boilers.
11. Expansion joints, anchors and guides, including details of installation.
12. Air diffusers, registers and grilles.
13. Packaged and split systems.
14. Complete geothermal system with total capacity clearly indicated.
15. Schedule of ductwork, joints, gauges, supports, flexible connections, fire dampers, access doors, etc.
16. Utility fans, centrifugal fans, and power roof ventilators and propeller fans.
17. Sheet metal fabrication drawings.
18. Machinery guards and V-belt drives.
19. Roof vent fittings.
20. Schedule of piping and fitting materials.
21. Piping shop drawings.
22. Schedule of valves, strainers, vacuum breakers.
23. Schedule of steam pressure reducing valves.
24. Flow metering device and systems.
25. Thermometers and pressure gauges.
26. Automatic stop-check valves.
27. Expansion tanks.
28. Schedule of pipe and ductwork supports, including inserts, escutcheons, etc.
29. Heating systems, including unit heaters, cabinet heaters, fintube radiation, fan power boxes, convectors, etc., as specified.
30. Outside air supply unit including coils, filters, draft gauges, etc.
31. Heat recovery reclaim system.
32. Cabinet heaters, and unit heaters.
33. Water pumps including pump curves.
34. All motor starters and motor control devices.
35. Water treatment equipment and systems.
36. Schedule of insulation types and samples of each type.
37. Vibration isolation schedule including inertia block details.
38. Templates for equipment bases.
39. Acoustic material (internal duct lining).
40. VAV and constant air valve boxes.
41. Building management system.
42. Integrated room automation system.
43. Air vents, air separators, water strainers, reducing safety valves for water systems.
44. Diesel generator system.
45. Concrete pad location and size.
46. All air and water cooled condensers.
47. VRF condensers and evaporators, pipe and wiring diagrams, accessories.
48. All water source heat pumps.
49. Electric baseboard heaters and trench heaters.

F. All shop drawings being submitted that include electrical work shall be submitted with all internal and external wiring

diagrams.

G. The previously listed items are major equipment and do not limit this Division's responsibility to submit shop drawings for all equipment and accessories which are to be provided under this Division of the Specifications.

2.4 GREEN BUILDING REQUIREMENTS AND PERFORMANCE CRITERIA

A. Green Building Performance Criteria:

1. All field-applied concrete admixtures, adhesives, sealants, paints and coatings used for interior applications shall meet the volatile organic compound (VOC) and chemical component limitations as defined in architects specification or as required to obtain relevant LEED credit.

B. Green Building Submittal Requirements:

The Contractor and their sub-contractors shall submit the GREEN BUILDING CERTIFICATION items listed herein.

1. GBMCF: Submit a completed GREEN BUILDING MATERIALS CERTIFICATION FORM which will be provided by the architect or engineer. Information to be supplied for this form shall include:

   a. Cost breakdowns for the materials included in the Contractor or sub-contractor's work. Cost breakdowns shall include total cost plus itemized material costs for and VOC containing products.
2. Validation: Published product literature or manufacturer's letter of certification (on the manufacturer's letterhead) validating all information, other than costs, provided in the GBMCF.
3. Cut Sheets: Product cut sheets for materials listed in the GBMCF. Cut sheets shall be submitted with the Contractor or Trade Contractor's stamp, confirming that the submitted products are the products installed in the Project.
4. VOC Content: Material Safety Data Sheets (MSDS), published product literature, or manufacturer's signed certification (on manufacturer's letterhead) stating the VOC content of all applicable products.
5. Submittal Package: The GREEN BUILDING submittal information shall be assembled into one (1) package per Section or trade, and sent to the Consultant for review. Incomplete or inaccurate Green Building submittals may be used as the basis for rejecting the submitted products or assemblies.

2.5 COMPATIBILITY

A. General: Provide products which are compatible with other products of the mechanical work, and with other work requiring interface with the mechanical work.

B. Altitude Ratings: Except where noted otherwise, all ratings and capacities stated in the Contract Documents are at the altitude of the project.

C. Power Characteristics:

1. For power characteristics of equipment supplied under Division 21, 22 and 23 Sections, refer to the Sections of Divisions 26, 27 and 28 and the Electrical Drawings for the power characteristics of each power driven item of mechanical equipment.
2. Coordinate available power with Electrical Contractor before ordering equipment. Mechanical Contractor shall be responsible for ordering equipment to meet the available power characteristics.
3. See also Division 23 05 01 of these specifications.
4. If there is a conflict between Divisions 21, 22 and 23 documents and Divisions 26, 27 and 28 documents, alert the engineer. Do not order equipment prior to determining the proper electrical service. No contract cost adjustment will be allowed for equipment ordered in conflict with the available power characteristics.

2.6 SAFETY PROVISIONS

A. Equipment Nameplates: Provide power-operated mechanical equipment with a permanent nameplate attached by the manufacturer, indicating:

1. The manufacturer
2. Product name
3. Model number
4. Serial number
5. Speed
6. Capacity
7. Power characteristics
8. Labels of testing, listing, or inspecting agencies
9. Other similar data

B. Where manufacturer affixed nameplate is not available, Mechanical Contractor shall fabricate and attach nameplate.

C. Guards:

1. Unless equivalent guards are provided integral with the equipment, enclose each belt drive (including sheaves) on both side in a galvanized, one inch, mesh screen of No. 18 gauge steel wire or expanded metal, fastened to an approved, structural steel frame, securely fastened to the equipment or floor.
2. Provide tachometer holes at shaft centers. Unless equivalent guards are provided integral with the equipment, install a solid guard of No. 20 gauge galvanized steel over the coupling of each item of direct-driven equipment.

D. Refrigerant

1. Any refrigeration system containing any refrigerants listed in the Clean Air Act as a Class I or Class II Ozone Depleting Compound shall comply with the Clean Air Act.
2. As a minimum all systems shall be equipped with refrigerant recovery service valves, relief valves capable of resetting after activation, and for system with more than 50 pounds of charge, and isolateable receiver and/or condenser capable of holding the complete charge.
3. Any refrigerant removed from systems shall be recovered in accordance with Clean Air Act.

PART 3 – EXECUTION

3.1 COORDINATION OF MECHANICAL INSTALLATION

A. Inspection and Preparation:

1. Examine the work interfacing with mechanical work, and the conditions under which the work will be performed, and notify the Architect/Engineer of conditions detrimental to the proper completion of the work at original contract price.
2. Do not proceed with the work until unsatisfactory conditions have been corrected.

B. Layout:

1. Layout the mechanical work in conformity with the Contract Drawings, Coordination Drawings and other Shop Drawings, product data and similar requirements so that the entire mechanical plant will perform as an integrated system, properly interfaced with other work, recognizing that portions of the work are shown only in diagrammatic form.
2. Where coordination requirements conflict with individual system requirements, comply with the Architect's or Engineer's decision on resolution of the conflict.
3. Take necessary field measurements to determine space and connection requirements.

4. Provide sizes and shapes of equipment so the final installation conforms to the intent of the Contract Documents.

C. Integrate mechanical work in ceiling spaces with suspension system, light fixtures and other work so that required performances of each will be achieved. Modification of duct work sizes from contract documents to sheet metal shop drawings for coordination purposes shall be included in the contractor's scope of work, confirm new ductwork dimensions with the engineer.

3.2 PRODUCT INSTALLATION

A. Manufacturer's Instructions:

1. Except where more stringent requirements are indicated, comply with the product manufacturer's instructions and recommendations.
2. Consult with manufacturer's technical representatives, who are recognized as technical experts, for specific instructions on special project conditions.
3. If a conflict exists, notify the Architect/Engineer in writing and obtain his instruction before proceeding with the work in question.

B. Movement of Equipment:

1. Wherever possible, arrange for the movement and positioning of equipment so that enclosing partitions, walls and roofs will not be delayed or need to be removed.
2. Otherwise, advise other Contractors of opening requirements to be maintained for the subsequent entry of equipment.

C. Heavy Equipment:

1. Coordinate the movement of heavy items with shoring and bracing so that the building structure will not be overloaded during the movement and installation.
2. Where mechanical products to be installed on an existing roof are too heavy to be hand-carried, do not transport across the existing roof deck; position by crane or other device so as to avoid overloading the roof deck.

D. Return Air Path: Coordinate mechanical work in return air plenum to avoid obstructing return air path.

1. Do not make changes in layout which will reduce return air path cross-sectional areas. Minimum cross-sectional area will provide an average of 500 fpm and a maximum of 750 fpm velocity through return air plenum at specified supply air quantity unless otherwise noted.
2. Provide openings in any full height walls to allow for free movement of return air. Openings are to be sized for 500-750 fpm velocity. Provide fire or fire/smoke dampers at openings in fire rated walls, even if not specifically shown on the drawings.
3. Report any obstructions by work of other Divisions to Architect/Engineer.

E. Coordinate location of all floor mounted work (piping, ductwork, supports, etc.) in all areas (including mechanical rooms) to avoid obstruction of egress path.

F. Clearances:

1. Install piping and ductwork:
   a. Straight and true.
   b. Aligned with other work.
   c. Close to walls and overhead structure (allowing for insulation).
   d. Concealed, where possible, in occupied spaces.
   e. Out-of-the-way with maximum passageway and headroom remaining in each space.

2. Except as otherwise indicated, arrange mechanical services and overhead equipment with a minimum of:
   a. 8'-0" headroom in storage spaces.
   b. 8'6" headroom in other spaces; where approved by Architect.
3. Do not obstruct windows, doors or other openings.
4. Give the right-of-way to piping systems required to slope for drainage (over other service lines and ductwork).

G. Access:

1. Provide for removal, without damage to other parts, of:
   a. Coils
   b. Humidifier manifolds
   c. Tubes
   d. Shafts
   e. Fan wheels
   f. Drives
   g. Filters
   h. Strainers
   i. Bearings
   j. Control components
   k. Other parts requiring periodic replacement or maintenance
2. Connect equipment for ease of disconnecting with minimum of interference with other work.
3. Provide unions where required.
4. Locate operating and control equipment and devices for each access.
5. Provide access panels where units are concealed by non-accessible finishes and similar work.
6. Extend all grease fittings to an accessible location.

3.3 PROTECTION OF WORK

A. All pipe ends, valves, ducts, and equipment left unconnected shall be capped, plugged or otherwise properly protected to prevent damage or the intrusion of foreign matter.

B. Do not allow any fans in the HVAC system to operate before the area served by the fan has been cleaned and vacuumed of all debris and dust which might enter the system.

C. Any equipment, duct or piping systems found to have been damaged or contaminated above "MILL" or "SHOP" conditions shall be replaced or cleaned to the Engineer's satisfaction.

D. Provide initial water seal fill for all waste P-traps, condensate traps, or similar traps.

3.4 PROTECTION OF POTABLE WATER SYSTEMS

A. All temporary water connections shall be made with an approved back flow preventer.

B. All hose bibs shall have as a minimum, a vacuum breaker, to prevent back flow.

C. Direct connections to hydronic systems shall only be made through a reduced pressure zone back flow preventer. Backflow drain shall be piped to drain to nearest floor drain or mopsink.

3.5 REFRIGERATION SYSTEMS

A. All techniques involved in the installation of refrigeration systems shall be by certified staff trained in accordance with the state and local requirements, and the applicable sections of the Clean Air Act.

B. No refrigerant shall be intentionally vented to the atmosphere. All refrigerant shall be recovered before opening a closed system for charging, evacuation or service. Equipment being demolished that contains R-170, R-290, R-600, R-600W, R-1150, R-1270 type refrigerants shall be subject to the approval of the commissioner of the Fire Department.

All refrigerant installed shall be new unless approved by the Engineer.

C. All refrigerant installed shall be new unless approved by the Engineer.

D. The Contractor shall be responsible and accountable for compliance with the EPA Clean Air Act (CAA) Section 608, 40 CFR Part 82 and any state or local codes for all refrigerant related work. In general, an EPA-certified technician shall perform any activity involving refrigerant-containing equipment that includes: (1) attaching and detaching hoses and gauges to and from refrigerant containing equipment to measure pressure; (2) adding refrigerant to, or removing refrigerant from equipment; or (3) any other activity that violates the integrity of a refrigerant containing circuit (for example any activity where a refrigerant containing circuit is 'opened' in any manner).

E. Refrigerant and oil shall be recovered from any equipment that does not meet the definition of a small appliance in 40CFR Part 82 Subpart F before removal and subsequent disposal. Small appliances (as defined in 40CFR Part 82 Subpart F) may be removed from the site with the charge (refrigerant) intact, provided it is properly labeled and handled in such a manner so as to prevent damage to coils. Small Appliances are defined in 40CFR Part 82 Subpart F as: Any appliance that is fully manufactured, charged, and hermetically sealed in a factory with five (5) pounds or less of a Class I or Class II substance used as a refrigerant, including, but not limited to, refrigerators and freezers (designed for home, commercial, or consumer use), medical or industrial research refrigeration equipment, room air conditioners (including window air conditioners and packaged terminal air heat pumps), dehumidifiers, under-the-counter ice makers, vending machines, and drinking water coolers.

F. All new equipment installed shall utilize non-CFC refrigerants.

G. Prior to starting construction, demolition, or service work Contractor shall provide to Owner a list of all service technicians with EPA certification numbers and level of certification. (Copies of EPA certification cards are acceptable for those who will be working on the site.)

H. Contractor shall provide to the Owners Representative all Service Invoices (or equivalent service documentation acceptable to owner) for all work performed by EPA- certified Technicians. Service Invoices (or equivalent documentation) shall include the following information at a minimum for each piece of refrigerant containing equipment serviced:

- Date of Service
- Name of EPA-Certified Technician
- Technicians Certification Level
- Type of Equipment Serviced
- Equipment Manufacture
- Equipment Model and Serial Number
- Description of Service Performed
- Date Leak Discovered (if applicable)
- Date Leak Repaired (if applicable)
- Date Follow-Up Leak Test Performed (if applicable)
- Type of Refrigerant
- Normal System Full Charge (in pounds)
- Amount of Initial Refrigerant Charge Recovered During Service
- Amount of Recovered Refrigerant Returned to System
- Type of Additional Refrigerant Added to System
- Amount of Additional Refrigerant Charged to System
- System Charge at End of Service

I. Contractor shall provide Owners Representative a copy of complete manifests, invoices, or other documentation showing any refrigerant removed from the project by the contractor was disposed of appropriately or reclaimed by an EPA-certified Reclaimer.

3.6 LEAK TESTING

A. All new equipment not meeting the definition of a small appliance, including packaged equipment, factory charged, field charged, split systems or field-constructed systems with field-installed refrigerant piping shall be leak tested prior to or during startup. Leak testing shall utilize appropriate electronic leak-testing equipment.

B. Leak testing shall be conducted by an EPA-certified technician. The contractor shall provide written verification of the leak testing and results.

C. If a leak is detected, the following procedure shall be followed:

1. Notify the Owner's Site Representative (who will notify the Refrigerant Compliance Coordinator).
2. Document the leak.
3. Repair the leak.
4. Document the procedures followed.
5. Leak test to verify the leak was repaired.
6. Schedule and provide a 30-day follow-up verification leak test witnessed by a designated HVAC technician.
7. Document follow-up leak testing.
8. Repeat the above process if follow-up leak is detected.

3.7 DEMOLITION PROCEDURE FOR EQUIPMENT REMOVED BY CONTRACTOR

A. The Contractor, in contractor-provided refrigerant recovery cylinders, shall take ownership of the recovered refrigerant and transport off site to a proper disposal company or certified reclaimer.

B. Service Invoices, as described in RECORD DOCUMENTS, shall be provided.

C. The Contractor technician shall tag the unit that the refrigerant was removed.

D. Once an EPA-certified technician has removed the refrigerant and tagged the unit, a noncertified person may perform the remainder of the demolition.

3.8 START-UP

A. Tests shall be performed to the satisfaction of the Architect. The Architect will be present at such test, when he deems necessary and such other parties as may have legal jurisdiction.

B. Pressure tests shall be applied to piping only before connection of equipment and installation of insulation. In no case shall piping, equipment, or accessories be subjected to pressure exceeding their rating.

C. All defective work shall be promptly repaired or replaced and the tests shall be repeated until the particular system and component parts thereof receive the approval of the Architect.

D. Any damages resulting from tests shall be repaired or replaced and the tests shall be repeated until the particular system and component parts thereof receive the approval of the Architect.

E. The duration of tests shall be as determined by all authorities having jurisdiction, but in no case less than the time prescribed in each Section of the Specification.

F. Equipment and systems which normally operate during certain seasons of the year shall be tested during the

appropriate season. Tests shall be performed on individual equipment, systems, and their controls. Whenever the equipment or system under test is interrelated with and depends upon the operation of other equipment, systems and controls for proper operation, functioning, and performance, the latter shall be operated simultaneously with the equipment or system being tested. Provide any temporary devices required to complete start-up of equipment where that system's installation is incomplete at the time of start-up.

G. The electrical work shall include providing any assistance (such as removal of switchboard and panelboard trims and covers, pull and junction box covers, etc.) deemed necessary by the Architect to check compliance with the Drawings and Specifications.

H. The Contractor shall assign a Plumbing, Fire Protection and HVAC Start-Up Coordinator to this project.

I. The Start-Up Coordinator shall develop detailed start-up procedures, equipment checkout procedures and data forms for recording compliance with contract document performance criteria, and will assist in developing schedules for checkout and Owner acceptance.

J. The Plumbing, Fire Protection and HVAC Contractors shall include as part of the work of this contract, manpower, equipment, tools, ladders, instruments, etc. necessary to confirm start-up of Plumbing, Fire Protection and HVAC systems.

K. The Test, Adjust and Balancing Contractor shall include as part of the work of his/her contract, labor and material to provide manpower, equipment, tools, ladders, instruments, etc. necessary to assist the Start-Up Coordinator in accomplishing his/her work.

L. The Start-Up Coordinator shall be responsible for maintaining documentation of Start-Up activities until final acceptance of the project.

M. The documentation shall be kept current by the Start-Up Coordinator and shall be available for inspection at all times. At the time of acceptance of the project, the Start-Up Coordinator shall surrender 3 completed copies of the documentation to the Owner's representative.

N. Before Testing, Adjusting, Calibration and Balancing, the Start-Up Coordinator shall confirm, in writing to the Owner, the following:

1. All equipment, components, and systems have been set, started-up, and adjusted.
2. Systems have been established at the appropriate temperatures and pressures for proper operation and performance.
3. All electric power connections, disconnects, fuses, circuit breakers, etc. are properly sized and installed.
4. The operation of all valves, dampers and sensors is positive (per the control sequences) and demonstrated.

O. Provide dated matrices for each item of equipment showing the date each of the start-up activities was witnessed or performed by the Start-Up Coordinator.

1. Start-up and operating performance test documentation shall include all Division 21, 22 and 23 equipment with scheduled or rated capacities.

P. At the completion of the start-up; and test and balance, Plumbing, HVAC and Fire Protection contractors shall conduct a 72 hour dynamic mode demonstration of the systems in the presence of the Owner and Architect/Engineer. Contractor shall be available during the period to adjust equipment operation or setpoints. The engineer may direct the contractor to implement new control sequences or alter system installation in response to data collected during start-up. Work that can be completed by staff assigned to start-up that can be completed in the time period assigned to the start-up shall be completed with out additional cost to the owner.

Q. The Owner may require operation of parts or all of the installation for the beneficial occupancy to final completion and acceptance of the building. The operation shall not be construed to mean acceptance of the work by the Engineer

for the Owner. The Owner will furnish supervisory personnel to direct operation of the entire system and the Contractor shall continue to assume this responsibility until final acceptance.

3.9 DEMONSTRATION

A. Refer to Architectural sections of the specifications regarding requirements of Record Drawings and Operation and Maintenance Manual submittal and systems demonstration.

1. Demonstrate to the Architect/Engineer that each system operates in accordance with the contract documents.
2. Explain the operation of each system to the Owner's Representative. Explain use of O&M manual in operating and maintaining systems.

B. Date and time of demonstration will be determined by Owner.

C. Demonstration Requirements.

1. Provide a point-to-point check-out of 100% of BMS controlled points for all equipment.

3.10 PROJECT CLOSEOUT

A. Refer to the individual sections of the specifications for individual closeout requirements.

B. Provide a written schedule of when systems are to be started up, tested and demonstrated along with dates for completion of the temperature controls and balancing. This schedule shall be submitted no later than 30 days prior to starting up and testing equipment.

C. The contractor shall notify the Architect/Engineer no later than 2 weeks in advance of system testing or demonstration.

END OF SECTION

SECTION 23 05 03

BASIC MECHANICAL MATERIALS AND METHODS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. This Section supplements Division 1, General Requirements.

B. Where contradictions occur between this Section and Division 1, the most stringent of the two shall apply. The design team shall decide which is most stringent.

C. Provisions of this Section shall also apply to all Sections of Divisions 21, 22 and 23.

1.2 SUBMITTALS

A. Manufacturer's Data - Submit manufacturer's data for:

1. Access panels.
2. Fire stopping materials.
3. Heat Trace.

B. Application Data - Submit application data for firestopping materials showing UL required installation details for every combination of pipe material, penetrated structure, opening size and required fire rating within the scope of this project. Application data drawings shall include UL system number.

PART 2 – PRODUCTS

2.1 ACCESS PANELS

A. See Architectural specification for access panel types and finishes.

1. If panels are not specified in architectural specification, comply with the following:
   a. Manufacturers:
      1) Design Basis: Milcor Division, Inryco, Inc.
      2) Other Acceptable Manufacturers:
         a) Birmingham Ornamental Iron Co.
         b) Karp Associates, Inc.
         c) Wilkenson Co., Inc.

B. Construction:

1. Doors: 14 gauge steel.
2. Frames: 16 gauge steel.
3. Fire Rating: Equivalent to construction in which installed.
4. Latches: Flush or concealed, ¼ turn.
5. Finish: Selected by Architect.

2.2 FIRE STOPPING MATERIAL

A. Manufacturers:

1. Design Basis: 3M.
2. Other acceptable manufacturers:
   a. GE
   b. Metalines
   c. Hilti

B. General Requirements:

1. Products to be used shall have been tested in accordance with ASTM E 814-88, and be listed in the UL Fire Resistance Directory.

C. Bare Piping:

1. Model: FD 150, or CP-25.

D. Insulated Piping:

1. Model: CP-25 or FS-195, Intumescent.
2. “No-sag” or “self-leveling” as required.

E. Accessories:

1. Provide fasteners, restricting collars, backing materials, and protective coatings as required to comply with the UL system listing.

2.3 SPARE PARTS

A. Geothermal and solar thermal pumps - For each pump listed, unless otherwise specified.

1. One set of wearing rings or seals.
2. One set of bearings.
3. One set of packing glands complete with rings, nuts and bolts.
4. Three gaskets for casing joint.
5. Sufficient stuffing box packing for four packings.

Where pump specifications do not require mechanical seals, packing glands or stuffing boxes, spares listed may be omitted. Spare set of seals shall be provided.

B. Filters

1. The Contractor shall furnish a minimum of 2 complete spare filter sets for the filters for all units.

C. Heat Pump Spare Parts

1. Provide one complete compressor section for each vertical heat pump size used in the guest rooms and suites. Compressor section shall be complete and easily exchanged for replacement/repair.

D. Miscellaneous Spare Parts

1. Water column glasses shall be provided for each tank utilizing one.
2. Furnish one complete set of V-belts for each belt driven unit installed.
3. A full set of spare fuses for each VFD drive.

2.4 ESCUTCHEONS

A. Provide escutcheons on pipes wherever they pass through ceilings, walls, floors, or partitions.

B. Escutcheons or pipes passing through outside walls shall be Ritter Pattern and Casting Co., No. 1, solid, cast brass, flat type secured to pipe with set screw.

C. Escutcheons for pipes passing through floors shall be Ritter Pattern and Casting Co., No. 36A, split-hinged, cast brass type, designed to fit pipe on one end and cover sleeve projecting through floor on the other end.

D. Escutcheons for pipes passing through interior walls, partitions, and ceilings shall be Ritter Pattern and Casting Co., No. 3A, split-hinged, cast beams chromium plated type.

PART 3 – EXECUTION

3.1 EXCAVATION

A. Quality Coordination: Where excavation and backfill for mechanical work passes through or occurs in the same area as work specified in Division 2, comply with both the requirements of Division 2 and the requirements of this Section, or whichever is the more stringent (as determined by the Architect/Engineer in cases of conflicting requirements).

B. Inspection:

1. Examine the areas to be excavated, and the conditions under which the work is to be performed.
2. Notify the Architect/Engineer in writing of conditions detrimental to the proper completion of the work.
3. Do not proceed with excavating until unsatisfactory conditions have been corrected.

C. General:

1. Do not excavate for mechanical work until the work is ready to proceed without delay, so that the total time lapse from excavation to completion of backfilling will be minimum.
2. Remove all rock and boulders from excavation before installing mechanical work.
3. Slope sides of excavations as required for stability, or provide necessary shoring.
4. Remove shoring during backfilling.
5. Excavate near large trees (within the drip line) by hand.
   a. Protect the root system from damage or drying to the greatest extent possible.
   b. Maintain moist condition for root system and cover exposed roots with burlap.
   c. Paint root cuts of 1” diameter and larger with asphaltic tree paint.
6. Saw-cut asphalt and concrete surfaces.

D. Depth of Excavation:

1. Depth for Exterior Piping: Except as otherwise indicated, excavate for exterior piping so that the vertical distance between top of piping and finished grade will not be less than 5’-0”.
2. Depth for Unsatisfactory Soil Conditions:
   a. Where directed, because of unsatisfactory soil condition at bottom of excavation, excavate additional depth as directed to reach satisfactory soil-bearing condition. Backfill with “squeegee” washed rock, or other approved sub-base material, compacted as directed, to indicated excavation depth.

b. Where piping crosses over an area more than 5'0" wide, which has been previously excavated to a greater depth than required for the piping installation:
   1) Excavate to undisturbed soil in a width equal to the pipe diameter plus 2'0".
   2) Install "squeege" washed rock, or 8" courses of approved subbase material; each course compacted to 95% of maximum density, as required to fill excavation and support piping.

E. Protection:

1. Provide temporary covering or enclosure and temporary heat as necessary to protect bottoms of excavations from freezing and frost action. Do not install mechanical work on frozen excavation bases or subbases.
2. Coordinate excavations with weather conditions, to minimize the possibility of washouts, settlements and other damages and hazards.
3. Allow no more than 100 feet between pipe laying and point of complete backfilling.
4. Maintain dry excavations for mechanical work by removing water.
   a. Protect excavations from inflow of surface water.
   b. Pump minor inflow of ground water from excavations.
   c. Protect excavations from major inflow of ground water by installing temporary sheeting and waterproofing.
   d. Provide adequate barriers which will protect other excavations and below-grade property from being damaged by water, sediment or erosion from or through mechanical work excavations.
5. Provide signs, illumination and barricades as necessary to prevent accidents at excavations.
6. Install and operate a well-point dewatering system to maintain ground water at a level approximately 2'0" below mechanical work excavations, until backfilling is completed.

F. Excavated Material:

1. Store excavated material (temporarily) near the excavation, in a manner which will not interfere with or damage the excavation or other work. Do not store under trees (within the drip line).
2. Retain excavated material which complies with the requirements for backfill material.
3. Remove excavated material which is either in excess of quantity needed for backfilling or does not comply with requirements for backfill material from project site, and dispose of in a lawful manner.
4. Coordinate acceptable stockpiling areas with Owner in advance of excavation.

G. Bedding:

1. Where indicated below, install as bedding material graded sand with 100% passing through a 3/8" sieve, and 0% passing through No. 100 sieve.
   a. Compact by tamping to form a firm base for the work.
   b. Install bedding from six inches below bottom of pipe to six inches above top of pipe.
   c. Provide bedding for:
      1) Wrapped, coated or plastic pipe and tanks.
      2) Piping over six inches, horizontal cylindrical tanks, and similar work.
         a) Shape the subbase to fit the shape of the bottom 90º of the cylinder, for uniform continuous support.
      3) All water and sewer pipe.
2. Where rock is used as sub-base, place 8-mil polyethylene between rock and bedding.
3. Shape sub-bases and bottoms of excavations with recesses to receive pipe bells, flange connection, valves and similar enlargements in the piping systems.

H. Concrete Encasement: Where piping under roadways is less than 2'6" below surface of roadway, or where ductwork is buried below grade:

1. Provide 4" base slab of concrete to support piping and ductwork.

2. After piping or ductwork is installed and tested, provide 4" thick encasement (sides and top) of concrete before backfilling.
    a. Provide external structural reinforcing of all rectilinear cross section ductwork or any ductwork which is less than 18 ga sheet metal (or equivalent) to prevent collapse of ductwork encasement.
3. Provide minimum 2500 psi concrete for encasement and slab.

I. Backfilling:

1. Do not backfill until installed mechanical work has been tested and accepted, wherever testing is indicated.
2. Condition backfill material by either drying or adding water uniformly, to whatever extent may be necessary to facilitate compaction to the required densities.
3. Do not backfill with frozen soil materials.
4. Backfill simultaneously on opposite sides of mechanical work, and compact simultaneously.
5. Do not dislocate the work from installed positions.
6. Backfill to elevations matching adjacent grades, at the time of backfilling excavations for mechanical work.
7. Backfill with finely graded sub-base material to 6" above wrapped, coated, and plastic piping and tanks, and to centerline of other tanks.
8. Backfill excavations in 8" high courses of backfill material, uniformly compacted to the densities indicated in Division 2 using power-driven, hand-operated compaction equipment.
9. If densities are not indicated in Division 2, compact to the following percent of maximum per ASTM D1557:
    a. Lawn/Landscaped Areas: 85%.
    b. Paved Areas, Other than Roadways: 90%.
    c. Roadways: 95%.
    d. Floors: 95%.
10. Where compaction tests indicate lower densities of backfill than specified, continue compaction (and re-excavation and backfilling where necessary).
    a. Provide additional testing as directed by the Architect/Engineer.
    b. The allowable density tolerance is not more than one-test-out-of-five failing more than two percentage points below the specified density.
    c. Initial testing is not work of this Section.
11. Where subsidence is measurable or observable at mechanical work excavations during the guarantee period:
    a. Remove the surface (pavement, lawn or other finish).
    b. Add backfill material, compact, and replace the surface treatment.
    c. Restore the appearance, quality and condition of the surface or finish to match adjacent work.
    d. Eliminate evidence of the restoration to the greatest extent possible.

J. Landscape Restoration:

1. Where excavation and backfill for mechanical work passes through or occurs in a landscaped area, repair or replace the landscape work to match the original condition and quality of the work.
2. Comply with the requirements of Division 2 for repair or replacement of work, and for follow-up maintenance on lawns and planting to ensure satisfactory recovery.

K. Pavement Restoration:

1. Where excavation and backfill for mechanical work passes through or occurs in an area of paving or flooring, replace and restore the construction and finish of the paving or flooring to match the original condition and quality of the work.

L. Surface Repairs:

1. The repairing and replacing of previously installed landscape development work, paving, floor slabs and similar finishes occurring in excavated areas shall be provided, but is not included in work of Divisions 21, 22

and 23.

3.2 CUTTING AND PATCHING

A. Refer to Architectural sections of the Specifications for additional requirements.

B. Provide measurements, drawings and layouts to installers of other work so that required openings may be provided as construction progresses. Any cutting and patching made necessary by failure to provide this information shall be done at no increase in the contract amount.

C. All cutting and patching of existing work required for Plumbing, HVAC and Fire Protection work is included in the scope of the plumbing, HVAC and Fire Protection contracts. Finish patching, painting and restoration of finishes outside of primary work area is the Plumbing, HVAC and Fire Protection contractor performing work. Finish patching, painting and restoration of finishes in primary work area is by others. Rough patching, finish patching, painting and/or restoration of finishes outside of the primary work area is by each trade contractor.

D. Where possible, mark openings to be cut on existing construction. Otherwise, provide measurements, drawings and layouts to the trade doing the cutting so that openings may be provided as construction progresses.

E. Cutting Concrete:

1. Where authorized, cut openings through concrete for pipe penetration and similar services by core drilling or sawing.
2. Do not cut by hammer-driven chisel or drill.

F. Cutting:

1. Cut openings in accordance with layouts, measurements or drawings of the Installer of work requiring openings. Cut openings in concrete by core drilling or sawing; not by hammer-driven chisel or drill.
2. Coordinate the location of all openings with structural drawings. Report any discrepancies to Architect. Do not proceed with work until discrepancies have been resolved.
3. Do not endanger or damage other work through the procedures and processes of cutting to accommodate mechanical work.
4. Review the proposed cutting with the Installer of the work to be cut, and comply with his recommendations to minimize damage.
5. Where necessary, engage the original Installer or other specialists to execute the cutting in the recommended manner.

G. Patching:

1. Where patching is required to restore other work because of either cutting or other damage inflicted during the installation of mechanical work, engage experienced craftsmen to complete the patching of the other work.
2. Restore the other work in every respect, including the elimination of visual defects in exposed finishes.
3. All openings in fire rated construction shall be patched and sealed with U.L. approved sealant to maintain the fire integrity of the structure.

H. Perform cutting, patching and restoration of finishes required to:

1. Uncover work to provide installation of ill-timed work.
2. Remove and replace defective work.
3. Remove and replace work not conforming to requirements of the Contract Documents.
4. Remove samples of installed work as specified for testing.
5. Install equipment and materials in existing structures.

6. Upon written instructions from the Architect/Engineer, uncover and restore work to provide for Architect/Engineers observation of concealed work.

I. Painting:

Paint all surfaces marred by cutting and/or patching to match existing.

1. Engage experienced painters.
2. Comply with requirements of Painting Sections of the Specification.

J. Structural Limitations:

1. Do not cut or drill into structural framing, walls, floors, decks, and other members intended to withstand stress, except with Engineer's written authorization.
   a. Provide lintels, columns, braces and other temporary and permanent supports made by cutting.
   b. Submit shop drawings of permanent supports.
   c. Do not penetrate legs of structural "T's" or any other location where pre-stressed structural chords are likely to be encountered when cutting or drilling.

K. Provide inspection via metal detector or x-ray to identify existing concealed utilities when existing conditions make it apparent that concealed utilities may exist.

3.3 ACCESS PANELS

A. Furnish access panels where indicated and at locations where required for access to:

1. Concealed valves
2. Dampers
3. Control devices
4. Equipment servicing
5. Shock arresters
6. Air vents
7. Flow measuring and balancing stations
8. Any other device or item equipment requiring maintenance, adjustment or service.

B. Deliver access panels for installation by the trade responsible for surface in which installed.

1. Provide instructions for location.
2. The minimum size for access doors shall be the larger of 24"x24" or to fit the size of equipment to be removed.
3. If calculation of required access doors under item A above identifies less than 1 access door per 200 square feet of ceiling and wall construction, the quantity of access doors shall be increased to 1 per 200 square feet of ceiling and wall construction.

C. See "mechanical and electrical coordination" for additional access door requirements if section has been included in this specification.

3.4 SLEEVES

A. Provide sleeves for piping passing through walls, floors and roofs.

B. Provide sleeves for existing-to-remain piping through new walls.

C. Set pipe sleeves and inserts in place before concrete is poured. Coordinate the placing of these items to avoid delaying concrete placing operations.

D. Locate chases, shafts, and openings required for the installation of the mechanical work during framing of the structure. Do any additional cutting and boring required due to improperly located or omitted openings without cost to the Owner under the supervision of the Owner's representative.

E. Size sleeves for below grade pipe a minimum of 2" beyond outside of pipe.

F. Coat surface of all sleeves in contact with concrete, masonry or soil with two coats of coal tar bitumastic paint.

G. Provide Sleeves as Follows:

Sleeve Location	Sleeve Material
Interior Stud Partition Walls	Adjustable galvanized sheet metal with wall flanges and plaster lip, 2" and smaller – 22 gauge, 3" through 6" – 20 gauge, 8" and larger – 18 gauge.
Membrane Waterproof Floor and Roof Construction	Galvanized cast iron body with flashing clamp, threaded for sleeve riser. (J.R. Smith 1760 or equivalent by Ancon, Zurn or Josam).
Nonmembrane Floor, Construction	Non-adjustable galvanized sheet metal with deck flange and end cap, 2" and smaller – 22 gauge, 3" – 20 gauge, 4" and larger – 16 gauge.
Exterior Walls Below Grade	Standard weight galvanized steel pipe with a continuously welded water stop of ¼" steel plate extending from outside of sleeve a minimum of 2" all around. Provide modular mechanical–type seal consisting of interlocking synthetic rubber links with bolts shaped to continuously fill the annular space between the pipe and sleeve. Thunderline Corporation "Link-Seal" sealant assembly or equal by Metraflex "MetaSeal".
Floors of Mechanical Rooms, Concrete Walls or Masonry Walls Above Grade.	Standard weight galvanized steel pipe.

H. Length of Sleeves as Follows:

Location	Sleeve Length
Floors	Equal to depth of floor construction including finish. Extend minimum of 1" above finished floor level within partitions, mechanical rooms, pipe chases and finished areas.
Roofs	Equal to depth of roof construction including insulation. Extend to 2" above maximum flood depth where rooftop retention is provided.
Walls	Equal to depth of construction.

3.5 FIRE STOPPING

A. Install firestopping materials in accordance with their UL and ASTM tested methods.

B. Coordinate required annular space with size of pipe and sleeve.

C. Requirements for specific systems:

1. Cold piping - includes chilled water, domestic water, storm water and refrigerant: Insulation and vapor barrier shall be continued through wall and firestopping for “insulated piping” shall be provided.
2. Hot piping - to 250ºF -includes domestic hot water, steam to 15 psig and heating hot water: The Contractor has the option of continuing the insulation through the penetration and providing firestopping for “insulated piping”, or stopping the insulation on either side of the penetration and using firestopping for “uninsulated piping”.
3. High temperature piping, over 250ºF or over 15 psig steam: Contractor shall stop insulation and provide firestopping for high temperature piping.

3.6 EQUIPMENT BASES AND SUPPORTS

A. Supporting Steel: Provide supporting steel not indicated on the Structural Drawings for equipment, pipe ductwork, and other pieces of this Division’s work requiring same.

1. Submit shop drawings and structural calculations to the Engineer for information and records.
2. Brace and fasten with flanges bolted to structure.
3. Paint supporting steel with one coat of primer paint in the shop after fabrication welding is complete. Paint completed field joints with one coat of matching primer.

B. Housekeeping Bases:

1. Concrete bases for pumps, boilers, tanks, fans, etc., including anchor bolts and inserts, will be provided in accordance with American Concrete Institute (ACI) and American Society for Testing and Materials (ASTM) Standards for housekeeping pads and equipment support bases.
2. The concrete shall be placed in accordance with setting diagrams and sizes furnished by the equipment installer.
3. The Section furnishing the equipment shall provide not less than 4" high concrete bases for all pumps, refrigeration machines, compressors, and rotating machinery. Bases shall extend six inches beyond machinery base in all directions, with top edge chamfered. Provide 1/2" x 6" steel dowels into floor to anchor bases. Provide anchor bolts set in pipe sleeves, two sizes larger than anchor bolts for securing machinery. After anchor bolts are aligned with equipment bases, fill sleeves with concrete and allow to set.

3.7 RAILINGS

A. Where railings and guards are not provided in another section of the specification, each contractor shall provide protection as described below for all equipment installed by the contractor.

1. Guards shall be provided where appliances, equipment, fans or other components that require service are located within 10 feet of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches above the floor, roof, or grade below.
2. The guard shall extend not less than 30 inches beyond the end of such appliance, equipment, fan or component.
3. The top of the guard shall be located not less than 42 inches above the elevated surface.
4. The guard shall be constructed so as to prevent the passage of a 21-inch-diameter sphere and shall comply with the loading requirements for guards specified in the local Building Code.

3.8 DRIP PANS

A. Drip Pans:

Where possible to run mechanical piping elsewhere, do not run mechanical piping directly above electrical (or electronic) work which is sensitive to moisture. Otherwise, provide drip pans under mechanical piping, sufficient to protect electrical work from dripping.

1. Locate pan immediately below piping, and extend a minimum of 6" on each side of piping and lengthwise 18" beyond equipment being protected.
2. Fabricate pans 2" deep of reinforced 22 gauge galvanized sheet metal with rolled edges and welded seams.
3. Provide ¾" copper drainage piping from pan to nearest floor drain or similar suitable point of discharge, and terminate pipe as an open-sight drainage connection.
4. Provide permanent support and anchorage to prevent displacement of drip pans.
5. Insulate bottom of pan where pan is subject to the frequent discharge of water or materials less than 60˚F.

END OF SECTION

SECTION 23 05 13

MOTORS AND STARTERS

PART 1 - GENERAL

1.1 SUBMITTALS

A. Submit manufacturer's product data.

1. Motors: Identify by unit served. Include:
   a. Voltage
   b. Phase
   c. Horsepower
   d. Frame
   e. Insulating class
   f. Efficiency
   g. Power factor
   h. Index number
   i. Speed
   j. Starting characteristics
2. Starters: Identify by motor served. Include:
   a. Enclosure, NEMA Type
   b. NEMA size
   c. Accessories, switches, transformers, etc.
   d. Wiring diagram
   e. Auxiliary contacts
   f. Thermal overload size
3. Submit as part of packaged unit submittals when purchased as part of item of equipment.

1.2 SINGLE MANUFACTURER

A. Provide all motors, except those factory mounted, by a single manufacturer.

B. Provide all starters, except those factory mounted, by a single manufacturer.

C. "Factory mounted" means "as part of a packaged unit" where the motor is not purchased separately from the driven equipment.

PART 2 - PRODUCTS

2.1 MOTORS (OTHER THAN FACTORY MOUNTED)

A. Manufacturers:

1. Design Basis: Reliance
2. Other Acceptable Manufacturers:
   a. General Electric
   b. Westinghouse
   c. U.S. Motor
   d. Magnetek
   e. Baldor

f. U.S. Electric

3. Factory mounted motors may be by equipment manufacturer's standard supplier.

B. Bearings: Ball bearings, grease lubricated with grease fittings.

C. Enclosure: As required by location.

D. Service Factor: 1.15.

E. Full-Load Operation: At 105ºF and altitude of project.

F. Overload Protection:

1. Type: Trip-free thermal overload relay.
2. Location: Each ungrounded conductor.
3. Reset: Manual.
4. Ambient Temperature Compensation: Provide where required.
5. Overload protection to be sized for nameplate running amps.

G. Insulation:

1. Constant Speed: Class B.
2. Variable Frequency Controlled: Class F.

H. Efficiency Ratings:

1. All motors one horsepower and larger, except as noted, shall be premium efficiency motors, in accordance with NEMA Standard MGI-2003, Tables 12-12 and 12-13.

I. Electrical Characteristics:

1. Refer to sections 23 05 01, Mechanical and Electrical Coordination.
2. Motors less than ½ hp shall be 115-volt single phase.
3. Motors ½ hp and larger shall be three phase, of voltage shown in Electrical Section of Contract Documents.

J. Multi-speed Motors:

1. Type: Motors may be one of the following:
   a. Two speed, two winding 1800/900 rpm.
   b. Two speed, one winding 1800/900 rpm.

K. Variable Speed Drives:

1. All motors operated by a variable speed drive shall be rated for inverter duty.
2. Motor insulation shall be rated for 1600-volt peak.
3. All motors need to be NEMA MG-1, Part 31 compliant.
4. Refer to VFD specification for additional requirements if included in this specification.
5. Provide AEGIS shaft grounding rings for all motors operated by a VFD.

2.2 MOTORS (FACTORY MOUNTED)

A. Provide premium efficiency motors.

B. Variable Speed Drives:

1. All motors operated by a variable speed drive shall be rated for inverter duty.
2. Motor insulation shall be rated for 1600 volt peak.
3. All motors need to be NEMA MG-1, Part 31 compliant.
4. Refer to VFD specification for additional requirements if included in this specification.
5. Provide shaft grounding rings for all motors operated by a VFD.

2.3 STARTERS

A. Manufacturers:

1. Allen Bradley
2. Cutler-Hammer
3. General Electric
4. Square D

B. General:

1. Starters shall be standard NEMA sizes and UL listed.

C. Type: Across the line except where noted.

D. Enclosure: NEMA Type as required for location. Provide stainless steel enclosures in wash down areas, kitchens, dishwasher areas, exterior spaces, and any other areas where equipment will be exposed to moisture. Provide space heater and any necessary transformer within the enclosure as required to maintain the minimum internal temperature required by the manufacturer.

E. Overload Protection:

1. Type: Trip-free thermal overload relay for each ungrounded conductor.
2. Reset: Manual.
3. Ambient Temperature Compensation: Provide where required.
4. Overload protection to be sized for nameplate running amps.

F. Auxiliary Contacts:

1. Number: Provide three per starter as required for control sequence, and one (1) auxiliary contact.
2. Switchable type, easily changed from N.O. to N.C. without removing from its mounting.

G. Switches in Cover:

1. Manually Controlled: Three wire start-stop.
2. Automatically Controlled: Hand-off-automatic.
3. Start and stop indicating lights.
4. Equipment used for life safety (smoke exhaust, etc.): Hand-Automatic.
5. Equipment not designed to run continuously: Off-Automatic.

H. Control Transformer:

1. Provide when line voltage exceeds 208 volts.
2. Secondary wiring shall have one leg fused and the other grounded.
3. Secondary voltage not to exceed 120 volts.

I. Provide starters for all motors as follows:

1. Single phase motors less than ½ hp.
   a. With internal overload protection: None.
   b. Without internal overload protection:
      1) Manually Controlled: Manual starter.
      2) Automatically Controlled: Magnetic starter.
2. Single phase motors ½ hp and larger:
   a. Manually Controlled: Manual starter.
   b. Automatically Controlled: Magnetic starter.
3. Three Phase Motors: Magnetic starter.

J. Soft Start Starters:

1. Provide Y-Delta or solid state reduced voltage starters for all motors 50hp and larger.
2. Starter shall limit starting voltage to 200% of full load voltage.

K. Multi-Speed Starters:

1. Starters shall be suitable for the type multi-speed motor selected.
2. Provide time delay for automatic transfer from high to low speed.

L. Housing coils to be 120V.

M. Motor Protection: (above 20 hp)

1. Provide Single-phase protection.
2. Provide under-voltage protection.

N. Disconnecting Means

1. Provide combination starters-disconnects for all starters unless specifically stated otherwise.

PART 3 - EXECUTION

3.1 MOTORS

A. Install motors on motor mounting systems so coupling or belt drive is properly aligned. Provide proper belt tension. Dowel direct coupled motors.

B. Field quality control: Fun each motor to demonstrate rotation, speed, current draw meets nameplate, etc.

C. Requirements for storage, handling and protection: Keep motor windings protected and clear of dust.

3.2 STARTERS

A. Deliver to installer of electrical work.

B. All safety devices shall be wired so that they will stop the motor with a hand-off-automatic switch in the hand as well as the automatic position.

END OF SECTION

SECTION 23 05 19

ENERGY METERING DEVICES

PART 1 - GENERAL

1.1 DESCRIPTION

A. In addition to the work covered under this section, comply with description of individual systems under other sections of the Specifications.

PART 2 - PRODUCTS

2.1 BTU METERING STATIONS

A. Provide BTU demand and consumption metering stations on the geothermal and condenser water systems and as indicated on the drawings. Meters shall be of either ultrasonic type, or electromagnetic insertion type. Meter shall be capable of accurate measurement while operating under design water flow turndown ratios as shown on the drawings, as specifically approved by the Architect, and under actual water flow conditions.

B. Thermal Energy Meter

1. Provide complete Thermal Energy (BTU) Measurement System including micro-processor based BTU meter, flowmeter, matched set of temperature sensors and mechanical installation hardware and cabling required for a complete system installation. BTU measurement system shall be configured for the specific application prior to delivery.
2. BTU meter shall be constructed, calibrated and scaled for the intended application in terms of pipe size, pipe material, installation requirements, expected energy rate, ambient conditions and fluid characteristics which include but are not limited to pressure, temperature and viscosity.
3. Total thermal energy measurement (BTU) system to be provided by a single manufacturer, including flowmeter, temperature sensors and BTU meter.
4. Design
    a. BTU Calculator
        1) Computation error </= 0.09% @ 30-degree F delta T
    b. Enclosure
        1) NEMA 12K enclosure minimum, designed for wall or DIN rail mounting. Non-metallic enclosure materials of construction must meet UL 94 V-0 flammability requirements and be suitable for use in plenum spaces.
    c. Connections
        1) Provide three (3) ½" conduit access holes minimum
    d. Ratings
        1) Pressure: N/A
        2) Temperature: -13 F to 140 F ambient
5. Operations and Configuration:
    a. Temperature Sensor Accuracy:
        1) Provide a matched pair of 1000 Ohm platinum RTDs, wet calibrated to a differential measurement uncertainty of +/- 0.18-degree F over the stated range. RTD's must meet EN1434/C900 accuracy requirements for 3K sensors.
    b. Calibration and Configuration:

1) Each thermal energy (BTU) metering system shall be factory programmed for the specific application and each metering system component, including temperature sensors and flow meter, shall receive a certificate of calibration, directly traceable to N.I.S.T.

c. Transmitter and Display
1) Provide an operator interface consisting of four push-buttons and graphical interface. Display shall visually indicate total fluid volume in gallons, instantaneous flow rate, supply temperature, return temperature, thermal energy flow rate and thermal-energy flow total in kilowatts per hour or British thermal units (BTU). Output signals shall be RS485 serial network protocol, native BACnet MS/TP or MODBUS RTU, three (3) programmable pulse outputs and one (1) analog output signal. Meter shall have the capability to receive and totalize three (3) auxiliary input pulses which can be viewed locally and communicated over the RS485 network.

d. Listings and Certifications
1) Meter shall have FCC: Part 15, Subpart B
2) Meter shall have CE approval
3) Meter shall be UL listed
4) Meters selected with BACnet shall have BTL Certification to ASHRAE 135:2009

6. Manufacturer:
a. Basis of Design: Onicon System 20
b. Alternate Manufacturers:
1) Panametrics
2) Siemens

C. Flow Meter
1. Provide an insertion electromagnetic flowmeter complete with NIST traceable, wet calibrated flow-measuring element, integral transmitter, installation valves, installation depth gage and calibration certificate. Flowmeter shall be wet tappable, allowing insertion and removal from the flow stream without system shutdown. Onicon Model F-3500 Series or approved equal.
2. Flowmeter shall be constructed, calibrated and scaled for the intended application in terms of pipe size, pipe material, installation requirements, expected flow rate, ambient conditions and fluid characteristics which include but are not limited to pressure, temperature, conductivity and viscosity.
3. Design:
a. Electromagnetic velocity-measuring element. Element shall utilize two sets of diametrically opposed electrodes to measure the average flow rate velocity
b. Construction
1) Wetted components shall be constructed of 316L stainless steel with attached tag indicating calibration information.
2) 1” Male NPT Hot Tap Adapter fitting. Installation through 1” full port isolation valve, minimum.
c. Ratings
1) Maximum Pressure: 400 psig
2) Maximum Temperature: 200 F
4. Flow-measuring element and transmitter shall cover operating range of equipment or system served.
5. Flowmeter shall provide calibrated outputs directly from the integral transmitter, throughout the operating range with the accuracy stated as follows:
a. ± 1.0% of rate from 2.0 to 20.0 ft/sec velocity (10:1 turndown)
b. ± 0.02 ft/sec below 2 ft / sec
6. Each flowmeter shall receive a wet calibration, within the expected operating range, against a primary volumetric standard that is traceable to NIST.
7. Local display shall provide instantaneous flow rate information and totalized flow information and shall be factory configured for connection to a specific flowmeter.

D. Piping location for meter must meet the manufacturer’s recommendation for minimum specified length of straight pipe.

E. Refer to detail drawings for metering arrangement.

F. Meters shall record peak demand in tons and consumption in ton-hours times 10 or other appropriate factor corresponding to the daily consumption at each meter.

G. Demand meters shall be capable of transmitting a remote signal to the BMS.

H. Metering devices shall be calibrated to meter the specific system fluid being measured at the anticipated system temperatures.

I. Device mounting method shall allow for removal of device from a filled system without significant fluid loss.

J. All elements of the metering equipment exposed to fluid shall be rated for service at a minimum of 300 PSI and constructed of a stainless steel alloy compatible with fluid being measured.

K. Provide thermal wells and electronic temperature probes in supply and return piping to allow for a calculation of differential temperature in system being metered. Probes shall not be installed within the manufacturer's recommended minimum straight lengths of the flow meter.

L. Flow sensor shall be provided with electronic metering equipment to produce a signal proportional to flow that can be output to the BMS. Coordinate with control specification.

M. Measuring devices shall not require moving parts and shall sample across the full diameter of the pipe being measured.

N. Provide all tools and software required for proper operation and maintenance of metering equipment.

O. The mounting coupling shall be made of a material that is compatible with the process pipe material.

P. Electronic control module shall sample 20 times per seconds and convert collected data to a signal suitable for collection by the building management system. The building management system shall log data and maintain a running sum of daily, weekly, and monthly consumption.

Q. Basis of design shall use an electromagnetic meter. Notify owner and engineer of special conditions requiring the use of a strap-on type ultrasonic meter.

R. Provide BTU metering for the following systems:

1. Geothermal Water (Ground Loop)
2. Condenser Water (Building Loop)

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturers recommendations. For clearance, upstream straight pipe length, downstream straight pipe length and support. Where manufacturers requirement for straight pipe is less than 15 pipe diameters (including up- and downstream straight lengths) a minimum of 15 pipe diameters shall be provided. Provide straightening vanes where required pipe lengths cannot be maintained.

B. Install meters and transmitters/displays adjacent to machines and equipment to allow service and maintenance. Displays shall be mounted at eye-level at the MER floor. Where this is infeasible, display shall be adjusted to proper angle for visibility from the MER floor.

C. Contractor shall connect all flow meter system elements, including sensors, meter transmitters, displays, etc.

D. Provide all labor and materials required to deliver a signal compatible with the BMS system. Contractor to connect, start-up and calibrate meter.

E. Entire system shall be covered by a 3-year parts and labor warranty.

END OF SECTION

SECTION 23 05 23

VALVES

PART 1 - GENERAL

1.1 SUBMITTALS

A. Manufacturer's Data: Submit manufacturer's product data including:

1. Dimensions
2. Sizes
3. End Connections
4. Weights
5. Installation instructions
6. Instructions on repacking and repairing valves.
7. Range of flow for balancing valves and plug valves.

B. Valve Tag List: See requirements in this Specification.

PART 2 - PRODUCTS

2.1 GENERAL

A. In addition to valves specified herein, provide products meeting the pressure requirements of the system.

B. Where type or body material is not indicated, provide valve with pressure class selected from MSS or ANSI standards, based on the maximum pressure and temperature in the piping system. Valve body material shall be coordinated with the piping system material.

C. Except for balancing or otherwise indicated, provide valve of same size as connecting pipe size.

D. All valves shall be ball or butterfly type. If globe, plug, or balancing valves are called out by note or symbol, only that type of valve is acceptable.

E. Ball valves or butterfly valves may be used in non-balancing applications when pressure and temperature ratings are adequate.

F. Where pipe sizes overlap, contractor has the option of threaded or flanged valves.

G. Where grooved pipe mechanical coupling systems are accepted, provide flange adapters to mate with valves as specified below. Valves manufactured by the mechanical coupling system manufacturer shall not be used unless they meet all of the specified requirements for a given valve and are of the same manufacturer as the adjoining couplings.

H. All valves shall be domestically manufactured unless approved for use by Engineer.

I. All components in hydronic systems shall be compatible with propylene glycol and water solution.

J. All valves shall be of a design which the manufacturer lists for the service and shall be of materials allowed by the latest edition of the ASME Code for pressure piping for the pressure and temperature contemplated, unless a higher grade or quality is herein specified.

K. Valve packing compression is to be independent of the stem, ball or handle systems. All valve stems are to be blowout proof. Packing shall be accessible without disturbing the insulation.

L. All valves used for vent or drain service on water systems shall have a brass hose connection with cap and chain.

M. Unless otherwise noted, all valves for shut-off and bypass service shall be ball valves, 2" and below, and butterfly valves 2-1/2" and above. Ball valves are acceptable in 2-1/2" and 3" copper only.

N. End connections for NPS 2" and below shall be the same as is used for fittings. Use flanged valves for NPS two and one half inches (2-1/2") and above. Solder joints are also acceptable in 2-1/2" and 3" copper piping systems.

O. Install valves after welding adjacent to valve is completed to protect seat and disk.

P. All valves used for vent or drain service on water systems shall have a brass hose connection with cap and chain.

Q. Non-electric radiator control valves with valve mounted heads are not acceptable, except on cast iron radiators, where they shall be side mounted. Where used, thermostatic radiator valves shall be remote bulb and remote control head design. The control head shall be mounted on the radiation enclosure, if possible.

R. Plug or gate valves shall not be used on any services without approval by the Vassar Department of Planning, Design and Construction.

2.2 GLOBE VALVES (Water, Oil, Gas)

A. Manufacturers:

1. Design Basis: Milwaukee
2. Other Acceptable Manufacturers:
   a. Viega
   b. Crane
   c. Nibco
   d. Powell
   e. Gruvlok
   f. Stockham

2" AND SMALLER	UNDER 300 PSI	Milwaukee Model 591A Bronze, 150 SWP at 406 deg. F., 300 WOG at 150 deg. F., Non-Shock, Heavy Duty Service, Special Hardened Stainless Steel Seat Ring and Disc, Union Bonnet, Gland Packed, Threaded Ends
2 ½" AND LARGER	UNDER 200 PSI	Milwaukee Model F-2981 Iron, 125 SWP, 200 WOG, Non-Shock, Solid Disc, Bolted Bonnet, Gland Packed, Flanged Ends
3" AND SMALLER (for use with copper tubing)	UNDER 300 PSI	Milwaukee Model 590T Bronze, 150 SWP, 300 WOG, Heavy Duty Service, Teflon Disc, Union Bonnet, Gland Packed

2.3 ANGLE VALVES

A. Manufacturers:

1. Design Basis: Milwaukee

2. Other Acceptable Manufacturers:
   a. Viega
   b. Crane
   c. Nibco
   d. Stockham
   e. Hammond
   f. Gruvlok

2" AND SMALLER	UNDER 300 PSI	Milwaukee Model 595T Bronze Body, 150 WSP, 300 WOG, Threaded, Union Bonnet, Angle Bronze Disc
2½ " AND LARGER	UNDER 300 PSI	Milwaukee Model 595T Bronze, 150 SWP, 300 WOG, Heavy Duty Service, Teflon Disc, Union Bonnet, Gland Packed.

2.4 REFRIGERANT VALVES

A. All refrigerant valves shall be silver brazed joint as follows:

1. Globe Valves – 1-1/8" O.D. and smaller: packless, Henry type 626; 1-3/8" O.D. and larger: packed, wing cap, Henry type 203.
2. Angle Valves – 1-1/8" O.D. and smaller: packless, Henry type 647 and 642; 1-3/8" O.D. and larger: packed, wing cap, Henry type 216.
3. Globe valves shall be of all bronze with composition disc, threaded or brazed joint ends as required by piping system in which they are installed.
4. All refrigerant valves shall be silver brazed joint as follows:
   a. Check Valves – 7/8" O.D. and smaller: brass, Henry type 116A; 1-1/8" O.D. and larger: bronze, Henry type 205.

2.5 SILENT/WAFER CHECK VALVES

A. Manufacturers:

1. Design Basis: Milwaukee
2. Other Acceptable Manufacturers:
   a. Viega
   b. Metra Flex
   c. Hammond
   d. GA Industries
   e. Nibco
   f. Tyco
   g. Victaulic (for Grooved Pipe Systems)
   h. Gruvlok
   i. Stockham

2½" – 6"	UNDER 200 PSI @ 150 °F	Milwaukee Model 1400 Cast Iron body, Bronze trim, Center guided single disc, 200 PSI rating.
8" -10"	UNDER 400 PSI @ 150 °F	Milwaukee Model 1400 Cast Iron body, Bronze trim, Center guided single disc, 400 PSI rating.

B. Hydronic piping system grooved end spring-loaded check valves shall be suitable for pressures up to 365 psi and operating temperatures up to 230 deg F.

1. 2” through 3”: Ductile iron body, stainless steel disc and spring, nickel-plated seat, 365 psi CWP.
2. 4” through 12”: Ductile iron body, EPDM coated ductile iron disc, stainless steel spring and shaft, welded-in nickel seat, 300 psi CWP.

C. Double disc or bi-folding disc type valves are not acceptable.

2.6 SWING CHECK VALVES

A. Manufacturers:

1. Design Basis: Milwaukee
2. Other Acceptable Manufacturers;
   a. Viega
   b. Crane
   c. Nibco
   d. Hammond
   e. Stockham
   f. Victaulic (for Grooved Pipe Systems)
   g. Gruvlok

2” and Smaller	Under 400 PSI	Milwaukee Model 508 Bronze body, 200 PSI SWP, 400 PSI WOG, Straight through pattern, bronze disc

B. Hydronic piping system grooved end horizontal swing check valves shall be suitable for pressures up to 300 psi and operating temperatures up to 230 deg F. Ductile iron body, type 316 stainless steel clapper, EPDM seat.

C. Two inches (2") and under: 45˚ swing check, screwed end.

D. Two and one half inches (2 1/2") and over: Non-slam type globe style lift check, non-slam type tilting disc or wafer body non-slam type lift check. Double disc or bi-folding disc type valves are not acceptable.

2.7 BUTTERFLY VALVES (Water, Oil, Gas)

A. Manufacturers:

1. Design Basis: Bray
2. Other Acceptable Manufacturers:
   a. Jamesbury
   b. Victaulic (for Grooved piping systems)

½” – 1 ½”	USE BALL VALVE	
2” – 8”	UNDER 250 PSI	Bray Model 40/41 Cast Iron body, Stainless Steel stem, 316 stainless steel disc

B. Butterfly valves in size 2" - 8" shall be of the single flange, lug body style. Bodies shall be ductile iron. Valves shall provide drip-tight shutoff at differentials up to 300 psi.

C. Lug body valves shall have a retained seat and shall provide tight shutoff up to the full valve rating on dead end or isolation service without the use of downstream flanges.

D. All valves shall be furnished with self lubricated bearings of TFE coated stainless steel. Shaft seals shall be provided to prevent leakage and to protect bearings from internal or external corrosion.

E. Body:

1. Shall be one-piece wafer, lug or double flanged design with extended neck to allow for 2” of piping insulation.
2. Flange hole drilling per international flange standard as specified.
3. Provided with top and bottom stem bearings consisting of a 316 stainless steel shell with a TFE/glass fabric liner bearing surface.
4. Equipped with an externally adjustable stem packing system that allows packing adjustment without removing the actuator.
5. Internal over-travel stop shall be provided to prevent over-travel of the disc and minimize possible seat damage.

F. Seats:

1. Design shall consist of a resilient energizer totally encapsulated by the seat.
2. Seat retainer shall be full-faced and firmly attached by bolts located outside the sealing area to protect them from corrosion.
3. The seat assembly shall be locked in the body recess by the full-faced retainer.
4. The seat shall be self-adjusting for wear and temperature changes.
5. The seat shall be easily field replaceable.

G. Stem:

1. Shall be one-piece design
2. Stem shall be provided with blow-out proof stem retention system to assure full retention of the stem in the unlikely event of an internal stem failure.
3. Disc-to-stem connection shall be an internal connection design with no possible leak paths in the disc-to-stem connection. External disc-to-stem connections such as disc screws or pins are not allowed.
4. Stem shall be provided with blow-out proof stem retention system to assure full retention of the stem in the unlikely event of an internal stem failure.

H. Disc edge shall be hand polished for minimum torque and maximum sealing capability.

I. Valve shall be tested for tight shut-off per API 598 requirements.

J. Latch lock levers shall provide automatic, positive latching in the open, closed or eight intermediate positions. These valves shall allow locking in any position with a standard padlock. Infinite position levers shall allow manual throttling and locking in any position from open to close. External disc position indicators shall be provided.

K. All manually actuated valves 8" and larger shall be operated using a cast iron housed handwheel actuator available in standard, weatherproof, or buriable constructions - as required - with optional chainwheel, crank, or 2" square nut input. All units to have adjustable open and closed position stops with provision to prevent accidental adjustment changes. Operating shaft to be supported axially and radially at input end by permanently lubricated bronze thrust and sleeve bearings.

L. Butterfly valves equipped with gear or automatic operators shall have operator factory mounted and the stops factory adjusted. Loose gear operators shall not be permitted to be installed in the field. Gear operators on steam valves shall be spaced a minimum of 4” above packing assembly.

M. All automatic butterfly valves intended for exterior use shall be furnished with and wired for crankcase heaters.

N. Grooved end steel pipe butterfly valves 2" through 12" shall be ductile iron, nickel-plated ductile iron stainless steel disc, type 416 stainless steel two-piece stem, disc shall be offset from the stem centerline to provide continuous 360 degree seating, EPDM pressure-responsive seat and seal material suitable for water temperatures to +250 deg F. Valve shall have a lever handle or gear operator with handwheel. Valve shall be suitable for bubble tight shutoff, dead-end and bi-directional service at 300 psi full rated pressure. Victaulic Vic-300 MasterSeal or engineer approved equal.

O. Grooved end copper tube butterfly valves, 2-1/2" through 6", shall have copper-tube dimensioned bronze body, EPDM pressure responsive seat, aluminum-bronze disc, and stainless steel stem. (Stem shall be offset from the disc centerline to allow complete 360 degree circumferential seating.) Valves shall have lever handle or gear operator with handwheel and shall be suitable for bubble tight shutoff, dead-end and bi-directional service at 300 psi full rated pressure. Victaulic Series 608N or engineer approved equal.

2.8 BALL VALVES

A. Manufacturers:

1. Design Basis: Milwaukee
2. Other Acceptable Manufacturers:

   a. Viega
   b. Apollo
   c. Dyna Quip
   d. Hammond
   e. Victaulic (for Grooved Pipe Systems)
   f. Watts
   g. Bray
   h. Gruvlok
   i. Stockham

3" and above	UNDER 300 PSI	Milwaukee BA400 Bronze body, Threaded, Full Port, SST Trim, Blowout-Proof Stem, 300 lb. WOG 150 PSI Non-Shock Cold Working Pressure, 150 PSI/Saturated Steam. Conforms to MSS SP-110 Reinforced Teflon seat
2½" and below	UNDER 300 PSI	Bronze body, standard port, 316 SST ball, 316 SST stem, Stem extension for insulated applications, RTFE seat, 15% glass filled double seal, Seat working rating 300 PSIG, 250°F minimum, Body working rating 300 PSIG 300°F minimum. 300 PSI WOG. 150 PSI steam

B. Options: Provide the following where required:

1. Extended stems for insulated valves.
2. Memory stop device for balancing applications.
3. Tee handle for tighter areas.
4. Hose end and cap for drain.
5. Mounting pads for actuator.
6. Provide "stop and drain" for compressed air.

C. Minimum flow coefficients (Cv):

Size	Cv
½"	8
¾"	14

1”	35
1¼”	46
1½”	75
2”	105
2½”	300
3”	390
4”	680

2.9 BALANCING VALVES

A. Manufacturer, variable orifice type circuit setter:

1. Viega
2. Armstrong
3. Victaulic/Tour and Andersson
4. Nibco
5. Oventrop

2” AND SMALLER	UNDER 300 PSI	Armstrong CBV-VS/VT Brass alloy body/stem and disk, 300 PSI Max. Working Pressure, -4°F to 300°F Operating Temperature Range, Threaded or Solder Connections Victaulic/Tour & Andersson Series 786, 787, 78K A metal brass copper alloy body, EPDM o-rings, 4-turn digital hand wheel for balancing, soldered or threaded end connections, 250°F temperature rating.
	UP TO 350 PSI	Oventrop Hydrocontrol R Bronze alloy body/ brass alloy stem and disk, 7-turn minimum veneer/digital hand wheel, threaded or solder end connections, 300°F rated operating temperature
2 ½” AND LARGER	UNDER 125 PSI	Armstrong CBV-FS/FA 125 PSI rating, Cast Iron valve body, Bronze disc, Brass stem, Stainless Steel spring, Straight or Angle
	UP TO 350 PSI	Victaulic/Tour & Andersson Series 789. Ductile iron body, EPDM o-rings, multiple-turn digital readout handwheel for balancing, flanged or grooved end connections, 250 deg F temperature rating. Oventrop Hydrocontrol G Cast iron body / brass alloy stem and disk, 8-turn minimum veneer/digital hand wheel, grooved end connections, 300°F rated operating temperature.

B. Manufacturers, valve and venturi type:

1. Flowset
2. Gerand
3. Griswold
4. HCI
5. Nexus
6. Oventrop

7. Preso

C. Connections: Threaded, soldered, grooved, or flanged.

D. Pressure Reading Ports:

1. "P/T" Ports, Shraeder valves, or Hansen type quick connect. No "refrigeration" fittings.

E. Design, variable orifice type:

1. Globe-type valve.
2. Multiple turns of handwheel from full closed to full open.
3. Bubble-tight shut-off.
4. Taps upstream and downstream.
5. Memory stop device to allow valve to be returned to balanced position after being closed.

F. Design, valve and venturi type:

1. Ball valve complying with the above requirements for ball valves.
2. Fixed orifice or venturi, upstream of valve.
3. Taps on venturi, upstream and downstream.
4. Memory stop device to allow valve to be returned to balanced position after being closed.
5. Regardless of the manufacturer's claims, these valves shall not be considered as tight shut off for service. Provide additional valves for equipment isolation.

G. Insulation: Provide premolded insulation conforming to the valve body. Material shall have a flame spread of 25 and a smoke development of 50.

H. Where application or building height causes working pressure to exceed 150 psi. Provide 2" and smaller: Crane No. 80E, 250 lb. WSP, bronze; 2 ½" and larger: use globe.

I. Balancing Cocks: Up to 2"

1. Bronze.
2. Screwed 120 psi WSP Class; similar to Fig. 554.
3. 250 psi WSP Class; similar to Fig. 576.

J. Balancing Cocks 2½ and 3"

1. Iron body similar to Walworth Co.
2. Screwed.
3. 120 psi WSP Class; similar to Fig. 651.
4. 250 psi WSP Class; similar to Fig. 671.

K. Balancing cocks 4" and above

1. Provide flanged lubricated plug valve.

L. Automatic Balancing Valves (1/2" through 1-1/2"):

1. Manufacturers:
   a. Hays
   b. Griswold
   c. Oventrop
   d. Balancing accuracy shall be within 10% of maximum flow.

e. Suitable for up to 600 psig. 32°F to 225°F operating temperature range.
f. Select cartridges based on maximum flows listed in equipment schedules. Valves shall provide automatic control over a 40 to 1 differential pressure operating range (2-80 psi). Differential pressure control cartridges shall be changeable after installation in case of flow rate change.
g. All valves shall have permanent label indicating model number, size, and flow.
h. Provide with pressure/temperature taps for verification of pressure drop.
i. Materials:
   1) Diaphragm: Elastomeric.
   2) Orifice: Brass or polyphenylsulfone.
j. The balancing valves shall be Y-pattern globe style design and all metal parts of nonferrous, pressure die cast, nonporous DZR Brass. Each valve shall provide four (4) functions:
   1) Precise flow measurement
   2) Precision flow balancing
   3) If used as equipment isolation, provide positive shut-off with no drip seat.
   4) If provided with strainer, provide drain connection using 3/4" NPT hose end thread. Otherwise drain connection shall be provided on strainer.

2.10 COMBINATION THROTTLING/CHECK/SHUTOFF VALVES

A. Manufacturers:

1. Basis of Design: Armstrong Flo-Trex Valve.
2. Other Acceptable Manufacturers:
   a. Bell and Gossett
   b. Taco
   c. Watts

B. Features:

1. 150 psi, 230ºF water working pressure.
2. Globe style valve with stainless steel spring loaded brass disk guided and limited by a brass or stainless steel stem.
3. Resilient seat.
4. Able to be re-packed under pressure.

C. Tri-Duty Valve Assembly: Combination shutoff, throttling, and non-slam check service in one unit, with pressure rating up to 300 psig at 230 deg F. Victaulic Vic-300 MasterSeal™ butterfly valve and Series 716H/716 check or 779 venturi check valve with flow measurement capabilities assembled with Victaulic couplings (style to be determined by system requirements). For sizes 14” through 24”, assembly shall consist of Vic-300 AGS butterfly valve and Series W715 dual disc design check valve with pressure rating up to 250 psig at 230 deg F.

2.11 SUCTION DIFFUSERS

A. Manufacturers:

1. Basis of Design: Armstrong
   a. Bell & Gossett
   b. Taco
   c. Victaulic (for grooved pipe systems)
   d. Watts

B. Features:

1. 150 psi, 230ºF water working temperature.
2. Strainer shall be 1/8” perforated stainless steel.
3. Provide a removable cover for easy access to the strainer.
4. Ductile iron body.

C. Pump suction diffuser with grooved inlet and straight, single, or double reduction flanged outlet, ASTM A395 ductile iron body, Type 304 stainless steel frame and perforated sheet diffuser with 5/32” diameter holes, Type 304 stainless steel 20-mesh startup pre-filter, pipe plug for system drainage, and bosses for support. Victaulic Series 731-D rated to the working pressure of the mating flange.

2.12 DRAIN VALVES

A. Ball valve with hose end adapter and cap. Milwaukee BA100H or approved equal.

B. Drain valves: 2” and smaller: Crane No. 451, 300 lb. WOG, non-rising stem, Hose end, bronze with bronze cap and chain.

C. Where application or building height cause working pressure to exceed 150 psi provide Crane No. 453, 300 lb. WOG, non-rising stem, hose for valves 2” and smaller.

2.13 PLUG VALVES

A. Manufacturers:

1. Design Basis: Homestead
2. Other Acceptable Manufacturers:
   a. DeZURIK
   b. Victaulic (For grooved pipe systems)

B. Model: Series 600 (ANSI class 125) cast-iron, full port body; EPDM coated plug; welded nickel seat; stainless steel bearings; integral memory stop device.

C. Lubricated Plug Valves:

1. Full port opening tapered plug suitable for lubrication under service pressure with plug in any direction.

2. Lubricating Guns:
   a. One for every 10 valves.
   b. Extra heavy, lever type, hydraulic hand gun.
   c. 15,000 psi gauge and 12" long connection hose.
   d. Similar to Walworth #1699 or approved equal.

3. Lubricant:
   a. Manufacturer's recommendations.
   b. One year supply, each valve.

4. Operators:
   a. 4" to 6", wrench, except as noted. Provide wrench set for each size valve, one wrench for every 10 valves, each size.
   b. 8" and larger: Gear operated with permanently installed handwheel.

5. Valve Construction

   a. Piping less than 100 psi: 200# WOG Class, cast iron body.
   b. Piping 100 psi to 250 psi: 500# WOG Class, cast iron body.

c. Piping over 250 psi: 720# WOG Class, carbon steel body.
d. Up to 2": screwed. 2½ " and larger: flanged, USAS 250#.
e. Similar to the following Walworth figure numbers:

Class	4"	5" & 6"
200#	1700F	1705F
500#	2720F	2721F
720#	1760F	1761F

6. In lieu of lubricated plug valves use DeZURIK BOS-US for piping up to 250 psi. For piping above 275 psi use DeZURIK BHP high performance butterfly valve.

D. Non-Lubricated, Eccentric Type Plug Valves:

1. 175 psi CWP, ductile iron body and plug, EPDM plug coating, welded-in nickel seat, grooved ends, lever handle or gear operator with hand wheel. Victaulic Series 377.

2.14 BUTTERFLY VALVE (WATER SERVICES)

A. Ductile or cast iron body.

B. Fully lugged 316 or 17-4 pH stainless steel trim.

C. Stainless steel disc.

D. Resilient seat fully bi-directional dead-endable EPDM seat. Working pressure 150 PSIG at 250 PSIG.

E. Body working pressure ANSI 150.

F. Handwheel gear operator above 4”, locking lever handle below 4”.

PART 3 - EXECUTION

3.1 GENERAL

A. Furnish all valves as indicated on the plans, and as may be required for the proper control of the pipe lines installed under this Specification, so that any fixture, line or piece of apparatus may be cut out for repair without interference or interruption of the service to the rest of the Building.

B. Install valves where required for proper operation of piping and equipment including valves in branch lines necessary to isolate sections of piping. Whether they are shown on the drawings or not, provide isolation valves at the following locations:

1. All branch piping connections to risers
2. All branch piping connections to piping mains
3. Branch piping at each mechanical room
4. Each piece of equipment, fixture, and appliance so that the supply and return services can be shut off to remove the item without draining the remainder of the piping system

C. Provide drain valves at main shut-off valves, all low points of piping and apparatus.

D. Install check and globe valves on downstream side of the shutoff valve on hot water circulating riser and branch lines.

E. Provide shut-off valves and check valves on each pump discharge line.

F. Locate all valves so as to be accessible.

G. All valves shall be installed as per manufacturer's recommendations.

H. Combination balancing and shut-off valves may be used instead of a separate balancing valve and shut-off valve if the valve has a memory stop and the manufacturer lists its use as a leak-proof service valve

I. Valves, where exposed and used in connection with finished piping, shall be same finish as the pipe.

J. Install valves with bodies of metal other than cast iron where thermal or mechanical shock is indicated or can be expected to occur.

K. Do not install bronze valves and valve components in direct contact with steel, unless bronze and steel are separated by dielectric insulator. Install bronze valves where corrosion is indicated or can be expected to occur.

L. Limit selection and installation of valves with non-metallic discs to locations indicated and where foreign material in piping system can be expected to prevent tight shutoff of metal seated valves.

M. Select and install valves with renewable seats, except where otherwise indicated.

N. All valves shall have the trademark of the manufacturer and the guaranteed working pressure cast or stamped on the body of the valve.

O. Provide separate support for weight of valve where necessary.

P. Install all valves except butterfly with stems pointing up, and as close to vertical as possible. Butterfly valves to be offset at least 10° from vertical. Do not allow meter connections of balancing valves to point downward.

Q. Except as otherwise indicated, install ball, globe, and butterfly valves to comply with ANSI B31.1.

R. All valves of a given type shall be of one manufacturer.

S. Provide extended stems on insulated system to prevent interference of operator with insulation.

T. Provide chain wheel operators for valves more than 7' – 0" AFF in mechanical rooms and wherever shown on drawings.

U. Grooved end valves shall be installed in accordance with the manufacturer's guidelines and recommendations. All grooved end valves shall be the products of a single manufacturer. Grooved end shall be clean and free from indentations and projections. A factory-trained field representative shall provide on-site training for contractor's field personnel in the installation of grooved piping products. Factory-trained representative shall periodically review the product installation. Contractor shall remove and replace any improperly installed products.

V. Provide ball valves for shut-off on all pressure gauges at the gauge and separate 1/2" (one half inch) ball valves for the various taps to the gauge on a manifold gauge.

3.2 CHECK VALVE INSTALLATION

A. Swing and Check Valves:

1. Install only in horizontal lines unless absolutely impractical. If installed vertically, flow shall be upwards.
2. Do not install in pump discharge piping.

B. Silent Check Valves:

1. Install in all pump discharge lines.
2. Silent check valves may be installed in vertical pipes with flow down upon Engineer's review for each instance.

C. Installation of Check Valves:

1. Wafer Check Valves: Install between 2 flanges in horizontal or vertical position.
2. Horizontal Lift Check Valve: Install in horizontal piping line with stem vertically upward.
3. Vertical Lift Check Valve: Install in vertical piping line with upward flow with stem vertically upward.
4. Air Compressor Lift Check Valve: Install in air compressor discharge line.
5. Spring Loaded Horizontal Lift Check Valve: Install in horizontal piping line with stem vertically upward.

3.3 VALVES USED FOR THROTTLING/BALANCING

A. Balancing valves shall not be used for flow indication in pipes 2½" and larger, or in pump discharge piping.

B. Flow indication in piping 2½" and larger and in pump discharge piping, shall be by a venturi with a plug, butterfly, or globe valve for throttling.

C. Throttling/Balancing Valves shall be selected so that the maximum design flow causes between 1' and 10' W.G. pressure drop or meter reading with the valve wide open.

D. Install balancing valves (excluding flow limiters) used for flow indication with a minimum of ten times pipe diameters downstream of a pump, five times the pipe diameter downstream and two times the pipe diameter upstream of a fitting or valve, unless otherwise specified by the valve manufacturer.

E. Circuit setters or plug valves may be used for throttling/balancing. Provide an infinitely variable, lockable memory stop device to allow the valve to be returned to the "balanced" position after closing, and to prevent movement of the disk or plug during operation. When ball valves are used for throttling, provide an additional valve for equipment isolation.

3.4 COMBINATION THROTTLING/CHECK VALVES

A. Combination throttling/check valves may be used in lieu of separate throttling and check valves on pump discharge piping. However, they may not be used for flow measurement.

END OF SECTION

SECTION 23 05 29

PIPE SUPPORTS AND ANCHORS

PART 1 - GENERAL

1.1 STANDARDS

A. Comply with MSS Standard Practice SP-58, SP-69 and SP-89, published by Manufacturer's Standardization Society of the Valve and Fitting Industry for type and size.

1.2 SUBMITTALS

A. Submit manufacturer's product data on the following:

1. Hangers other than clevis type.
2. Anchors.

B. Submit structural calculations for trapeze type supports.

PART 2 – PRODUCTS

2.1 PIPE HANGERS

A. General:

1. Use adjustable pipe hangers on suspended pipe. Trapeze hangers may be used at the Contractor's option. Contractor shall be responsible for sizing supports.
2. Chain, wire or perforated strap hangers will not be permitted.
3. Isolate hangers in contact with dissimilar materials with dielectric hanger liners. Tape is not acceptable.
4. Provide supports between piping and building structure where necessary to prevent swaying.

B. Hanger Rods:

1. Exposed in public areas: Zinc electroplated steel.
2. Concealed or in service areas: Black threaded steel.
3. Outside, exposed to weather: Hot dipped galvanized.

C. Spot Concrete Inserts: Steel case and expander plug for threaded connection with lateral adjustment, top slot for reinforcing rods and lugs for attaching to forms.

1. Size inserts to match size of threaded hanger rods.
2. Inserts to be UL and FM listed.
3. Minimum 1000 lb. Capacity with ½" rod.

D. Channel Type Inserts:

1. Standard channel support with anchor tabs on 4" centers, and nail holes for attaching to forms.
2. Styrofoam inserts to prevent wet concrete seepage.
3. Minimum 2000 pounds/foot capacity.

E. Expansion Anchors:

1. For use only in renovations or where modifications to piping layouts require installation away from pre-installed insert locations.
2. Inserts shall be of the drill, insert, and expand type. Power driven fasteners are not acceptable for piping.
3. Contractor shall select the appropriate type based on the following:

Rod Size	Maximum Working Load
3/8	600 pounds
½	1100 pounds
5/8	1800 pounds
¾	2700 pounds
7/8	3700 pounds

F. Steel Structure Attachments:

1. Contractor may select welded or mechanically attached. All mechanically attached supports shall have jam nuts or other means to prevent loosening. Maximum loading requirements are as follows:

Rod Size	Maximum Working Load
3/8	600 pounds
½	1100 pounds
5/8	1800 pounds
¾	2700 pounds
7/8	3700 pounds

G. Single Hangers:

1. Piping 2" and smaller: MSS type 1, Clevis hanger or type 7 adjustable swivel ring hanger. Minimum 180 pounds design load.
2. Piping 2" and smaller (steel): Clevis hanger, Anvil Fig. No. 260, F & M Fig. No. 239, Paterson Fig. No. 100.
3. Piping 2" and smaller (copper): Adjustable wrought iron, Anvil Fig. No. CT-65, F & M Fig. No. 364, Paterson Fig. No. 100 CT
4. Piping 2½" and larger: MSS type 1 Clevis hanger.
5. Piping 2½" to 4" (steel): Adjustable swivel pipe roll, Anvil Fig. No. 181, F & M Fig. No. 2729, Paterson Fig. No., 16.
6. Piping 2½" to 4" (copper): Adjustable wrought ring, Anvil Fig. No. CT-69.
7. Piping 5" and above: Two rod roller hanger, Anvil Fig. No. 171, F & M Fig. No. 170, Paterson Fig. No., 142.
8. Bare copper pipe: Above hangers, plastic or Neoprene coating, sized for copper pipe O.D. and copper coated for identification.
9. Insulated pipe: Hangers to be sized for O.D. of insulation. Hangers shall not penetrate any insulation.
10. Cast iron pipe above hangers sized for O.D. of cast iron pipe.
11. Hanger wire, cable or perforated metal strapping are not acceptable.

H. Trapeze hangers and wall supports:

1. Channel strut or structural steel shapes. Contractor shall follow channel strut manufacturers guidelines for loading or provide structural steel supports designed by a professional Engineer, licensed in the state where the project is located.
2. All piping shall be attached to the support by means of a channel strut clamp, U-bolt, or pipe rollers which will maintain lateral position of the pipe but allow longitudinal movement. Provide dielectric isolation between all dissimilar metals.
3. All insulation shall be continuous at supports. Do not notch or penetrate insulation or vapor barrier.
4. Kindorf or similar materials used for support of small piping shall not be used for piping 3" or larger.
5. ½" through 3": Unistrut type channel and steel clamp.
   a. Use Hydrosorb cushions on copper pipe.

6. 4" and Over: Welded steel bracket and wrought steel clamp.

I. Vertical Supports: Provide steel riser clamp at each floor penetration or every 14 foot supported from wall bracket. Do not anchor riser clamps.

J. Hangers:

1. General: Adjustable wrought steel clevis with locking nut attachment.
2. Multiple or Trapeze: Steel channels with welded spacers and hanger rods.
3. Hanger Sizes and Spacing:
   a. For drain piping, conform to the code requirements for spacing, and the following table for hanger rod sizes.
   b. For hydronic piping, conform to the following table:

PIPE TYPE	PIPE SIZE	MAXIMUM HORIZONTAL SPACING	MAXIMUM VERTICAL SPACING	MINIMUM HANGER ROD SIZE
Steel and	½"	6'-0"	15'-0"	3/8"
Stainless Steel	¾" thru 1¼"	8'-0"	15'-0"	3/8"
Pipe	1½" and 2"	10'-0"	15'-0"	3/8"
	2½" thru 3½"	12'-0"	15'-0"	½"
	4" and 5"	12'-0"	15'-0"	5/8"
	6"	12'-0"	15'-0"	¾"
*	8" thru 12"	12'-0"	15'-0"	7/8"
Copper Pipe	½" thru 1"	8'-0"	10'-0"	3/8"
	1¼" thru 2"	10'-0"	10'-0"	3/8"
	2½" thru 3"	10'-0"	10'-0"	½"
	4"	10'-0"	10'-0"	5/8"
	6"	10"-0"	10'-0"	¾"
Copper Tubing	1¼ " and below	6'-0"	10'-0"	3/8"

* Submit routing and support plans to Architect/Engineer for review.

K. Insulated Pipe Supports:

1. Size pipe supports for outside diameter of pipe insulation.
2. It is not acceptable to notch insulation or vapor barrier at supports.

L. Pipes over five inches and over 120ºF: Provide cast iron roller supports.

M. Beam clamps - Hangers supported from floor steel shall be approved I beam clamps. I beam clamps for hangers supporting piping 2 inches and smaller shall be C & P Fig. No. 148 adjustable beam clamps. For piping 2-1/2 inches and larger, I beam clamps shall be wrought steel. C & P Fig. No. 268 or equal.

N. Hangers for copper piping shall be copper plated.

2.2 INSULATION INSERTS

A. Pipe shall be protected at the point of support by an insert of high density, foam glass insulation, encased in a sheet metal shield. Insert to be same thickness as adjoining pipe insulation. Insulation insert to extend one inch beyond sheet metal shield on all "cold" lines. If pipe hanger spacing exceeds ten feet and for all pipe roller applications, utilize double layer shield on bearing surface.

B. Provide 180º insulation inserts when utilizing clevis hangers. Provide 360º insulation inserts at all trapeze and wall supports.

2.3 PIPE ANCHORS

A. Manufacturers:

1. Design Basis: Flexonics
2. Other Acceptable Manufacturers:
   a. Adsco
   b. Keflex
   c. Hilti

B. Model AC with threaded ends and welded angle brackets for steel pipe.

C. Model AC copper tube with solder ends and steel angle brackets brazed to tubing for copper tube.

D. Anchors may be field fabricated similar to manufactured products specified.

2.4 PIPE GUIDES

A. Manufacturers:

1. Basis of Design: B-line.
2. Other Acceptable Manufacturers:
   a. Fee & Mason
   b. Anvil
   c. M-Co
   d. PHD

B. Any of the Following:

1. Spider Type: B3281-7.
2. Roller Type: 2 sets of roller son opposite sides of pipe.
3. Slide Type: B3893 with hold down lugs.
   a. Not for use with cold piping.
4. Light duty, 1½" and smaller copper: U bolt or channel strut clamp (B2417) allowing clearance from O.D. of pipe or insulation.

2.5 ROOF MOUNTED PIPING

A. Manufacturers:

1. Miro Industries, Inc.
2. Portable Pipe Hangers, Inc.
3. Approved Equivalent.

B. Where roofing is not being replaced piping on roof shall be supported by an engineered prefabricated portable pipe system specifically designed to be installed on the roof without roof penetrations, flashing or damage to the roofing material. The system shall consist of recycled rubber or plastic bases, hot dipped galvanized or stainless steel frame

with threaded rods and suitable pipe hangers and supports. The system shall be custom designed to fit the piping and conduits to be installed and the actual conditions of service.

C. Provide seismic restraints as required for seismic zone.

D. Piping on areas of roof being replaced shall be installed on pipe curbs bearing on roof structure and flashed into roofing material.

PART 3 – EXECUTION

3.1 INSTALLATION OF PIPE SUPPORTS

A. Adequately support piping from the building structure with adjustable hangers to maintain uniform grading where required and to prevent sagging and pocketing.

1. Provide supports between piping and building structure where necessary to prevent swaying.
2. Do not support pipe from other pipe or equipment.

B. Install hangers to provide minimum ½" clear space between finished covering and adjacent work.

1. Place a hanger within one foot of each horizontal elbow.
2. Space hangers generally as called for in Table in Part 2, Products.

C. Use hangers, which are vertically adjustable 1-½" minimum after piping is erected.

D. Use inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams wherever practicable.

1. Set inserts in position in advance of concrete work.
2. Where concrete slabs form finished ceiling, finish inserts flush with slab surface.
3. Do not penetrate concrete "TT" legs for piping inserts. Do not penetrate the stressed (i.e. lower) chords of any structural member.

E. Provisions for Movement: Install hangers and supports:

1. To allow controlled movement of piping systems.
2. To permit proper movement between pipe anchors.
3. To facilitate the action of expansion joints, expansion loops, bends and offsets.
4. To isolate force due to weight or expansion from equipment connections.

F. In general, attach hangers to upper chord of roof trusses and floor joists, using long rods to facilitate pipe movement.

G. Anchors:

1. Use no pipe anchors. Arrange piping such that pipe expansion and contraction is accommodated by controlled movement of the pipe within the pipe supports. Provide sufficient offsets in branch piping to accommodate movement of main piping due to expansion and contraction. Where this is not possible due to building geometry or other reasons, securely anchor piping where indicated or where required for a proper installation and to force the pipe expansion in the proper direction.
2. Anchors shall be suitable for the location of installation and shall be designed to withstand not less than five times the anchor load.
3. Anchor vertical pipes by means of clamps welded around pipes and secured to wall or floor construction. Anchor at bottom of riser only but provide guides for vertical thermal movement.
4. All anchors shall be separate and independent of all hangers, guides, and supports. Anchors shall be of heavy blacksmith construction suitable in every way for the work approved by the Architect. Anchors shall be welded to the pipe and fastened to the structure with bolts.

5. Anchors shall be fabricated and assembled in such a form as to secure the piping in a fixed position. They shall permit the line to take up its expansion and contraction freely in opposite directions away from the anchored points: and shall be so arranged as to be structurally suitable for particular location, and line loading. Submit details for approval.

H. Assume the responsibility for the proper transfer of the loads to the piping systems to the structure. No additional cost to the owner should be expected for any corrective work during construction.

I. Provide necessary structural members, hangers, and supports of approved design to keep piping in proper alignment and prevent transmission of injurious thrusts and vibrations. In all cases where hangers, brackets, etc., are supported from metal decking and/or concrete construction, care shall be taken not to weaken decking and/or concrete or penetrate waterproofing. Hangers supporting piping expanding into loops, bends and offsets shall be secured to the building structure in such a manner that horizontal adjustment perpendicular to the run of piping supported may be made to accommodate displacement due to expansion. All such hangers shall be finally adjusted, both in the vertical and horizontal direction, when the supported piping is hot, or chilled, as required.

J. Provide supplemental bolted steel in all locations where drilling of slab will create unacceptable noise in adjacent spaces.

K. Where piping is run near the floor and not hung from the ceiling construction but is supported from the floor, such supports shall be of pipe standards with base flange and adjustable top yoke similar to C & P Fig. 247 or equal.

L. All vertical piping shall be anchored by means of heavy steel clamps securely bolted or welded to the piping, and with end extension bearing on the building.

M. Vertical runs of pipe not over 15 feet long shall be supported by hangers placed not over one foot from the elbows on the connecting horizontal runs.

N. Vertical runs of pipe over 15 feet long but not over 60 feet long and not over 6 inches in size, or not over 30 feet long and not over 12 inches in size, shall be supported on heavy steel clamps. Clamps shall be bolted tightly around the pipes and shall reset securely on the building structure without blocking. Clamps shall be welded to the pipes or placed below couplings. Clamps shall be type 8, Federal Specification WW-H-171C, unless other types are approved.

O. For all hydronic water and makeup water and insulated refrigerant piping, provide "Insulshield" as made by Insulcoustic Corp. or pipe covering protection shield F & S Fig. 980 with steel shield, with vapor barrier jacket. For hot fuel oil and hot-water heating piping 2 inches and smaller, same as above.

P. Piping in trenches shall hang from angle iron cross supports provided by the Contractor with two coatings of red led primer and final coat of black asphaltum paint.

Q. Hanger rods shall be attached to preset concrete inserts with steel reinforcing rod through the insert and both ends hooked over the reinforcing mesh. For pipes 4 inches and larger, rods shall extend through concrete slab above where they shall be attached to steel bearing plates 6" x 6" x 1/4".

R. Piping shall not be hung from other piping, ducts, conduits or from equipment of other trades and no vertical expansion shields will be permitted. Hanger rods shall not pierce ducts.

S. All water piping connected to rotating equipment within all mechanical spaces shall be isolated from the building structure by means of vibration hangers inserted in the hanger rods. The vibration hangers shall consist of a steel spring in combination with a double deflection neoprene element within a rectangular steel housing. Combined static deflection shall be 1.375" minimum. Hangers shall have capability of supporting the piping at a fixed elevation during installation and shall incorporate an adjusting device to transfer the load to the spring. Deflection shall be indicated by means of scale. Vibration hangers shall be type PCDNHS made by Mason Industries.

T. All piping running on walls shall be supported by means of hanger suspended from heavy angle iron wall brackets. No wall hooks will be permitted.

END OF SECTION

SECTION 23 05 30

ELECTRONIC SPEED CONTROLLERS

PART 1 – GENERAL

1.1 SUBMITTALS

A. Submit manufacturer's product data for each unit. Include:

1. Capacity:
   a. Horsepower
   b. Voltage
   c. Amps – both input and output
2. Wiring Diagrams:
   a. Include diagrams for basic unit and for all required accessories.
   b. Provide control wiring connections
3. Dimensions.
4. Installation instructions.
5. Description of diagnostic system.
6. Options provided.
7. BIM objects containing IFC parameters and associated data applicable to building system requirements.
8. Compliance to IEEE 519 – harmonic analysis for particular jobsite including total harmonic voltage distortion and total harmonic current distortion (TDD).
   a. The VFD manufacturer shall provide calculations; specific to this installation, showing total harmonic voltage distortion is less than 5%. Input filters shall be sized and provided as required by the VFD manufacturer to ensure compliance with IEEE standard 519. All VFD's shall include a minimum of 5% impedance, no exceptions.
   b. Notwithstanding the calculations specified above, provide harmonic filters on all drives with an input current rating higher than 78 amps.
9. Vendor shall program one drive of each type (pump, fan, etc.) and submit a complete listing of parameters to engineer for review with commissioning authority before proceeding with programming of all drives. Provide a complete listing of all parameters for each drive as both a hard copy and electronically in both text format and the format of the manufacturer's communication/service program.
10. The VFD manufacturer shall submit a list of all parameters with a suggested setting for each drive's specific application.
11. The VFD manufacturer shall submit documentation that the drive is capable of continuous operation at a minimum of 110% of motor nameplate rating, including the service factor.

1.2 QUALITY ASSURANCE

A. Referenced Standards:
1. Institute of Electrical and Electronic Engineers (IEEE) Standard 519-1992, IEEE Guide for Harmonic Content and Control.
2. Underwriters laboratories UL508C
3. National Electrical Manufacturer's Association (NEMA) ICS 7.0, AC Adjustable Speed Drives
4. IEC 16800 Parts 1 and 2
5. National Electric Code (NEC) NEC 430.120, Adjustable-Speed Drive Sys
6. International Building Code (IBC)
   a. IBC 2006 Seismic – referencing ASC 7-05 and ICC AC-156

PART 2 - PRODUCTS

2.1 GENERAL

A. Manufacturer:

1. Basis of Design:
   a. ABB ACH 550
2. Other Acceptable Manufacturers (provided the submitted model adheres to the spec.):
   a. Allen Bradley 700 Series
   b. Eaton SPX 9000
   c. Hitachi SJ700

B. Drive shall convert the constant frequency AC line voltage to a variable frequency, variable voltage AC output suitable for control of a standard NEMA design B induction motor over a 10:1 speed range and with full load amp rating between 65% and 130% of the drive full load current capability and without modification to the motor or the drive.

C. Variable frequency drives for all three phase motors shall have the following features:

1. Drive input: 208 or 480 volts +30% to -35%, 3 phase, 60 Hz.
2. Drive output: 0-208 or 0-460 volts, 3 phase, 0-80 Hz. For efficient operation of a variable torque load.
3. Operating conditions: Capable of continuous operation at 0 to 50^0 C (-10 to 122^0 F) ambient temperature
   a. Provide conformal coating on all printed circuit boards
4. Drive type: Pulse width modulation type, designed to minimize harmonic generated noise in the motor.
5. Enclosure type: UL type as required for location.
   a. Drives shall be UL listed as a plenum rated VFD
   b. See additional enclosure requirements herein.
6. AC line circuit breaker.
7. Input fuses for the VFD which shall ensure operation of the bypass in the event of the short circuit of the VFD
8. The input current rating of the VFD shall be no more than 3% greater than the output current rating.
9. Provide VFD one horsepower size higher than motor size for drives where input current rating of the VFD is more than 3% greater than the output current rating.
10. Coordinate additional costs with contractor, ensure no additional cost to engineer and/or owner.
11. Metal oxide varistors on incoming line for transient protection.
12. All VFD's shall include EMI/RFI filters. The onboard filters shall allow the VFD assembly to be CE Marked and the VFD shall meet product standard EN 61800-3 for the First Environment restricted level with up to 100 feet of motor cable. No Exceptions. Certified test reports shall be provided with the submittals confirming compliance to EN 61800-3, First Environment.
13. The VFD and Bypass shall be rated 100,000 SCCR for short circuit interrupt.
    a. The installation fuses is not an acceptable design for SCCR rating.
14. 120 volt Control power transformer with fused primary and fused secondary.
    a. Control power shall be fed from the DC bus.
    b. Control contactors shall be 120V; 24 V are not acceptable.
15. The Keypad shall include a backlit LCD display. The display shall be in complete English words for programming and fault diagnostics (alpha-numeric codes are not acceptable). All VFD faults shall be displayed in English words. The keypad shall include a minimum of 14 assistants including:
    a. Start-up assistant
    b. Parameter assistants
       1) PID assistant
       2) Reference assistant
       3) I/O assistant
       4) Serial communications assistant
       5) Option module assistant
       6) Panel display assistant
       7) Low noise set-up assistant
    c. Maintenance assistant

d. Troubleshooting assistant
e. Drive optimizer assistants
f. All applicable operating values shall be capable of being displayed in engineering (user) units. A minimum of three operating values from the list below shall be capable of being displayed at all times. The display shall be in complete English words (alpha-numeric codes are not acceptable):
   Output Frequency
   Motor Speed (RPM, %, or Engineering units)
   Motor Current
   Motor Torque
   Motor Power (kW)
   DC Bus Voltage
   Output Voltage

16. Instantaneous overcurrent shutdown with indicator light when current exceeds 200%. Time-overcurrent overload protection for the motor.
17. There shall be a built-in time clock in the VFD keypad. The clock shall have a battery back up with 10 years minimum life span. The clock shall be used to date and time stamp faults and record operating parameters at the time of fault. If the battery fails, the VFD shall automatically revert to hours of operation since initial power up. Capacitor back-up is not acceptable. The clock shall also be programmable to control start/stop functions, constant speeds, PID parameter sets and output Form-C relays.
18. Inverse characteristic time-overcurrent overload protection for the motor sized in accordance with NEC requirements.
19. Drive shall be capable of withstanding random application of an output short circuit without damage to drive components or fuses.
20. Input phase loss and undervoltage protection.
21. Torque/current limit control which will slow the motor without tripping when the motor is subjected to an overload, or slow the acceleration ramp when accelerating a high inertia load.
22. Drives shall be capable of “riding through” a momentary loss of power for up to 2 seconds.
23. Provide AC line reactors in the drive cabinet for each VFD with an input current rating above 78 Amps for protection against line notching and surges without requirement for an input isolation transformer. The VFD shall have internal 5% impedance reactors to reduce the harmonics to the power line and to add protection from AC line transients. The 5% impedance may be from dual (positive and negative DC bus) reactors, or 5% AC line reactors. VFD’s with only one DC reactor shall add an AC line reactor.
24. There shall be no VFD components shipped loose and / or mounted external to the VFD cabinet
25. Power factor shall be minimum 95% at all speeds and loads.
26. UL listed
27. Minimum and maximum speed adjustment.
28. Factory Tests: The VFD shall be tested with the system logic and given complete factory tests including simulated operation.
    a. Provide certification this test has been made for the particular units shipped for this job.
29. Field Adjustments: Independent acceleration/deceleration rates: 0.5 – 120 seconds.
30. Provide a maximum of 1000 volts at the motor terminals.
31. PWM technology, with diode bridge front ends and IGB transistors (IGBT) in the output section that utilize soft switching.

D. Control Interface Components

1. Provide every VFD complete with all control devices to accomplish each function described in the specification. Field installation of sensors, relays, terminal strips, etc. is not permitted. Provide all transducers, relays and interface devices factory installed and wired to a dedicated terminal strip to provide the following functions (described elsewhere in the specification) as follows:
   a. Proof of flow – current sensing
   b. Damper control
   c. Smoke control – all modes as described herein
   d. Broken belt
   e. Single phase protection

f. Welded contactor
g. Amps – all phases
h. Volts – all phases

E. Serial Communications – addressable for drive and separately for the bypass

1. The VFD shall have an EIA-485 port as standard. The standard protocols shall be Modbus, Johnson Controls N2, Siemens Building Technologies FLN, and BACnet. [Optional protocols for LonWorks, Profibus, EtherNet, BACnet IP, and DeviceNet shall be available.] Each individual drive shall have the protocol in the base VFD. The use of third party gateways and multiplexers is not acceptable. All protocols shall be "certified" by the governing authority (i.e. BTL Listing for BACnet). Use of non-certified protocols is not allowed.
2. The BACnet connection shall be an EIA-485, MS/TP interface operating at 9.6, 19.2, 38.4, or 76.8 Kbps. The connection shall be tested by the BACnet Testing Labs (BTL) and be BTL Listed. The BACnet interface shall conform to the BACnet standard device type of an Applications Specific Controller (B-ASC). The interface shall support all BIBBs defined by the BACnet standard profile for a B-ASC including, but not limited to:
   a. Data Sharing – Read Property – B.
   b. Data Sharing – Write Property – B.
   c. Device Management – Dynamic Device Binding (Who-Is; I-Am).
   d. Device Management – Dynamic Object Binding (Who-Has; I-Have).
   e. Device Management – Communication Control – B.
3. If additional hardware is required to obtain the BACnet interface, the VFD manufacturer shall supply one BACnet gateway per drive. Multiple VFDs sharing one gateway shall not be acceptable.
4. Serial communication capabilities shall include, but not be limited to; run-stop control, speed set adjustment, proportional/integral/derivative PID control adjustments, current limit, accel/decel time adjustments, and lock and unlock the keypad. The drive shall have the capability of allowing the DDC to monitor feedback such as process variable feedback, output speed / frequency, current (in amps), % torque, power (kW), kilowatt hours (resettable), operating hours (resettable), and drive temperature. The DDC shall also be capable of monitoring the VFD relay output status, digital input status, and all analog input and analog output values. All diagnostic warning and fault information shall be transmitted over the serial communications bus. Remote VFD fault reset shall be possible.
5. Serial communication in bypass shall include, but not be limited to; bypass run-stop control, the ability to force the unit to bypass, and the ability to lock and unlock the keypad. The bypass shall have the capability of allowing the DDC to monitor feedback such as, current (in amps), kilowatt hours (resettable), operating hours (resettable), and bypass logic board temperature. The DDC shall also be capable of monitoring the bypass relay output status, and all digital input status. All bypass diagnostic warning and fault information shall be transmitted over the serial communications bus. Remote bypass fault reset shall be possible.
6. The VFD / bypass shall allow the DDC to control the drive and bypass digital and analog outputs via the serial interface. This control shall be independent of any VFD function. The analog outputs may be used for modulating chilled water valves or cooling tower bypass valves. The drive and bypass' digital (Form-C relay) outputs may be used to actuate a damper, open a valve or control any other device that requires a maintained contact for operation. In addition, all of the drive and bypass' digital inputs shall be capable of being monitored by the DDC system. This allows for remote monitoring of which (of up to 4) safeties are open.
7. The VFD shall include an independent PID loop for customer use. The independent PID loop may be used for cooling tower bypass value control, chilled water value / hot water valve control, etc. Both the VFD PID control loop and the independent PID control loop shall continue functioning even if the serial communications connection is lost. As default, the VFD shall keep the last good set point command and last good DO & AO commands in memory in the event the serial communications connection is lost and continue controlling the process.

F. Harmonic Filter - provide integral harmonic filters as part of the factory assembled VFD package, completely wired including interface of all monitoring and control points to the VFD serial communications. The integral harmonic filter shall be provided as follows:

1. The harmonic filter shall be designed to filter all characteristic low frequency harmonics (5th, 7th, 11th, 13th, etc.) .
2. The filter shall consist of inductive element(s) in series with the load and an inductive-capacitive network in shunt with the load. The shunt circuit shall be tuned to 4.7 times the fundamental frequency.
3. The filter shunt circuit shall be protected by field replaceable fuses on each phase to ensure the VFD remains operational in the event of a capacitor over current or other condition causing the fuses to open. Fuses internal to the capacitor cell shall not be acceptable in lieu of field replaceable fuses.
4. The filter shall have a fuse status which is monitored by a digital input on the VFD and available to the serial communications interface.
5. The filter shall have a labeled SCCR rating of 100kA per UL 508A. An SCCR rating of EXEMPT will not be accepted as a valid alternative.
6. The Total Demand Distortion (TDD) of the current at the input terminals of the filter, in combination with the variable frequency drive, shall not exceed 5% THID at full rated load and given the filter is correctly applied.
7. The Total Harmonic Voltage Distortion (THVD) at the input terminals of the filter in combination with the variable frequency drive shall not exceed the limits defined in Table 10-2 of IEEE-519.
8. The full load efficiency of the filter shall not be less than 97% for filters larger than 5 HP or less than 98.5% for filters larger than 25 HP. The voltage regulation at the VFD terminals and attributable to the filter shall not exceed 5%. Filters with greater than 10% voltage drop, and/or filters that have capacitors in series with the VFD, are not acceptable.
9. The filter shall have a shunt capacitor in the circuit to control the capacitive VARS on the power system. The contactor shall be controlled by a digital output on the VFD. Both shunt circuit inductors and series line reactors shall be designed for harmonic filtering service and for slowing the rate of rapid current changes.
10. The inductors shall be UL component-recognized or listed and shall be built to comply to UL 508. Construction shall be of copper wire-wound on magnetic steel cores. Inductors shall be three-phase. Series line reactors shall be sized appropriately for the total connected load. Design maximum temperature rise for inductors shall be 115°C on bobbin wound and 155°C on form wound devices at rated current. Windings shall consist of copper wire or of copper foil. Terminations shall be copper alloy ring lugs, UL-recognized terminal blocks, or solid copper bus. Completed inductors shall be impregnated, using 100% solid epoxy resin. All insulation varnish systems shall be rated class H (180°C) or class R (220°C), 600V. Inductors shall be Hi-Pot tested (2,500V, 60 Hz, 1 minute) line-to-line and line-to-ground.

G. Bypass Controller - All variable frequency drives shall be equipped complete factory wired and tested bypass system consisting of a door interlocked, padlockable circuit breaker, output contactor, bypass contactor, and fast acting VFD input fuses are required. UL Listed motor overload protection shall be provided in both drive and bypass modes.

1. Drives with an INPUT Amp Rating equal to 114 Amps or greater must include a solid state soft starter in the bypass circuit. The soft starter must include a shunt contactor which will close when the motor reaches full speed.
2. The bypass enclosure door and VFD enclosure must be mechanically interlocked such that the disconnecting device must be in the “Off” position before either enclosure may be accessed.
3. The VFD and bypass package shall have a UL listed short circuit current rating (SCCR) of 100,000 amps and this rating shall be indicated on the UL data label.
4. The drive and bypass package shall be seismic certified and labeled to the IBC:
   a. Seismic importance factor of 1.5 rating is required, and shall be based upon actual shake table test data as defined by ICC AC-156.
5. Drive Isolation Fuses - To ensure maximum possible bypass operation, fast acting fuses, exclusive to the VFD, shall be provided to allow the VFD to disconnect from the line prior to clearing upstream branch circuit protection. This maintains bypass operation capability in the event of a VFD failure. Bypass designs which have no such fuses, or that incorporate fuses common to both the VFD and the bypass, will not be accepted.
6. The bypass shall include a minimum of two contactor (motor and bypass) and a lockable service switch to isolate the drive while in bypass mode. Designs that use a third contactor for drive isolation must also provide a lockable disconnect in series with the drive contactor for positive means of isolation avoiding the possibility of the drive contactor being welded closed.

7. The system (VFD and Bypass) tolerated voltage window shall allow the system to operate from a line of +30%, -35% nominal voltage range. The system shall incorporate circuitry that will allow the drive or bypass contactor to remain "sealed in" over this voltage tolerance at a minimum.
8. The bypass shall maintain positive contactor control through the voltage tolerance window of nominal voltage +30%, -35%. This feature is designed to avoid contactor coil failure during brown out / low line conditions and allow for input single phase operation when in the VFD mode. Designs that will not allow input single phase operation in the VFD mode are not acceptable.
9. Motor protection from single phase power conditions - the bypass system must be able to detect a single phase input power condition while running in bypass, disengage the motor in a controlled fashion, and give a single phase input power indication. Bypass systems not incorporating single phase protection in bypass mode are not acceptable.
    a. All current sensing transducers to accomplish single phase detection must be factory mounted. Faults for single phase must be displayed on the keypad and communicated over serial interface.
10. The bypass system shall NOT depend on the VFD for bypass operation. The bypass system shall be designed for stand alone operation and shall be completely functional in both Hand and Automatic modes even if the VFD has been removed from the system for repair / replacement. Serial communications shall remain functional even with the VFD removed.
11. Serial communications – the bypass shall be capable of being monitored and / or controlled via serial communications. On-board communications protocols shall include ModBus; Johnson Controls N2; Siemens Building Technologies FLN (P1); and BACnet.
12. Serial communication capabilities shall include, but not be limited to; bypass run-stop control; the ability to force the unit to bypass; and the ability to lock and unlock the keypad. The bypass shall have the capability of allowing the DDC to monitor feedback such as, current (in amps), kilowatt hours (resettable), operating hours (resettable), and bypass logic board temperature. The DDC shall also be capable of monitoring the bypass relay output status, and all digital input status. All bypass diagnostic warning and fault information shall be transmitted over the serial communications bus. Remote bypass fault reset shall be possible. The following additional status indications and settings shall be transmitted over the serial communications bus and / or via a Form-C relay output – keypad "Hand" or "Auto" selected, bypass selected, and broken belt indication. The DDC system shall also be able to monitor if the motor is running in the VFD mode or bypass mode over serial communications. A minimum of 50 field serial communications points shall be capable of being monitored in the bypass mode.
13. The bypass serial communications shall allow control of the bypass' digital outputs via the serial interface. This control shall be independent of any bypass function or operating state. The bypass' digital (relay) outputs may be used to actuate a damper, open a valve or control any other device that requires a maintained contact for operation. In addition, all of the bypass' digital inputs shall be capable of being monitored by the DDC system.
14. There shall be an adjustable motor current sensing circuit for the bypass and VFD modes to provide proof of flow (broken belt) indication. The condition shall be indicated on the keypad display, transmitted over the building automation protocol and / or via a Form-C relay output contact closure. The broken belt indication shall be programmable to be a system (drive and bypass) indication. The broken belt condition sensing algorithm shall be programmable to cause only a warning or a fault and / or system shutdown.
15. The digital inputs for the system shall accept 24VAC or 24VDC. The bypass shall incorporate an internally sourced power supply and not require an external control power source. The bypass power board shall supply 250 ma of 24 VDC for use by others to power external devices.
16. There shall be a run permissive circuit for damper or valve control. Regardless of the source of a run command (keypad command, time-clock control, digital input, or serial communications) the bypass shall provide a dry contact closure that will signal the damper to open (motor does not operate). When the damper is fully open, a normally open dry contact (end-switch) shall close. The closed end-switch is wired to a bypass system input and allows motor operation. Up to four separate safety interlock inputs shall be provided. When any safety is opened, the motor shall be commanded to coast to stop, and the damper shall be commanded to close. This feature will also operate in Fireman's override / smoke control mode.
17. The bypass control shall monitor the status of the VFD and bypass contactors and indicate when there is a welded contactor contact or open contactor coil. This failed contactor condition shall be indicated on the bypass LCD display, programmed to fire a Form-C relay output, and / or over the serial communications protocol.

18. The bypass control shall include a programmable time delay for bypass start and keypad indication that this time delay is in process. A Form C relay output provides a contact closure to signal the VAV boxes open. This will allow VAV boxes to be driven open before the motor operates at full speed in the bypass mode. The time delay shall be field programmable from 0 – 120 seconds.
19. There shall be a keypad adjustment to select manual or automatic transfer bypass. The user shall be able to select via keypad programming which drive faults will result in an automatic transfer to the bypass mode and which faults require a manual transfer to bypass. The user may select whether the system shall automatically transfer from drive to bypass mode on the following drive fault conditions:
    a. Over current
    b. Over voltage
    c. Under voltage
    d. Loss of analog input
    e. The following operators shall be provided:
        1) Bypass Hand-Off-Auto
        2) Drive mode selector
        3) Bypass mode selector
        4) Bypass fault reset
20. The bypass shall include a two line, 20 character LCD display. The display shall allow the user to access and view:
    a. Energy savings – in US dollars
    b. Bypass motor amps
    c. Bypass input voltage– average and individual phase voltage
    d. Bypass power (kW)
    e. Bypass faults and fault logs
    f. Bypass warnings
    g. Bypass operating time (resettable)
    h. Bypass energy (kilowatt hours – resettable)
    i. I/O status
    j. Parameter settings / programming
    k. Printed circuit board temperature
21. The following indicating lights (LED type) or keypad display indications shall be provided. A test mode or push to test feature shall be provided.
    a. Power-on (Ready)
    b. Run enable
    c. Drive mode selected
    d. Bypass mode selected
    e. Drive running
    f. Bypass running
    g. Drive fault
    h. Bypass fault
    i. Bypass H-O-A mode
    j. Automatic transfer to bypass selected
    k. Safety open
    l. Damper opening
    m. Damper end-switch made
22. The Bypass controller shall have six programmable digital inputs, and five programmable Form-C relay outputs. This I/O allows for a total System (VFD and Bypass) I/O count of 24 points as standard. The bypass I/O shall be available to the BAS / DDC system even with the VFD removed.
23. The on-board Form-C relay outputs in the bypass shall programmable for any of the following indications.
    a. System started
    b. System running
    c. Bypass override enabled
    d. Drive fault
    e. Bypass fault
    f. Bypass H-O-A position

g. Motor proof-of-flow (broken belt)
h. Overload
i. Bypass selected
j. Bypass run
k. System started (damper opening)
l. Bypass alarm
m. Over temperature

24. The bypass shall provide a separate terminal strip for connection of freeze, fire, smoke contacts, and external start command. All external safety interlocks shall remain fully functional whether the system is in VFD or Bypass mode. The remote start/stop contact shall operate in VFD and bypass modes. The terminal strip shall allow for independent connection of up to four (4) unique safety inputs.
25. The bypass shall include a supervisory control mode. In this bypass mode, the bypass shall monitor the value of the VFD's analog input (feedback). This feedback value is used to control the bypass contactor on and off state. The supervisory mode shall allow the user to maintain hysteresis control over applications such as cooling towers and booster pumps even with the VFD out of service.
26. The user shall be able to select the text to be displayed on the keypad when an external safety opens. Example text display indications include "FireStat", "FreezStat", "Over pressure" and "Low suction". The user shall also be able to determine which of the four (4) safety contacts is open over the serial communications connection.
27. Smoke Control Override Mode (Override 1) – The bypass shall include a dedicated digital input that will transfer the motor from VFD mode to Bypass mode upon receipt of a dry contact closure from the Fire / Smoke Control System. The Smoke Control Override Mode action is not programmable and will always function as described in the bypass User's Manual documentation. In this mode, the system will ignore low priority safeties and acknowledge high priority safeties as required by UL 864/UUKL. All keypad control, serial communications control, and normal customer start / stop control inputs will be disregarded. This Smoke Control Mode shall be designed to meet the intent of UL864/UUKL.
28. Stair Pressurization Mode – the bypass shall include an option to control the speed of the motor based on an external pressure transmitter. In this mode the VFD shall modulate the speed of the motor to maintain a pressure setpoint and avoid over pressurization of the stairwell.
29. Preset speed mode – the bypass shall include an option to run the drive at a preset speed and follow the acceleration values programmed in the VFD. The preset speed can be any fixed value.
30. Fireman's Override Mode (Override 2) – the bypass shall include a second, programmable override input which will allow the user to configure the unit to acknowledge some digital inputs, all digital inputs, ignore digital inputs or any combination of the above. This programmability allows the user to program the bypass unit to react in whatever manner the local Authority Having Jurisdiction (AHJ) requires. The Override 2 action may be programmed for "Run-to-Destruction". The user may also force the unit into Override 2 via the serial communications link.
31. Class 10, 20, or 30 (programmable) electronic motor overload protection shall be included.

H. In addition to the above feature all drives shall have the following additional features:

1. Catch-a-spinning load capability.
2. Critical speed avoidance capability.
3. Where the building walls are not suitable for mounting drives a floor stand kit shall be provided.
4. Provide output isolator to provide VFD signal operation of frequency, and current to an isolated 4-20 mA signal for transmission to the building automation system for monitoring capability.

I. For variable frequency drives serving multiple motors, the following shall be provided:

1. Provide redundant drives, each drive sized for the aggregated load of all motors.
2. The system shall monitor drive performance and switch to the standby drive in the event of a drive failure.
3. The system shall balance run time between drives
4. Manual switchover will be required in an instance of electrical system deficiencies such as under voltage, ground fault, single phase input, etc.

5. Provide motor contactors for each motor for drives serving more than one motor, each contactor shall have auxiliary contacts to prevent drive damage if remote motor disconnect switch is open of closed.
6. Each drive shall have contactors for each motor it serves with individual thermal overload protection for each motor and H-O-A motor select switch.
7. All multiple motor variable speed controllers shall be capable of operating even if one of the motors is off.
8. Multiple motor protectors must be integral to the VFD enclosure.

J. Enclosure: NEMA Type as required for location.

1. Provide NEMA 4X stainless steel enclosures in wash down areas, kitchens, dishwasher areas, exterior spaces, and any other areas designated by the Engineer. Provide space heater/air conditioning as well as all necessary conditioning within the enclosure as required to maintain the minimum internal temperature required by the manufacturer. Air conditioning shall be powered by a single point of connection within the cabinet.
2. Provide NEMA 3r enclosures for drives exposed to weather. NEMA 3 r enclosures shall be fabricated from 304 SS with protected keypads. The enclosure shall be bottom entry and shall include heating and ventilation to maintain and operation environment during design conditions
3. Provide NEMA 12 enclosure for all interior drives. NEMA 12 enclosures shall be fabricated from epoxy painted carbon steel with protected keypads. The enclosure shall be bottom entry.

K. For drive manufacturers who use portable test meter for diagnostics, provide not less than one test meter for each model or type used. Meters shall be supplied to the Owner upon completion of the project.

L. Provide one complete set of spare fuses for all variable speed controllers.

M. Interlock all disconnects with variable speed drive so variable speed drive opens before disconnect opens to prevent damage to the drive.

PART 3 – EXECUTION

3.1 Deliver units to installer of electrical work. Provide installation and wiring instruction and diagrams.

3.2 Certified factory start-up shall be provided for each drive by a factory authorized service center. A certified start-up form shall be filled out for each drive with a copy provided to the owner, and a copy kept on file at the manufacturer. The local service office shall be staffed by factory trained engeers within a 100-mile radius of the job site. Training shall be provided for the Owner's service personnel at the Owner's facility.

3.3 Provide wiring control diagrams and instructions to installer of automatic temperature controls.

3.4 Provide Two years warranty to cover parts and labor

3.5 In applications where the drive will be more than 100 cable feet from the motor, it is the responsibility of the contractor to have the manufacturer coordinated with the motor manufacturer to ensure that the motor is suitable for the application, or to provide a motor protecting DV/DT filter on the drive output to protect the motor. The manufacturer shall adjust the carrier frequency to minimize the audible noise of the connected motor.

3.6 An asbult drive control schematic (ladder diagram) shall be taped to the inside of the drive cabinet and sent to the Project Engineer and be included as part of the closeout document package.

END OF SECTION

SECTION 23 05 48

VIBRATION CONTROL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplemental Conditions of the Construction Contract, and Specification Sections (General Requirements), apply to this Section.

1.2 DESCRIPTION

A. Furnish and install all vibration control devices, accessories, materials, and related items. Perform all work as shown on the drawings and as specified herein to provide complete vibration isolation systems in proper working order.

1.3 MATERIAL AND EQUIPMENT

A. Design Basis: Mason Industries

B. Alternate Manufacturers:

1. Vibration Eliminator Co.
2. Korfund Dynamics Corp.
3. Amber/Booth Co.
4. Vibration Mountings & Controls, Inc.

C. Unless otherwise specified, supply only new equipment, parts and materials.

1.4 QUALITY ASSURANCE

A. Firms regularly engaged in manufacture of this equipment with characteristics and capacities required, whose products have been in satisfactory use in similar service for not less than ten (10) years.

B. Coordinate the size, location, and special requirements of vibration isolation equipment and systems with other trades. Coordinate plan dimensions with size of housekeeping pads.

C. Provide vibration isolators of the appropriate sizes, with the proper loading to meet the specified deflection requirements.

D. Supply and install any incidental materials needed to meet the requirements stated herein, even if not expressly specified or shown on the drawings, without claim or additional payment.

E. Verify correctness of equipment model numbers and conformance of each component with manufacturer's specifications.

F. Should any rotating equipment cause excessive noise or vibration, the Contractor shall be responsible for rebalancing, realignment, or other remedial work required to reduce noise and vibration levels. Excessive is defined as exceeding the manufacturer's specifications for the unit in question.

1.5 SUBMITTALS

A. Prior to ordering any products, submit shop drawings and the items listed below. The shop drawings must be complete when submitted and must be presented in a clear, easily understood form. Incomplete or unclear

presentation of shop drawings may be reason for rejection of the submittal. Contractor shall provide:

1. A complete description of products to be supplied, including product data, dimensions, specifications, and installation instructions.
2. Detailed selection data for each vibration isolator supporting equipment, including:
   a. The equipment identification mark;
   b. A cut sheet of the isolated equipment showing equipment support points and operating weight at each point.
   c. The isolator type;
   d. The actual load;
   e. The static deflection expected under the actual load;
   f. Specified minimum static deflection;
   g. The additional deflection-to-solid under load;
   h. The ratio of spring height under load to spring diameter.
3. Steel rails, steel base frames, and concrete inertia bases showing all steel work, reinforcing, vibration isolator mounting attachment method, and location of equipment attachment bolts.
4. Special details necessary to convey complete understanding of the work to be performed.

PART 2 - PRODUCTS

2.1 VIBRATION ISOLATION MOUNT TYPES

A. General:

1. All mechanical equipment shall be mounted in accordance with the specifications below and for the specific requirements shown in the equipment schedule.
2. The isolation manufacturer shall supply all unit isolators, complete rails, fan and motor bases and structural steel forms for concrete inertia blocks, where called for and shall be responsible for the selection of all vibration eliminators and shall guarantee to meet the requirements of these Specifications.
3. Wherever rotational speed is mentioned as the disturbing frequency, the lowest speed in the system shall be used. All isolation devices shall be selected for uniform static deflections according to distribution of weight. Lateral motion of all isolators shall be 1/4" maximum during start-up and shut-down.
4. All metal parts of vibration isolation units installed out-of-doors shall be cold-dip galvanized, cadmium plated, or neoprene coated after fabrication. Galvanizing shall meet ASTM Salt Spray Test Standards and Federal Test Standard No. 14. Isolators shall be equipped with limit stops to resist wind velocity.
5. All isolators installed out-of-doors shall have base plates with bolt holes for fastening the isolators to the support members.
6. Isolator types are scheduled to establish minimum standards. At the Contractor's option, laborsaving accessories can be an integral part of isolators supplied to provide initial lift of equipment to operating height, hold piping at fixed elevations during installation and initial system filling operations, and similar installation advantages. Accessories must not degrade the vibration isolation system.
7. Static deflection of isolators shall be as provided in SECTION 3 - EXECUTION. All static deflections stated are the minimum acceptable deflection for the mounts under actual load. Isolators selected solely on the basis of rated deflections are not acceptable and will be disapproved.
8. All fan units and air handling units (except fans with wheels under 27") shall be isolated as follows:

1.	Up to 450 RPM:	75% eff. (3-1/2" max. deflection)
2.	450 RPM to 850 RPM:	90%
3.	850 RPM and over:	95%

   Submittals shall show disturbing frequency, required efficiency, designed deflection and outside diameter of springs, when pertinent.
9. All horizontal pipe connected to rotating equipment within the mechanical equipment room area, but not less than 50 feet from connected equipment shall be isolated from building structure by means of units designed

for insertion in rods.

B. Type FSN (Floor Spring and Neoprene)

1. Spring isolators shall be freestanding and laterally stable without any housing. Spring diameter shall be not less than 0.8 of the compressed height of the spring at the rated load. Springs shall have a minimum additional travel-to-solid equal to 50% of the rated deflection. Springs shall be so designed that the ratio of horizontal stiffness to vertical stiffness is approximately one (1). All mounts shall have leveling bolts.
2. Either the spring element in the isolator shall be set in a neoprene cup and have a steel washer to distribute the load evenly over the neoprene, or each isolator shall be mounted on a Type NP isolator. If the NP isolator is used, provide a rectangular bearing plate of appropriate size to load the pad uniformly within the manufacturer's recommended range.
3. If the basic spring isolator has a neoprene friction pad on its base and a NP isolator is to be added to the base, a galvanized steel, stainless steel or aluminum plate shall be used between the friction pad and the NP isolator. If the isolator is outdoors, the plate shall not be made of galvanized steel. The NP isolator, separator plate and friction pad shall be permanently adhered to one another and to the bottom of the bearing plate.
4. If the isolator is to be fastened to the building structure and Type NP isolator is used under the bearing plate, neoprene grommets shall be provided for each bolt hole in the base plate. Bolt holes shall be properly sized to allow for grommets. The hold down bolt assembly shall include washers to distribute load evenly over the grommets. Bolts and washers are to be galvanized.

   Type FSN isolators shall be Mason Type SLF with the appropriate neoprene pad (if used) selected from Type NP or approved equal.

C. Type FSNTL (Floor Spring and Neoprene Travel Limited)

1. Spring isolators shall be freestanding and laterally stable without any housing. Spring diameter shall not be less than 0.8 of the compressed height of the spring at the rate load. Spring shall have a minimum additional travel-to-solid equal to 50% of the rated deflection. Springs shall be so designed that the ratio of horizontal stiffness to vertical stiffness is approximately one (1). All mounts shall have leveling bolts. All mounts shall have vertical travel limit stops to control extension when weight is removed. The travel limit stops shall be capable of serving as blocking during erection of the equipment. A minimum clearance of ¼" shall be maintained around restraining bolts and between the limit stops and the spring to avoid interference with the spring action.
2. Either the spring element in the isolator shall be set in a neoprene cup and have a steel washer to distribute the load evenly over the neoprene, or each isolator shall be mounted on a Type NP isolator. If the NP isolator is used, provide a rectangular bearing plate of appropriate size to load the pad uniformly within the manufacturer's recommended range. If the basic spring isolator has a neoprene friction pad on its base and a NP isolator is to be added to the base, a galvanized steel, stainless steel or aluminum plate shall be used between the friction pad and the NP isolator. If the isolator is outdoors, the plate shall not be made of galvanized steel. The NP isolator, separator plate, and friction pad shall be permanently adhered to one another and to the bottom of the bearing plate.
3. If the isolator is to be fastened to the building structure and Type NP isolator is used under the bearing plate, neoprene grommets shall be provided for each bolt hole in the base plate. Bolt holes shall be properly sized to allow for grommets. Hold down assembly shall include washers to distribute load evenly over the grommets. Bolts and washers are to be galvanized.

   Type FSNTL isolators shall be Mason Type SLR with the appropriate neoprene pad (if used) selected from Type NP or approved equal.

D. Type FN (Floor Neoprene)

1. Neoprene isolators shall be neoprene-in-shear type with steel reinforced top and base. All metal surfaces shall be covered with neoprene. The top and bottom surfaces shall be ribbed. Bolt holes shall be provided

in the base and the top shall have a threaded fastener. The mounts shall include leveling bolts that may be rigidly connected to the equipment.

Type FN isolators shall be Mason Type ND or approved equal.

E. Type FNC (Floor Neoprene Chiller)

1. Neoprene isolators shall be double neoprene-in-shear type with steel reinforced top intermediate plates and base. Neoprene elements shall be ¾". Steel plates shall be ¼" and the top and bottom plates shall be ribbed. Bolt holes shall be provided in the base and the top shall have a threaded fastener. The mounts shall include leveling bolts that may be rigidly connected to the equipment.

Type FNC isolators shall be Mason Type ND: Fabricate of type "Super W" pads, similar to Type ND otherwise.

F. Type NP (Neoprene Pad)

1. Neoprene pad isolators shall be one layer of ¼" to 3/8" thick ribbed or waffled neoprene. The pads shall be sized so that they will be loaded within the manufacturer's recommended range.

Type NP isolators shall be Mason Type W or approved equal.

G. Type DNP (Double Neoprene Pad)

1. Neoprene pad isolators shall be formed by two layers of ¼" to 3/8" thick ribbed or waffled neoprene, separated by a galvanized steel, stainless steel or aluminum plate. If the isolator is outdoors, the plate shall not be made of galvanized steel. These layers shall be permanently adhered together. The pads shall be sized so that they will be loaded within the manufacturer's recommended range.

Type DNP isolators shall be Mason Type WSW or approved equal.

H. Type HSN (Hanger Spring and Neoprene)

1. Vibration isolation hangers shall consist of a free standing and laterally stable steel spring and a neoprene element in series, contained within a steel housing. Spring diameters and hanger housing lower hole sizes shall be large enough to permit the hanger rod to swing through a 30º arc before contacting the housing. Hangers shall provide a means to adjust hanger elevation under load. Spring diameter shall be not less than 0.8 of the compressed height of the spring at the rated load. Spring elements shall have a minimum additional travel-to-solid equal to 50% of the rated deflection. The neoprene element shall be designed to have a 0.3" minimum static deflection. The deflection of both the spring element and the neoprene element shall be included in determining the overall deflection of Type HSN isolators.

Type HSN isolators shall be Mason Type P30N or approved equal.

I. Type DSN (Double deflection spring and neoprene)

1. Vibration hangers shall contain a steel spring and a double deflection neoprene element in series. The neoprene element shall be molded with a rod isolation bushing that passes through the hanger box. Springs shall have a minimum additional travel to solid equal to 50% of the rated deflection and be seated in a neoprene cup with an integral molded bushing that passes through the lower hanger box.

Type DSN isolators shall be Mason type DNHS or approved equal.

J. Type HN (Hanger Neoprene)

1. Vibration isolation hangers shall consist of a neoprene-in-shear element contained within a steel housing. A neoprene neck bushing shall be provided where the hanger rod passes through the hanger housing to prevent the rod from contacting the hanger housing. The diameter of the hole in the housing shall be sufficient to permit the hanger rod to swing through a 30º arc before contacting the hanger housing.

   Type HN isolators shall be Mason Type HD or approved equal.

2.2 EQUIPMENT BASES

A. Type BIB (Base - Inertia Base)

1. Concrete inertia bases shall be formed of stone-aggregate concrete (150 lbs./cu.ft.) and appropriate steel reinforcing cast between welded or bolted perimeter structural steel channels. Inertia bases shall be built to form a rigid base which will not twist, racks deform, deflect, or crack in any manner which would negatively affect the operation of the supported equipment or the vibration isolation mounts. Inertia bases shall be adequately sized to support basic equipment units and motors plus any associated pipe elbow supports, duct elbow supports, electrical control elements, or other components closely related and requiring resilient support in order to prevent vibration transfer to the building structure. Inertia base depth shall be at least 1/12 the longest dimension of the inertia base, but not less than 6" nor more than 12". The base foot print shall be large enough to provide stability for supported equipment. Inertia bases shall include side mounting brackets for attachment to vibration isolators. Mounting brackets shall be located on the sides of the base that are parallel to the axis of rotation of the supported equipment.
2. The steel frame and reinforcement shall be supplied by the vibration isolator manufacturer. Concrete may be provided by the General Contractors.

   Frame and reinforcement for Type BIB bases shall be Mason Type KSL or approved equal.

B. Type BC-1 (Base - Curb)

1. Curb type isolation bases shall be a prefabricated assembly consisting of an extruded aluminum frame and steel spring isolation system that fits over the roof curb and under the isolated equipment. The aluminum frame shall be sufficiently rigid to support the equipment load without detrimental twist or deflection. Spring isolators shall be selected and positioned along the curb to achieve the minimum static deflection called for in the schedule. The static deflection shall be constant around the entire periphery of the base. Springs shall be free standing, laterally stable with a diameter of not less than 0.8 times the compressed height, and have additional travel-to-solid that is at least 50% of the rated deflection. Resilient neoprene snubbers shall be provided at the corners of the base to limit the movement of the equipment under wind load to ¼".
2. The isolation curb base shall be made weather tight by sealing all around the periphery with closed cell neoprene or flexible vinyl. This shall in no way inhibit the vibration isolation of the spring elements. A closed cell sponge gasket or field caulking shall be used between the equipment unit and the isolation curb base and between the isolation curb and roof curb to form a weather-tight seal. The isolation curb shall be designed to arrest and utilize outer placement of standard 2" roof insulation to act as a sound attenuation for inside of the curb.
3. Each spring isolator used in the curbs shall be weather protected. The entire assembly shall be dry galvanized or PUC coated.

   Type BC-1 vibration isolation curb bases shall be Mason Type CMAB or approved equal.

2.3 RESILIENT LATERAL GUIDES

A. These units shall either be a standard product of the vibration isolation mounting manufacturer, or be custom fabricated from standard components. These units shall incorporate neoprene isolation elements similar to Type FN which are specifically designed to provide resilient lateral bracing of duct or pipe risers.

Resilient lateral guides shall be Mason Type ADA.

2.4 FLEXIBLE DUCT CONNECTORS

A. Flexible duct connection shall be made from coated fabric (or leaded vinyl if called for on the drawings). The clear space between connected parts shall be a minimum of 3" and the connection shall have 5" minimum of slack material.

2.5 FLEXIBLE PIPE CONNECTIONS

A. Flexible pipe connection shall be fabricated of multiple plies of nylon cord, fabric, and neoprene; and shall be vulcanized so as to become inseparable and homogeneous. Flexible connections shall be formed in a double sphere shape, and shall be able to accept compressive, elongative, transverse, and angular movements.

B. The flexible connections shall be selected and specially fitted, if necessary, to suite the system temperature, pressure, and fluid type. In addition, suitable flexible connections should be selected which do not require rods or cables to control extension of the connector.

C. Connectors for pipe sizes 2" or smaller shall have threaded female union couplings on each end. Larger sizes shall be fitted with metallic flange couplings.

D. Provide Mason Industries Type MFTNC or MFTFU; Metraflex Twin Sphere; or Amber/Booth Type 2600 or 2655 for flexible pipe connections less than 220˚F and 150 psi.

E. Flexible pipe connections shall be mason Industries Type BSS braided stainless steel hose with carbon steel fittings for pressures above 150 psi or temperatures greater than 220˚F

2.6 RESTRAINTS

A. Snubber:

1. Snubbers shall be custom fabricated using Type FN isolators mounted to steel angle brackets. The steel angle shall be sufficiently rigid and the mounting sufficiently secure to resist excessive movement of equipment during on-off cycle.

B. Thrust Restraints:

1. Thrust restraints shall consist of a spring element in series with a neoprene pad. The unit shall be designed to have the same deflection due to thrust-generated loads as specified for the isolators supporting the equipment. The spring element shall be contained within a steel frame and be designed so it can be precompressed at the factory to allow for a maximum of ¼" movement during starting or stopping of the equipment. Allowable movement shall be field-adjustable.
2. The assembly shall be furnished complete with rods and angle brackets for attachment to both the equipment and the adjacent fixed structural anchor.
3. Thrust restraints shall be Mason Industries Type WB, Kinetics Noise Control Type HSR, Amber/Booth Type TRK or an equal product of the manufacturer supplying the isolators.

2.7 GROMMETS

A. Grommets shall either be custom made by combining a neoprene washer and sleeve, be Isogrommets as manufactured by MBIS, Inc. (Bedford Heights, Ohio), or be Series W by Barry Controls (Watertown, Mass.). Grommets shall be sized so that they will be loaded within the manufacturer's recommended load range. Grommets shall be specially formed to prevent both from directly contacting the isolator base plate.

2.8 ACOUSTICAL SEALANT

A. Sealants for acoustical purposes as described in this specification shall be silicone or one of the non-setting sealants indicated below:

Acoustical Sealant	D.A.P
BR-96	Pecora
Acoustical Sealant	Tremco
Acoustical Sealant	U.S.G.

PART 3 - EXECUTION

3.1 APPLICATION

A. General:

1. Refer to SECTION 2 - PRODUCTS of this specification for vibration isolation devices identified on the drawings or specified herein.
2. The static deflection of all isolators specified herein are the minimum acceptable deflections for the mounts under actual load. Isolators selected solely on the basis of rated deflection are not acceptable and will be disapproved.
3. Refer to Section 23 05 49 for seismic requirements.

B. Major Equipment:

1. Unless otherwise shown or specified, all floor-mounted major equipment shall be set on 4” high concrete housekeeping pads. Mount vibration isolating devices and related inertia blocks on concrete pads.
2. Types and minimum static deflections of vibration isolation devices for major equipment items shall be as scheduled on the drawings or specified hereunder.
3. Flexible duct connections shall be installed at all fan unit intakes, fan unit discharges, and wherever else shown on the drawings.
4. Flexible pipe connections shall be installed at all pipe connections to vibration-isolated equipment, refer to drawings for proper position.
5. Thrust restraints shall be installed on all floor-mounted fans developing 4” or more of static pressure, all suspended fans developing 2” or more static pressure, and wherever else called for on the drawings.
6. Snubbers shall be installed as called for on the drawings.
7. Brackets shall be provided to accommodate the isolator. The vertical position and size of the bracket shall be specified by the isolator manufacturer.

C. Miscellaneous Mechanical Equipment:

1. Miscellaneous pieces of mechanical equipment such as converters, pressure reducing stations, dryers, strainers, storage tanks, condensate receiver tanks, and expansion tanks which are connected to isolated piping system shall be vibration isolated from the building structure by Type NP or Type HN isolators (selected for 0.1” static deflection) unless their position in the piping system requires a higher degree of isolation as called for under Pipe Isolation.

D. Pipes:

1. All geothermal water, drain and engine exhaust piping that is connected to vibration-isolated equipment shall be isolated from the building structure within the following limits:
   a. Within mechanical rooms.
   b. And within 50’ total pipe length of connected vibration-isolation equipment (chillers, pumps, air handling units, pressure reducing stations, etc.):

2. Piping shall be isolated from the building structure by means of vibration isolation mounts, resilient pipe guides, and resilient penetration sleeve/seals.
3. Isolators for the first three support points adjacent to connected equipment shall achieve one half the specified static deflection of the isolators supporting the connected equipment. When the required static deflection of these isolators is greater than ½" Type FSN or HSN isolators shall be used. When the required static deflection is less than or equal to ½", Type FN or HN isolators shall be used. All other pipe support isolators within the specified limits shall be either Type FN or HN achieving at least ¼" static deflection.
4. Where lateral support of pipe risers is required within the specified limits, this shall be accomplished by use of resilient lateral supports.
5. Pipes within the specified limits that penetrate the building construction shall be isolated from the building structure by use of resilient penetration sleeve/seals.
6. Provide flexible pipe connections on all piping connected to all isolated equipment, when required by manufacturer, and wherever shown on the drawings.

3.2 INSTALLATION OF VIBRATION ISOLATION EQUIPMENT

A. General:

1. Locations of all vibration isolation devices shall be selected for ease of inspection and adjustment as well as for proper operation.
2. Installation of vibration isolation equipment shall be in accordance with the manufacturer's instructions.

B. Isolation Mounts:

1. All vibration isolators shall be aligned squarely above or below mounting points of the supported equipment.
2. Isolators for equipment with bases shall be located on the sides of the bases, which are parallel to equipment shaft unless this is not possible because of physical constraints.
3. Locate isolators to provide stable support for equipment, without excess rocking. Consideration shall be given to the location of the center of gravity of the system and the location and spacing of the isolators. If necessary, a base with suitable footprint shall be provided to maintain stability of supported equipment, whether or not such a base is specifically called to herein.
4. If a housekeeping pad is provided, the isolators shall bear on the housekeeping pad and the isolator base plates shall rest entirely on the pad.
5. Hanger rods for vibration-isolated support shall be connected to structural beams or joists, not the floor slab between beam joists. Provide suitable intermediate support members as necessary.
6. Vibration isolation hanger elements shall be positioned as high as possible in the hanger rod assembly, but not in contact with the building structure, and so that the hanger housing may rotate a full 360º about the rod axis without contacting any object.
7. Parallel running pipes may be hung together on a trapeze, which is isolated from the building. Isolator deflections must be the greatest required by the provisions for pipe isolation for any single pipe on the trapeze. Do not mix isolated and non-isolated pipes on the same trapeze.
8. Pipes, ducts and equipment shall not be supported from other pipes, ducts and equipment.
9. Resiliently isolated pipes, ducts and equipment shall not come in rigid contact with the building construction or rigidly supported equipment.
10. The installed and operating heights of equipment vibration-isolated with Type FSNTL isolators shall be identical. Limit stops shall be out of contact during normal operation. Adjust isolators to provide ¼" clearance between the limit stop brackets and the isolator top plate, and between the travel limit nuts and travel limit brackets.
11. Adjust all leveling bolts and hanger rod bolts so that the isolated equipment is level and in proper alignment with connecting ducts or pipes.

C. Bases:

1. No equipment unit shall bear directly on vibration isolators unless its own frame is suitably rigid to span between isolators and such direct support is approved by the equipment manufacturer. This provision shall

apply whether or not a base frame is called for on the schedule. In the case that a base frame is required for the unit because of the equipment manufacturer's requirements and is not specifically called for on the equipment schedule, a base frame recommended by the equipment manufacturer shall be provided at no additional expense.

2. Unless otherwise indicated, there is to be a minimum operating clearance of 2" between inertia bases or steel frame bases and the floor beneath the equipment. Position isolator mounting brackets and adjust isolators so that the required clearance is maintained. The clearance space shall be checked by the Contractor to ensure that no construction debris has been left to short circuit or restrict the proper operation of the vibration isolation system.

D. Flexible Duct Connections:

1. Sheet metal ducts and plenum opening shall be squarely aligned with the fan discharge, fan intake, or adjacent duct section prior to installation of the flexible connection, so the clear length is approximately equal all the way around the perimeter. Flexible duct connections shall not be installed until this provision is met. There shall be no metal-to-metal contact between connected sections, and the fabric shall not be stretched taut.

E. Flexible Pipe Connections:

1. Install flexible pipe connections in strict accordance with the manufacturer's instructions.

F. Restraints:

1. Snubbers shall be adjusted to clear the equipment base and to provide lateral restraint during on-off cycling, but be out of contact during normal operation of the equipment.
2. Thrust restraints shall be attached at the centerline of thrust and symmetrically on each side of the unit. The two rods of the thrust restraint shall be axially aligned. This may require modified brackets or standoffs. The body of the thrust restraint shall not come in contact with the connected elements. Thrust restraints shall be adjusted to constrain equipment movement to the specified limit.

G. Resilient Penetration Sleeve/Seals:

1. Maintain an airtight seal around the penetrating element and prevent rigid contact between the penetrating element and the building structure. Fit the sleeve tightly to the building construction and seal airtight on both sides of the construction penetrated with acoustical sealant.
   a. At minimum, provide resilient penetration seals at all Mechanical, Equipment and Fan Room Penetrations.

3.3 ISOLATOR SCHEDULE

UNIT	ISOLATOR TYPE	MINIMUM STATIC DEFL.(IN.)	BASE TYPE	REMARKS
Air Handling Units (Floor Mounted)	FSN (Note 1)	1.5		Thrust restraints if internally isolated.
Air Handling Units Suspended	DSN	0.35		Thrust restraints if internally isolated.
Rooftop Air Handling Units	BC-1	1.5	BC-1	
Inline Fans (Suspended)	HSN	2		
Pumps (Inline)	HSN	0.75		

Pumps (Basemount)	BIB (Note 3)	1.5		
Utility Fans (Floor Mounted)	FSNTL	2		
Refrigeration Reciprocating Compressors, Condensing Units or Chillers	FSN	1.5		
Self-Contained Air Conditioning Units	FSN (Note 1)	1.5		Thrust restraints if internally isolated.
Heat Pumps (Ceiling Mounted)	DSN	1.0		
High Pressure Ductwork in Mechanical Equipment Rooms	DSN	1.0		

Notes:

(1) External isolator may be omitted if units have internally isolated fans and no other rotating or reciprocating components.
(2) Isolators for fan coil units should be either HSN with 0.75" minimum static deflection or be equivalent to Mason Industries Type HN with 0.35" minimum static deflection.
(3) For slab-on-grade installations isolators are not required. Refer to section 23 21 23.

3.4 INSPECTION AND COORDINATION

A. Contractor shall examine location where this equipment is to be installed and determine space conditions and notify Architect in writing of conditions detrimental to proper and timely completion of the Work.

B. Do not proceed with the work until unsatisfactory conditions have been corrected.

C. Coordinate work with other trades to avoid rigid contact with the building. Inform other trades following work, such as plastering or electrical, to avoid any contact which would reduce the vibration isolation.

D. Bring to the Architect's attention, prior to installation, any conflicts with other trades which may result in unavoidable rigid contact with equipment or piping as described herein, duct to inadequate space or other unforeseen conditions. Corrective work necessitated by conflicts after installation shall be at the responsible Contractor's expense.

E. Bring to the Architect's attention, any discrepancies between the Specifications and field conditions or changes required due to specific equipment selection, prior to installation. Corrective work necessitated by discrepancies after installation shall be at the Contractor's expense.

3.5 FIELD QUALITY CONTROL

A. Obtain inspection and approval of any installation to be covered or enclosed, prior to such closure.

B. Upon completion of installation of all vibration isolation devices herein specified, the local representative of the isolation materials manufacturer shall inspect the completed system and report, in writing, any installation error, improperly selected isolation devices, or other faults in the system that could affect the performance of the system. Contractor shall submit a report to the Architect, including the manufacturer's representative's final report, indicating all isolation reported as improperly installed or requiring correction, and include a report by the Contractor on steps taken to properly complete the isolation work.

END OF SECTION

SECTION 23 05 53

MECHANICAL IDENTIFICATION

PART 1 - GENERAL

1.1 SUBMITTALS

A. Submit manufacturer's product data on the following:

1. Plastic Pipe Markers and method of application.
2. Engraved Plastic Laminate Sign.
3. Equipment label and valve tag schedules shall be submitted to review as an MS Excel digital file.

PART 2 - PRODUCTS

2.1 GENERAL

A. Except as otherwise indicated, provide manufacturer's standard products.

B. Where more than a single type is specified for an application, selection is Installer's option, but provide a single selection for each application.

2.2 PLASTIC PIPE MARKERS (TYPE A)

A. Provide manufacturer's standard pre-printed, flexible or semi-rigid, permanent, color-coded, plastic-sheet pipe markers, complying with ANSI A13.1.

B. For Pipes Less Than Six Inches (including insulation if any): Provide full-band pipe markers, extending 360º around pipe at each location, fastened by one of the following methods:

1. Snap-on application of pre-tensioned semi-rigid plastic pipe marker.
2. Adhesive lap joint in pipe marker overlap.
3. Taped to pipe (or insulation) with color-coded plastic adhesive tape, not less than ¾" wide; full circle at both ends of pipe marker, tape lapped 1-½".

C. For Pipes Six Inches and Larger (including insulation if any): Provide either full-band or strip-type markers, but not narrower than 3 x letter height, taped to pipe (or insulation) with color-coded plastic adhesive tape, not less than 1-½" wide; full circle at both ends of pipe marker, tape lapped 3".

D. Lettering: Manufacturer's pre-printed wording which conforms to contract document system descriptions.

E. Where work is an extension or alteration of an existing system, new markers shall match existing terminology for systems which are modified or added by this work.

F. Arrows: Print each pipe marker with arrows indicating direction of flow, either integrally with piping system service lettering or as a separate unit of plastic (to accommodate both directions).

G. Pipe Size: All insulated pipes shall be labeled to indicate pipe size.

2.3 STENCILING (TYPE B)

A. Using a color contrasting to the surface to identify, spray or brush paint through neatly cut stencils.

B. Lettering shall conform to wording on contract documents. Size shall be in accordance with ANSI A13.1.

2.4 BACKGROUND COLOR AND STENCILING (TYPE C)

A. In addition to the requirements above, paint a background color band in accordance with ANSI A13.1.

2.5 VALVES TAGS

A. Brass Valve Tags: Provide manufacturer's standard 19 ga brass tag; approximately 1-½" round wit ½" high black filled numbers and 3/16" top hole.

1. Numbers shall be sequential in accordance with schedule below.
2. Provide separate numbering for each legend sequence. Provide separate sequences for the following:
   a. Geothermal Condenser Water (GCW)
   b. All other systems (No legend)

B. Valve Tag Fasteners: Manufacturer's standard chain (wire link or beaded type), or S-hooks.

2.6 VALVE SCHEDULE

A. Provide schedule for each piping system, as defined on the drawings, and below, typewritten and reproduced on 8-½" x 11" bond paper.

B. Tabulate valve number, piping system, system legend (as shown on tag), location of valve (room or space), and variations for identification (if any).

C. Provide piping schematic for each system as defined below in Part 3.

D. In addition to mounted copies, furnish extra copies for maintenance manuals as specified.

E. Valve Schedule Frames: For each page of the valve schedule, provide a glazed frame, with screws for removable mounting on masonry walls.

2.7 ENGRAVED PLASTIC-LAMINATE SIGNS

A. General: Provide engraving stock melamine plastic laminate, 1/16" thick, black with white core (letter color).

B. Fastening:

1. Screws
2. Rivets
3. Permanent Adhesive

C. Lettering and Graphics:

1. Coordinate names, abbreviations and other designations used in the mechanical identification work, with the corresponding designations shown, specified or scheduled in the construction documents.
2. In addition, for heating or cooling units and exhaust fans, identify area served.

PART 3 - EXECUTION

3.1 GENERAL

A. Where identification is to be applied to surfaces which require insulation, painting or other covering or finish, install identification after completion of covering and painting.

B. Install identification prior to installation of acoustical ceilings and similar removable concealment.

3.2 DUCTWORK IDENTIFICATION

A. General: Identify air supply, return, exhaust, intake and relief ductwork with stenciled signs and arrows, showing ductwork service and direction of flow, in black or white, whichever provides most contrast with ductwork color.

B. Location: In each space where ductwork is exposed, or concealed only by removable ceiling system, locate signs near points where ductwork originates or continues into concealed enclosures (shaft, underground or similar concealment), and at 50’ spacing along exposed runs.

C. Access Doors: Provide stenciled or plastic laminate type signs on each duct or equipment mounted access door in ductwork and housings, indicating the purpose of the access (to what equipment) and other maintenance and operating instructions, and appropriate safety and procedural information.

3.3 PIPING SYSTEM IDENTIFICATION

A. General: Install pipe markers on piping of the following systems and include arrows to show normal direction of flow.

1. Geothermal condenser water (supply and return).
2. Refrigerant piping (suction, liquid, hot gas bypass).
3. Any other piping system as indicated on the drawings, or as required to match existing.

B. Locate pipe markers and color bands as follows wherever piping is exposed to view in occupied spaces above accessible ceilings, in accessible maintenance spaces, including chases, and above ceiling:

1. Near each valve and control device.
2. Near each branch, excluding short take-offs for fixtures and terminal units. Mark each pipe at branch, where there could be a question of flow pattern.
3. Near locations where pipes pass through walls, floors, or ceilings, or enter non-accessible enclosures.
4. Near major equipment items and other points of origination and termination.
5. Spaced intermediately at maximum spacing of 25’ along each piping run.
6. Within 6’ of access doors above otherwise non-accessible ceilings and chases.

C. Type:

1. Normally exposed to view - Type A or C.
2. Normally concealed from view - Type B.

3.4 VALVE IDENTIFICATION

A. Provide valve tag on every valve, cock and control device in each piping system; exclude check valves, valves within factory fabricated equipment units, hose bibs, HVAC terminal devices and similar rough-in connections of end-use fixtures and units. List each tagged valve in valve schedule for each piping system.

B. Mount framed valve schedules with piping schematics in each MER.

C. Identify each valve tagged on as-built drawings.

3.5 MECHANICAL EQUIPMENT IDENTIFICATION

A. Install an engraved plastic laminate sign on or near each major item of mechanical equipment.

1. Provide signs for the following general categories of equipment and operational devices:

a. Evaporative Coolers
b. Fans
c. Air Handling Units
d. Condensing Units
e. Packaged Air conditioning Units (including Rooftop Units)
f. Motor Starters and Variable Frequency Drives (Mount near starter)
g. Cabinet Heaters
h. Terminal units (VAV, CAV, etc.)
i. Heat Pumps
j. Pumps
k. Heat Exchangers

B. Provide engraved plastic laminate nameplate on every new piece of equipment not already provided with one in accordance with Section 23 05 02 of the specifications.

C. Identify area served, if applicable.

3.6 NON-POTABLE WATER IDENTIFICATION

A. Provide an engraved plastic laminate sign.

1. Legend: “Non-Potable Water”.
2. Location: At each outlet of piping downstream of backflow preventer, (e.g. Boiler Room hose bibb).

END OF SECTION

SECTION 23 05 93

TEST-ADJUST-BALANCE

PART 1 - GENERAL

1.1 RESPONSIBILITY

A. Work of this section shall be completed by a sub-contractor of the HVAC contractor.

B. The Balancing Contractor shall not be a sub-contractor of any other Division 21, 22 or 23 Contractor.

1.2 QUALITY ASSURANCE

A. Qualification:

1. Work shall be done by a firm certified by the National Environmental Balancing Bureau (NEBB), or the Associated Air Balance Council (AABC), or the firm shall have technicians certified by the “National Training Fund Sheet Metal & Air Conditioning Industry”.
2. The firm shall be an independent testing and balancing form specializing in testing and balancing of environmental systems.
3. The firm shall have an experience record of not less than five (5) years experience in the TAB industry.

B. Industry Standards: Comply with the following:

1. HVAC Systems-Testing, Adjusting, Balancing published by Sheetmetal and Air Conditioning Contractors National Association, Inc. (SMACNA).
2. Procedural Standards for Testing, Adjusting, Balancing of Environmental Systems published by National Environmental Balancing Bureau. (NEBB).
3. ASHRAE Systems Handbook. Testing, Adjusting and Balancing.

C. Registration: Work shall be done under the supervision of a professional engineer registered in the jurisdiction of the work. Engineer shall be available for all meetings and interpretation of all materials in the report.

D. Pre-qualification of TAB Contractor.

1. The firm must have experience and qualifications satisfactory to the consulting mechanical engineer and must be accepted by him prior to bidding.
2. Firms desiring approval to provide work under this section shall submit a booklet indicating procedures and data forms that they would use in the performance of the work.
3. Submittals shall be in accordance with Section 23 05 02.
4. Only firms which have been approved by the mechanical engineer may provide work under this section.

PART 2 - PRODUCTS

2.1 PRODUCTS (Not applicable)

PART 3 - EXECUTION

3.1 GENERAL

A. Sequence work to commence after completion of system and start-up procedures and schedule completion of work before Substantial Completion of Project.

B. The project will be completed in phases and it will be necessary to balance new and existing equipment at the end of each phase.

1. Assume that any equipment installed in a phase must be balanced in its installation phase.
2. Assume that any equipment serving more than a single space will need to be rebalanced at the turnover of each phase after installation.
3. Assume that all equipment will require final balancing after the completion of the final phase.
4. Submit preliminary balancing reports at the end of each phase. Submit final balancing report at the completion of final phase.

C. Examine the installed work and conditions under which testing is to be done to ensure that work has been completed, cleaned and is operable.

D. Notify the Contractor in writing of conditions detrimental to the proper completion of the test-adjust-balance work.

1. Do not proceed with the work until unsatisfactory conditions have been corrected.
2. Provide Engineer/Architect with a copy of the notification.

E. Adjust flows to within 10% of values shown. If design flows cannot be obtained within specified limits the Balancing Contractor will perform the following (at the minimum):

1. Measure and record major pressure drops in the system.
2. Consult with the Engineer and Installer as required.
3. Upon receiving written directions to proceed and after any corrections are performed, re-balance affected portion of system.

F. Optimization: Work closely with the controls contractor to optimize setpoints.

1. Establish the minimum air static pressure or water differential pressure for variable or bypass flow system.
2. Establish the position of minimum outside air dampers, damper/valve and sequencing relays.

G. Calibration: Be responsible for calibration of flow measurement devices used as input to the temperature control system. All air systems flow measurement stations including VAV terminals shall be calibrated against a pitot tube traverse or air diffuser capture hood. Balancing contractor shall assure accuracy of all flow measurement devices or shall report on their failure to be accurate.

H. Patch holes in insulation, ductwork and housings, which have been cut or drilled for test purposes, in a manner recommended by the original Installer.

I. Make all final readings for each system at the same time, and after all adjustments have been made.

J. Mark equipment settings, including damper control positions, balancing cocks, circuit setters, valve indicators, fan speed control settings and similar controls and devices, to show final settings at completion of test-adjust-balance work.

1. Mark with paint or other suitable permanent identification material.

K. Check all new thermal overloads.

1. Identify improperly protected equipment in report.

L. All piping and equipment shall be tested; labor including standby electrician, materials, instruments and power required for testing shall be furnished unless otherwise indicated under the particular section of the Specification.

M. Tests shall be performed in the presence and to the satisfaction of the Architect and such other parties as may have legal jurisdiction.

N. In no case shall piping, equipment, or accessories be subjected to pressure exceeding their ratings.

O. All defective work shall be promptly repaired or replaced and the tests shall be repeated until the particular system and component parts thereof receive the approval of the Architects.

P. Any damage resulting from tests to any and all trades shall be repaired and damaged materials replaced, all to the satisfaction of the Architect.

Q. The duration of tests shall be as determined by all authorities having jurisdiction, but in no case less than the time prescribed below.

R. Equipment and systems which normally operate during certain seasons of the year shall be tested during the appropriate season. Tests shall be performed on individual equipment, systems, and their controls. Whenever the equipment or system under test is interrelated and depends upon the operation of other equipment, systems and controls for proper operation, functioning and performance, and latter shall be operated simultaneously with the equipment or system being tested.

S. All fans and duct systems shall be completely balanced by the adjustment of sheaves, dampers, registers and other volume and diverting control devices, to obtain the air quantities indicated on the design drawings. Replace sheaves if required to meet design conditions.

T. All pumps and piping systems shall be completely balanced by the adjustment of the plug cocks, globe valves or other control devices, to obtain the flow quantities indicated on the design drawings.

3.2 EXAMINATION

A. Examine the Contract Documents to become familiar with Project requirements and to discover conditions in systems' designs that may preclude proper TAB of systems and equipment.

B. Examine systems for installed balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers. Note the locations of devices that are not accessible for testing and balancing.

C. Examine the approved submittals for HVAC systems and equipment.

D. Examine ceiling plenums and underfloor air plenums used for supply, return, or relief air to verify that are properly separated from adjacent areas. Verify that penetrations in plenum walls are sealed and fire-stopped if required.

E. Examine equipment performance data including fan and pump curves.

F. Examine HVAC equipment and verify that bearings are greased, belts are aligned and tight, clean permanent filters are installed, and equipment with functioning controls is ready for operation.

G. Examine terminal units, such as variable-air-volume boxes, and verify that they are accessible and their controls are connected, configured by the controls contractor, and functioning.

H. Examine strainers to verify that mechanical contractor has replaced startup screens with permanent screens and that all strainers have been cleaned.

I. Examine two-way valves for proper installation and function.

J. Examine three-way valves for proper installation for their intended function of diverting or mixing fluid flows.

K. Examine heat-transfer coils for correct piping connections and for clean and straight fins.

L. Examine air vents to verify that mechanical contractor has removed all air from all hydronic systems.

3.3 PREPARATION

A. Prepare a TAB plan that includes the following:

1. Equipment and systems to be tested.
2. Strategies and step-by-step procedures for balancing the systems.
3. Instrumentation to be used.
4. Sample forms with specific identification for all equipment.

B. Prepare system-readiness checklists, as described in the "AABC National Standards for Total System Balance," for use by systems installers in verifying system readiness for TAB. These shall include, at a minimum, the following:

1. Airside:
    a. Ductwork is complete with terminals installed.
    b. Volume, smoke and fire dampers are open and functional.
    c. Clean filters are installed.
    d. Fans are operating, free of vibration, and rotating in correct direction.
    e. Variable-frequency controllers' start-up is complete and safeties are verified.
    f. Automatic temperature-control systems are operational.
    g. Ceilings are installed.
    h. Windows and doors are installed.
    i. Suitable access to balancing devices and equipment is provided.

2. Hydronics:
    a. Piping is complete with terminals installed.
    b. Water treatment is complete.
    c. Systems are flushed, filled and air purged.
    d. Strainers are pulled and cleaned.
    e. Control valves are functioning per the sequence of operation.
    f. Shutoff and balance valves have been verified to be 100 percent open.
    g. Pumps are started and proper rotation is verified.
    h. Pump gage connections are installed directly at pump inlet and outlet flanges or in discharge and suction pipe prior to valves or strainers.
    i. Variable-frequency controllers' start-up is complete and safeties are verified.
    j. Suitable access to balancing devices and equipment is provided.

3.4 GENERAL REQUIREMENTS

A. At a minimum, measure, adjust and report the following:

1. Fans:
   a. Inlet and outlet pressure
   b. Air flow
   c. Fan speed
   d. Motor amps and KW
2. Ductwork Systems:
   a. Air flow at each inlet and outlet.
   b. Blade angles at all adjustable diffusers.
   c. Filter pressure drop.
   d. Outside air percentage at minimum and maximum setting.
   e. Air flow at supply, return, outside air and exhaust mains to determine total air flow.
3. Coils:
   a. Air flow.
   b. Inlet and outlet air static pressure.
   c. Inlet and outlet air temperature.
   d. Water flow.
   e. Inlet and outlet water pressure.
   f. Inlet and outlet water temperature.
   g. KW draw on electric coils.
4. Pumps:
   a. Water flow
   b. Inlet and outlet pressure
   c. Motor amps and KW
5. Radiation and Convectors:
   a. Inlet and outlet water temperature
   b. Air temperature (room)
   c. KW draw
6. Cabinet Heaters, Unit Heaters:
   a. Entering air temperature
   b. Leaving air temperature
   c. KW draw
7. Unit Ventilators:
   a. CFM
   b. Entering air temperature
   c. Leaving air temperature
   d. Inlet and outlet water temperature
   e. Water flow
   f. Outside air percentage
8. Heat Pump Units (water cooled):
   a. Perform tests for individual components present in units in accordance with specific requirements above.
   b. At full heat:
      1) EAT
      2) LAT
      3) EWT
      4) LWT
   c. At full cooling: (Check at minimum outside air):
      1) EAT (DB/WB)
      2) LAT (DB/WB)
      3) EWT

4) LWT
5) Ambient temperature
6) Suction and discharge pressures
7) Oil pressure
8) Compressor amps and KW
9) Minimum air flow rate.

9. Air-Cooled Condensing Units:
   a. Ambient temperature
   b. Suction and discharge pressure
   c. Oil pressure
   d. Compressor amps and KW
   e. Fan amps and KW
10. Packaged Air Conditioning Units:
   a. Perform tests for individual components present in units in accordance with specific requirements above.
   b. At full heat: (Check at minimum outside air):
      1) EAT
      2) LAT
   c. At full cooling: (Check at minimum outside air):
      1) EAT (DB/WB)
      2) LAT (DB/WB)
      3) Ambient temperature
      4) Suction and discharge pressures
      5) Oil pressure
      6) Compressor amps and KW
      7) Minimum air flow rate.
11. Heat Exchangers:
   a. Cooler fluid inlet and outlet temperatures
   b. Cooler fluid flow
   c. Warmer fluid inlet and outlet temperatures
   d. Warmer fluid flow
12. All Exhaust Hoods:
   a. Face velocity

B. Refer to other sections of these specifications for additional requirements.

3.5 GENERAL PROCEDURES FOR BALANCING AIR SYSTEMS

A. Scope: All air systems are to be balanced.

B. Before any adjustments are made, check for:

1. Dirty filters, coils, or air intakes
2. Duct leakage
3. Filter leakage
4. Damper leakage, or blockage
5. Equipment vibrations
6. Correct damper operation

C. Simulate a pressure drop across filters equal to that when 50% loaded with dust.

1. Check fan motor amps with clean filters and simulated loaded filters, and report.

D. Procedure:

1. Measure and report all supply, return, exhaust, and outside air systems by means of (4) four methods:
   a. Individual air inlets and outlets.
   b. Pitot traverses of main supply, return, exhaust and outside air ducts.
   c. Rotating valve or velocity grid traverse of coils or filters.
   d. Plot operating point on fan curve. Include compensation for effects of altitude and inlet vanes.
2. Above measurements shall be made with system in normal, full load condition.
   a. Systems with economizers shall be measured at minimum outside air and 100% outside air.
   b. Systems with 100% outside air capability or evaporative cooling sections shall be measured at maximum outside air.
   c. VAV systems shall be measured at the zone level at maximum air condition, and at the main at the system diversity condition.
3. Make main duct traverses or coil/filter traverses and report operation at all other operating conditions (as applicable).
   a. Economizer operation
   b. Unoccupied mode
   c. Smoke evacuation mode
   d. Pre-cool mode
   e. Fail over mode
   f. Two-speed fans
   g. All VAV terminals driven to maximum position
4. Set fan speed such that under no condition will the motor exceed the service factor rating when operating in any of the above possible modes.
5. Measure fan motor amps in each of the above possible operating modes (clean filters).

E. Adjust Air Systems to provided proper air pressure relationships as shown by relative air quantities or as indicated on the drawings.

1. Review drawings for room by room pressure relationships and use a smoke candle to prove proper relative air flow.

F. Adjust distribution system for uniform space temperatures free from objectionable drafts and noise.

G. Exchange sheaves and belts as required to adjust the RPM of all fans so they handle specified air quantity.

H. Set minimum outside air quantities.

I. Prepare test reports for both fans and outlets. Obtain approved submittals and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.

J. Prepare single-line schematic diagram of systems for the purpose of identifying HVAC components.

K. For variable-air-volume systems, develop a plan to simulate diversity.

L. Determine the best locations in main and branch ducts for accurate duct-airflow measurements.

M. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.

N. Verify that motor starters are equipped with properly sized thermal protection.

O. Check condensate drains for proper connections and functioning.

P. Check for proper sealing of air-handling-unit components.

Q. Refer to other sections of these specifications for additional requirements

3.6 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS

A. Retain this article if using constant-volume air systems.

B. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.

C. Measure total airflow.

1. Set outside air, return air and relief air dampers for proper position that simulates minimum outdoor air conditions.
2. Where duct conditions allow, measure airflow by Pitot-tube traverse. If necessary, perform multiple Pitot-tube traverses to obtain total airflow.
3. Where duct conditions are not suitable for Pitot-tube traverse measurements, a coil traverse may be acceptable.
4. If a reliable Pitot-tube traverse or coil traverse is not possible, measure airflow at terminals and calculate the total airflow.

D. Measure fan static pressures as follows:

1. Measure static pressure directly at the fan outlet or through the flexible connection.
2. Measure static pressure directly at the fan inlet or through the flexible connection.
3. Measure static pressure across each component that makes up the air-handling system.
4. Report any artificial loading of filters at the time static pressures are measured.

E. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload will occur. Measure amperage in full-cooling, full-heating, economizer, and any other operating mode to determine the maximum required brake horsepower.

F. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows.

1. Measure airflow of submain and branch ducts.
2. Adjust sub-main and branch duct volume dampers for specified airflow.
3. Re-measure each sub-main and branch duct after all have been adjusted.

G. Adjust air inlets and outlets for each space to indicated airflows.

1. Set airflow patterns of adjustable outlets for proper distribution without drafts.
2. Measure airflow at all inlets and outlets.
3. Adjust each inlet and outlet for specified airflow.
4. Re-measure each inlet and outlet after all have been adjusted.

H. Verify final system conditions.
1. Re-measure and confirm minimum outdoor air, return and relief airflows are within design. Readjust to design if necessary.
2. Re-measure and confirm total airflow is within design.
3. Re-measure all final fan operating data, rpms, volts, amps, static profile.
4. Mark all final settings.
5. Test system in economizer mode. Verify proper operation and adjust, if necessary.
6. Measure and record all operating data.

7. Record final fan-performance data.

3.7 PROCEDURES FOR VARIABLE-AIR-VOLUME SYSTEMS

A. Adjust the variable-air-volume systems as follows:

1. Verify that the system static pressure sensor is located 2/3 of the distance down the duct from the fan discharge.
2. Verify that the system is under static pressure control.
3. Select the terminal unit that is most critical to the supply-fan airflow. Measure inlet static pressure, and adjust system static pressure control setpoint so the entering static pressure for the critical terminal unit is not less than the sum of the terminal-unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge system losses.
4. Calibrate and balance each terminal unit for maximum and minimum design airflow as follows:
    a. Adjust controls so that terminal is calling for maximum airflow (note some controllers require starting with minimum airflow. Verify calibration procedure for specific project).
    b. Measure airflow and adjust calibration factor as required for design maximum airflow. Record calibration factor.
    c. When maximum airflow is correct, balance the air outlets downstream from terminal units.
    d. Adjust controls so that terminal is calling for minimum airflow.
    e. Measure airflow and adjust calibration factor as required for design minimum airflow. Record calibration factor. If no minimum calibration is available, note any deviation from design airflow.
    f. When in full cooling or full heating, ensure that there is no mixing of hot deck and cold deck airstreams unless so designed.
    g. On constant volume terminals, in critical areas where room pressure is to be maintained, verify that the airflow remains constant over the full range of full cooling to full heating. Note any deviation from design airflow or room pressure.

B. After all terminals have been calibrated and balanced, test and adjust system for total airflow. Adjust fans to deliver total design airflows within the maximum allowable fan speed listed by fan manufacturer.

1. Set outside air, return air and relief air dampers for proper position that simulates minimum outdoor air conditions.
2. Set terminals for maximum airflow. If system design includes diversity, adjust terminals for maximum and minimum airflow so that connected total matches fan selection and simulates actual load in the building.
3. Where duct conditions allow, measure airflow by Pitot-tube traverse. If necessary, perform multiple Pitot-tube traverses to obtain total airflow.
4. Where duct conditions are not suitable for Pitot-tube traverse measurements, a coil traverse may be acceptable.
5. If a reliable Pitot-tube traverse or coil traverse is not possible, measure airflow at terminals and calculate the total airflow.

C. Measure fan static pressures as follows:

1. Measure static pressure directly at the fan outlet or through the flexible connection.
2. Measure static pressure directly at the fan inlet or through the flexible connection.
3. Measure static pressure across each component that makes up the air-handling system.
4. Report any artificial loading of filters at the time static pressures are measured.

D. Set final return and outside airflow to the fan while operating at maximum return airflow and minimum outdoor airflow.

1. Balance the return-air ducts and inlets the same as described for constant-volume air systems.
2. Verify all terminal units are meeting design airflow under system maximum flow.

E. Re-measure the inlet static pressure at the most critical terminal unit and adjust the system static pressure setpoint to the most energy-efficient setpoint to maintain the optimum system static pressure. Record setpoint and give to controls contractor.

F. Verify final system conditions as follows:

1. Re-measure and confirm minimum outdoor air, return and relief airflows are within design. Readjust to design if necessary.
2. Re-measure and confirm total airflow is within design.
3. Re-measure all final fan operating data, rpms, volts, amps, static profile.
4. Mark all final settings.
5. Test system in economizer mode. Verify proper operation and adjust, if necessary. Measure and record all operating data.
6. Verify tracking between supply and return fans.

3.8 GENERAL PROCEDURES FOR HYDRONIC SYSTEMS

A. Scope: Balance all hydronic systems.

B. Prepare test reports for pumps, coils, heat exchangers and other equipment. Obtain approved submittals and any manufacturer-recommended testing procedures. Crosscheck the summation of required coil and heat exchanger flow rates with pump design flow rate.

C. Verify that hydronic systems are ready for testing and balancing:

1. Check liquid level in expansion tank.
2. Check that makeup water-has adequate pressure to highest vent.
3. Check that control valves are in their proper position.
4. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.
5. Verify that motor starters are equipped with properly sized thermal protection.
6. Check that air has been purged from the system.

D. Before any adjustments are made:

1. Check temperature control valve operation.
2. Check pump rotation.
3. Adjust pressure reducing valve.
4. Remove any roughing strainer screens in systems.

E. Using system flow meters, adjust the quantity of fluid handled by each pump and supplied to each coil, piece of radiation, heat exchanger, cross-over bridge, bypass, etc., to meet design requirements.

F. Procedure:

1. Measure and report all hydronic and domestic water recirculation systems by all of the below means which are applicable.
    a. System, pump, branch, or terminal flow measuring stations.
    b. Terminal or heat exchanger pressure drop, compare to submittal data.
    c. Plot operating point on pump curve. Include compensation for effects of temperature, viscosity and density.
2. Above measurements to be made and reported at full heating/cooling load.
    a. For 3-way valve terminals/heat exchangers set bypass flow to equal coil flow.
    b. For primary/secondary systems, set crossover/bridle to have constant flow at all conditions.

G. Refer to other sections of these specifications for additional requirements

3.9 FIELD TESTING OF HYDRONIC SYSTEMS

A. During construction properly cap or plug all lines so as to prevent the entrance of sand, dirt, etc. The system of piping shall be blown through wherever necessary after completion (for the purpose of removing grit, dirt, sand, etc., from all equipment and piping), for as long a time as is required to thoroughly clean the apparatus.

B. Use anti-freeze solution for piping to be tested in winter.

C. All piping shall be tested as hereinafter specified. Tests shall be made after erection and before covering is applied or piping painted or concealed and as sections of mains and groups of risers are completed. The extent of the work completed before pressure tests are made shall be determined by the Architect.

D. All piping shall be tested to a hydrostatic pressure at least 1-1/2 times the maximum designed working pressure unless a higher pressure is required elsewhere (but not less than 50 psi) for a sufficiently long time to detect all leaks and defects; and after testing shall be made tight in the most approved manner. Tests shall be repeated once after leaks and defects have been repaired. When automatic-control valves and similar devices are incapable of withstanding test pressures applied to piping, such devices shall be removed, or otherwise protected during tests. After completion of such tests, devices shall be installed and tested with the operating medium to operating pressures.

E. The following systems shall be tested for four consecutive hours and proved tight. Leaks shall be remedied by replacing defective work. Test shall be performed at 1-1/2 times working pressure unless a higher pressure is required elsewhere; minimum pressures listed in table below.

Item	Hydrostatic Field Test
Overflow and drain	50 psi
Cold Water (domestic)	100 psi
Geothermal/Condenser water	100 psi
Chemical Treatment	
- Geothermal/Condenser water	100 psi
Vent - water discharge	100 psi

F. Leaks appearing during the various pressure tests shall be corrected by replacing all defective materials or welds and subsequent tests shall be made until the piping is found perfect. Caulking of screwed joints or peening of welds is prohibited. Wherever it is necessary to cut out a weld and the ends of the pipe cannot be conveniently brought together, then a short piece of pipe shall be fitted in and welded as approved by the Architect.

G. Provide all other tests required by Building Department, Fire Department and other Authorities having jurisdiction.

H. Running Test of Piping Systems:

1. When directed, any section of the work, after it has been completed and otherwise satisfactorily tested, shall be put in actual operation and operated for a period of two days of 24 hours each, during which time any defects which may appear shall be remedied and any adjustment which may be necessary shall be made.
2. During the time of the tests, repack all valves, make all adjustments and otherwise put the apparatus in perfect condition for operation, and instruct the Owner's representative in the use and management of the apparatus.

3.10 PROCEDURES FOR VARIABLE-FLOW HYDRONIC SYSTEMS

A. Balance systems with automatic two- and three-way control valves by setting systems at maximum flow through heat-exchange terminals and proceed as specified above for hydronic systems.

B. Adjust the variable-flow hydronic system as follows:

C. Verify that the differential-pressure sensor is located per the contract documents.

D. Determine if there is diversity in the system.

E. For systems with no diversity:

F. Follow procedures outlined in "Procedures for Constant-Flow Hydronic Systems" Article.

G. Prior to verifying final system conditions, determine the system differential-pressure set point.

H. If the pump discharge valve was used to set total system flow with variable-frequency controller at 60 Hz, at completion open discharge valve 100 percent and allow variable-frequency controller to control system differential-pressure set point. Record pump data under both conditions.

I. Mark all final settings and verify that all memory stops have been set.

J. For systems with diversity:

K. Determine diversity factor.

L. Simulate system diversity by closing required number of control valves, as approved by the design engineer.

M. Follow procedures outlined in "Procedures for Constant-Flow Hydronic Systems" Article.

N. Open control valves that were shut. Close a sufficient number of control valves that were previously open to maintain diversity, and balance the terminals that were just opened.

O. Prior to verifying final system conditions, determine the system differential-pressure set point.

P. If the pump discharge valve was used to set total system flow with variable-frequency controller at 60 Hz, at completion open discharge valve 100 percent and allow variable-frequency controller to control system differential-pressure set point. Record pump data under both conditions.

Q. Mark all final settings and verify that all memory stops have been set.

3.11 PROCEDURES FOR HEAT EXCHANGERS

A. Balance water flow to within specified tolerances.

B. Measure inlet and outlet water temperatures.

C. Check settings and operation of safety and relief valves. Record settings.

3.12 PROCEDURES FOR MOTORS

A. Motors, 1/2 HP and Larger: Test at final balanced conditions and record the following data:

1. Manufacturer's name, model number, and serial number.
2. Motor horsepower rating.
3. Motor rpm.
4. Phase/Hertz (Hz)
5. Nameplate and measured voltage, each phase.
6. Nameplate and measured amperage, each phase.
7. Starter size and thermal-protection-element rating.
8. Service factor and frame size.

B. Motors Driven by Variable-Frequency Controllers: Test the manual bypass of the controller to prove proper operation.

3.13 PROCEDURES FOR CONDENSING UNITS

A. Verify proper rotation of fans.

B. Measure entering- and leaving-air temperatures.

C. Record fan and motor operating data.

3.14 PROCEDURES FOR COILS

A. Measure, adjust, and record the following data for each electric heating coil:

1. Nameplate data.
2. Airflow.
3. Entering- and leaving-air temperature at full load.
4. Voltage and amperage input of each phase at full load.
5. Calculated kilowatt at full load.
6. Fuse or circuit-breaker rating for overload protection.

B. Measure, adjust, and record the following data for each refrigerant coil:

1. Dry-bulb temperature of entering and leaving air.
2. Wet-bulb temperature of entering and leaving air.
3. Airflow.

3.15 ADDITIONAL TESTS

A. Seasonal Periods: If initial TAB procedures were not performed during near-peak conditions, the engineer may request a temperature recheck to further verify performance at near-peak conditions.

B. Duct Leakage Testing:

1. Witness the duct pressure testing performed by the mechanical/installing contractor.
2. Verify that proper test methods are used and that leakage rates are within specified tolerances.
3. Report any deficiencies observed.

C. Controls Verification

1. In conjunction with system balancing perform the following:
   a. Work with the temperature control contractor to ensure the system is operating within the design limitations, and gain a mutual understanding of intended control performance.
   b. Confirm that the sequences of operation are in compliance with the approved drawings.
   c. Verify that controllers are calibrated and function as intended.

d. Verify that controller setpoints are as specified.
e. Verify the operation of lockout or interlock systems.
f. Verify the operation of all valve and damper actuators.
g. Verify that all controlled devices are properly installed and connected to the correct controller.
h. Verify that all controlled devices travel freely and are in the position indicated by the controller: open, closed, or modulating.
i. Verify the location and installation of all sensors to ensure they will sense only the intended temperatures, humidity, or pressures.

3.16 FINAL TEST AND BALANCE REPORT

A. Provide a general information sheet listing:

1. Instruments used:
   a. Most recent calibration date.
2. Method of balancing.
3. Altitude correction.
4. Manufacturer's performance data for all air devices used.

B. Provide data sheets for all equipment, including motors and drives, listing:

1. Make
2. Size
3. Serial number
4. Capacity Rating
5. Amperage
6. Voltage input
7. Thermal heater size for each motor
8. Operating speed of driver and driven devices
9. Any additional pertinent performance data

C. Include design and final values for all items listed in Detailed Requirements, and totals for each system.

D. Provide data sheets showing:

1. Air flow at each inlet and outlet
2. Instrument used
3. Velocity reading
4. Manufacturer's free area factors

E. Provide recap sheet with explanation for each device not meeting specified performance. Contractor shall be responsible for correcting all deficiencies noted in the TAB report. Upon completion of correction of deficiencies, the TAB contractor shall retest all devices and provide an updated report.

F. Provide a set of prints with equipment, inlets and outlets marked to correspond to data sheets.

3.17 COMMISSIONING

A. Reference Section 23 08 00 for commissioning scope.

B. Provide all necessary personnel, tools and equipment to comply with the commissioning scope.

END OF SECTION

SECTION 23 07 00

MECHANICAL INSULATION

PART 1 - GENERAL

1.1 SUBMITTALS

A. Submit manufacturer's product data on the following:

1. Insulation.
2. Jackets, coatings and protective finishes.
3. Sealers, mastics and adhesives.
4. Fitting covers.
5. Manufacturer's installation details for fire rated duct wrap.

1.2 FLAME AND SMOKE RATINGS

A. Provide insulation tested on a composite basis (insulation, jacket, covering, sealer, mastic and adhesive) complying with the following for:

1. Flame Spread: 25 or Less
2. Smoke Developed: 50 or Less
3. Method: ASTM E84 (NFPA 255), UL 723

B. Accessories such as adhesives, mastics, cements, tapes and cloths for fittings shall have component ratings as listed above. All products shall bear UL labels indicating the above are not exceeded.

1.3 PRODUCT DELIVERY

A. Deliver insulation products in factory containers bearing manufacturer's label showing fire and smoke hazard rating, density and thickness.

B. Protect insulation against, dirt, water, chemical and mechanical damage. Do not install damaged insulation; remove from project site.

C. Store insulation in original wrappings and protect from weather and construction traffic.

1.4 DEFINITIONS

A. Exposed Location: Located in mechanical rooms or other areas exposed to view.

B. Concealed Location: Locations not exposed to view, such as pipe chases, furred spaces, attics, crawl-spaces and above wall to wall suspended ceilings.

1.5 STANDARDS

A. Comply with the latest edition of National Commercial and Industrial Insulation Standards.

B. Provide certifications or other data as necessary to show compliance with these Specifications and governing regulations. Include proof of compliance for test of products for fire rating, corrosiveness, and compressive strength.

PART 2 - PRODUCTS

2.1 PIPE INSULATION

A. Manufacturers:

1. Design Basis: Johns-Manville
2. Other Acceptable Manufacturers:
   a. Armacell
   b. Foster
   c. Childers
   d. Owens-Corning
   e. Knauf
   f. KFlex USA
   g. Imcoa
   h. Pittsburgh Corning

B. Materials:

1. Fiberglass Pipe Insulation with Vapor Barrier: Johns-Manville Micro-Lok heavy density pipe insulation with AP-T jacket or Owens-Corning Fiberglass Corp. ASJ/SSL-II.
2. Fiberglass Pipe Fitting Insulation: Johns-Manville "Zeston" fitting covers with factory-cut fiberglass insulation insert. Insulation blanket with foil tape and tie-wire will not be acceptable.
3. Flexible Unicellular Pipe Insulation: Armstrong Armaflex, II or Therma-cel By Nomaco.
4. Cellular glass with vapor barrier coating: Pittsburgh Corning.
5. Rigid Closed Cell Insulation: ITW Insulation Trymer 2000 XP (not for use indoors).
6. Vapor Barrier Mastic: Foster 30-65 or Childers CP-34; permeance shall be 0.03 perms or less per ASTM E96. Mastic must meet California Dept of Public Health (CDPH) Standard Method Ver. 1.1, 2010 Small Scale Environmental Chamber Test for VOCs for CA Specification 01350 and LEED IEQ 4.2.
7. Weather Barrier Mastic: Foster 46-50 or Childers CP-10/11. For use on hot service pipe and ducts.
8. Lagging Adhesive: Foster 30-36 or Childers CP-50AMV1.
9. Fiberglass Adhesive: Foster 85-60 or Childers CP-127.
10. For hot pipe insulation material shall be rated at 650˚F.

C. Thickness: (Thickness listed below are minimum required. Provide thickness required by Local Building or Energy Codes).

1. Hydronic Piping:

2.2 Piping Insulation Thickness (inches)

Operating Temperature	Insulation Conductivity[a]		Pipe Size				
°F	Btu*in/ (h*ft^2*F)	Mean Rating Temperature, F	<1"	1" to < 1-1/2"	1-1/2" to < 4"	4" to < 8"	≤ 8"
Geothermal/Condenser Water							
40°F - 60°F	0.21-0.27	75	1.5	1.5	1.5	1.5	1.5
Solar Thermal Water							
141°F - 200°F	0.25-0.29	125	1.5	1.5	2	2	2

a. For insulation outside the stated conductivity range, the minimum thickness (T) shall be determined as follows:

$T = r\{(1+t/r)^{K/k}-1\}$

where:

T: minimum insulation thickness,

r: actual outside radius of pipe,

t: insulation thickness listed in the table for applicable fluid temperature and pipe size,

K: conductivity of alternate material at mean rating temperature indicated for the applicable fluid temperature (Btu x in/h x ft^2 x F) and

k: the upper value of the conductivity range listed in the table for the applicable fluid temperature.

1. Refrigerant Piping (Suction and Hot Gas Bypass) and AC Condensate
   a. Up to 1" – ¾"
2. Heat Traced Piping
   a. Size 2" and smaller: 1" (minimum)
   b. Size 2½" and larger: 2" (minimum)
3. Condensate Drain Piping: 1"

B. Application: Unless otherwise indicated, use the following:

1. Inside, concealed: Fiberglass pipe insulation with vapor barrier.
2. Inside, exposed: Fiberglass pipe insulation with vapor barrier and PVC jacket (jacket not required in mechanical rooms).
   a. A vapor barrier mastic compatible with the PVC shall be applied around the edges of the adjoining pipe insulation and on the fitting cover throat overlap seam. The PVC fitting cover is then applied and shall be secured with pressure sensitive pearl gray Z-Tape along the circumferential edges. The tape shall extend over the adjacent pipe insulation and have an overlap on itself at least 2" on the downward side.
   b. 2 or more layers of the Hi-Lo Temp insulation inserts shall be applied with the first layer being secured with a few wrappings of fiberglass yarn.

c. Refrigerant systems and cold systems in severe ambient conditions: Fittings shall be insulated to a full thickness the same as the adjacent pipe insulation, with insulation which has been mitered to conform to the PVC fitting cover. An intermediate vapor barrier mastic and reinforcing mesh compatible with the PVC shall be applied directly onto the insulation, completely sealing the insulation. The PVC fitting cover is then applied and shall be secured with pressure sensitive pearl gray Z-Tape along the throat seam and the circumferential edges overlapping itself 2" on the downward side.
d. Qualifications for Using Insulation: Use one Hi-Lo Temp insert for each additional 1" of pipe insulation.
e. Fitting Cover: the temperature of the PVC fitting cover must be kept below 150˚F by the use of proper thickness of insulation and by keeping the PVC cover away from contact with, or exposure to, sources of direct or radiant heat.

3. Refrigerant systems pipe insulation shall be closed cell expanded form in a tubular form similar to Armaflex as made by Armstrong Company. Pipe insulation shall meet flame spread index of 25 and smoke density of 50 when tested in accordance with ASTM-E-84
4. Outside, protected: Fiberglass pipe insulation with vapor barrier and aluminum jacket.
5. Outside, exposed to weather: Rigid closed cell pipe insulation with aluminum jacket.
6. Below grade or slab:
   a. Pipe size 1½" and less: Single piece of flexible closed cell insulation slipped over soft annealed copper tube without slitting insulation.
   b. Pipe size 2" and larger: Pre-Insulated System (Perma-Pipe, or equal) with rigid closed cell insulation and shrink fit jacket.
7. All fittings, valves and flanges for pipe sizes 3" and below shall be insulated with preformed molded fiberglass insulation of same thickness as the adjoining pipe insulation, secured with No. 20 gauge galvanized annealed steel wire covered with Zeston 2000 molded PVC fitting covers as manufactured by Manville, or equal.
8. All fittings, valves and flanges for pipe sizes 4" and larger shall be insulated with fabricated mitered segments of pipe insulation of same thickness as the adjoining pipe insulation, secured with no. 20 gauge galvanized annealed steel wire and covered with Zeston 2000 molded PVC fitting covers as manufactured by Manville or equal.
9. Direct contact between pipe and hangers will not be accepted. Hangers shall pass outside of a metal saddle which shall cover a section of high density insulation of sufficient length to support pipe without crushing insulation. Hangers shall not pierce insulation and all vapor barriers shall be unbroken and continuous. High density insulation shall be one of the following:
   a. Foam glass.
   b. Fiberglass, high density, minimum of 7 lb. material or heavier.
   c. High density calcium silicate insulation. See Part 3 of this Section for high density insulation lengths.
10. At pipe supports insulation shield protection saddles and matching hanger shall be used.
11. All strainers for geothermal/condenser water and insulated condenser water piping shall be insulated and boxed in with galvanized sheet metal cover, and insulation shall be made removable.
12. The Contractor shall have the option to use Armaflex as made by Armstrong Co. pipe insulation in lieu of fiberglass hereinbefore specified for geothermal/condenser, and hot water piping insulation in fan coil units. Pipe insulation shall meet flame spread index of 25 and smoke density of 50 when tested in accordance with ASTM-E-84.
13. Provide vapor barrier dams at locations and intervals recommended by the insulation manufacturer and as described in this specification.
14. All high pressure steam insulation for straight pipe is fiberglass and shall conform to ASTM C-547, Type I. Insulation shall consist of single layer thickness. Multi-layered and/or multi-section insulation is unacceptable.

C. Flexible elastomeric insulation (25/50 flame spread/smoke developed index) is acceptable in lieu of fiberglass on cold piping (roof leaders, geothermal/condenser water, condensate drains from cooling units).

1. Use pre-molded roll on pipe sizes 3.5" and below.
2. Use either pre-molded roll or sheet on pipe sizes 4" and above, adhere insulation on 100% of the pipe. This requirement exceeds the typical industry standard of adhering to lower one-third of pipe on horizontal runs.

3. Match thickness of fiberglass insulation on all pipe sizes. Provide multiple layers when a single layer of material cannot accomplish required thickness.
4. No exposed cross section edges are permitted.

2.3 DUCT INSULATION

A. Manufacturer:

1. Design Basis: Johns Manville
2. Other Acceptable Manufacturers:
   a. Owens-Corning
   b. Certainteed
   c. Knauf

B. Materials:

1. Flexible fiberglass Ductwork Insulation: Johns-Manville Microlite XG, with FSK factory applied foil-scrim-kraft vapor barrier facing, with maximum K factor of 0.25 at 75˚F mean temperature.
2. Rigid Fiberglass Ductwork Insulation: Johns-Manville 800 Series, Spin-Glas Type 814, with FSK factory applied foil-scrim-kraft vapor barrier facing, with maximum K factor of 0.23 at 75˚F mean temperature.
3. Ductwork Insulation Accessories: Provide staples, bands, wires, tape, anchors, corner angles, and similar accessories as recommended by the insulation manufacturer for the applications indicated.
4. Cellular glass: Pittsburgh Corning with vapor barrier.

C. Thickness: (Thickness listed below are minimum required. Provide thickness required by Local Building or Energy Codes).

Ductwork Insulation				
Location	Exposed/Concealed	Insulation Type	R-Value	Thickness
Supply Ductwork (unlined)				
Indoor	Exposed	Rigid	R-6	1½"
Indoor	Concealed	Flexible	R-6	2"
Indoor, Unconditioned Space	Exposed	Rigid	R-6	1½"
Indoor, Unconditioned Space	Concealed	Flexible	R-6	2"
Outdoor	See Outdoor Duct Insulation Section			
Return Ductwork (unlined)				
Indoor	Exposed	Rigid	R-6	1½"
Indoor	Concealed	Flexible	R-6	2"
Indoor, Unconditioned Space	Exposed	Rigid	R-6	1½"
Indoor, Unconditioned Space	Concealed	Flexible	R-6	2"
Outdoor	See Outdoor Duct Insulation Section			
Outside Air Ductwork (unlined)				
Indoor	Exposed	Rigid	R-6	2"
Indoor	Concealed	Flexible	R-6	2"
Indoor, Unconditioned Space	Exposed	Rigid	R-6	2"
Indoor, Unconditioned Space	Concealed	Flexible	R-6	2"
Outdoor	See Outdoor Duct Insulation Section			

D. Application:

1. Where energy codes require additional insulation over that listed above, provide insulation in accordance with those codes.
2. The Contractor shall have the option to use the following material: Insulation for round ducts shall be of thickness noted above and shall be fiberglass Bend-a-Board having a factory applied ASJ vapor barrier jacket secured with stables and ASJ pressure sensitive tape. Bend-a-Board is a 3.00 p.c.f. board cut into strips, adhered to jacketing it must have a UL label.
3. Adhere insulation to duct with Foster water based, fire resistant adhesive 85-60, Chiders CP-127, or approved equal, applied in 3 inch wide transverse strips at 8 inch intervals. Insulation shall be butted with facing overlapping all joints at least 2 inches and sealed with Foster fire resistant adhesive 85-60, Childers CP-127, or approved equal. For insulation with vapor barrier use Foster fire resistant vapor barrier adhesive or equal and joints without tabs shall be firmly sealed with aluminum foil tape adhered with same adhesive. Secure insulation with 16 gauge copperclad wire spaced not more than 12 inches on center.
4. Additionally, secure insulation to bottom of rectangular ducts over 24" wide with welded pins or stick clips on 18" centers coated with a vapor barrier coating.
5. Rigid duct insulation shall be fastened to duct with 12 gauge welded pins and washers, or equivalent as approved. Fasteners shall be spaced 12 to 18 inches on center, a minimum of two rows per side of duct. Secure insulation in place with suitable speed washers firmly embedded in insulation, or push a self-locking cap over pin after coating with fitting mastic type C by Owens-Corning or equal. For rigid duct insulation, seal all joints, breaks and impressions with Foster water based, fire resistant vapor barrier mastic Foster 30-65, Childers CP-34, or approved equal, and apply 5" wide joint sealing tape to all joints. All surface must be clean and dry before applying tape and mastic.
6. Insulation for exposed round ductwork shall be of the same material as specified for concealed ductwork and shall be covered with glass cloth or all service jacket smoothly adhered with Foster 85-60 or Childers CP-127 adhesive. Seal joints with 5" wide tape.

E. Acoustical Duct Lagging

1. Manufacturers:

a. Design Basis: Sound Seal
b. Other acceptable manufacturers:
    1) Kinetics Noise Control
    2) The Proudfoot Company
    3) Acoustical Solutions
c. Model: B-10 LAG/QFA-3, foil face loaded vinyl or lead barrier sheet fully bonded to a minimum 1” thick fiberglass blanket, nominal density of 1.0psf, install so jacket edges overlap by minimum of 6”. Minimum STC-27 tested by independent laboratory in accordance with ASTM E90 and E413. Minimum insertion loss (IL) value at 500Hz shall be 23. Lagging shall meet IMC flame/smoke ratings in accordance with ASTM E84.
d. Duct lining shall be rated to prevent fiber erosion at air velocities up to 4,000 FPM and shall have a minimum density of 1.5 pounds per cubic foot. The liner must be installed with sheet metal nosing at the leading edge. Exposed edges-including butt joints – shall be sealed with mastic.
e. Lining shall be contained between outer wall of duct and perforated metal inner liner of material to match the duct material. Perforations shall not exceed 3/32” diameter, free area shall be approximately 22%. Metal liner need not be perforated at fittings. Provide continuous mylar liner between the perforated liner and insulation to prevent the erosion of the insulation.
Provide transitions at end of insulated sections to adapt duct liner size to dimension of unlined ductwork. Liner and transition shall be concentric for low pressure drop.
f. Thickness shall be per thickness required for externally insulated ductwork of same function and location.

2.4 OUTDOOR DUCT INSULATION

A. Manufacturers:

1. Design Basis: Armstrong
2. Other Acceptable Manufacturers:
   a. Johns-Manville
   b. Nomaco

B. Materials:

1. Model: Armaflex
   a. Description: Flexible, cellular, elastomeric foam.
   b. Form: Sheet
2. Paint: Armaflex Finish
   a. Description: Vinyl lacquer. Contractor must coordinate color of vinyl lacquer with Architect. Submit color chart to Architect for his review.
3. Adhesive: Armstrong 520.
4. Cellular glass: Pittsburgh Corning with vapor barrier.
5. Weatherproofing Finishes for Outdoor Duct Insulation:
   a. VentureClad 1579CW Jacketing System, or equal. 13 Ply, 0.45 mm minimum thickness.
   b. Color selected by architect

C. Application:

1. All outdoor supply, return and transfer air ducts that are specified with acoustical duct lining shall be provided with 2” duct lining (minimum R=8).
2. All outdoor supply, return, and transfer air ducts that are not specified to have acoustical lining shall be insulated with two layers of one inch thick sheet on the exterior.
3. Jacketing shall be applied with minimum 2 inch overlaps facing down from the weather and the jacketing shall be secured with aluminum bands 1/2 inch by 0.020 inches and aluminum wing seals applied on 12 inch centers, with bands applied directly over butt overlaps or with Pli-Grip Rivets. Where jacketing is cut out or abuts an uninsulated surface, the joint shall be sealed with Foster 95-44, Childers CP-76, or Insul-Coustic Sure-Joint 405.
4. Over the insulated surface apply a tack coat of Foster 46-50, Childers CP-10/11, or Vi-AC Mastic and imbed in it a layer of glass cloth. A smooth finish coat of weather barrier mastic shall be applied to the entire area so that the total film thickness is a minimum of 1/8 inch. Provide high point at center, so that no water accumulation will occur.

2.5 EQUIPMENT INSULATION

A. Manufacturer:

1. Design Basis: Johns Mansville
2. Other Acceptable Manufacturers:
   a. Armstrong
   b. Certainteed
   c. Owens-Corning
   d. Knauf
   e. Pittsburgh Corning

B. Materials:

1. Model: Pipe and tank insulation.

Description: Flexible board type insulation. 3 PCF glass fiber insulation with all purpose jacketing. Maximum thermal conductivity .32 BTU-IN/(hr-FT^2-ºF) at 150ºF. Glass fibers oriented such that insulation will conform to rounded shapes while maintaining high compressive strength.

2. Model: Johns-Manville 800 series, spin glass type 814.
   Description: 3 PCT density rigid glass fiberboard, with all purpose jacketing. Maximum thermal conductivity .27 BTU-IN/hr-FT^2--ºF).
3. Jacketing Material: PVC or aluminum jacketing material, except as otherwise indicated. Seal all joints.
4. Fiberglass: Johns-Manville Micro-Lok 850 insulation with APT jacket.
5. Flexible Unicellular Insulation: Armstrong Armacell sheet form.

C. Application:

1. Equipment Insulation Accessories: Provide staples, bands, wire, wire netting, tape, corner angles, anchors, stud pins, metal covers, adhesives, cements, sealers, mastics and protective finishes as recommended by insulation manufacturer for applications indicated.

2.6 KITCHEN GREASE HOOD EXHAUST DUCT INSULATION

A. Manufacturers (all components to be by one manufacturer):

1. 3M
2. Unifrax
3. Nelson
4. Thermal Ceramics
5. Pyroseat
6. Vesuvius
7. ETS Schaefer

B. Materials:

1. Lightweight, non-asbestos, high temperature inorganic ceramic fiber blanket wrap.
2. Insulation to be fully encapsulated in reinforced foil.
3. Sufficient thickness to provide two (2) hour fire resistant enclosure.
4. Fibers to be non-carcinogenic and soluble in human lung tissue.
5. Zero clearance to combustibles rating.
6. As an alternate to manufactured wrap systems the contractor may, with the engineers approval, utilize 2" thick calcium silicate 11 PFC minimum density insulation wired on and finished with 1/2" thick hard plaster laid over chicken wire and troweled smooth. Finish with two (2) coats of cement over hexagonal wire. Wire shall be copperclad steel.

C. Listings and Testing :

1. ASTM E84: Standard Test Method for Surface Burning Characteristics of Building Materials
   Surface burning characteristics:
   a. Flame Spread: 0
   b. Smoke Developed: 0.
2. ASTM E814: Standard Test Methods for Fire Tests of Through-Penetration Firestops
3. ASTM E119: Standard Test Methods for Fire Tests of Building Construction Materials
4. NFPA 96.
5. NFPA 101.
6. Submit written approval from authority having jurisdiction for use of system at specified clearance.
7. Bureau of Standards and Appeals MEA #.

D. Application:

1. Insulate all kitchen grease hood exhaust duct systems from hood to exhaust fan full length, including kitchen hood above ceiling.
   a. Insulate fan housing on indoor kitchen exhaust fans
2. Wrap duct supports for two (2) hour rating.
3. Install per manufacturer's recommended installation guidelines.
4. Provide Manufacturers approved transition between fire wrap and gypsum board rated enclosures where both systems are used. Do not transition from gypsum enclosure system back to fire wrap, regardless of what may be shown on drawings.
5. Use bands and/or welded pins as required. Adhesives are not acceptable.
6. Provide rated access doors (as required) insulated to maintain two (2) hour rating and required clearance.
7. Provided fire barrier sealant, tape, rods, pins, clips, bands and other components as required to provide fully functioning system.

PART 3 - EXECUTION

3.1 GENERAL

A. Verify acceptability of all materials which are to be used in air plenums (above ceiling, etc.). Materials must meet all requirements of Local Building Code and Authority having jurisdiction.

B. Insulation Packing:

1. Piping :
   a. Wherever piping penetrates walls, partitions, floor slabs, etc., the space between the piping and the sleeve shall be packed with mineral wool and sealed with approved type non-hardening fire resistant caulking compound for sleeves through exterior walls.
2. Ductwork:
   a. Provide 1/2" thick rigid fiberboard sleeve wherever ductwork penetrates walls, floor slabs, partitions, etc. Space between duct and wall sleeve and between duct and slab opening shall be tightly packed with mineral wool and sealed with approved type non-hardening fire resistant caulking compound.
3. Material:
   a. Packing material shall be rockwool insulation as manufactured by United Stated Gypsum Co. or equal and shall comply with Fed. Spec. HH-1-558, Form A, Class 4, K=0.24, melting point 2000˚F.

C. All Winterized Lines That Are Electrically Traced

1. The basic insulation shall be dual temperature, Manville Micro-Lok piping insulation. The insulation shall be sized to accommodate the electric heat tracing applied against the pipe surface.
2. Finish for insulation shall be aluminum jacket as specified under "Weatherproofing of Piping".

D. Contractor shall examine location where this insulation is to be installed and determine space conditions and notify the Architect in writing of conditions detrimental to proper and timely completion of the Work.

E. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3.2 GENERAL INSTALLATION

A. Install insulation in accordance with manufacturer's written instructions, and with recognized industry practices, to ensure that insulation complies with requirements and serves intended purposes.

B. Coordinate with other work as necessary to interface installation of insulation with other components of systems.

C. All insulating materials shall be applied only by experienced workmen, in accordance with the best covering practice. All piping, duct or equipment shall be blown out, cleaned, tested and painted prior to the application of any covering.

Adhesives, sealers and mastics shall not be applied, when the ambient temperature is below 40˚F., or surfaces are wet.

3.3 PIPE INSULATION

A. Insulate the following:

1. Geothermal/condenser water piping.
2. Refrigerant suction and hot gas bypass lines.
3. Solar energy system piping.
4. All existing piping which is currently insulated and which is modified as a result of this work.
5. Condensate drain piping.
6. Heat traced piping

B. Installation:

1. Install insulation on pipe system subsequent to testing and acceptance of tests.
2. Install insulation materials with smooth and even surfaces. Insulate each continuous run of piping with full length units of insulation, with a single cut piece to complete the run. Do not use cut pieces or scraps abutting each other.
3. Clean and dry pipe surfaces prior to insulating. Butt insulation joints firmly together to ensure a complete and tight fit over surfaces to be covered.
4. Extend piping insulation without interruption through pipe clamps, hangers, walls, floors and similar piping penetrations, except where otherwise indicated. Notched insulation will not be acceptable.
5. Install protective metal shields and saddles where needed to prevent compression of insulation. Refer to Section 23 05 29.
6. Except as noted, cover valves, flanges, fittings and similar items in each piping system with equivalent thickness and composition of insulation as applied to adjoining pipe run.
   a. Install factory-molded, pre-cut or job-fabricated units (at Installer's option), except where a specific form or type is indicated.
   b. Do not cover:
      1) Valve operators.
      2) Nameplates or identification tags.
   c. Provide removable access for:
      1) Strainers.
      2) Other components requiring access for service.
7. Mark location of unions and flanges covered by insulation with permanent paint or ink, or approved label.
8. Maintain integrity of vapor-barrier jackets on insulation of cold pipes and storm drainage piping, and protect to prevent puncture or other damage. Insulation on cold surfaces where vapor barrier jackets are used shall be applied with a continuous, unbroken vapor seal. Hangers, supports, anchors, etc., that are secured directly to cold services shall be adequately insulated and vapor sealed to prevent condensation.
9. Inserts shall be installed at hangers for insulated piping. Inserts between the pipe and pipe hangers shall consist of rigid pipe insulation of equal thickness to the adjoining insulation and shall be provided with vapor barrier where required. Insulation inserts shall not be less than the following lengths:

2-1/2" pipe size and smaller	6" long
3" to 6" pipe size	9" long

10. Provide 18 gauge galvanized metal shields between hangers or supports and pipe insulation. Form shields to fit insulation. Extend shields up to centerline of pipe. Make shields same length as that specified above for inserts.
11. Where insulation is specified for piping, insulate similarly all connections, vents, drains, and any piping connected to system.
12. Fill surface imperfections such as chipped edges, small joints or cracks and voids or holes with insulation material and smooth all such areas with a skim coat of insulating cement.

13. Seal ends of sections with Foster 30-65 or Childers CP-34 vapor barrier mastic and reinforcing mesh to create moisture dams at:
    a. 20 ft. intervals.
    b. Valves and fittings.
    c. All hangers and supports.
14. On underground pipe insulation, install unicellular insulation on pipe without slitting insulation. Seal all transverse joints with adhesive.
15. Replace existing insulation removed or damaged because of work of this project.
16. Insulate new pipes and replace insulation on existing pipes to remain where insulation was removed or damaged by demolition or revisions.
17. Do not insulate steam traps.
18. Insulate between fingers of spiders in alignment guides.
19. Insulate between pipe and pipe saddle.
20. Perform all work in a neat and workmanlike manner. Poor work (as determined by Architect or Engineer) will be cause for rejection.
21. Specialties shall be insulated to match those of the systems to which they are connected.
22. No insulation shall be installed until the piping systems have been hydrostatically tested as specified elsewhere to the satisfaction of the Engineer.
23. Provide glass cloth and aluminum bands 18" on center on calcium silicate insulation jacket and flared-out staples on all fiberglass hot pipe insulation. Tape vapor barrier joints and seams on all cold pipe insulation.
24. Provide insulation on all horizontal runs of condenser water piping running over occupied areas to avoid condensation on pipe surfaces during winter operation of the Water Side Economizer.
25. Provide extended valve stems to maintain vapor barriers on all geothermal/condenser water valves as required.
26. In addition to the requirements above, provide ITW SARAN CX Vapor Retarder or vapor barrier mastic/reinforcing mesh on all Geothermal/condenser Water vertical elbows.
27. When available, insulate fittings with factory pre-molded fittings of the same thickness as adjoining pipe insulation.
28. When pre-molded fittings are unavailable, use a hydraulic setting cement paste.
29. Clamps and anchors on cold piping shall be insulated. Full taping of pre-molded fittings is required.
30. Insulation at pipe strainer flanges shall be arranged for ease of servicing.
31. Insulation and vapor barriers shall be properly protected at all hangers and penetrations.
32. Insulated valves shall have extended handle stems so all operators or handles are outside of the insulation system. This is particularly true of high pressure steam piping.
33. Provide factory manufactured removable covers on all steam PRV's, constructed with 2" TEMPMAT insulation, fiberglass cloth, stainless steel grommets, and stitching. Cold side shall be silicone impregnated for moisture and soiling resistance.
34. Geothermal/condenser water pumps shall be enclosed in a removable, insulated aluminum box that allows access to the pump with no disruption of piping or electrical connections, or with minimum 1-inch thick, flexible elastomeric insulation (25/50 flame spread/smoke developed index).
35. All refrigerant line accessories that are part of the suction and hot gas bypass refrigerant system (e.g. valves, vibration eliminators, P-traps, filters, etc.) shall be complete insulated.
36. All refrigerant insulation must be properly sized for the piping that it is being installed on.

    a. Insulation installed on horizontal runs of refrigerant piping will require that the insulation protection shield be installed between the insulation and the pipe hanger.
    b. All seams and joints in the insulation will be required to be sealed with the proper adhesive, for the product being use, to provide a continuous vapor barrier.
    c. Piping clamps that are in contact with the suction line are required to be covered with insulation.
    d. All thermostatic expansion valve sensor bulbs are required to be covered with insulation.

3.4 OUTDOOR PIPE INSULATION

A. Install rigid closed cell insulation with butt joints of half pipe sections staggered. Insulation shall be held in place with strapping tape. Install aluminum jacket with all joints lapped to shed water. Apply a bead of Foster 95-44 or Childers

CP-76 metal jacketing sealant at all transverse and longitudinal seams. Secure with aluminum bands, minimum of 2 per jacket section.

3.5 DUCTWORK INSULATION

A. Insulate all ductwork except the following portions of ductwork:

1. Ducts and casings internally insulated or provided with sound absorptive lining.
2. All exhaust ductwork, except where otherwise noted.
3. Return air ductwork from air conditioning systems passing through air conditioned space and/or hung ceiling of air conditioned space.
4. Return air ductwork from heating and ventilating systems, where return air ducts pass through heated areas.
5. Exposed air conditioned supply and return air ducts in air conditioned spaces if same supply or return air ducts serve that area only.
6. Exposed supply air duct from heating and ventilating systems, if same duct serves that area only.

B. Except where otherwise noted, all concealed rectangular and round ductwork shall be covered with flexible duct insulation with or without vapor barrier.

C. Install insulation materials with smooth and even surfaces, after inspection and release for insulation application. Butt insulation joints firmly together to ensure complete and tight fit over surfaces to be covered.

D. Clean and dry ductwork prior to insulating.

E. Extend ductwork insulation without interruption through walls, floors, and similar ductwork penetrations, except where otherwise indicated.

F. Except as otherwise indicated, do not insulate lined ducts. However, extend duct insulation 12” beyond start of lining where lined ductwork meets insulated ductwork.

G. Maintain integrity of vapor-barrier on insulation of ducts carrying cold air, and protect it to prevent puncture and other damage. Insulation on cold surfaces where vapor barrier jackets are used shall be applied with a continuous, unbroken vapor seal. Hangers, supports, anchors, etc., that are secured directly to cold services shall be adequately insulated and vapor sealed to prevent condensation.

H. Do not install covering before ductwork has been tested and approved.

I. The finish including any vapor barrier treatment shall lap adjacent sections at both the transverse and longitudinal joints and 3" strips of matching finish material shall be adhered at the transverse joints.

J. For Outdoor Armaflex Insulation:

1. Stagger joints on multilayer applications.
2. Locate joints at sides of ducts whenever possible.
3. Use 520 adhesive to attach insulation. Provide full coverage.
4. Seal all seams and joints with adhesive.
5. Maintain full thickness at standing seams and flanges by additional layer(s).
6. Cover flexible connections.
7. Extend covering to inside face of outside wall.
8. Finish with two coats of Armaflex finish or Foster 30-64 coating.

K. The installer of the ductwork insulation shall advise the Contractor of required protection for the insulation work during the remainder of the construction period, to avoid damage and deterioration.

L. Ductwork directly connected to ovens shall be insulated to the requirements for breeching.

M. The use of flexible elastomeric insulation on ductwork is permitted as an acceptable alternative to fiberglass. Insulation shall be adhered to 100% of the duct surface area.

3.6 EQUIPMENT INSULATION

A. Install insulation materials with smooth and even surfaces and on clean and dry surfaces, after inspection and release for insulation application.

1. Re-do poorly fitted joints.
2. Do not use mastic or joint sealer as filler for gaping joints and excessive voids resulting from poor workmanship.

B. Maintain integrity of vapor-barrier on equipment insulation and protect it to prevent puncture and other damage.

C. Apply insulation using the staggered joint method for both single and double layer construction, where feasible. Apply each layer of insulation separately.

D. Do not insulate handholes, cleanouts, ASME stamp and manufacturer's nameplate.
Provide neatly beveled edge at interruptions of insulation.

E. Insulation for factory-fabricated air handling units shall be furnished as part of units.

F. Geothermal/condenser Water Pumps:

1. Geothermal/condenser water pump and standby geothermal/condenser water pump casings shall be encased in 14 GA aluminum casings, gasketed and bolted together with brass bolts, washers and nuts, split horizontally and removable in two sections and packed with 2" thick 1lbs. density fiberglass blanket insulation. Corners shall be constructed with a frame of 2" wide 0.05" thick aluminum corner angles put together with pop rivets or all welded. Frame sides shall be cut for pipes, flanges and pump shaft.

G. Hot Equipment (Above Ambient Temperature):

1. Includes hot and heating water as well as steam equipment such as air release tanks, air separators, expansion tanks, flash tanks, vessels etc.
2. Insulate with 3" thick fiberglass U.L. labeled insulation finished with glass cloth jacket adhered and wired and coated with two coats of Foster 30-36 or Childers CP-50AMV1 lagging adhesive.
3. Do not apply insulation to equipment while hot.
4. The Contractor shall have the option of using 2" thick fiberglass Bend-A-Board insulation with .016" thick aluminum jacket with lock seams at longitudinal seams and 1/2" aluminum bands 12" on center at traverse joints. Joints and jacket shall provide complete protection for the insulation.

H. Heat Exchanger + Converters

1. Cover top and both sides of exchanger with 24 gauge galvanized steel panels with ½" flexible unicellular insulation cemented to the inside of the panels.
2. Panels shall be easily removable and easy to re-install.
3. Adhere flexible unicellular insulation to end plates with Armstrong No. 520 adhesive.
4. Insulate with 2" thick fiberglass, 3# density U.L. Labeled insulation and hexagonal mesh wire screen finished with glass jacket adhered and coated with two coats of Foster 30-36 or Childers CP-50AMV1 lagging adheasive. Flanges shall be treated as specified under Hot Pipe Insulation "Fittings, Valves & Flanges 4" and Larger".
5. The Contractor shall have the option of using 2" thick fiberglass Bend-A-Board insulation with .016" thick aluminum jacket with lock seams at longitudinal seams and 1/2" aluminum bands 12" on center at traverse joints. Joints and jacket shall provide complete protected for the insulation.

I. Cold Equipment (At or below ambient equipment):

1. Includes geothermal/condenser equipment such as air release tanks, air separators, expansion tanks, flash tanks, vessels, etc.
2. Insulate air release tanks (air separators) with 2 inches of pipe and tank insulation or 1½ inches of rigid fiber glass board.
3. Vapor barrier to be provided on geothermal/condenser water expansion tank, air separator and chemical treatment tank.
4. The Contractor shall have the option of using 2" thick fiberglass Bend-A-Board insulation with .016" thick aluminum jacket with lock seams at longitudinal seams and 1/2" aluminum bands 12" on center at traverse joints. Joints and jacket shall provide complete protection for the insulation.

J. Return Air Fans for Air Conditioning Systems:

1. Insulation for single inlet return air fans shall be of material as specified for concealed ductwork and shall be covered with glass cloth or all service jacket smoothly adhered with Foster 85-60 or Childers CP-127 adhesive. Seal joints with 5" wide tape. The Contractor shall have the option to use the following material: Insulation for the fans shall be of thickness noted above and shall be fiberglass Bend-A-Board having a factory applied fire retardant vapor barrier jacket and shall be provided with presized glass cloth smoothly adhered with same adhesive. Bend-A-Board is a 3.00 p.c.f. board cut into strips, adhered to jacketing. Finish shall be Manville No. 301 Insulating Cement or approved equal applied 1/4" thick in one coat, trowelled to a smooth finish. Same option shall apply.

K. Filters:

1. Prefilter, afterfilter housing and flow measuring devices shall be insulated same as ductwork.

L. Exterior Ductwork:

1. Ductwork outside of the building shall have weatherproof cover. Fan located inside or outside of the building shall have insulation similar to return air fans. If fan located outside of the building, provide weatherproofing.
2. Outside Air Intakes and Exterior Ducts: 2-inch thick rigid, fiberglass board, 6.0 pounds per cubic foot density, to a minimum R-value of 8, complete with insulation faced and anchored as described for exposed ductwork.

M. Insulate equipment to match adjoining piping insulation.

N. Outside Air Intakes and Exterior Ducts: 2-inch thick rigid, fiberglass board, 6.0 pounds per cubic foot density, to a minimum R-value of 8, complete with insulation faced and anchored as described for exposed ductwork.

3.7 FIRE RATED DUCT WRAP

A. Remove dirt and dust and clean all duct surfaces.

B. Install per manufacturers instructions and referenced standards. Where pins are required they shall be tack welded to duct.

C. Repair any damage in accordance with manufacturer’s instruction.

3.8 PROTECTION AND REPLACEMENT

A. Replace damaged insulation which cannot be repaired satisfactorily. Including units with vapor barrier damage and moisture saturation. The insulation installer shall advise the Contractor of required protection for the insulation work during the remainder of the construction period, to avoid damage and deterioration.

END OF SECTION

SECTION 23 08 00

HVAC SYSTEM COMMISSIONING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: The Work of this Section shall include but not be limited to the following:

1. Systems and equipment Start-Up and Functional Performance Testing.
2. Validation of proper and thorough installation of Division 23 systems and equipment.
3. Generic Start-Up Documentation for mechanical systems and equipment.
4. Development of final Start-Up Documentation for mechanical systems and equipment.
5. System Start-Up and Turn-Over procedures.
6. Systems balancing verification.
7. Coordination and execution of Training Events.

B. Related Sections

1. The Cx process references many related Sections, particularly Section 01 91 00 - General Commissioning. It is important for all Contractors subject to the Cx process to be familiar with Section 01 91 00.
2. Refer to Section 01 91 00 for a complete list of Sections on Related Work.

1.3 GENERAL DESCRIPTION

A. Commissioning (Cx) is the process of ensuring that (i) all building systems are installed and perform interactively according to the design intent; (ii) that systems are efficient and cost effective and meet the Owner's operational needs; (iii) that the installation is accurately documented; and (iv) that the Operators are adequately trained. Commissioning serves as a tool to minimize post-occupancy operational problems, and establishes testing and communication protocols to advance the building systems from installation to optimized, fully-dynamic operation.

B. Commissioning Authority (CxA) shall work with the Contractor and the design engineers to direct and oversee the Cx process and perform Functional Performance Testing.

C. The Commissioning Plan outlines the Cx process beyond the Construction Contract, including design phase activities and design team/owner responsibilities. The specification Sections dictate all requirements of the commissioning process relative to the construction contract. The Cx Plan is not part of the construction contract, although it is available for reference at the request of the Contractor.

D. This Section outlines the Cx procedures specific to the Division 23 Contractors. Requirements common to all Sections are specified in Section 01 91 00 and Section 01 91 10 This Section and other sections of the specification details the Contractor's responsibilities relative to the Cx process.

E. This specification covers the start-up, operating performance test and commissioning of the HVAC systems. The purpose of this effort is to bring the project mechanical systems to a state of dynamic operation in accordance with the contract documents by verifying the operation of individual components, subsystems and systems.

F. The Owner will retain the services of an independent commissioning agent (CA) separate from the work of this Contract. As herein specified the Owner and CA shall develop detailed commissioning procedures, equipment checkout procedures and data forms for recording compliance with contract documents, performance and punchlist deficiencies, and will assist in developing schedules for checkout and Owner acceptance, at a future date during the construction phase.

G. Each Contractor and the General Contractor shall include as part of the work of this contract, labor and material to provide manpower, equipment, tools, ladders, instruments, etc. necessary to accomplish the work and labor and material for execution, monitoring and printing data forms necessary to verify and record system observations.

H. The Test and Balance Contractors shall include as part of the work of this contract, labor and material to provide manpower, equipment, tools, ladders, instruments, etc. necessary to execute and accomplish the work.

I. At the completion of the start-up, operations performance test and test and balance, the Contractor shall conduct a 72 hour dynamic mode demonstration of the systems in the presence of the Owner/Architect/Engineer and CA.

1.4 SCOPE

A. The following systems and equipment are included in the Scope of Commissioning for this project:

B. Mechanical/HVAC Systems: All Division 23 equipment and systems are subject to commissioning, including but not limited to the systems listed below. All components and devices (sensors, valves, etc.) that make up these systems are included.

1. Rooftop Air Handling Unit Systems:
    a. Coil entering and leaving air temperature.
    b. Coil entering and leaving water temperature.
    c. Coil water pressure drop.
    d. Space temperatures at thermostats or sensors.
    e. Total fan air CFM.
    f. Selected air flow readings at major branch ducts and grilles.
    g. Fan speed.
    h. Fan total static pressure.
2. VAV System:
    a. Box entering air temperature.
    b. Space temperature at thermostats or sensors.
    c. Total box air CFM minimum position and maximum position.
    d. Selected air flow readings at branch ducts and grilles.
    e. Static pressure entering and leaving box.
3. Fan Powered Systems:
    a. Coil entering and leaving air temperature.
    b. Coil entering and leaving water temperature.
    c. Space temperatures at thermostats or sensors.
    d. Total fan air CFM.
    e. Selected air flow readings at major branch ducts and grilles.
    f. Fan speed.
    g. Fan total static pressure.
4. Ventilation/Outside Air Fans:
    a. Total fan CFM.
    b. Fan speed.
    c. Fan total static pressure.

5. Exhaust Fans:
   a. Total fan CFM.
   b. Fan speed.
   c. Fan total static pressure.
6. Coils (electric):
   a. Input Kw
   b. Entering and leaving air temperature.
7. Heat Exchangers:
   a. Entering water temperature and pressure.
   b. Leaving water temperature and pressure.
8. Electric Motors:
   a. Full load amperes and voltage.
   b. Starter heater size and rated amperage range for heater installed.
   c. Measure running current, after adjustment of system to deliver rated performance.
9. Controls:
   a. Operational setting of controllers and instruments.
   b. Positioning and function of valves and dampers.
   c. Interlock and operation of systems (HVAC and Fire)
10. Refrigeration System:
   a. Compressor safety and operating controls.
   b. Capacity reduction controls.
   c. Low ambient controls.
   d. Condenser fan operation.
11. Pumps:
   a. Water pressure entering and leaving.
   b. Installed impeller diameter.
12. Heat Pumps:
   a. EAT and LAT temperatures on each coil.
13. Heat Recovery Systems
   a. Entering and leaving temperature.

C. Building Automation Systems (BAS)

1. The entire BAS shall be subject to commissioning, including all hardware components, software, networking, programming and engineering services, and controls documentation.

1.5 DEFINITIONS AND ABBREVIATIONS

A. Refer to Section 01 91 00 for a complete list of Definitions and Abbreviations.

1.6 REFERENCE STANDARDS

A. Refer to Section 01 91 00 for a complete list of Reference Standards.

1.7 DOCUMENTATION

A. Documentation shall be as required in Section 01 91 00. In addition, Contractor shall also provide to the CxA the following per the procedures specified herein, in the Cx Plan, and in other Sections of the specification:

1. Factory Test Reports: Contractor shall provide any factory testing documentation or certified test reports required by the specifications. These shall be provided prior to the Acceptance Phase. Factory Test Reports should be provided in PDF electronic format. These may include but are not limited to:

   a. Rooftop Air Handling Units

   b. Heat Pumps

c. Fans Capacity

d. Fan Sound Power Levels

e. Pump Capacity

2. Field Testing Agency Reports (other than TAB): Provide all documentation of work of independent testing agencies required by the specification. These shall be provided prior to Acceptance Phase. Field Testing Agency Reports should be provided in PDF electronic format. These may include but are not limited to:

a. Pipe Pressure Testing

b. Duct Leakage Testing

c. Water Treatment

3. TAB Plan: The Testing, Adjusting, and Balancing Plan shall include the following:

a. Certifications on all instruments to be used throughout the testing. Certification must be documented within the previous 6 months.

b. Résumés and Certification of individuals who will be balancing the systems.

c. Detailed step-by-step plans for each procedure to be performed by the TAB Contractor.

d. Sample forms to be used for each measurement.

e. Sample balancing report.

4. Piping Cleaning, Flush, and Fill Plan: Contractor shall provide this document in accordance with details in this Section. CxA will review.

5. Temporary Operating and Conditioning Plan: Contractor shall provide in accordance with details in this Section. CxA will review.

6. Completed TAB Reports. CxA will review prior to FPT.

1.8 SEQUENCING AND SCHEDULING

A. Refer to Section 01 91 00.

1.9 COORDINATION MANAGEMENT PROTOCOLS

A. Coordination responsibilities and management protocols relative to Cx are initially defined in Section 01 91 00 and the Cx Plan, but shall be refined and documented in the Construction Phase Cx Kick-Off Meeting. Contractor shall have input into the protocols to be used and all Parties will commit to scheduling obligations. The CxA will record and distribute.

1.10 CONTRACTOR RESPONSIBILITIES

A. Refer to Section 01 91 00: Detailed Contractor responsibilities common to all Divisions are specified in Section 01 91 00. The following are additional responsibilities or notable responsibilities specific to Division 23.

B. Construction Phase

1. Provide skilled technicians qualified to perform the work required.

2. Provide factory-trained and authorized technicians where required by the Contract Documents.

3. Prepare and submit required draft Start-Up Documentation and submit along with the manufacturer’s application, installation and start-up information.

4. Provide assistance to the CxA in preparation of the specific Functional Performance Test (FPT) procedures. Contractors, subcontractors and vendors shall review FPT procedures to ensure feasibility, safety and equipment protection and provide necessary written alarm limits to be used during the tests. Damage caused to equipment performed in accordance with the approved procedures will be the responsibility of the Contractor.
5. Thoroughly complete and inspect installation of systems and equipment as detailed throughout Contract Documents, as required by reference or industry standards, and as specifically indicated elsewhere this Section.
6. Start-Up, test/adjust/balance, and Turn-Over systems and equipment prior to functional performance testing by the CxA. Approved Start-Up Documentation shall be in accordance with Contract Documents, reference or industry standards, and specifically elsewhere in Part I of this Section.
7. Record Start-Up on approved Start-Up Documentation forms and certify that the systems and equipment have been started and or tested in accordance with the requirements specified above and in Section 01 09 00. Each task or item shall be indicated with the Party actually performing the task or procedure.
8. TAB: As outlined in Section 23 05 93. Specifically as it relates to Cx:
    a. Attend Construction Phase Cx Kick-Off Meeting and Cx progress meetings beginning within 3 months of start of TAB work;
    b. Submit TAB Plan as indicated above;
    c. Meet with Cx team to review TAB procedures and documentation required;
    d. Demonstrate TAB procedures for repetitive tasks (zone balancing, AHU adjusting) as called for by the CxA;
    e. Participate in Action List dialogue;
    f. Provide all documentation electronically.

C. Acceptance Phase
1. Assist CxA in Functional Performance Testing. Assistance will typically include the following:
    a. Manipulate systems and equipment to facilitate Functional Performance Testing (as specified in Section 01 91 00, Section 01 91 10, and the Cx Plan; in some cases this will entail only an initial sample);
    b. Provide any specialized instrumentation necessary for Functional Performance Testing;
    c. Manipulate BAS and other control systems to facilitate Functional Performance Testing (as specified in Section 01 91 00, Section 01 91 10, and the Cx Plan; in some cases this will entail only an initial sample);
    d. Provide a TAB technician to work at the direction of CxA for up to 8 hours beyond assistance specified above.
    e. Provide a BAS technician to work at the direction of CxA for up to 16 hours beyond assistance specified above.

D. Warranty Phase
1. Maintain record documentation of any configurations, setpoints, parameters, etc. that change throughout the Warranty Period.
2. Provide representative for off-season testing as required by CxA.
3. Respond to warranty issues as required by Division 01 and the General Conditions.

1.11 EQUIPMENT SUPPLIER RESPONSIBILITIES

A. Refer to Section 01 91 00.

1.12 CONTRACTOR NOTIFICATION AND SCHEDULING

A. Refer to Section 01 91 00.

1.13 START-UP DOCUMENTATION

A. Refer to Section 01 91 00.

1.14 EQUIPMENT NAMEPLATE DATA

A. Refer to Section 01 91 00.

1.15 PIPING CLEANING, FLUSH, AND FILL PLAN

A. Contractors shall provide a “Piping Cleaning, Flush, and Fill Plan” to the CxA that provides a descriptive narrative and supporting calculations of the means and methods that will be used to clean out, flush, and fill the piping systems. CxA will review and post the final approved document to the Portal.

B. The “Piping Cleaning, Flush, and Fill Plan” shall incorporate and be inclusive of all requirements of individual Sections relating to piping and pipe cleaning and flushing. In addition to the requirements of any other related Section, this document shall consist of the following at a minimum for each individual hydronic loop:

1. Overview schematic diagram of each of the hydronic systems, showing individual flow components such as chillers, boilers, pumps, heat exchangers, cooling towers, control valves, and strainers.
2. Narrative and illustration indicating the equipment that will either participate or be bypassed by fluid flow during the clean and flush process.
3. For equipment to be bypassed, description of the means for providing the bypass, including the type, size, and length of hoses or piping to be used.
4. Description of how flow is to be induced (permanent pumps, temporary pumps, etc.) and flow rates to be imposed during the flush process.
5. Calculation of resultant flow velocities in various portions of the piping system, with specific identification of the minimum velocity sections of the piping loop. Velocities should generally be shown to be above a 7 feet-per-second minimum speed to provide for adequate capability to flush and carry debris through the system to the appropriate strainer or clean-out location.
6. Description of cleaning methods and materials to be used to flush the system. Description shall include cleaning material and concentration, details of the cleaning process including duration of circulation and flushing intervals, criteria for determining a “clean” flush, and name and qualifications of cleaning or chemical treatment subcontractors to be used.
7. Identification and discussion of any isolated sections or ‘dead-legs’ that will be present, including means to provide cleaning and flushing for these sections.
8. Details of the strainers to be used for the flush and clean process, as well as final strainers to be used after cleaning. Contractor shall clean all strainers prior to turning over the system for commissioning.
9. If the cleaning and flushing process is to be phased in sections, details should be provided to clarify how clean sections will be protected as other sections are flushed.

1.16 TEMPORARY OPERATION AND CONDITIONING PLAN

A. Contractor shall be allowed to use permanent building equipment to provide temporary conditioning ONLY upon the approval of the A/E, Owner, and the CxA. Approval for such will only be given upon acceptance of a detailed TemGC. This Temporary Operating and Conditioning Plan shall be a required element of the Construction IAQ Management Plan required for the LEED Credit EQ 3.1. The Temporary Operating and Conditioning Plan shall consider/address the following at a minimum:

1. Indicate that the full Start-Up protocol, including development and documentation of Start-Up Documentation as required by the specification will be performed for the temporary start-up. The Temporary Conditioning Plan shall include the Start-Up Documentation to be used, which shall be the same as those that will be used for final Start-Up.

2. Contractor shall address how equipment will be maintained in good, clean condition. Specifically address:
   a. Temporary Filtering of Air: Air filters used for construction shall be as or more effective than those specified for permanent use. Contractor shall remove construction filters and replace with new filters prior to FPT. Filters shall be maintained and replaced at the specified final pressure drop. Contractor shall install a magnehelic gauge for visual indication of pressure drop as well as setting and adjusting the loaded filter DP switch for monitoring on the BAS.
   b. Temporary Filtering of Water and Condensate: Construction strainers shall be used while circulating fluid during construction. Construction strainer shall be finer than that specified for final strainers.
   c. Sealing/Filtering of Open Ducts: Address that all open ducts shall be either sealed or protected with filter media. Return or exhaust systems shall not be used during construction unless otherwise approved.
   d. Lubrication and Maintenance: Contractor shall maintain the systems and equipment in accordance with the manufacturer's instructions. Contractor shall coordinate lubricants used with Owner's operators. Frequency of lubrication and inspection shall be as recommended by manufacturer's literature. Applicable maintenance lubrication schedules shall be included in the Plan. Draft maintenance logs shall be submitted with Plan and completed as maintenance is performed.
   e. Operation Outside of Normal Ranges: Systems and equipment shall not be operated outside the range of specified conditions. The Temporary Conditioning Plan shall address how the Contractor will ensure that operation will not harm the equipment.
   f. Emergency Condition Identification and Response Protocols: The Temporary Conditioning Plan shall address protocols for responding to equipment malfunctions and or harmful operation. Automatic safeties and remote enunciation shall be in place to protect people and property. Temporary operation shall not be allowed until there is an automatic communication/enunciation medium such as a phone connection or an Internet connection. At a minimum, an alarm on the equipment used for temporary service shall be automatically sent to the Contractor's 24 hour monitoring service and to the Owners help desk. The Contractor shall respond to and be responsible for securing conditions within the building. Owner shall assess the situation and as necessary secure utilities feeding the building from isolation points outside of the building.

3. Campus Utility Impact: The Temporary Conditioning Plan shall address the expected impact on the campus utilities involved in the temporary conditioning equipment. Specifically address:
   a. How the systems will be controlled to both ensure they are operating in range, and to avoid energy waste or inefficient conditions;
   b. Project the range of loads and flows to be imposed on the campus systems. For cooling, indicated how you will ensure a temperature split of at least 12°F.
   c. For campus chilled water connections, the bridge connection and automatic control of the bridge-related sequences shall be installed, functional and tested.
4. Building Protection: Address how the system will be controlled to avoid humidity conditions that could either promote mold growth or cause corrosion.

5. Equipment Reconditioning: Address with specific means and methods how the equipment used for temporary conditioning will be reconditioned to like-new condition. Belts, seals, bearings, couplings, or other parts that wear more than 3% of their expected life shall be replaced.
6. Cleaning: Address how ducts, pipes, coils, converters, air handling equipment, terminal units, etc. shall be cleaned prior to Turn-Over.
7. Operations Log: Contractor responsible for operating the equipment shall maintain a log of all activities associated with operating and maintaining equipment. Log shall be submitted to Owner on a frequency specified by the Owner.
8. Operating System Alterations: The Temporary Conditioning Plan shall address specific protocol for doing work on the systems.
9. Damages: Any material, device, component, or equipment that is assessed as damaged or as having a substantially shortened life as a result of temporary conditioning operation shall be replaced by the Contractor at no cost to the Owner or to the project.
10. Segregation: Where only portions of a system are to be used, Contractor shall specifically indicate how the used portion will be isolated from the unused portion. The Temporary Conditioning Plan shall address how to ensure that the reduced operation condition will be maintained within acceptable ranges, and/or how capacity will be throttled to keep all operating parameters in recommended ranges.

1.17 TRAINING EVENTS AND TRAINING PLAN

A. Contractors, subcontractor, vendors, and other applicable Parties shall prepare and conduct training sessions on the installed systems and equipment they are responsible for per the requirements of Section 01 91 00 and the individual Specifications.

1.18 SYSTEMS MANUAL AND O&M DOCUMENTATION CONTENT - PREPARATION AND LOGISTICS

A. Refer to Section 01 91 00 the individual Specifications.

1.19 BAS TRENDING REQUIREMENTS

A. Trending requirements are as specified in Section 01 91 00 and Section 230801

B. The BAS Contractor shall configure and analyze all trends required under Section 230801.

C. Trends are historical archives on computer disks that document the operation of the systems and equipment. Trends can be time-series (interval) recordings of system I/O parameters or change-of-value (COV) based trends that record when a system value changes by more than a specified threshold.

D. CxA will analyze trend logs of the system operating parameters to evaluate normal system functionality. The requirements of the trending are specified below. Contractor shall establish these trends, ensure they are being stored properly, and forward the data in electronic format to the CxA.

E. Data shall include a single row of field headings and the data thereafter shall be contiguous. Each record shall include a date and time field. Recorded parameters for a given piece of equipment or component shall be trended at the same time intervals and be presented in a maximum of two separate two dimensional formats with time being the vertical axis and field name being the horizontal axis.. Data shall be forwarded in one of the following formats.
   1. Microsoft Access Database (.mdb)
   2. Microsoft Excel Spreadsheet (.xls)
   3. Comma Separated Value (.csv or .txt), preferably with quotes delimiting text fields and # delimiting date/time fields.

F. Sample times indicated as COV (±) mean that the changed parameter only needs to be recorded whenever the value changes by the amount listed. When output to the trend file, the latest recorded value shall be listed along with the

time increment record. If the BAS does not have the capability to record based on COV, the parameter shall be recorded based on the time interval common to other point trends for the system.

G. Contractor shall provide the CxA with required passwords, phone numbers, etc. to allow the CxA access to the trend log data and allow downloading to a remote location. Contractor shall also provide step-by-step written instructions for accessing the data.

1.20 FUNCTIONAL PERFORMANCE TESTING

A. Contractor shall participate in the initial samples of Functional Performance Testing as stipulated in Section 01 91 00 and Section 01 91 10.

1.21 FPT ACCEPTANCE CRITERIA

A. Acceptance criteria for tests are indicated in Section 01 91 10 and in the specification Sections applicable to the systems being tested. Unless indicated otherwise, the criteria for acceptance will typically be that specified with the individual system, equipment, component, or device.

PART 2 - PRODUCTS

2.1 INSTRUMENTATION

A. General: All testing equipment used by any Party shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified. If not otherwise noted, the following minimum requirements apply:

B. Temperature sensors and digital thermometers shall have a certified calibration within the past year and a resolution of +/- 0.1°F.

C. Pressure sensors shall have an accuracy of +/- 2.0% of the value range being measured (not full range of meter) and have been calibrated within the last year.

D. All equipment shall be calibrated according to the manufacturer's recommended intervals. Calibration tags shall be affixed or certificates readily available.

E. Standard Testing Instrumentation: Standard instrumentation used for testing air and water flows, temperatures, humidity, noise levels, amperage, voltage, and pressure differential in air and water systems related to functional testing shall be provided by CxA.

F. Special Tools: Special equipment, tools and instruments (only available from vendor, specific to a piece of equipment) required for testing equipment, according to these Contract Documents shall be included in the base bid price to the Contractor and turned over to the Owner upon project completion.

2.2 WEB-BASED COMMISSIONING PORTAL

A. All general and major subcontractors participating in the Cx process shall use the web-based Cx Portal ('Portal') to document the Cx procedures. The Portal is a Web-based Internet hub used to electronically collaborate and coordinate activities and deliverables throughout the Cx process. The Portal is hosted by the CxA and shall be accessible to all Parties participating in the Cx program. The Portal provides a common location to store Start-Up Documentation, Functional Performance Tests and results, project documents and deliverables. It also serves as a collaborative email hub to facilitate, automate, and track communications between Parties relating to the Cx process.

B. Refer to Section 01 91 00 the individual Specifications for additional information and requirements for using the Portal.

PART 3 - EXECUTION

3.1 GENERIC START-UP DOCUMENTATION - GENERAL

A. Part III of this Section outlines 'generic' or minimally acceptable Start-Up Documentation (which are defined to include both 'Start-Up Checks' and 'Start-Up Tests') and individual systems training requirements for systems and equipment. These procedures are the direct responsibility of the Contractor as a basic element of validating that the installation is correct per normal quality control practices. These items shall provide a minimally acceptable guideline for required Contractor development of Start-Up Documentation. Contractor shall synthesize these minimum requirements along with their own internal quality control practices, those of the manufacturer, and any applicable codes and standards to develop specific and itemized final Start-Up Documentation specific to the equipment and systems installed on this project.

B. Section 01 91 00 defines the systems and equipment Start-Up process in detail and provides definitions for Start-Up Documentation, including the generic Start-Up Documentation provided below.

3.2 SYSTEM COMMISSIONING

A. All systems components, equipment, etc. furnished as part of this Contract shall be subjected to system commissioning as hereinafter specified. All systems, components, equipment, etc. commissioned in this section of the Specifications shall be evaluated based on the sequences of control/operation, performance characteristics, and equipment schedules, etc. as specified in other sections of the Specifications and as shown on the contract drawings. Systems, components, equipment, etc. that does not have specified operating sequence, etc. shall be operated and evaluated based on its use and function for this project.

B. Commissioning Documentation: The Contractor shall maintain the commissioning documentation in 3-ring binders. The commissioning documentation shall be organized by system when practicable. All pages shall be numbered and a table of contents page shall be provided. The commissioning documentation shall include, but not be limited to, the following:

1. Design Criteria provided by the A/E.
2. Approved Test and Balance Report for the system or component being commissioned, provided by Test and Balance Contractor.
3. Approved submittals for all equipment to be commissioned, provided by Mechanical Contractor.
4. All approved shop drawings of equipment to be commissioned. Shop drawings shall be full size sheets folded as required to fit in binders. Provided by Mechanical Contractor.
5. All pre-commissioning checklists initialized by indicated personnel organized by system and subsystem.
6. All functional performance test checklist initialized by indicated personnel organized by systems and subsystems.
7. Three copies of the Operation and Maintenance Manuals specified in other sections of these specifications shall be reviewed by the CA for completeness and for applicability. The manuals shall be incorporated in the Commissioning Documentation prior to the commencement of the training required in other sections of the specifications. Preparation of Operation and Maintenance Manuals shall be as specified in other sections of these specifications.

C. Shop Drawings and As-Built Drawings and Specifications shall be assembled by the Contractor after completion of the pre-commissioning phase and turned over to the Owner's representative. Changes as a result of subsequent Commissioning procedures will be incorporated (as required) at the conclusion of final Commissioning.

D. Commissioning Schedule:

1. Phase 1 - Preliminary Commissioning: All shop drawings, including but not limited to, equipment, controls, test and balance reports, and operation and maintenance manuals, shall be submitted and approved by the CA. In addition, all pre-commissioning checklists shall be completed (initialed by all parties).
2. Phase 2 - Functional Performance Testing shall be performed as indicated on the Functional Performance Test Checklists. Functional Performance Testing shall not begin until Phase 1 of the commissioning process is complete. Owner's operation and maintenance personnel shall observe the function performance testing. The Contractor may perform initial system familiarization and training of Owner's operating and maintenance personnel required under other sections of the Specification during the functional performance testing.
3. Functional Performance Test Notification: The Contractor shall notify the CA 2 weeks before functional performance testing is to begin.
4. Phase 3 - System training and operating instructions shall be conducted by the Contractor as indicated in the specifications of each item of equipment. The Contractor shall be responsible for specified training and operating instructions being observed by the CA.

E. Pre-Commissioning Checklists:

1. Pre-Commissioning Checklists shall be developed by the CA and shall be executed and certified prior to the commencement of functional performance testing. The indicated initial is required in each location for all items, except where an "X" is shown indicating an initial is not required. See initials legend below for required initials. The pre-commissioning checklist will not be accepted as complete until all items have been initialed signifying this portion of the project is ready for Functional Performance Testing. The Contractor shall provide the CA with the completed Pre-Commissioning Checklists for his review and initials. The CA shall be the last person to initial each checklist item. The Contractor shall submit for approval a list of all contractor and subcontractor representatives responsible for the completion of the pre-commissioning checklist phase of the project. This list of representatives shall be submitted 2 weeks prior to commencement of any pre-commissioning activities of any systems or equipment. Representatives may be replaced only after written approval from the CA.
2. Initials Legend:
   a. Construction Manager.
   b. Mechanical Contractor's representative.
   c. Electrical Contractor's representative.
   d. Commissioning Agent.
   e. Balancing Contractor's representative.
   f. Controls Contractor's representative.
3. Pre-Commissioning checklists shall be provided for each system and piece of HVAC equipment to be Commissioned. Checklists shall be submitted to the Architect and Owner to review.

F. Functional Performance Test Checklist:

1. Functional performance testing shall be performed by the Contractor as directed by the CA and observed by a commissioning team consisting of the individuals indicated on the Functional Performance Test Checklists. The Contractor shall submit in writing a list of all contractor and subcontractor representatives responsible for the functional performance testing phase of the project. This list of representatives shall be submitted 2 weeks prior to the commencement of functional performance testing of systems and equipment. All representatives shall remain on the commissioning team throughout functional performance testing. Substitutions will not be permitted. Functional performance test checklists shall be completed in the presence of all commissioning team personnel at the time of the functional performance test.
2. Upon failure of completion of a functional performance test checklist, the Contractor shall provide a written report to the CA listing the deficiencies causing the failure and remedies to correct all deficiencies. After the

Contractor has corrected all deficiencies, the entire functional performance test checklist for the item of equipment shall be repeated. If possible, corrections can be accomplished during the functional performance testing of equipment in other non-related systems. In any case, no system will be accepted until all equipment items in the system have complete functional performance test checklists thereby demonstrating satisfactory performance.

3. Failure to complete 2 functional performance test checklists constitutes failure of Phase 2 of the HVAC Commissioning process. The Contractor shall provide a written report to the CA listing the deficiencies causing all failures and remedies to correct all deficiencies. After correction of all deficiencies, Phase 2 of the HVAC Commissioning process shall be repeated in its entirety. The Contractor shall give the CA 2 weeks notice before repeat functional performance testing is scheduled. Should the first or one subsequent functional performance test fail, the Owner reserves the right to obtain compensation from the Contractor for fees and expenses incurred in conjunction with having to perform more than two (2) functional performance tests.
4. Blank examples functional performance test checklists are in the Appendix 2 located at the end of this section of the specifications. A separate Functional Performance Checklist shall be provided for each system and piece of equipment to be Commissioned.

3.3 DEMONSTRATION TEST

A. After completion of system start-up, operating performance test and commissioning, but before Owner acceptance, the Contractor shall conduct a 72 hour dynamic mode demonstration of the systems provided under this Contract. The intent of the 72 hour dynamic test is to verify that the mechanical and electrical equipment will respond as designed to meet the changes that may occur under varying indoor/outdoor conditions including seasonal variations and occupancy loads.

B. A detailed procedure and sequence of events shall be developed by the Contractor and submitted to the Owner and CA for review and approval. Procedures and sequence of events should contain as a minimum the following activities:

1. Hours 1-4: Bring all systems on line for standard operations and parameters.
2. Hours 5-28: Operate all systems under normal parameters and verify proper operation.
3. Hours 29-52: Validation of systems operation through indoor/outdoor changes to include heating, cooling, ventilation, humidity control and control systems.
4. Hours 53-72: Return of systems to normal operation.

C. Systems and their associated equipment which are to be included in the dynamic test are all systems and components furnished under this Contract and as a minimum will include, but are not limited to the following:

1. Pressurization Air Handling Systems
2. Air Handling Systems
3. Geothermal/Condenser Water Systems
4. Solar Thermal System
5. Heat pump Systems
6. Pumping Systems
7. Exhaust Systems
8. Air Filtration Systems
9. Building Management and Control Systems

D. Contractor shall notify the Owner and CA in writing that the project is completed and ready for the demonstration test. Schedule for test will then be established and documented. Initiation of the 72 hours dynamic test will not occur until all systems are balanced, operational and incorporated into the building management and control system.

Should the demonstration test fail for any reason, the problems shall be corrected and another demonstration test conducted. Should the first or one subsequent demonstration test fail, the Owner reserves the right to obtain compensation from the Contractor for fees and expenses incurred in conjunction with having to witness more than two (2) 72 hour demonstration tests.

E. The attendees of each 72 hour demonstration test shall include representative from the following organizations:

1. General Contractor
2. Mechanical Contractor
3. Electrical Contractor
4. Test and Balance Contractor
5. Building Management and Control System Contractor
6. Architect of Record
7. Mechanical Engineer
8. Electrical Engineer
9. Commissioning Agent

Minor problems are anticipated and the necessary personnel required to correct problems and adjust systems need to be available to insure continuation of the dynamic testing process. Is major problems are encountered, at the discretion of the Owner and CA, the testing will be terminated and rescheduled.

The Contractor shall notify any external organizations, which are not directly involved in the testing, but might be affected due to interface to insure that false alarms do not occur.

F. During the demonstration test all systems shall operate in the “hands-off” automatic mode in accordance with the requirements of the Contract Documents. Changes in operating modes required to simulate load shifting, seasonal changeover, emergency modes, etc. will be accomplished by changing set points and equipment operating status at the BMS central control console as required to observe capacity control and monitoring. Provide a readout of space temperature at each thermostat, building relative humidity, building pressurization, chilled water supply and return temperatures, chiller capacity and other critical measurements.

3.4 START-UP DOCUMENTION COMMON TO ALL SYSTEMS

A. The following Start-Up Documentation (Checklists and Tests) shall be considered common to all systems:

1. Checkout shall proceed from lower level devices to larger components to the entire system operation.
2. Verify labeling is affixed per specification and visible.
3. Verify prerequisite procedures are done.
4. Inspect for damage and ensure none is present.
5. Verify system is installed per the manufacturer’s recommendations.
6. Verify system has undergone Start-Up per the manufacturer’s recommendations.
7. Verify that access is provided for inspection, operation and repair.
8. Verify that access is provided for eventual replacement of the equipment.
9. Verify that record drawings, submittal data and O&M documentation accurately reflect the installed systems.
10. Verify all gauges and test ports are provided as required by contract documents and manufacturer’s recommendations.
11. Verify all recorded nameplate data is accurate.
12. Verify that the installation ensures safe operation and maintenance.
13. Verify specified replacement material/attic stock has been provided as required by the Contract Documents.
14. Verify all rotating and moving parts are properly lubricated.
15. Verify all monitoring and ensure all alarms are active and set per Owner’s requirements.
16. Complete all nameplate data and confirm that ratings conform to the design documents.

3.5 VALVES

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions:

1. Operate all valves, manual and automatic, through their full stroke. Ensure smooth operation through full stroke and appropriate sealing or shutoff.
2. Verify actuators are properly installed with adequate clearance.
3. Verify all valves are labeled per the construction documents. Confirm that concealed valves are indicated on the finished building surface.
4. For automatic pneumatically-operated valves, verify spring range and adjust pilot positioners where applicable.
5. For electronically operated valves, check the stroke and range.
6. For all automated valves controlled by a program, ensure that the minimum and maximum stroke and ranges on the valves are coordinated with the limits entered in the program.

3.6 METERS AND GAUGES

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions:

1. Adjust faces of meters and gauges to proper angle for best visibility.
2. Clean windows of meters and gauges and factory-finished surfaces. Replace cracked and broken windows, and repair scratched and marred surfaces with manufacturer's touch-up paint.
3. For meters and gauges requiring temporary manual connection of read-out device such as pressure taps on a flow measuring device, ensure threads are clean and that connection can be made easily.
4. Meters and gauges requiring manual connection of readout device shall be installed with adequate access to allow connection of device with normal tools.

3.7 MECHANICAL IDENTIFICATION

A. Start-Up Checks: Perform the following checks:

1. Verify all valve tags, piping, duct, and equipment labeling corresponds with drawings and indexes and meets requirements specified. Correct any deficiencies for all piping and duct systems.
2. Adjusting: Relocate any mechanical identification device which has become visually blocked by work of this division or other divisions.
3. Cleaning: Clean face of identification devices, and glass frames of valve charts.

3.8 MECHANICAL INSULATION

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Start-Up Checks: Examine all piping, systems and equipment specified to be insulated.

1. Ensure quality of insulation. Patch and repair all insulation damaged after installation.
2. Ensure the integrity of vapor barrier around all cold surfaces.

3.9 PIPING - GENERAL

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Start-Up Checks: These procedures apply to all installed piping systems, including underground site utilities.

1. Inspect all piping for proper installation, adequate support (with appropriate vibration isolation where applicable) and adequate isolation valves for required service.
2. Submit welding certifications as required by the applicable specification section or referenced ASME specification.
3. Submit certified welding inspection results per the applicable specification section or referenced ASME specification. ASME B31.1 requires 100% inspection based on pressure class.
4. Provide notification of pipe cleaning and flushing activities.
5. Flush and clean all piping and clean all strainers. Provide documentation of all related procedures.
6. Ensure adequate drainage is provided at low points and venting is provided at high points.
7. Ensure facilities to effectively drain and fill the system are in place.
8. Ensure air is thoroughly removed from the system as applicable.
9. Ensure all piping is adequately supported and anchored to allow expansion. Bump across-the-line pumps and inspect for excessive pipe movement.
10. Provide notification of pressure testing.
11. Pressure and/or leak test all applicable systems in accordance with the requirements in the applicable sections, ASME B 31.1 and 39.1 as applicable.
12. Sterilize applicable piping systems as specified in the individual Sections and as required by regulatory authorities.
13. Submit pressure test reports that document the pressure testing results with certification of the results.
14. Verify the operation of applicable safety relief valves, operating controls, safety controls, etc. to ensure a safe installation.
15. Set and adjust fill, pressure, or level controls to the required setting.

3.10 AC MOTORS

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions:

1. Verify proper alignment, installation, and rotation.
2. Verify properly sized overloads are in place

C. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up and as specified in manufacturer's instructions:

1. Measure insulation resistance, phase balance, and resistance to ground.
2. Measure voltage available to all phases. Measure amps and RPM after motor has been placed in operation and is under load.
3. Record all motor nameplate data.

3.11 BEARINGS

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions. This applies to all bearings on fans, pumps, compressors, and other equipment installed under this Division.

1. Check alignment as applicable.
2. Lubricate all bearings per the manufacturer's instructions. When bearing is used for temporary conditioning, lubricate on manufacturer's recommended frequency and document it.

C. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up and as specified in manufacturer's instructions:

1. Use infrared thermometer to measure temperature at peak conditions. Ensure temperature is below manufacturer's recommendations.
2. For bearings in drives with motors over 10 HP, use a vibration meter and measure the maximum peak-to-peak acceleration. Compare it to the Vibration Severity Chart. Rectify any condition causing severity indicated as "Rough" or worse.

3.12 VARIABLE SPEED DRIVES

A. Include all applicable 'Start-Up Checks Common to All Systems". Additional Start-Up Checks and Tests are as follows.

B. General: Provide the services of a factory authorized service representative to test and inspect unit installation, provide start-up service, and to demonstrate and train Owner's maintenance personnel as specified below.

C. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's instructions:

1. Check unit for shipping damage.
2. Perform a point-to-point continuity test for all field installed wiring interconnections. Verify terminations of field-installed wiring.
3. Check for proper torque on connections.
4. Verify use of shielded cable where specified and check that shields have been terminated properly.
5. Verify grounding.
6. Check motor nameplate against drive input rating.
7. Manually rotate motor shaft to ensure free rotation.
8. Check that motor leads are not grounded.

D. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up and as specified in manufacturer's instructions. Ensure device and system which drive is serving is configured to withstand the device operation specified below.

1. Adjust the 'Minimum Voltage Adjustment' to enable starting but not to draw excessive power at start.
2. Adjust the 'Volts/Hz Adjustment' to proper setting.
3. Adjust the 'Acceleration and Deceleration Rates' to the specified times.
4. Adjust 'Current Limiting' to coordinate with the overcorrect device and protect the motor.
5. Set the 'Maximum and Minimum Speed' pots.
6. Manually ramp fan speed from minimum to maximum and check for excessive noise and vibration.
7. Determine any critical speeds to avoid and set these in the drive.
8. Check for acceptable voltage and current distortion on the power system. Record the input and output voltages and currents showing the harmonic content as a percentage of the base frequency.
9. Measure and record overall efficiency at 50%, 75%, and 100%.
10. Record the motor terminal voltage.

E. Training: Train Owner's maintenance personnel on procedures and schedules related to start-up and shutdown, troubleshooting, servicing, and preventative maintenance. Review data in manufacturer's Operation and Maintenance Manuals.

3.13 HYDRONIC PIPING

A. Include all applicable 'Start-Up Checks Common to All Systems". Additional Start-Up Checks and Tests are as follows.

B. Start-Up Checks: Perform the following checks during start-up:

1. Prepare hydronic and test piping in accordance with applicable Section and ASME B 31.9 and/or B 31.1.
2. Flush system with clean water in accordance with applicable Section.
3. Clean strainers.
4. Check expansion tanks to determine that they are not air-bound and that the system is completely full of water.
5. Set automatic fill valves for required system pressure.
6. Check air vents at high points of systems and determine if all are installed and operating freely (automatic type) or to bleed air completely (manual type).
7. Set and coordinate automatic fill pressure and relief valve settings.

C. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up:

1. Chemical Treatment: Provide a water analysis prepared by the chemical treatment supplier to determine the type and level of chemicals required for prevention of scale and corrosion. Perform initial treatment after completion of system testing.

3.14 PUMPS

A. Include all applicable 'Start-Up Checks Common to All Systems". Additional Start-Up Checks and Tests are as follows.

B. Refer to 'AC Motors' in this Section.

C. Refer to 'Bearings' in this Section.

D. Refer to Division 23 Section "Testing, Adjusting, and Balancing" for detailed requirements for testing, adjusting, and balancing hydronic systems.

E. Start-Up Checks: Perform the following checks during start-up:

1. Check suction lines connections for tightness to avoid drawing air into the pump.
2. Clean and lubricate all bearings.
3. Check motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
4. Check that pump is free to rotate by hand. For pumps handling hot liquids, pump shall be free to rotate with the pump hot and cold. If the pump is bound or even drags slightly, do not operate the pump until the cause of the trouble is determined and corrected.
5. Clean associated strainers.
6. Check that the proper overloads have been installed in the starter and are the correct size.
7. Verify that the integrity of the vibration isolation is maintained throughout the support and the connections.
8. Align pump within manufacturers recommended tolerances.
9. Ensure all associated piping has been cleaned, tested, and deaerated.
10. Verify that all thermometers and gauges are installed, are clean and undamaged, and are functional.

F. Start-Up Tests: Perform the following tests, measurements, or procedures during start-up:

1. Start the pump per the manufacturer's instructions.
2. Check the general mechanical operation of the pump and motor.
3. Verify that checkvalve seal is appropriate.
4. Check noise and vibration levels and ensure they are within the manufacturer's recommended tolerances.
5. Check that the NPSH is with that allowable for the operating condition.
6. Refer to Division 23 Section "Testing, Adjusting, and Balancing" for detailed requirements for testing, adjusting, and balancing hydronic systems.

3.15 PACKAGED HEATING AND COOLING UNITS

A. Include all applicable 'Start-Up Checks Common to All Systems". Additional Start-Up Checks and Tests are as follows.

B. General: Provide the services of a factory-authorized service representative to test and inspect unit installation, provide startup service, and to demonstrate and train Owner's maintenance personnel as specified below.

C. Refer to AC Motors in this section.

D. Start-Up Checks: Perform the following inspections/checks during start-up:

1. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.
2. Install new filters after start-up.

E. Training: Factory-authorized representative shall train Owner's maintenance personnel including:

1. Procedures and schedules related to start-up and shutdown, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
2. Familiarization with contents of Operating and Maintenance Manuals.

3.16 ROOFTOP HEATING AND COOLING UNITS

A. Include all applicable 'Start-Up Checks Common to All Systems". Additional Start-Up Checks and Tests are as follows.

B. General: Provide the services of a factory-authorized service representative to test and inspect unit installation, provide startup service, and to demonstrate and train Owner's maintenance personnel as specified below.

C. Refer to AC Motors in this section.

D. Start-Up Checks: Perform the following inspections/checks during start-up:

1. Ensure unit is level.
2. Coils are undamaged and fins are combed.
3. Condenser fan rotates freely and check rotation direction.

E. Start-Up Tests: Perform the following before or during start-up:

1. Start-up condensing units, in accordance with manufacturer's start-up instructions.
2. Test controls and demonstrate compliance with requirements. Replace damaged or malfunctioning controls and equipment.
3. Charge systems with refrigerant and oil, and test for leaks. Repair leaks and replace lost refrigerant and oil.
4. Install new filters after start-up.

F. Training: Factory-authorized representative shall train Owner's maintenance personnel including:

1. Procedures and schedules related to start-up and shutdown, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
2. Familiarization with contents of Operating and Maintenance Manuals.

3.17 TERMINAL UNITS

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Start-Up Checks: Perform the following inspections/checks during start-up:

1. After construction is completed, including painting if applicable, clean unit exposed surfaces.
2. Vacuum-clean terminal coils and inside of cabinets.
3. Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint.
4. Verify adequate access for maintenance.
5. Check power and control voltages.
6. Check rotation of fan where applicable.
7. Check calibration and operation of the controlling elements.
8. Check control valves for required close-off and fail position.
9. Install new filter units for terminals requiring same.

3.18 VAV TERMINAL UNITS

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Refer to and coordinate with Division 23 Section "Testing, Adjusting, and Balancing".

C. Start-Up Checks: Perform the following inspections/checks during start-up:
1. After construction is completed, including painting if applicable, clean exposed unit surfaces.
2. Clean factory-finished surfaces. Retouch any marred or scratched surfaces of factory-finished cabinets, using finish materials furnished by manufacturer.
3. Ensure unit is properly supported and that integrity of vibration isolation has been maintained where applicable.
4. Ensure that air velocity sensor is correctly installed and that inlet/outlet restrictions for accurate measurements have been met.
5. Ensure air inlet is free of obstructions. Start fans and ensure proper rotation (as applicable). Measure and record motor amperage and voltage.
6. Ensure the coils are undamaged, combed, and vented.
7. Check the heating device and control to ensure functionality and proper installation. Check stroke and range on the valve and ensure it closes and seals tightly.

D. Start-Up Tests: Perform the following during start-up:

1. Calibrate and adjust the airflow control parameters. Set applicable min and max setpoints. Coordinate with the ATC contractor as necessary to obtain flow parameters required.
2. Install new filters where required.
3. Set all temperature and humidity setpoints to those as directed by Owner.
4. Record supply air temperature at full cooling and at full heating (compare both with current air handler temp)

3.19 FANS

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. General: Provide the services of a factory-authorized service representative to test and inspect unit installation, provide startup service, and to demonstrate and train Owner's maintenance personnel as specified below.

C. References: The following additional Sections shall also apply:

1. Refer to AC Motors in this Section.
2. Refer to Bearings in this Section
3. Refer to Division 23 Section "Testing, Adjusting, and Balancing" for procedures for air-handling-system testing, adjusting, and balancing.
4. Refer to Division 23 Section “BAS Commissioning” for procedures for starting the controls related to the AHU.

D. Start-Up Checks: Perform the following inspections/checks during start-up:

1. Inspect the field assembly of components and installation of central-station air-handling units including piping, ductwork, and electrical connections.
2. Clean unit cabinet interiors to remove foreign material and construction dirt and dust. Vacuum clean fan wheel, fan cabinet, and coils entering air face. Ensure volatile irritants are contained and kept out of occupied spaces.
3. Adjust and lubricate dampers and linkages for proper damper operation.
4. Verify that unit is secure on mountings and supporting devices and connections for ductwork, and electrical are complete. Verify proper thermal overload protection is installed in motors, starters, and disconnects.
5. Ensure vibration isolation integrity is maintained with the fan installation and associated connections.
6. Disconnect fan drive from motor and verify proper motor rotation direction and verify fan wheel free rotation and smooth bearings operations. Reconnect fan drive system, align belts, and install belt guards.
7. Lubricate bearings, pulleys, belts, and other moving parts with factory-recommended lubricants.
8. Stroke all dampers to ensure free and full travel.

E. Training: Contractor shall train Owner's maintenance personnel including:

1. Procedures and schedules related to start-up and shut down, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
2. Familiarization with contents of manufacturer’s Operating and Maintenance Manuals.

3.20 ENERGY RECOVERY VENTILATION SYSTEMS (WHEEL-BASED)

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Refer to AC Motors in this Section.

C. Refer to Fans in this Section (if applicable).

D. General: Provide the services of a factory-authorized service representative to test and inspect unit installation, provide startup service, and to demonstrate and train Owner's maintenance personnel as specified below.

E. Start-Up Checks: Perform the following checks during start-up and as specified in manufacturer's start-up instructions:

1. Check for damage to the ERV wheel and media and ensure media is evenly/thoroughly impregnated.
2. Ensure the ERV wheel rotates freely.

3. Ensure all drive components are correctly installed, aligned and lubricated.
4. Ensure air seals are tight and properly installed.
5. Verify all controls are in place and that they are properly interfaced.

F. Start-Up Tests: Follow the manufacturer's written procedures and the following as a minimum:

1. Energize circuits.
2. Check for proper rotation in all modes of operation.
3. Start and run ERV unit through complete sequence of operations.
4. Measure and record the sensible and latent recovery efficiency.
5. Measure and record air pressure drop.
6. Adjust operating controls.

G. Training: Factory-authorized representative shall train Owner's maintenance personnel including:

1. Procedures and schedules related to start-up and shut down, troubleshooting, servicing, preventative maintenance, and how to obtain replacement parts.
2. Familiarization with contents of manufacturer’s Operating and Maintenance Manuals.

3.21 AIR CLEANING AND FILTERS

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. General: Operate installed air filters to demonstrate compliance with requirements. Test for air leakage of unfiltered air while system is operating. Correct malfunctioning units at site, then retest to demonstrate compliance; otherwise remove and replace with new units, and proceed with re-testing.

3.22 METAL DUCTWORK

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Temporary Closure: At ends of ducts which are not connected to equipment or air distribution devices at time of ductwork installation, provide temporary closure using polyethylene film or other covering which will prevent entrance of dust and debris until time connections are to be completed.

C. Start-Up Checks: Perform the following checks during start-up and as specified:

1. Clean ductwork internally of dust and debris, unit-by-unit as it is installed. Clean external surfaces of foreign substances which might cause corrosive deterioration of metal or, where ductwork is to be painted, might interfere with painting or cause paint deterioration.
2. Strip protective paper from stainless ductwork surfaces if applicable, and repair finish wherever it has been damaged.

D. Start-Up Tests: In addition to specifications, perform the following as a minimum:

1. Leakage Tests: After each duct system which is constructed for duct classes over 3" is completed, test for duct leakage in accordance with SMACNA HVAC Air Duct Leakage Test Manual. Repair leaks and repeat tests until total leakage is less than 1% of system design air flow.
2. Balancing: Refer to Division-23 section "Testing, Adjusting, and Balancing" for air distribution balancing of metal ductwork; not work of this section. Seal any leaks in ductwork that become apparent in balancing process.

3.23 DUCTWORK ACCESSORIES

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Start-Up Checks: Perform the following checks during start-up and as specified:

1. Cleaning: Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint.

C. Start-Up Tests: In addition to specifications, perform the following as a minimum:

1. Operate installed ductwork accessories to demonstrate compliance with requirements. Test for air leakage while system is operating. Repair or replace faulty accessories, as required to obtain proper operation and leak proof performance.
2. Label access doors in accordance with Division 23 Section "Mechanical Identification".
3. Adjusting: Adjust ductwork accessories for proper settings, install fusible links in fire dampers and adjust for proper action.
4. Final positioning of manual dampers is specified in Division 23 Section "Testing, Adjusting, and Balancing".
5. Fire Damper Testing: For every fire damper, remove the fusible link and verify that the damper operates freely and closes tightly. Reinstall the fusible link.

3.24 AIR TERMINALS

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Start-Up Checks: Upon completion of installation and prior to initial operation, check that air terminals are:

1. Properly installed with the proper airflow direction.
2. Properly supported with vibration isolation integrity maintained where applicable.
3. Duct connections to air terminals are leak-tight.
4. Operable dampers travel free.
5. Airflow measuring devices are properly installed and connected.
6. Repair or replace air terminals and duct connections as required to eliminate leaks, and retest to demonstrate compliance.
7. Clean exposed factory-finished surfaces. Repair any marred or scratched surfaces with manufacturers touch-up paint.

3.25 BUILDING AUTOMATION AND CONTROL SYSTEMS

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Start-Up Checks: Perform the following checks during start-up and as specified:

1. Cleaning: Clean factory-finished surfaces. Repair any marred or scratched surfaces with manufacturer's touch-up paint.

C. Start-Up Tests: Refer to Section 230801 “BAS Commissioning”. This requires manufacturers authorized representative to start-up, test, adjust, and calibrate direct digital and other microprocessor-based control systems and demonstrate compliance with requirements. This will include verification of sequences, normal and emergency operations, calibration, interfaces, and interlocks, etc.

3.26 TESTING, ADJUSTING, AND BALANCING

A. Reference: Perform testing, adjusting, and balancing (TAB) procedures on each system identified, in accordance with the detailed procedures outlined in the respective section and the referenced standards.

B. Start-Up Checks: In addition to specifications, perform the following as a minimum:

1. Cut insulation, ductwork, and piping for installation of test probes to the minimum extent necessary to allow adequate performance of procedures.
2. Patch insulation, ductwork, and housings, using materials identical to those removed.
3. Seal ducts and piping, and test for and repair leaks.
4. Seal insulation to re-establish integrity of the vapor barrier.
5. Mark equipment settings, including damper control positions, valve indicators, fan speed control levers, and similar controls and devices, to show final settings. Mark with paint or other suitable, permanent identification materials.
6. Retest, adjust, and balance systems subsequent to significant system modifications, and resubmit test results.
7. Test and adjust mechanical systems for sound and vibration in accordance with the detailed instructions of the referenced standards.

C. Training:

1. Train the Owner's maintenance personnel on troubleshooting procedures and on testing, adjusting, and balancing procedures.
2. Review for the Owner’s personnel the locations of TAB reports and data.

3.27 ROOM/ZONE CHECKOUT

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Contractor shall complete a checklist acknowledging completion of Div. 23 responsibilities for all rooms. Checklist shall include items such as the following as applicable:

C. Typical Room:

1. Diffusers, registers, and grilles installed and cleaned.
2. Zone controls in place and functional.
3. All terminal equipment functional, clean, and punched out.
4. Occupancy schedules entered with applicable control setpoints.

D. Rooms with Plumbing Fixtures

1. Plumbing fixtures clean and operational.

3.28 HEAT TRACING

A. Include all applicable ‘Start-Up Checks Common to All Systems”. Additional Start-Up Checks and Tests are as follows.

B. Electrician shall measure insulation resistance of heater with 1000 volt DC megohmeter (megger) after the plumber has attached heater to pipe and before thermal insulation has been installed. Insulation resistance, measured between braid and either bus wire, should be at least 20 megohms regardless of heater length. Record these readings for each circuit.

C. Contractor shall test continuity of both heater bus wires to verify connection of splices or tees.

D. Megger heater after thermal insulation has been installed and record readings. Insulation resistance should be at least 20 megohms when measured at 1000 volts DC.

E. If heater circuit fails either insulation resistance test or continuity test, electrician shall notify Plumbing Contractor. Plumbing Contractor must repair or replace circuits yielding unacceptable readings. Megger tests must be witnessed by Construction Manager and manufacturer's representative. Copy of test report shall be submitted to engineer. Manufacturer's representative shall retain one copy for their file and mail copy to factory for record.

3.29 SEQUENCING ILLUSTRATION

A. Reference Section 01 91 00.

END OF SECTION

SECTION 23 08 01

BUILDING AUTOMATION SYSTEM (BAS) COMMISSIONING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: The Work of this Section shall include but not be limited to the following:

1. BAS Start-Up and Functional Performance Testing.
2. Validation of proper and thorough installation of BAS and associated equipment.
3. Generic Start-Up Documentation for BAS.
4. Development of final Start-Up Documentation for BAS.
5. Functional Performance Testing of BAS.
6. Coordination of BAS-related training.
7. Documentation of BAS Operation and Maintenance Documentation.

B. Related Work and Documents

1. The Cx process references many related Sections.
2. Refer to Section 01 91 00 for a complete list of Sections on Related Work.

1.3 GENERAL DESCRIPTION

A. This section defines responsibilities of the Building Automation System Contractor to commission the BAS.

B. Commissioning (Cx) is the process of ensuring that (i) all building systems are installed and perform interactively according to the design intent; (ii) that systems are efficient and cost effective and meet the Owner's operational needs; (iii) that the installation is accurately documented; and (iv) that the Operators are adequately trained. Commissioning serves as a tool to minimize post-occupancy operational problems, and establishes testing and communication protocols to advance the building systems from installation to optimized, fully-dynamic operation.

C. Commissioning Authority (CxA) shall work with the Contractor and the design engineers to direct and oversee the Cx process and perform Functional Performance Testing.

D. The Commissioning Plan outlines the Cx process beyond the Construction Contract, including design phase activities and design team/owner responsibilities. The specification Sections dictate all requirements of the commissioning process relative to the construction contract. The Cx Plan is not part of the construction contract, although it is available for reference at the request of the Contractor.

1.4 SCOPE

A. The scope of Commissioning on this project shall include the entire BAS system.

1.5 DEFINITIONS AND ABBREVIATIONS

A. POT (Portable Operators Terminal): Portable operator workstation (typically a laptop computer) that has BAS software loaded and the capability to access, program, and edit the BAS.

B. HHD (Hand-Held Device): Portable device (typically with limited functionality) that is used to access components of the BAS. May be a standard PDA or proprietary device/interface.

1.6 CONTRACTOR RESPONSIBILITIES

A. General responsibilities of the BAS Contractor (BAC) are specified in Section 01 91 00. The following indicate additional specific responsibilities of the BAS Contractor.

B. Assist CxA in verification and Functional Performance Testing. Assistance will typically include the following:

1. Establish trend logs of system operation as specified herein.
2. Manipulate systems and equipment to facilitate Functional Performance Testing. Typically, this will only be for initial samples of like systems.
3. Provide POTs or operator workstations in locations convenient to testing activities as specified below.
4. Provide CxA with appropriate passwords, keys, and access to control panels and workstations.
5. Where control systems do not allow a test mode or the overriding of physical input values for testing, program an interim virtual point for all inputs that can be used to represent the point and be overridden for testing.

C. Provide a control technician to work at the direction of the CxA for software optimization assistance for a minimum of 16 hours during the Acceptance Phase of the project.

D. Controls Parameter Matrix: Contractor shall provide a form summarizing all setpoints and alarm parameters and alarming strategies for the Owner to complete. Organize a meeting to discuss the desired initial setpoints and alarm parameters. Contractor shall enter the requested setpoints and alarm parameters at completion of start-up and record the applicable settings in the Start-Up Documentation.

E. Final Systems Operation Training: The BAC shall train the Owner and Operators on whole-building operation and use of the BAS. This training shall focus primarily on BAS control of building systems and operation and its impact on building performance, and shall be conducted after Functional Completion.

F. Compensate the Owner for any BAS Contractor site time incurred due to incompleteness of systems or equipment at time of Functional Performance Testing. All testing failures which require on-site time for retesting will be considered actual damages to the Owner. The contract sum shall be reduced by contract modification at a rate of $160 per worker-hour of on-site time necessary to retest failures. All parties under contract with the Owner who are affected by the retesting shall be included in the contract modification.

1.7 COMMISSIONED EQUIPMENT

A. All Air Handlers and as scheduled.

B. All VAV, CAV and FP boxes as scheduled.

C. All pumps as scheduled.

D. All heat pumps as scheduled.

E. All split systems as scheduled.

F. All fans as scheduled.

G. Water Treatment.

H. Heat Exchanger.

1.8 COMMISSIONED SYSTEMS

A. All HVAC systems in new and renovated spaces.

1.9 COMMISSIONING PLAN

A. The CA shall prepare a plan listing the parties involved with their responsibility, scope, definitions, safety concerns, design criteria, attendance schedules, commissioning schedules, and commissioning manual requirements.

1.10 COMMISSIONING FORMS

A. Review 100% CD's. Provide written summary of how each commissioned item of equipment, should operate include calculations verifying scheduled capacity.

B. The CA shall develop forms for the Contractors use during the commissioning process. The forms shall become part of the final commissioning manual. Forms shall be provided for each piece of commissioned equipment and system. Any deviations from the design shall be noted and proved by the Owner prior to acceptance. Each form shall be signed by the Contractor, CA and Owner prior to acceptance of a system or piece of equipment.

1.11 SEQUENCING

A. The following list outlines the general sequence of events for Commissioning of the BAS.

1. Construction Phase:
    a. Collaborate on construction scheduling.
    b. Submit Product data and Shop Drawings, and receive approval.
    c. Meet with Cx Team to coordinate with all trades.
    d. Submit Control Logic Documentation, and receive approval.
    e. Begin BAS installation.
    f. Submit refinement of generic Start-Up Documents incorporating manufacture-specific start-up requirements accompanied by manufacturers pre-printed start-up forms for all equipment provided by the BAS Contractor
    g. Receive BAS Start-Up Documents approval from CxA.
    h. Submit Training Plan content.
    i. Receive approval of Training Plan content.
    j. Provide alarm list and receive approval.
    k. Provide sample graphics and receive approval.
    l. Complete BAS installation.
    m. Place systems under BAS control.
    n. Enter alarms as approved by Owner.
    o. Complete BAS graphics.
    p. Perform BAS system start up and complete Start-Up Documentation.
    q. Submit completed BAS Start-Up Documentation.
    r. Prepare and initiate trend log data storage and format trend graphs.
    s. Train Owner on BAS operation and maintenance.
    t. Formal BAS System Turn-Over Meeting.
    u. Submit commissioning BAS Software/Access and provide Level 5 (monitoring, point override/test, and setpoint adjustment) password access to Owner and CxA.

v. Receive BAS Start-Up Documentation approval and approval to schedule BAS demonstration of completeness.

w. Demonstrate systems to CxA and Owner.

x. Submit trend logs in format specified.

y. Receive FPT or BAS demonstration approval and approval to schedule Acceptance Phase.

2. Acceptance Phase

a. Two-week BAS Observation Period to witness stable BAS operation.

b. Receive Observation Period approval which enables start of Functional Performance Testing.

c. CxA performs Functional Performance Testing and BAS Contractor participates in initial samples.

d. Receive Functional Completion approval for the BAS.

3. Substantial Completion.

4. Warranty Phase

a. Provide administrator access password access to Owner.

b. Train Owner on final sequences and modes of operation (Final Systems Operation Training).

c. Update Systems Manual content with any changes.

d. Revise and re-submit record drawings and O&M manuals.

e. Install framed control drawings.

f. Final Completion.

g. Opposite-season operational test and Functional Performance Testing.

h. Receive opposite-season operational test and FPT approval.

i. Revise and re-submit record drawings and O&M manuals.

j. Update framed control drawings.

k. Complete owner training.

l. End of Warranty Period.

PART 2 - PRODUCTS

2.1 INSTRUMENTATION

A. General: All testing equipment used by any Party shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances specified. If not otherwise noted, the following minimum requirements apply:

1. Temperature sensors and digital thermometers shall have a certified calibration within the past year and a resolution of +/- 0.1°F.
2. Pressure sensors shall have an accuracy of +/- 2.0% of the value range being measured (not full range of meter) and have been calibrated within the last year.
3. All equipment shall be calibrated according to the manufacturer's recommended intervals. Calibration tags shall be affixed or certificates readily available.

B. Standard Testing Instrumentation: Standard instrumentation used for testing air and water flows, temperatures, humidity, noise levels, amperage, voltage, and pressure differential in air and water systems related to functional testing shall be provided by CxA.

C. Special Tools: Special equipment, tools and instruments (only available from vendor, specific to a piece of equipment) required for testing equipment, according to these Contract Documents shall be included in the base bid price to the Contractor and turned over to the Owner upon project completion.

2.2 WEB-BASED COMMISSIONING PORTAL

A. General: The Cx Portal ('Portal') is a Web-based Internet hub used to electronically collaborate and coordinate activities and deliverables throughout the Cx process. The Portal is hosted by the CxA and shall be accessible to all Parties participating in the Cx program. The Portal provides a common location to store Start-Up Documentation, Functional Performance Tests and results, project documents and deliverables. It also serves as a collaborative email hub to facilitate, automate, and track communications between Parties relating to the Cx process. The Portal uses a hierarchical object tree to represent building systems, components and devices. From this object tree, one can access associated information at and below the applicable level. All applicable elements of information are associated with the object tree. The Portal facilitates either completing information directly via the software or by printing forms to fill out in the field.

B. Participation: All general and major subcontractors participating in the Cx process shall participate in the use of the Portal to document the Cx procedures.

C. Requirements for Use: Options for accessing and interfacing with the Cx Portal are as follows:

1. Print, Test, and File: Using this approach, Contractors simply go online to the Portal using a web browser, print checklists and tests as needed, fill them out in the field, and enter the results back into the Portal database when completed.
2. Online in the Field: The applicable documents can be accessed and filled out live and online if the Contractor has the means to access the Internet while working in the field using a local Wi-Fi network or wireless air card.
3. Database Client: At the Contractor's option, the CxA can provide the Contractor with a software tool that will allow the Contractor to download electronic test database files from the Portal, work on the database files in the field electronically (but offline), and later synchronize their entries with the master database on the Portal.

D. Portal Training: Included in the contract are two Contractor training sessions given by the CxA (one scheduled near the Construction Phase Cx Kickoff Meeting and one scheduled prior to the first equipment Start-Up). Contractors shall send at least one representative to at least one training session. Each Contractor is entitled to two hours phone technical support beyond training sessions.

2.3 TAB & COMMISSIONING PORTABLE OPERATORS TERMINAL

A. Provide the CxA with all software, connection devices, licenses, passwords, etc. to facilitate connection to the BAS throughout the building. Provide a license to graphic software, and all operating software necessary for testing and configuration of all control elements at all levels. License may be a temporary license that will expire after the completion of the Warranty Period. Options include:

1. A laptop computer provided by BAS Contractor for dedicated use by the CxA throughout the Construction and Acceptance Phases. This would be turned over to the Owner at the end of the Acceptance Phase.
2. Browser access to the full graphic software: CxA will provide laptop, however BAS Contractor shall set up the laptop to successfully connect.
3. Licensed client software to be installed on CxA computer: BAS Contractor shall install the software and ensure it is functional.
4. Terminal Services session access to a graphic server with required CALs to allow use of all required software. BAS Contractor shall configure the CxA computer to connect to the terminal session.

B. Access to the BAS must be provided throughout the building as more fully defined as follows:

1. Full wireless connection to the graphic server throughout the building will be adequate.
2. Network connection for full access to the graphic server within 50' of any point in the building.
3. Exception to 1 and 2 above: An acceptable alternative to full building access to the graphic server relating to terminal controls shall be providing to the CxA the devices and software required to connect to local terminal controllers through a connection port in the space such as connection to a jack on the temperature sensor (basically what is required by TAB specified below). This does not apply to mechanical rooms as full graphic access is required in mechanical rooms.

C. Provide software required by TAB to calibrate all flow sensors. TAB will provide computer to be used as a portable operator's terminal. Any manufacturer specific hardware such as connection cables, converters, hand held devices, etc. shall be provided by the BAS Contractor.

D. Connections shall be provided local to the device being calibrated. For instance, for VAV boxes, connection of the operator's terminal shall be either at the sensor as well as at the box. Otherwise a wireless system shall be provided to facilitate this local functionality.

PART 3 - EXECUTION

3.1 BAS START-UP TESTING, ADJUSTING, CALIBRATION

A. BAS work and/or systems shall be fully functioning prior to Demonstration and Acceptance Phase. Contractor shall start, test, adjust, and calibrate all work and/or systems under this contract, as described below:

1. Inspect the installation of all devices. Review the manufacturer's installation instructions and validate that the device is installed in accordance with them.
2. Verify proper electrical voltages and amperages, and verify that all circuits are free from faults.
3. Verify integrity/safety of all electrical connections.
4. Coordinate with TAB Contractor to obtain and with CxA to fine tune control settings that are determined from balancing procedures. Record the following control settings as obtained from TAB Contractor, and note any TAB deficiencies in the BAS Start-Up Documentation:
    a. Optimum duct static pressure setpoints for VAV air handling units.
    b. Minimum outside air damper settings for air handling units.
    c. Optimum differential pressure setpoints for variable speed pumping systems.
    d. Calibration parameters for flow control devices such as VAV boxes and flow measuring stations. BAS Contractor shall provide hand held device as a minimum to the TAB and CxA to facilitate calibration. Connection for any given device shall be local to the device (i.e., at the VAV box or at the thermostat). HHD or POT shall allow querying and editing of parameters required for proper calibration and Start-Up.
    e. Calibration parameters for fume hoods.
5. Test, calibrate, and set all digital and analog sensing and actuating devices. Calibrate each instrumentation device by making a comparison between the BAS display and the reading at the device, using an instrument traceable to the National Bureau of Standards, which shall be at least twice as accurate as the device to be calibrated (e.g., if field device is +/-0.5% accurate, test equipment shall be +/-0.25% accurate over same range). Record the measured value and displayed value for each device in the BAS Start-Up Documentation.
6. Check and set zero and span adjustments for all transducers and transmitters.
7. For dampers and valves:
    a. Check for adequate installation including free travel throughout range and adequate seal.

b. Where control loops are sequenced, check for proper control without overlap

8. For actuators:
   a. Check to insure that device seals tightly when the appropriate signal is applied to the operator.
   b. Check for appropriate fail position, and that the stroke and range is as required and coordinated with the programmed ranges when it is operating under normal conditions.
   c. For pneumatic operators, adjust the operator spring compression as required to achieve close off. If positioner or volume booster is installed on the operator, calibrate per manufacturer's procedure to achieve spring range indicated. Check split range positioners to verify proper operation. Record settings for each device.
   d. Check the stroke and range under actual loading conditions and validate that they correlate with programmed values.
   e. For sequenced electronic actuators, calibrate per manufacturer's instructions to required ranges.
9. Check each digital control point by making a comparison between the control command at the CU and the status of the controlled device. Check each digital input point by making a comparison of the state of the sensing device and the OI display. Record the results for each device.
10. For outputs to reset other manufacturers devices (such as VSDs) and feedback from them, calibrate ranges to establish proper parameters. Coordinate with representative of the respective manufacturer and obtain their approval of the installation.
11. Verify proper sequences by using the approved Start-Up Documentation to record results. Verify proper sequence and operation of all specified functions.
12. Verify that all safety devices trip at appropriate conditions. Adjust setpoints accordingly.
13. Tune all control loops to obtain the fastest stable response without hunting, offset or overshoot. Record tuning parameters and response test results for each control loop in the BAS Start-Up Documentation. Except from a start-up, maximum allowable variance from setpoint for controlled variables under normal load fluctuations shall be as follows. Within 3 minutes of any step-change (for which the system has the capability to respond) in the control loop, the following tolerances shall be maintained (exceptions noted):
    a. Duct air temperature: ±1°F
    b. Zone temperature: ±3°F within 3 minutes and control within ±2°F
    c. Chilled water temperatures: ±1°F
    d. Hot water temperatures: ±2°F
    e. Duct air pressure: ± 0.25" w.g.
    f. Water pressure: ±1 psid
    g. Duct relative humidity: ±3% when adding humidity
    h. Zone relative humidity: ±5% when adding humidity
    i. Terminal air flow control: ±5% of setpoint. This includes all VAV terminal control and exhausted BSCs, canopy hoods, ventilated cage racks, necropsy tables, and other scientific equipment with supply or exhaust ventilation.
    j. Fume hoods: ±10% on full sash travel (from min to max in 3 seconds) within 3 seconds. ±5% when sash is positioned in the controllable range. Refer to Section 15995 for fume hood acceptance requirements.
    k. Zone pressurization (on active control systems): ±0.03" w.c. with no door or window movements. No high containment space shall go more than 0.15" w.c. positive, nor go positive at all for more than 20 seconds.
14. For communication interfaces and BAS control panels:
    a. Ensure devices are properly installed with adequate clearance for maintenance and with clear labels in accordance with the record drawings.
    b. Ensure that terminations are safe, secure and labeled in accordance with the record drawings.

c. Check power supplies for proper voltage ranges and loading.
d. Ensure that wiring and tubing are run in a neat and workman-like manner, either bound or enclosed in trough.
e. Check for adequate signal strength and acceptable bandwidth utilization on communication networks.
f. Check for stand-alone performance of controllers by disconnecting the controller from the LAN. Verify the event is annunciated at Operator Interfaces. Verify that the controlling LAN reconfigures as specified in the event of a LAN disconnection.
g. Ensure that all outputs and devices fail to their proper positions/states.
h. Ensure that buffered and/or volatile information is retained through power outage.
i. With all system and communications operating normally and all trends functioning, sample and record update/annunciation times for critical alarms fed from the panel to the Operator Interface.
j. Check for adequate grounding of all BAS panels and devices.
k. Run self-diagnostic routines and ensure they are functional.
l. Check the memory allocation and loading to ensure adequate and excess capacity is available and that it will not affect control functionality.

15. Coordinate desired initial alarm strategies with Owner's Operators. Set all required alarms and document the initial settings in the Start-Up Documentation.

16. Coordinate all initial setpoints with Owner's Operators. Ensure those setpoints are active.

17. For Operator Interfaces:
    a. Verify that all elements on the graphics are functional and are properly bound to physical devices and/or virtual points, and that hot links or page jumps are functional and logical.
    b. Output all specified BAS reports for review and approval.
    c. Verify that the alarm printing and logging is functional and per requirements.
    d. Verify that trend archiving to disk and provide a sample to the CxA for review.
    e. Verify alarm enunciation functionality. Time delay from actual occurrence to the time updated or enunciated on the screen. Ensure it is per the specified requirements.
    f. Verify that real time and historical trends are accessible and viewable in graph format.
    g. Verify that paging/dial out alarm annunciation is functional.
    h. Verify the functionality of remote OIs and that a robust connection can be established consistently.
    i. Verify that required third party software applications required with the bid are installed and are functional.
    j. Demonstrate open protocol and custom third party interfaces reliably communicate and check response time.
    k. Verify response times and screen update and refresh times are per the requirements.
    l. Verify that all custom programs are editable from the OI. Check upload, download, and backup and restore capabilities of system configuration information as well as custom programs.
    m. Verify schedules are set up and working.
    n. Verify Owner stipulated security and permissions is set up and functional.
    o. In concert with the Building Power Outage test, validate that critical GUI installations are properly powered by UPS and emergency outlets to keep it functional during a power outage. Validate that the space has adequate lighting to manage the building in the event of an outage.

18. Start-up and check out control air compressors and air drying and filtering systems in accordance with the appropriate section and with manufacturer's instructions.
    a. Validate adequate deliver and pressures
    b. Validate adequate redundancy
    c. Validate max run time and cycle time vs manufacturer's recommendations

d. Validate that routing of the compressed air does not result in condensation at any point in the system when used with the specified drier

e. Check all PRVs both primary and back up to ensure adequate functionality and maintenance of downstream pressure

19. Verify proper interface with Fire Alarm System.

20. Verify proper interface with control panels of equipment with self-contained controls that are being monitored by the BAS.

B. Submit Start-Up Documentation. This shall be completed, submitted, and approved prior to demonstration and Acceptance Phase.

3.2 SENSOR CHECKOUT AND CALIBRATION

A. General Checkout: Verify that all sensor locations are appropriate and are away from causes of erratic operation. Verify that sensors with shielded cable are grounded only at one end. For sensor pairs that are used to determine a temperature or pressure difference, make sure they are reading within 0.2°F of each other for temperature and within a tolerance equal to 2% of the reading of each other for pressure. Tolerances for critical applications may be tighter.

B. Calibration: Calibrate all sensors using one of the following procedures:

1. Sensors Without Transmitters--Standard Application. Make a reading with a calibrated test instrument within 6 inches of the site sensor at various points across the range. Verify that the sensor reading (via the permanent thermostat, gage or BAS) is within the tolerances specified for the sensor. If not, adjust offset and range, or replace sensor. Where sensors are subject to wide variations in the sensed variable, calibrate sensor within the highest and lowest 20% of the expected range.

2. Sensors With Transmitters--Standard Application. Disconnect sensor. Connect a signal generator in place of sensor. Connect ammeter in series between transmitter and BAS control panel. Using manufacturer's resistance-temperature data simulate minimum desired temperature. Adjust transmitter potentiometer zero until 4 mA is read by the ammeter. Repeat for the maximum temperature matching 20 mA to the potentiometer span or maximum and verify at the OI. Record all values and recalibrate controller as necessary to conform to tolerances. Reconnect sensor. Make a reading with a calibrated test instrument within 6 inches of the site sensor. Verify that the sensor reading (via the permanent thermostat, gage or BAS) is within the tolerances specified. If not, replace sensor and repeat. For pressure sensors, perform a similar process with a suitable signal generator.

C. Sensor Tolerance: Sensors shall be within the tolerances specified for the device. Refer to

3.3 LOOP TUNING

A. For all control loops, Contractor shall tune the loops to ensure the fastest stable response without hunting, offset or overshoot with tolerances defined above. Contractor shall introduce upsets to the load when possible to affect response. Otherwise, setpoints can be changed to affect the response.

B. Generally tune loops during periods of high gain.

C. Document all parameters either by capturing text, short interval trends, or screen shots of trend graph documenting the final response.

3.4 COIL VALVE LEAK CHECK

A. Verify proper close off of the valves. Ensure the valve seats properly by simulating the maximum anticipated pressure difference across the circuit. Calibrate air temperature sensors on each side of coil to be within 0.5°F of each other. Via

the OI, command the valve to close. Energize fans. After 5 minutes, observe air temperature difference across coil. If a temperature difference is indicated, and the piping surface temperature entering the coil is within 3°F of the water supply temp, leakage is probably occurring. If it appears that it is occurring, close the isolation valves to the coil to ensure the conditions change. If they do, this validates the valve is not closing. Remedy the condition by adjusting the stroke and range, increasing the actuator size/torque, replacing the seat, or replacing the valve as applicable.

3.5 VALVE STROKE SETUP AND CHECK

A. For all valve and actuator positions checked, verify the actual position against the OI readout.

B. Set pumps to normal operating mode. Command valve closed, verify that valve is closed, and adjust output zero signal as required. Command valve open, verify position is full open and adjust output signal as required. Command valve to a few intermediate positions. If actual valve position doesn't reasonably correspond, replace actuator or add pilot positioner (for pneumatics)

3.6 ALARM SETPOINT COORDINATION

A. The Contractor shall prepare a list of all conceptual point types and recommend the types and recommended alarming strategies and setpoint for review of CxA and Owner. Owner shall use this alarm list to provide direction to Contractor for alarm strategies and setpoints. Alarm list shall be provided at least two months prior to the first functional test. Contractor shall have alarm setpoints entered prior to functional testing. Omitting an alarm setting, using the wrong strategy, or entering the wrong setpoints will be considered a failure from the perspective of the functional test.

3.7 GRAPHIC COORDINATION

A. The Contractor shall prepare all graphics (only one example graphic is required for typical systems like terminal units) with points embedded for review of CxA and Owner. Owner shall use these graphics to provide direction to Contractor for the required final graphic. All final graphics must be complete and active before functional testing. Any deviation from the approved graphics will be considered a failure from the perspective of the functional test.

3.8 BAS DEMONSTRATION

A. Demonstrate the operation of the BAS hardware, software, and all related components and systems to the satisfaction of the CxA and Owner. Schedule the demonstration with the Owner's representative 1 week in advance. Demonstration shall not be scheduled until all hardware and software submittals, and the Start-Up Test Report are approved. If the Work fails to be demonstrated to conform with Contract specifications, so as to require scheduling of additional site visits by the CxA for re-demonstration, Contractor shall reimburse Owner for costs of subsequent CxA site visits.

B. The Contractor shall supply all personnel and equipment for the demonstration, including, but not limited to, instruments, ladders, etc. Contractor supplied personnel must be competent with and knowledgeable of all project-specific hardware, software, and the HVAC systems. All training documentation and submittals shall be at the job site.

C. Demonstration shall typically involve small representative samples of systems/equipment randomly selected by the Owner and CxA.

D. The system shall be demonstrated following the same procedures used in the Start-Up Test by using the approved Commissioning Checklists. Demonstration shall include, but not necessarily be limited to, the following:

1. Demonstrate that required software is installed on BAS workstations. Demonstrate that graphic screens, alarms, trends, and reports are installed as submitted and approved.
2. Demonstrate that points specified and shown can be interrogated and/or commanded (as applicable) from all workstations, as specified.
3. Demonstrate that remote dial-up communication abilities are in accordance with these Specifications.

4. Demonstrate correct calibration of input/output devices using the same methods specified for the start-Up tests. A maximum of 10 percent of I/O points shall be selected at random by CxA and/or Owner for demonstration. Upon failure of any device to meet the specified end-to-end accuracy, an additional 10 percent of I/O points shall be selected at random by CxA for demonstration. This process shall be repeated until 100 percent of randomly selected I/O points have been demonstrated to meet specified end-to-end accuracy.
5. Demonstrate that all BAS and other software programs exist at respective field panels. The BAS programming and point database shall be as submitted and approved.
6. Demonstrate that all BAS programs accomplish the specified sequences of operation.
7. Demonstrate that the panels automatically recover from power failures, as specified.
8. Demonstrate that the stand-alone operation of panels meets the requirements of these Specifications. Demonstrate that the panels' response to LAN communication failures meets the requirements of these Specifications.
9. Identify access to equipment selected by CxA. Demonstrate that access is sufficient to perform required maintenance.
10. Demonstrate that required trend graphs and trend logs are set up per the requirements. Provide a sample of the data archive. Indicate the file names and locations.

E. BAS Demonstration shall be completed and approved prior to Functional Performance Testing. CxA shall determine if the system is ready for Functional Performance Testing and document any problems requiring Contractor attention.

1. If the systems are not ready for Functional Performance Testing, Contractor shall correct problems and provide notification to the Owner's representative that all problems have been corrected. The Acceptance Period shall be restarted at a mutually scheduled time for an additional one week period. This process shall be repeated until CxA issues notice that the BAS is ready for Functional Performance Testing.

F. Any tests successfully completed during the BAS Demonstration will be recorded as 'Passed' for the Functional Performance Testing and will not have to be re-accomplished.

3.9 BAS ACCEPTANCE PHASE AND OBSERVATION PERIOD

A. BAS Acceptance Phase: BAS Acceptance Phase consists of the Functional Performance Testing process of the BAS by the CxA and shall begin after approval of the BAS Demonstration and prior to issuance of Substantial Completion. Acceptance Phase for the BAS shall not be scheduled until all HVAC systems are in operation, the Start-Up Documentation has been reviewed, all required cleaning and lubrication has been completed (i.e., filters changed, piping flushed, strainers cleaned, etc.), and TAB report has been submitted and approved. Acceptance Phase and its approval to begin will be performed on a system-by-system basis if mutually agreed upon by Contractor and Owner.

B. BAS Observation Period: After Functional Performance Testing, the BAS shall be shown to operate properly for 2 weeks without malfunction, without alarm caused by control action or device failure, and with smooth and stable control of systems and equipment in conformance with these specifications. At the end of the two weeks, BAS Contractor shall forward the trend logs to the CxA for review.

C. During the Acceptance Phase, the Contractor shall maintain a hard copy log of all alarms generated by the BAS. For each alarm received, Contractor shall diagnose the cause of the alarm, and shall list on the log for each alarm, the diagnosed cause of the alarm, and the corrective action taken. If in the Contractor's opinion, the cause of the alarm is not the responsibility of the Contractor, Contractor shall immediately notify the Owner's representative.

D. During the Acceptance Phase, the Contractor shall maintain all controller network and workstation hardware and software in a state that will allow remote access by CxA to trend logs as specified below.

3.10 BAS TREND REQUIREMENTS

A. The BAS Contractor shall configure and analyze all trends required under this section

B. Trends are historical archives on computer disks that document the operation of the systems and equipment. Trends can be time-series (interval) recordings of system I/O parameters or change-of-value (COV) based trends that record when a system value changes by more than a specified threshold.

C. CxA will analyze trend logs of the system operating parameters to evaluate normal system functionality. The requirements of the trending are specified below. Contractor shall establish these trends, ensure they are being stored properly, and forward the data in electronic format to the CxA.

D. Data shall include a single row of field headings and the data thereafter shall be contiguous. Each record shall include a date and time field. Recorded parameters for a given piece of equipment or component shall be trended at the same time intervals and be presented in a maximum of two separate two dimensional formats with time being the vertical axis and field name being the horizontal axis. Data shall be forwarded in one of the following formats.

1. Microsoft Access Database (.mdb)
2. Microsoft Excel Spreadsheet (.xls)
3. Comma Separated Value (.csv or .txt), preferably with quotes delimiting text fields and # delimiting date/time fields.

E. Sample times indicated as COV (±) mean that the changed parameter only needs to be recorded whenever the value changes by the amount listed. When output to the trend file, the latest recorded value shall be listed along with the time increment record. If the BAS does not have the capability to record based on COV, the parameter shall be recorded based on the time interval common to other point trends for the system.

F. Contractor shall provide the CxA with required passwords, phone numbers, etc. to allow the CxA access to the trend log data and allow downloading to a remote location. Contractor shall also provide step-by-step written instructions for accessing the data.

G. Trending Requirements: All I/O points on primary equipment shall be trended throughout the Cx process on 10 min. intervals for analog values and change-of-value for binary values. Trends shall include but are not necessarily limited to the following points:

1. Outside air temperature
2. Outside air relative humidity
3. Outside air enthalpy
4. Cooling tons
5. All sensed hydronic temperatures
6. All sensed air temperatures and relative humidity measurements on primary equipment
7. All damper outputs on primary equipment
8. All valve outputs on primary equipment
9. All sensed fan volumes (flow) on primary equipment
10. All inputs and outputs to VSDs
11. Return (or exhaust) air temperature on each air handler
12. All safety indications
13. Status on all primary equipment
14. All air and water pressures on primary equipment or systems
15. Zone temperatures
16. Electricity consumption where monitored.
17. Domestic Water flow.
18. Basically all points on primary equipment and selected sampling of terminal points unless approved otherwise

H. Trending used to document ongoing FPTs may occur at a more frequent interval. Consult with the CxA to determine the required intervals for functional testing and modify intervals as required.

3.11 TREND GRAPHS

A. Trend graphs shall be used during Functional Performance Testing to facilitate and document testing. Contractor shall prepare controller and workstation software to display graphical format trends throughout the Acceptance Phase. Trend graphs shall demonstrate compliance with contract documents. Trended values and intervals shall be the same as those specified for the Functional Performance Tests.

B. Lines shall be labeled and shall be distinguishable from each other by using either different line types or different line colors.

C. Indicate engineering units of the y-axis values; e.g. degrees F., inches w.c., Btu/lb, percent wide open, etc.

D. The y-axis scale shall be chosen so that all trended values are in a readable range. Do not mix trended values on one graph if their unit ranges are incompatible.

E. Trend outside air temperature, humidity, and enthalpy during each period in which any other points are trended.

F. All points trended for one HVAC subsystem (e.g. air handling unit, chilled water system, etc.) shall be trended simultaneously and on a common trend period.

G. Each graph shall be clearly labeled with HVAC subsystem title, date, and times.

3.12 WARRANTY PHASE - OPPOSITE SEASON TRENDING AND TESTING

A. Trending: Throughout the Warranty Phase, trend logs shall be maintained as required for the Acceptance Phase. BAS Contractor shall forward archived trend logs to the CxA for review upon CxA request. CxA will review these and notify BAS Contractor of any warranty work required.

B. Opposite Season Testing: Within 6 months of completion of the Acceptance Phase, CxA shall schedule and conduct Opposite Season Functional Performance Testing. The BAS Contractor shall support this testing and remedy any deficiencies identified.

3.13 SOFTWARE OPTIMIZATION ASSISTANCE

A. The Contractor shall provide the services of a BAS technician as specified above at the project site to be at the disposal of the CxA. The purpose of this requirement is to make changes, enhancements and additions to control unit and/or workstation software that have been identified by the CxA during the construction and commissioning of the project and that are beyond the specified Contract requirements. The cost for this service shall be included with the bid. Requests for assistance shall be for contiguous or non-contiguous 8-hour days, unless otherwise mutually agreed upon by Contractor, CxA, and Owner. The Owner's representative shall notify Contractor 2 days in advance of each day of requested assistance.

B. The BAS technician provided shall be thoroughly trained in the programming and operation of the controller and workstation software. If the BAS technician provided cannot perform every software task requested by the CxA in a timely fashion, Contractor shall provide additional qualified personnel at the project site as requested by the CxA to meet the total specified requirement on-site.

3.14 BAS OPERATOR TRAINING

A. Provide up to 6 complete sets of User Manuals (hard copy and one electronic copy) to be used for training.

B. BAS Contractor shall submit a Training Plan per the requirements of Div 01 to the GC who will forward it to the A/E and CxA for review.

C. On Site Training: Provide services of BAS Contractor's qualified technical personnel for five 8-hour days to instruct Owners personnel in operation and maintenance of the BAS. Instruction shall be in classroom setting at the project site

for appropriate portions of the training. Training may be in non-contiguous days at the request of the Owner. The Owner's representative shall notify Contractor 1-week in advance of each day of requested training. The Contractor's designated training personnel shall meet with the A/E, CxA and Owner's representative for the purpose of discussing and fine-tuning the training agenda prior to the first training session. Training agenda shall be as follows:

1. Basic Operator Workstation Training – 8 hours for all potential users of the OWS in 4-hour non-contiguous segments:
    a. Brief walk-through of building, including identification of all controlled equipment and condensed demonstration of controller portable and built-in operator interface device display capabilities.
    b. Brief overview of the various parts of the BAS O&M manuals, including hardware and software programming and operating publications, catalog data, controls installation drawings, and BAS programming documentation.
    c. Demonstration of workstation login/logout procedures, password setup, and exception reporting.
    d. Demonstration of workstation menu penetration and broad overview of the various workstation features.
    e. Overview of systems installed.
    f. Present all site-specific naming conventions and points lists, open protocol information, configuration databases, back up sequences, upload/download procedures, etc.
    g. Overview of scheduling procedures.
    h. Overview of alarm features, including how to acknowledge, respond to, and archive alarms, and how to access further information from them.
    i. Overview of trend features, including how to set up and view trends.
    j. Overview of workstation reporting features and introductory level report generation and scheduling.
2. BAS Technician Training: One24-hour training sessions that can be in 4-hour non-contiguous segments for individuals who will troubleshoot the system hardware, I/O devices, and the systems in general.
    a. General review of sequence of operation and control logic for the project site, including standalone and fail safe modes of operation;
    b. Uploading/downloading and backing up controller configuration and application programs;
    c. Review of installed components including all communication devices, controllers, I/O, etc., and how to install/replace, maintain, commission, and diagnose them;
    d. Introduction to controller programming and overview of the programming application interface;
    e. Defining trends, generating graphs in real time; archiving trends, accessing historical archive and generating reports from them;
    f. Introductory network administration;
    g. Introduction to creating and editing graphics;
    h. Review of setpoint optimization and fine-tuning concepts;
    i. OI use and maintenance;
    j. Web page creation as applicable.
3. System Administrator Training: One 8-hour session that may be done in two 4-hour segments on non-contiguous days. Target audience is the person who will be maintaining the system from an IT perspective as well as Owners IT personnel. Agenda shall be as follows:
    a. Overview of system architecture including all routers, bridges, repeaters, gateways, communications protocols, servers, controllers, etc.;
    b. Overview of and recommendations for backing up and restoring the system configuration database;
    c. Server maintenance;
    d. Security Management: Assigning passwords and rights for various users on the server, workstations and GUI software.

4. Final Systems Operation Training
    a. The BAS Contractor shall conduct Final Systems Operation Training.
    b. Final Systems Operation Training provides the Owner and Operators a training session on whole-building operation. It shall focus primarily on BAS control of building systems and operation and its impact on building performance. System interactions shall be presented and discussed (such as a combined air handler, chiller, boiler, and terminal unit system), along with a detailed presentation of the sequences of operation and their relationship to the BAS. This training shall be conducted by the BAC with assistance from the CxA, and shall be attended by the Owner, Operators, Contractor, Design Team, and by any other Cx Team members deemed necessary by the CxA or the Owner.
    c. The Record BAS Shop Drawings shall be provided as a handout for the training.
    d. Scheduling, attendees, and training methods shall be as specified.

END OF SECTION

SECTION 23 09 00

BUILDING AUTOMATION AND AUTOMATIC
TEMPERATURE CONTROL SYSTEMS

PART 1 – GENERAL

1.1 GENERAL REQUIREMENTS

A. This Section is coordinated with and complementary to the General Conditions and Supplementary General Conditions of the Work, wherever applicable to Mechanical Work.

B. Section 23 05 02 – Basic Mechanical Requirements shall apply.

1.2 DESCRIPTION

A. The work described under this division is for all labor, materials, and equipment required for the construction of the Building Management System (BMS or BAS/Automatic Temperature Control/ (ATC) system.

B. The system shall be complete in all respects, tested and ready for operation.

C. All materials, equipment and apparatus shall be new and of first-class quality.

D. Electrical Standards: Provide electrical products which have been tested, listed and labeled by Underwriters' Laboratories and comply with NEMA standards, The Building Code of the City of New York, and the National Electric Code.

E. "Operator" is defined as the Owner's representative designated to operate the BMS/ATC system after Owner acceptance.

F. The work includes the providing of all labor, materials, equipment, accessories, services and tests necessary to complete and make ready for operation by the Owner, a building automatic system as shown on the drawings and hereinafter specified.

G. The Building Automation System shall be provided by the same manufacturer as the automation temperature controls.

H. The Automation System subcontractor shall furnish and install all equipment, accessories, wiring and instrument piping required for a complete and functioning system.

I. All materials and equipment used shall be standard components, regularly manufactured for this and/or other systems and not custom designed especially for this project. All systems and components shall have been thoroughly tested and proven in actual use.

J. The automation system shall be of a fully modular architecture permitting expansion by adding computer memory, application software, operator peripherals and field hardware.

K. If expansion of the automation system necessitates greater computer processing power, it shall be possible to transfer all existing software and data base, both vendor supplied and user-defined, to a new more powerful computer. This shall be accomplished by using removable, compatible disk cartridges.

L. Systems which require the existing user-defined data base to be reentered through the operator's terminal shall not be acceptable.

M. Although fire alarm and security points will not be installed or monitored, initially the system shall be installed completely ready to receive or accept these points at a later date without additional central hardware or software.

N. The system as specified shall monitor, control, and calculate all of the points and functions as listed in the Building Automation Schedule.

O. The system as installed shall have sufficient computer memory and application software for 100% point expansion above those points required and as listed in the Building Automation Schedule.

P. The Work includes the providing of all labor, materials, equipment, accessories, services and tests necessary to complete the place into satisfactory operation a complete system of automatic temperature controls as shown on the Drawings and hereinafter specified.

Q. The control system shall be of the electronic fully modulating type unless otherwise indicated, or as hereinafter specified. Control equipment shall be as manufactured by Andover, Siemens, Johnson Controls, Inc., Automated Logic Corporation, or Honeywell, Inc. All controls shall be the product of one manufacturer. The temperature control manufacturer shall be responsible for the quality and satisfactory operation of material provided even if not actually manufactured by him.

R. The control system shall include all necessary temperature sensors, damper motors, relays, sensors valves, etc., and all necessary equipment for a complete control system, regardless of whether or not specifically mentioned.

S. The control system shall include all control and interlock wiring. The control wiring shall include all wiring, including power wiring for sensors, controls, control devices, relays, freezestats, firestats and all other necessary equipment to provide a complete control system, regardless of whether or not specifically mentioned, unless otherwise shown on the electrical drawings, including electric relays and contactors required for control interlocking. Interlock wiring shall include interlocks between fan starters between pump starters between starters and remote condensing units, between pumps, chillers and cooling towers and wherever else called for in these specifications. Unless otherwise noted; all control circuits shall be 120 volts or less.

T. Provide nameplates on all devices, whether or not mounted on the face of local control panels. In occupied areas, nameplates shall be concealed beneath covers of room type instruments, to describe functions.

1.3 GENERAL INSTRUCTIONS

A. The BMS/ATC systems as specified herein shall be provided in their entirety by the BMS/ATC Contractor. The BMS/ATC Contractor shall base his Bid on the systems as specified.

B. The general provision of the contract (Division 1 and sections 23 05 01, 23 05 02, and 23 05 03) apply to work specified in this section.

C. Requirements for panels, CPU’s and other major devices.

1. Include manufacturer’s literature for each type of panel, controller or device that may be shown on the block Diagram.
2. Block Diagram shall show, schematically, the entire building system with all major components identified.
3. Include a points list for all input and output devices which shall be provided by the proposed systems.
4. Include information about proposed communications buss and data transmission.

5. Provide a written explanation of any characteristics, items of equipment or control intent, which differs from the requirements of this Division. Explain what, if any, alternative characteristics, items of equipment or control intent will be provided.
6. Alternate systems, characteristics, items of equipment or control intent, which do not comply with these specifications may be rejected if not acceptable to the Engineer. Any rejected alternate system, characteristics, items of equipment or control intent shall be replaced by the specified system, characteristics, items of equipment or control intent at no extra cost to the project.

1.4 QUALITY ASSURANCE

A. Only firms regularly engaged in manufacture and installation of this equipment with characteristics and capacities required, whose products have been in satisfactory use in similar service for not less than 10 years shall be acceptable.

B. The entire building automation system shall be installed by skilled electricians and mechanics, all of whom are properly trained and qualified for this work. All wiring shall be installed in accordance with the Project Electrical Specifications.

C. Supervision and checkout of the system shall be by factory-trained engineers and technicians directly employed by the automation Contractor.

D. Provide system produced and installed by the manufacturers, which are listed in Section "Approved Manufacturer's List".

E. Provide equipment which performance, under specified conditions, is certified by the manufacturer.

1.5 SCOPE

A. The proposal shall be based on an electronic or electronic/pneumatic system. Valve and damper actuators may be electronic actuated and DDC controlled. Provide electronic sensors and transmitters with full DDC capabilities.

B. The engineering, installation, calibration, hardware, software programming and checkout necessary for complete and fully operational BMS/ATC systems, as specified hereafter, shall be provided under this division by the BMS/ATC Installer.

C. The BMS Contractor shall guarantee that the installed system is capable of maintaining the following comfort goals in conditioned areas served by the BMS.

1. Space Design Temperature +/- 1ºF.
2. Relative Humidity 50% +/- 5%.
3. The BMS Contractor is not responsible for improper installation by other Divisions, however the BMS Contractor is responsible for informing the Construction Manager and Engineer of any requirements of this specification or any installation problem which prevents these goals from being maintained.

D. The contractor shall be responsible for all power and control wiring for BMS equipment including BMS panels, actuators, dampers, controllers, control power transformers, relays, etc. work shall be sub-contracted to a licensed electrical contractor by the BMS contractor if the BMS contractor is not suitably licensed. All work shall be completed in accordance with the electrical specification sections of this specification.

E. In the event of a power outage, upon restoration of normal power, the building systems shall be restarted in priority of criticality with a slight timing delay between starts to minimize the power inrush.

F. All points of data collected in the BMS shall be available for export to the campus dashboard system. Lucid Building OS or Lucid Dashboard will be provided by Owner using data points made available by BMS contractor.

1.6 ITEMS REQUIRED TO BE COORDINATED WITH OTHER DIVISIONS

A. Be responsible for coordinating the following:

1. Power requirements (voltage, amps, location) for all BMS equipment requiring power. See Section 23 05 01.

B. Installation and connection of all power wiring. Power wiring shall be defined as follows:

1. Wiring of power feeds through all disconnect starters and variable speed controllers to electric motors.
2. 120 VAC Emergency and 120V Normal power feeds to all BAS temperature control panels and equipment.
3. Wiring of any remote start/stop switches and manual or automatic motor speed control devices not furnished by the BAS/ATC Contractor.

C. Note that 120V to 24V surge protected transformers for low voltage wiring by this Division shall be furnished, set in place and wired (from designated circuit in electrical panel) by this Division, and all low voltage control wiring shall be installed under this Division.

1.7 WORK BY OTHERS

A. The following work shall be provided under separate divisions of the specifications:

1. Installation of all line size and non-line size automatic valves and separable wells. However, these devices shall be furnished under this division.
2. Provision of all necessary piping connections, taps and direct-contact wells required for flow, pressure or temperature devices specified under other divisions.
3. Provision of manual balancing dampers as specified under other divisions of Divisions 21 through 23.
4. Installation of all automatic control dampers shall be by HVAC Contractor. All control dampers shall be furnished under this division.

1.8 AGENCY LISTINGS

A. UL 916 PAZX Energy Management Systems.

B. FCC-Part 15 Subparagraph J. Class A. Emissions requirements.

C. UL-864/UUKL Smoke Removal.

1.9 RELATED SECTIONS

A. 23 05 01 - Mechanical and Electrical Coordination.

B. 23 05 02 - Basic Mechanical Requirements.

C. 23 05 03 - Basic Mechanical Materials and Methods.

1.10 BMS/ATC CONTRACTOR

A. The BMS/ATC Contractor shall have a local office within a 50 mile radius of the job site, staffed with factory trained engineers fully capable of providing instruction, routine maintenance and 24-hour emergency maintenance service on all system components. The BMS/ATC Contractor shall have a ten year experience record in the design and

installation of computerized building systems similar in scope and performance to that specified herein, and shall be prepared to provide evidence of this history prior to Contract Award should the Owner request it.

B. The BMS/ATC Contractor shall be prepared to make a personal presentation of his systems to the Owner or his designated representatives prior to award of Contract should the Owner request it.

C. The engineering, installation, calibration, hardware, software programming and checkout necessary for complete and fully operational BMS/ATC systems, shall be provided under this division by the BMS/ATC Installer.

D. Control components shall be mounted and wired by the BAS/ATC Contractor except as noted. Controllers may be mounted on terminal units at the factory.

1.11 SUBMITTALS AFTER CONTRACT AWARD

A. The following data/information shall be submitted for approval:

1. Complete sequence of operation.
2. Control system CAD generated drawings including all pertinent data to provide a functional operating system.
3. Valve, and damper schedules showing size, configuration, capacity and location of all equipment.
4. Data sheets for all hardware and software control components.
5. A description of the installation materials including conduit, wire, flex, etc.
6. Building Management System panel locations.
7. Schematic and flow diagrams indicating sensor and device locations.
8. A list of all points with summary counts, including alarms and trend.
9. Operating schedules including Vassar holidays and breaks.

B. The Controls Contractor shall provide submittal drawings for the entire control system for review and approval before work shall begin. Included in the submittal drawings shall be a diagram depicting the system architecture complete with a communications riser. Drawings shall include point-to-point wiring diagrams and must show all temperature controls, start-stop arrangement for each piece of equipment, equipment interlocks, wiring terminal numbers and any special connection information required for properly controlling the mechanical equipment. The submittal shall include a bill of material reference list as well as equipment sequences of operation. This shall be submitted in both hardcopy and editable electronic format.

C. Points list includes, for each physical or logical point, the name, description, display units, alarm limits, and definitions, along with the object description, object ID, and associated device ID. The list shall also indicate whether Trend Log or Schedule objects have been established for the point.

D. The submittals shall include a specification compliance analysis for review and approval before work shall begin. The compliance document shall address each paragraph of this specification by indicating COMPLY, EXCEED, or EXCEPTION. Do not indicate COMPLY unless the proposed system exactly meets the paragraph requirement. If EXCEED or EXCEPTION is indicated, then provide a clear and concise explanation of the variance from the specifications and the net effect this would have on the specified system performance.

E. Wiring diagrams shall include internal wiring of all electrical control devices.

F. Submit completed computer graphics for all the equipment and building floor plans and equipment prior to scheduled completion of the project for approval.

PART 2 – PRODUCTS

2.1 GENERAL

A. The Building Management System (BMS) shall provide an easy to use interface for monitoring and managing the building. The Building Management System shall provide the necessary Hardware, Software, and Network Communication abilities to provide Scheduling, Monitoring, Trending, Historical Storage, and Alarm Functions for the HVAC equipment and systems as described in this specification. Control capabilities shall include: Time of Day scheduling, Direct Digital Control, Custom Control, Boolean Logic, Optimum Start/Stop, Duty Cycling, Electrical Demand Control, Temperature Control, After Hours Override, Reports and Logs, Trend Prints, Remote Communications, Alarm Logging, Run Time and Maintenance, and Expanded Informational Messages.

B. The Building Management system shall be designed to allow full Operator operation with a minimum of training. It shall have an on-screen “Help” Operator tutorial.

C. Specified application programs shall be engineered, programmed and pre-tested prior to site installation. This shall be verified by standard format programming worksheets or flow diagrams included with the submittals.

2.2 BUILDING MANAGEMENT SYSTEM

A. Each panel memory shall be protected for a minimum of 48 hours in the event of power failure. Internal clock shall continue to run during a power failure so that the system makes the appropriate adjustment to all connected points when power is restored.

B. When specified or indicated on the point list or where required by the sequence of operation, outputs shall have three position manual override switch (On/Off/Auto), a status light, and shall be selectable for either normally open or closed operation.

2.3 MANUFACTURERS

A. Acceptable Manufacturers Are:

1. Andover Control – Day Automation
2. Andover Controls – EMF
3. Andover Controls – Richmar
4. Andover Controls – ACL

2.4 OPERATOR INTERFACE

A. Local Interface. Furnish one PC based workstation(s). Each of these graphics based workstation(s) shall be able to access all information in the system. These workstation(s) shall reside on the same high speed LAN as the building controllers. Each workstation shall be able to be custom configured based on the needs of the operator.

B. Hardware. Each operator workstation and custom programming workstation shall consist of the following:

1. Personal Computer. The CPU shall operate at a minimum of 2 GHz. A minimum of 16 GIGA BYTE of RAM, 48X DVD/CD Burner, Windows 7 Professional Operating System, a 1 TERA BYTE solid state hard disk with a maximum access time of 12 milliseconds shall be provided. A three button mouse will also be provided. Furnish all required serial, parallel, and LAN communication ports for proper system operation. The PC shall have a minimum of a 19” LCD monitor. PC shall be IBM compatible.
2. Megabit Ethernet card.
3. Printers: Each work station shall have one (1) printer, with tractor feed, and associated cables. Each printer shall be capable of a minimum 160 characters per second operation and be compatible with standard parallel or serial communications.

C. Workstation Software

1. Multiple Users: The system shall accommodate simultaneous multiple user operation. Access to the system data should be limited only by operator password. Multiple users shall have access to all valid system data. An operator shall be able to log onto any workstation on the system and have access to all valid data.
2. Operating System: Furnish a concurrent multi-tasking operating system. The operating system shall also support the use of other common software applications that operate under Microsoft Windows.
3. System Graphics: The Operator Workstation software shall be graphically oriented. The system shall allow display of up to multiple graphic screens at once for comparison and monitoring of system status. Provide a method for the operator to easily move between graphic displays and change the size and location of graphic displays on the screen. The system graphics shall be able to be modified while on line. An operator with the proper password level shall be able to add, delete, or change dynamic points on a graphic. Dynamic points shall include analog and binary values, dynamic text, static text, and animation files. Graphics shall have the ability to show animation by shifting image files based on the status of the point.
    a. Standard Graphics. Provide graphics for each major piece of equipment in the building. This includes but not limited to, each Chiller, Air Handler, VAV Terminal, Fan Coil, Boiler, and Cooling Tower. These standard graphics shall show all points as specified in the points list.
    b. Custom Graphics. The system shall have custom graphics provided for all air handling systems and hydronic systems. Graphics shall also include actual floor plans showing equipment, and sensors. Custom graphic files shall be created with the use of a PC Paint package furnished with the system. The PC Paint package shall be a graphically based system that uses the mouse to create and modify graphics that are saved in industry standard formats such as PCX, TIFF, and GEM. The PC Paint package shall also provide the capability of capturing or converting graphics from other programs such as Designer, or AutoCad.
    c. Graphics Library. Furnish a complete library of common HVAC equipment such as chillers, boilers, air handlers, terminals, fan coils, and unit ventilators. This library shall also include symbols for other equipment including fans, pumps, valves, piping, and ductwork. The library shall be furnished in a file format compatible with the PC Paint Program.
    d. Photo Quality Input. The system shall be able to accommodate high resolution digitized photographs. The owner shall be able to edit the photo quality graphics using the furnished PC Paint Program.
4. Workstation Applications. The workstation shall serve as the primary area of the system for operator interface and off-line storage of system information. The workstation shall also serve as the bridge to other building systems. Provide the following applications at the workstation.
    a. Manual Database Save and Restore. A system operator with the proper password clearance shall be able to save the database from any system panel. The operator shall also be able to clear a panel database and manually initiate a download of a specified database to any panel in the system.
    b. System Configuration. The workstation software shall provide a simple to use graphical method of configuring the system. As elements are located on the site they shall be displayed on a graphical representation of the system. This shall be flexible to allow for future system changes or additions.
    c. On Line Help. Provide a context sensitive, on line help system to assist the operator in operation and editing of the system. On line help shall be available for all applications and shall provide the relevant data for that particular screen. Additional help information shall be available through the use of hypertext.
    d. Security. Each operator shall be required to log on to the system with a user name and a password in order to view, edit, add, or delete data. System security shall be selectable for each operator. The system supervisor shall have the ability to set passwords and security levels for all other operators. Each operator password shall be able to restrict the functions accessible to viewing and/or changing each system application, editor, and object (i.e. Operator One can view and change all airside data but only view chiller plant data, operator two can only acknowledge alarms and not view or change system data etc.) Each operator shall automatically be logged off of the system if no keyboard or

mouse activity is detected. This auto logoff time shall be set per operator password. All system security data shall be stored in an encrypted format in the building management panels.

e. System Diagnostics. The system shall automatically monitor the operation of all workstations, printers, modems, LAN connections, building management panels and controllers. The failure of any device shall be annunciated to the operator.

f. Trend Logs. Each object in the system shall automatically be trend logged. This trend shall be stored for a minimum of 24 hours. The operator shall be able to view this trend on demand.

g. Event Log. The operator shall be able to view all systems alarms and change of states. Events shall be listed chronologically. An operator with the proper security level may acknowledge and clear alarms. All that have not been cleared by the operator shall be archived to the hard disk on the workstation.

h. Point Status and Control. Provide a method for the operator to view, and edit if applicable, the status of any object and property in the system. These statuses shall be available by menu on graphics or through custom programs.

i. Clock Synchronization. The real time clocks in all building control panels and workstations shall be synchronized on command of an operator. The system shall also be able to automatically sequence all system clocks, daily from any operator designated device in the system. The system shall automatically adjust for daylight savings and standard time if applicable.

5. Alarm Processing. Any object in the system shall be configurable to alarm in and out of normal state. The operator shall be able to configure the alarm limits, states and reactions for each object in the system.

a. Binary Alarms. Each binary object shall be set to alarm based on the operator specified state. Provide the capability to automatically and manually disable alarming.

b. Analog Alarms. Each analog object shall have both high and low alarm limits a well as high and low “early warning” limits. Provide separate sets of limits for both occupied and unoccupied (on/off) conditions. Alarming must be able to be automatically or manually disabled.

c. Alarm Reactions. The operator shall be able to determine what action if any are to be taken, by object, during an alarm. Actions shall include logging, printing, starting programs, displaying messages, providing audible annunciation or displaying specific system graphics. Each of these actions shall be configurable by workstation and time of day. The system shall provide multiple levels of alarm priority.

6. Workstation Applications Editors. Each PC workstation shall support editing of all system applications. Provide graphically based editors for each application at the PC workstation. The applications shall be downloaded and executed at one or more of the building management panels.

a. Application Specific Controller. Provide a full page editor for each application specific controller. This shall allow the operator to view and change the configuration, name, control parameters and set points for each device.

b. Scheduling.

1) A complete graphically based editor for the scheduling application shall be provided at each workstation. Provide an easy to use method of selecting the desired schedule and month.

2) This shall consist of graphically represented daily schedules and holidays.

3) Provide the capability for seasonal schedules that will be automatically executed during user defined periods. This shall enable the operator to have a group of equipment in discrete “Summer” and “Winter” schedules. Each seasonal schedule shall only be active during the operator specified time periods. The schedule shall be available for viewing and editing even when not active. The operator viewing a schedule shall be able to see graphically whether the schedule is active or inactive for up to a year in advance.

4) An operator with proper password level shall be able to modify the schedule. Schedules shall be able to be easily copied between objects and/or dates.

7. Custom Programming Language. Provide the capability to perform custom applications. The custom programming editor shall be accessible from all workstations. The operator shall be able to create, edit, and download custom programs at the same time that all other system applications are operating. The system shall be fully operable while custom routines are edited, compiled, and downloaded. Systems that require the operator interface be shut down to edit and compile programs shall include and additional Custom

Programming Workstation. This workstation shall be identical to the operators workstation in section 2.04.B.2.A.

The Program editor shall allow for creation, editing, troubleshooting, and simulation of custom programs. The editor shall check for proper programming context, use, spelling, and format. The custom programming editor shall also compile the program and be able to upload and download to the building management panel. All custom routines shall be executed at the building management panel.

8. Alarm Annunciation.
   a. Upon the incidence of an alarm, an alarm window shall be displayed showing the point in alarm, the time and date of the alarm and a user-selected predefined alarm message (and optionally printed to a user defined printer, printers and/or VT-100 or dumb terminal devices). Alarms shall be displayed regardless of the application in use including any non-ddc system DOS or Windows applications. The program shall display the current unacknowledged and acknowledged alarms. The user shall be able to selectively enable or disable a reminder in the event there are unacknowledged alarms. This reminder shall be both visual and audible. The user shall be able to record their own reminder messages and select the frequency at which they will play.
   b. Acknowledgement of alarms shall be from the alarm “pop-up” and/or from a separate alarm summary. Acknowledgment shall be by a specific event, date range, class, or specific alarm definition and condition. Upon acknowledging the alarm, the name of the operator acknowledging the alarm and the time and date will be associated with the acknowledgement, this data will be stored to the alarm history file and printed to the chosen printers or terminal devices.
   c. The system shall allow automatic or manual display of associated dynamic graphic screens and trend charts shall be provided for each alarm.
   d. Upon exiting the alarm handling mode the user shall be placed back to the application in use at the time of alarm/exception occurrence.
   e. A current alarm screen shall be provided which will dynamically display only alarms that are currently in alarm. As alarms are return-to-normal from their respective alarm states the current alarm screen shall be dynamically updated to reflect the change.
9. Trend Management
   a. The program shall automatically perform time based periodic collection of real time point data and subsequently store it to the systems hard disk. There shall be local and remote modes of operation. Local collection shall allow the program to directly query the controllers for individual point samples. Remote collection shall mean the controllers collect and store trend data on individual points and then release the entire trend table(s) upon a request from the computer work station.
   b. Storage and manipulation of sample points shall only be limited by disk space. Sampling rates shall be user selectable from instantaneous (once a second or less) to once a week. Collection of data shall be user selectable to start and stop on specific times and dates.
   c. Charting of the trend data shall be an integral part of the trend management program. Third party graphing packages such as Excel shall not be required to implement this program. Multiple points shall be chartable. Multiple X/Y charts may be run simultaneously displaying either real time data (instantaneous) or historical. Y scaling shall be either automatic or user selectable for any chart displayed, each chart may have different scaling. X scales shall be user selectable allowing for display of data over the wide range of times and dates. Multiple years of data shall be allowed. The chart display shall be capable of displaying a window of time as short as 15 seconds. Average, high and low values shall be displayed for selected point.
10. Reporting
   a. The report section shall be the gateway to the database for all data collected and shall provide an easy means of reporting and information management.
   b. The report generator shall be an integral part of the system. Offline third party packages (such as Excel) for report manipulation shall not be required to implement this program.
   c. Reports on historical trend data shall allow for daily, weekly, monthly and yearly reporting. These reports shall be completely flexible on the data items to be reported on. The user shall be able to

select from a list of predefined reports or selected data items on-the-fly. The selection of data item shall not be restricted by panel source. Reports shall have multiple columns and be infinite in length. Reports must be capable of reporting on data that has been collected at varying time intervals. Report generator shall allow an operator to easily and quickly define the contents of a report as well as define a print time and date if so desired. Information contained in the reports shall be derived from alarm history, system database, trend data and timed overrides.

d. The operator shall be able to compile reports by user, department, time and data period, point or points.

11. Multi-tasking

a. The system shall be capable of true multi-tasking capabilities. The user shall be able to use other non-related programs in the system while still running all ddc system application with no interruptions. This shall include the use of real time data in other applications. This feature shall allow spread sheet programs to gather data from the system dynamically while running a dynamically updated graphic screen. The system shall have the ability to allow the passing of data freely to MS Windows application, which incorporate the use of Dynamic Data Exchange.

D. Operator Interfaces: Provide at least one alphanumeric human-machine interface (HMI) per mechanical room. The HMI shall allow the user to:

1. Read the value of a measured variable.
2. Start or stop equipment.
3. Monitor the status of controlled equipment.
4. Read the setpoint, reset and modify tuning parameters of control loops.
5. Read all active alarms.

2.5 SYSTEM PERFORMANCE

A. The system shall consist of Operator Workstation, Building Management Panels, and Application Specific Controllers. All elements of the system shall be designed for standalone operation. Control shall always occur at the lowest level of the system. Communication between the building management panels and workstations shall be over a high speed communications buss. All nodes on this LAN shall be peers. The operator shall not have to know the panel identifier or location to view or control an object. Application Specific Controllers shall be constantly scanned by the building management panels to update point information and alarm information.

2.6 SYSTEM APPLICATION CONTROLLER SOFTWARE

A. System Security: User access shall be secured using individual security passwords and user names.

B. Passwords shall restrict the user to only the object, applications and system functions as assigned by the system manager.

2.7 SYSTEM SOFTWARE

A. Furnish the following applications for building and energy management. All software applications shall reside and run in the system controllers. Editing of applications shall occur at the operator workstation.

1. Scheduling: Provide the capability to schedule each object or group of objects in the system. Each scheduler shall consist of the following:

a. Weekly Schedule: Provide separate schedules for each day of the week. Each of these schedules should include the capability for start, stop, optimal start, optimal stop, and night economizer. Each scheduler may consist of up to 10 events. When a group of objects are scheduled together, provide the capability to adjust the start and stop times for each number.

b. Exception Schedules: Provide the ability for the operator to designate any day of the year as an exception schedule. Exception schedules may be defined up to one year in advance. Once an exception schedule is executed, it will be discarded and replaced by the standard schedule for that day of the week.
c. Holiday Schedules: Provide the capability for the operator to define up to 30 special or holiday schedules. These schedules may be placed on the scheduling calendar and will be repeated each year. The operator shall be able to define the length of each holiday period.

2. Optimal Start/Stop: The scheduling application outlined above shall support an optimal start/stop algorithm. This shall calculate the thermal characteristics of a zone and start the equipment prior to occupancy to achieve the desired space temperature at the specified occupancy time. Provide an early start limit in minutes to prevent the system from starting too early.
3. System Coordination: Provide a standard application for the proper coordination of equipment.
4. Alarm Reporting.
5. Trending.
6. Diagnostics.
7. Power Fail Recovery.
8. Reports and Logs.

2.8 NETWORK CONTROLLERS

A. General. Provide an adequate number of Building Management Panels to provide the performance specified above. Each of these panels shall meet the following requirements.

1. The Building Automation System shall be composed of one or more independent stand-alone, microprocessor based Network Controllers to manage the global strategies describes in Application software section.
2. The Master Controller shall have substantial memory to support its operating system, database, and programming requirements.
3. The multi-tasking operating system of the Controller shall manage the input and output communications signals to allow distributed controllers to share real and virtual point information and allow central monitoring and alarms.
4. Data shall automatically be shared between Master Controllers when they are networked together.
5. The database and custom programming routines of remote Network Controllers shall be editable from a single operator station.
6. The Master Controller shall continually check the status of all processor and memory circuits. If a failure is detected, the controller shall:
   a. Assume a predetermined failure mode.
   b. Emit an alarm.
   c. Display card failure identification.

B. Communications. Each Master Controller and Operator Workstation shall communicate using 10/100/1000 Ethernet (IEEE802.3). This LAN shall be self configuring and shall automatically reconfigure as nodes are added or removed.

1. Hard Wired Connections. Provide a twisted pair copper (CAT.5E or higher) cable between all nodes on the system LAN. Provide all necessary network switches to complete the network.

C. All controllers shall allow communication over open protocol such as LonTalk or BACNET. Open protocol; shall be appropriate to the signal being transmitted and shall selected to best communicate with the domains open protocol for systems that have been previously installed at the facility.

D. Serviceability. The Network Controller should be designed in a modular fashion so that the enclosure may be roughed in prior to the installation of the electronics. Provide diagnostic LEDs for power, communications, and alarms. The controller shall have provisions for expansion and future controller architecture. All wiring connections

shall be made to field serviceable terminal strips or to a termination card connected by a ribbon cable.

E. Memory. The Network Controller shall maintain all BIOS and programming information in EEPROM. The system BIOS shall be easily upgradable for the PC workstation without the need for going out to the panel. System manufacturer shall provide current version software and firmware at the end of the warranty period.

F. Controller software must be capable of detecting hardware and software failures and forcing all outputs to a predetermined state, consistent with the failure mode requirements defined on the drawings. In this state it shall issue an alarm.

G. Volatile memory is required to be backed up in the event of power loss. Software stored in non-volatile memory will not have to be downloaded from the central server after an interruption of power occurs.

H. Controllers used for time-scheduled operations must be equipped with a battery backed internal real-time clock function to provide a time base for implementing time-dependent programs. Provision shall be made for the routine updating of the controllers' clocks via a time master.

I. Resumption of power after an outage shall cause the controllers to automatically restart and establish communications as needed by their applications. Controller shutdown based on a self-diagnosed failure in the power supply, hardware, or software must set each piece of controlled equipment to a predetermined failure mode.

J. Controllers shall be powered from the most reliable source that powers any of the systems it serves. In the situation where a controller will be required to continuously collect data to be transmitted to a workstation, or where it monitors critical recovery information such as the presence of emergency power, it may be necessary to provide a UPS for the controller as well as any critical sensors. Where panels are provided with a different power source as the equipment (such as when the panel is on a UPS), the panel shall be provided with a means of monitoring the power source to the controlled equipment. This can be a dedicated power monitor or a value coming from transfer switch contacts.

2.9 APPLICATION SPECIFIC CONTROLLERS

A. Application Specific Controllers shall be stand-alone, microprocessor based Direct Digital Controllers with sufficient EEPROM memory to handle its operating system, database and programming requirements.

The controllers shall be clearly labeled as to controller type, where it is to be installed, and software address (if applicable). The controller shall be fully tested upon installation to ensure that it is properly matched to the equipment it is controlling.

B. The controller shall communicate with other devices on the communication network and be fully integrated with the other system components.

C. The hardware shall be suitable for the anticipated ambient conditions.

1. Controllers used outdoors and/or in wet ambient shall be mounted within waterproof enclosures, and shall be rated for operation at –40°F to 155°F.
2. Controller used in conditioned ambient shall be mounted in dust-proof enclosures, and shall be rated for operation at 32°F to 120°F.

D. Terminal Unit Controllers

1. The VAV terminal units shall be individually controlled by a dedicated DDC VAV controller. The DDC VAV controller, damper motor, transducer and transformer (if required) shall be supplied by the BAS contractor.

a. To assure proper operation and control, the BAS contractor as part of this bid, shall recalibrate the transducers six (6) months after acceptance of the BMS system to correct any deviations as a result of transducer drift.
b. Submit a copy of the recalibration report to the Engineer, Mechanical Contractor, Test, Adjust and Balance Contractor and Owner.

2. The BMS shall perform the following VAV Terminal unit control strategies and provide the points as listed on the DDC/VAV point list and specified monitoring and diagnostics.
   a. Grouping: The BAS shall be able to group VAV boxes via keyboard commands. These groups shall make it possible for the operator to send a common command to all boxes in a group to operate in the same mode. A sample of this group report must be provided in the submittal package for approval by Engineer and Owner. BAS shall also compile on a group basis, the following:
      1) Minimum group temperature.
      2) Maximum group temperature.
      3) Average group temperature.
      4) Current airflow through boxes in group (total).
      5) Total ventilation airflow in group (total).
   b. Setpoint Control: The BMS shall edit the zone space temperature setpoint of each VAV box. The zone temperature setpoint shall be operator adjustable. Individual zone setpoint and control logic shall reside at the zone level, and not be dependent upon the BMS for control. In the event of communication loss, the box will continue to control to current setpoints.
   c. Manual/Automatic Setpoint Control: Where indicated in the contract documents, provide a combination zone temperature sensor/temperature sensor (S/T) with master control via the Operator's Work Station. In automatic mode, the S/T shall operate only as a room sensor. In Manual mode, the space occupant shall have the capability to raise or lower space setpoint within limits established by BMS.
   d. Override Button: Where indicated on the contract documents, the VAV box shall be capable of being placed in the "occupied" mode. Operation of the over-ride shall energize the associated air handler.
   e. Override Cancel Button: The VAV box shall be capable of being placed back into the "occupied" mode by the zone occupant for a preset time period (adj.).
      1) The following areas shall have manual temperature re-set capability and unoccupied over-ride button:
         a) All office areas.
         b) All other areas shall have temperature sensing capability only.
   f. Cooling Valve Control: The BMS shall control the cooling air valve to a fully open, fully close, maximum CFM, or minimum CFM position based on operator commands. The operator shall also have the capability to adjust the maximum and minimum airflow limits of the air valve through the BMS.
   g. Operating Mode: The BMS shall place the box in either the occupied or unoccupied mode based on an operator adjustable time schedule. Separate heating and cooling setpoints shall be enterable for each mode through the BMS. Other modes available for special applications shall include full open, full closed, maximum flow, heating flow, minimum flow, etc.
   h. Occupied status shall be further divided into Game Day/Office/or Player Occupied schedule as appropriate. Certain public or player occupied areas shall have a higher "minimum occupied" setting for Game Day or Player Occupied time periods.
   i. Control Offset: The BMS shall be capable of offsetting the cooling or heating setpoints of one or more groups of boxes by an operator adjustable amount. This capacity will allow for automatic zone setpoint changes based on system requirements, such as demand limiting.
   j. Automatic Recalibration: The system shall automatically recalibrate its air flow sensing and air valve position measurement system at system startup and on a schedule basis.
   k. Portable interface terminal: The VAV box shall have a communications port on the space sensor for use with a hand held portable operator's terminal. This portable terminal shall give the operator the capability to interrogate and edit DDC/VAV box parameters. Portable interface terminal shall also have the capability to interrogate and edit DDC/VAV box parameters from a central controller.

l. Terminal Unit Status Reports: For each terminal unit, the BMS shall provide an operating status summary of all unit sensed values (zone temperature, CFM, etc.), setpoint and modes.
m. Terminal Unit Group Report: For each group of VAV terminal units, the BMS shall report the group mode, heating and cooling airflow, average zone temperature, minimum zone temperature, and maximum zone temperature. The report shall also display for each terminal unit in the group, the present temperature control setpoints and the current zone temperature.

3. Terminal Box Diagnostics:
   a. If zone temperature sensor input fails above its high range, unit shall control at its maximum CFM setpoint. If sensor input fails below its low range, units shall control to its minimum CFM setpoint.
   b. In both cases, all heat outputs shall be disabled. A diagnostic message shall be displayed upon operator inquiry.
   c. If flow measuring system fails, unit shall automatically convert to a pressure dependent, damper position based algorithm. Diagnostic message shall be displayed upon operator inquiry.
   d. If zone temperature setpoint potentiometer on zone sensor fails, unit shall automatically control to programmed occupied setpoints. Diagnostic message shall be displayed upon operator inquiry.
   e. If communications are not lost, controller shall continue to operate in current mode of operation. All setpoints shall be retained in nonvolatile memory. If communications are not restored within 15 minutes, unit shall automatically initiate a reset-recalibrate.

E. Controller software must be capable of detecting hardware and software failures and forcing all outputs to a predetermined state, consistent with the failure mode requirements defined on the drawings. In this state it shall issue an alarm.

F. Volatile memory is required to be backed up in the event of power loss. Software stored in non-volatile memory will not have to be downloaded from the central server after an interruption of power occurs.

G. Controllers used for time-scheduled operations must be equipped with a battery backed internal real-time clock function to provide a time base for implementing time-dependent programs. Provision shall be made for the routine updating of the controllers' clocks via a time master.

H. Resumption of power after an outage shall cause the controllers to automatically restart and establish communications as needed by their applications. Controller shutdown based on a self-diagnosed failure in the power supply, hardware, or software must set each piece of controlled equipment to a predetermined failure mode.

I. Controllers shall be powered from the most reliable source that powers any of the systems it serves. In the situation where a controller will be required to continuously collect data to be transmitted to a workstation, or where it monitors critical recovery information such as the presence of emergency power, it may be necessary to provide a UPS for the controller as well as any critical sensors. Where panels are provided with a different power source as the equipment (such as when the panel is on a UPS), the panel shall be provided with a means of monitoring the power source to the controlled equipment. This can be a dedicated power monitor or a value coming from transfer switch contacts.

2.10 CUSTOM APPLICATION CONTROLLERS

A. The Custom Application Controllers shall provide stand-alone control and require no additional system components for complete operation. It shall have sufficient EEPROM memory to support its operation system, database, and programming requirements. Custom application controllers shall meet the requirements of 2.06 Master Control Panels except they shall reside on a communications network operating at a minimum of 38,400 KBPS.

B. All programming required for operation shall be memory resident and shall be retained in permanent memory.

C. The Custom Application Controller shall be configured such that the Portable Operators Terminal can be plugged directly into it or within sight for programming, editing, and other operator functions. Custom application controllers

shall also be programmable from the operator workstation.

D. Controller hardware shall be suitable for the anticipated ambient conditions.

E. Controllers used outdoors and/or in wet ambient shall be mounted within waterproof enclosures and shall be rated for operation at –40°F to 155°F.

F. Controller used in conditioned ambient shall be mounted in dust-proof enclosures, and shall be rated for operation at 32°F to 120°F.

G. Controller software must be capable of detecting hardware and software failures and forcing all outputs to a predetermined state, consistent with the failure mode requirements defined on the drawings. In this state it shall issue an alarm.

H. Volatile memory is required to be backed up in the event of power loss. Software stored in non-volatile memory will not have to be downloaded from the central server after an interruption of power occurs.

I. Controllers used for time-scheduled operations must be equipped with a battery backed internal real-time clock function to provide a time base for implementing time-dependent programs. Provision shall be made for the routine updating of the controllers' clocks via a time master.

J. Resumption of power after an outage shall cause the controllers to automatically restart and establish communications as needed by their applications. Controller shutdown based on a self-diagnosed failure in the power supply, hardware, or software must set each piece of controlled equipment to a predetermined failure mode.

K. Controllers shall be powered from the most reliable source that powers any of the systems it serves. In the situation where a controller will be required to continuously collect data to be transmitted to a workstation, or where it monitors critical recovery information such as the presence of emergency power, it may be necessary to provide a UPS for the controller as well as any critical sensors. Where panels are provided with a different power source as the equipment (such as when the panel is on a UPS), the panel shall be provided with a means of monitoring the power source to the controlled equipment. This can be a dedicated power monitor or a value coming from transfer switch contacts

2.11 INPUT/OUTPUT INTERFACE

A. Hardwired inputs and outputs may tie into the system through Master Control Panel, Custom Application, or Application Specific Controllers. Any critical points requiring immediate reaction shall be tied directly in to the controller hosting the control software algorithm for the critical function.

B. Binary inputs shall allow the monitoring of on/off signals from remote devices. The binary inputs shall provide a sufficient wetting current to be compatible with commonly available control devices.

All status points shown on the point list shall be positive proof differential pressure or current sensing binary switches.

C. Analog inputs shall allow the monitoring of low voltage, current, or resistance signals and shall have a minimum resolution of 0.1% of the sensing range. Analog inputs shall be compatible with, and field configurable to commonly available sensing devices.

D. Binary outputs shall provide a continuous low voltage signal for on/off control of remote devices. Where specified in the sequence of operations or indicated on the points list, binary outputs shall have 3-position (on/off/auto) override switches, status lights, and shall be selectable for either normally open or normally closed position.

E. Analog outputs shall provide a modulating signal for the control of end devices. Outputs shall provide either a 0 to 10 VDC, 0 to 20 VDC or a 4 to 20 milliampere signal as required to provide proper control of the output device. Systems that utilize a pulse width modulating output (PWM) shall include a position feedback AI for each output.

F. System architecture shall allow for point expansion in one of the following ways:

1. The addition of input/output cards to an existing System Application Controller.
2. An additional panel and/or controller may be used to expand point capacity.
3. Ten (10) percent expansion capacity for all point types in all DDC panels.

2.12 IDENTIFICATION

A. Engraved Labels

1. Material: Melamine plastic laminate.
2. Thickness: 1/16".
3. Color
   a. Surface: White.
   b. Core: Black (letter color).
4. Fastenings: Any of the following:
   a. Screws.
   b. Rivets.
   c. Permanent adhesive.
5. Lettering: Coordinate with shop drawings.

2.13 DUCT SMOKE DETECTORS

A. Duct smoke detectors shall be provided and wired in accordance with manufacturer's requirements.

2.14 BMS/ATC CONTROL WIRING

A. General: 18 AWG Twisted pair cable shield wire shall be provided if required by system manufacturer.

B. Provide for all input and all analog output wiring.

C. Tinned copper conductors.

D. Do not run input/output wires together in the same conduit or wire bundle with 120V power wiring.

E. Pneumatic or sensor tubing shall not be installed in conduit with any wiring conductors.

F. All control wiring shall be run in metal conduit as follows:

1. EMT in Mechanical/Electrical Rooms.
2. Rigid at exterior.
3. Plenum rated for concealed spaces/hung ceiling.

G. Unless specifically required otherwise by the BACS equipment manufacturer, all I/O wiring shall be twisted shielded cable. For communications, the BACS equipment manufacturer's installation guidelines and recommendations shall apply.

H. All control wiring in mechanical equipment rooms or other spaces in which it is readily accessible shall be installed in electrical metal tubing (EMT) with compression fittings.

I. All control wiring run in interstitial spaces shall either be run in EMT or a cable tray or raceway.

J. All control wiring installed outdoors or any area subject to moisture shall be installed per code.

K. All control wiring installed in vertical chases shall be installed in EMT.

L. All control wiring above non-accessible ceilings shall be installed in EMT.

M. All control wiring installed above accessible ceiling spaces which are not laboratories or AHU's shall be plenum type, not installed in conduit, but neatly run with generous use of rings or ties.

N. Wire shall be unspliced from the controller to the sensor or device.

O. Control wiring shall not be routed in the same raceway as power wiring.

P. For sensors with twisted shielded pair cable, the shield shall be grounded at the panel and taped back at the sensor.

Q. Control wiring shall be color coded and labeled at all points of termination.

R. Remove and properly dispose of all abandoned control wiring, conduit, tubing, boxes, enclosures, components, and other controls-related work.

2.15 DAMPERS

A. The Building Automation System supplier shall provide all automatic control dampers not specified to be supplied integral to the HVAC equipment.

B. Dampers shall be low leakage or high velocity low leakage air foil as specified in the sequence of operation or in the equipment specifications and schedules. All proportional dampers shall be opposed blade type, except mixing dampers shall be parallel type. Two position dampers may be opposed or parallel blade type.

C. Damper frames and blades shall be galvanized steel and a minimum of 16 gauge. Blade width shall not exceed 8 inches. Dampers and seals shall be suitable for temperature ranges of –50°F to 250ºF.

D. Blades: 14-gauge,or 16-gauge air foil shaped, double, galvanized steel or extruded aluminum.

E. Bearings: Nylon or oil impregnated.

F. Axles: Welded, hexagonal or pin lock, or with other approved method to prevent blade rotating on axle.

G. Hardware: Zinc plated steel or aluminum.

H. Low Leakage Dampers:

1. Where specifically called out as "LOW LEAKAGE", provide the following:
   a. Field replaceable edge and end seals with be installed along the top, bottom, and side of the frame and each blade. Seals and bearings shall be suitable for temperature ranges from –40ºF to 200ºF. Leakage shall not exceed 6 CFM/Sq. Ft. at 4" W.G. differential and 3 CFM/Sq. Ft. at 1" W.G. differential.
   b. High Velocity Low Leakage dampers shall be Ruskin, Model CD60 or equivalent.

I. Provide low leakage dampers in the following locations:

1. Outside air dampers.
2. Motorized backdraft dampers.
3. Motorized intake dampers.
4. Exhaust dampers.

J. Dampers shall be applicable for the rated pressure and velocity service. Damper structural rating shall exceed extreme anticipated conditions like fan deadhead.

K. Modulating dampers shall be carefully selected to control in a smooth and stable fashion across the range of anticipated conditions. Except where size dictates a single blade, dampers shall always be opposed blade. When a large section of damper is to be connected to a single jackshaft, size limitations shall be followed. This will prevent excessive damper area or, more importantly, length from being connected to a single jackshaft. Typically, the manufacturer's recommendation shall be sufficient for specifying a limit to the size of a damper bank that may have field fabricated jackshaft connections.

L. Whenever possible, dampers shall have external crankshafts to allow the connection of the damper actuator outside of the air stream. This will allow for easier access to the actuators for maintenance.

M. Outside air control dampers shall be low leakage dampers with damper seals.

N. Output to modulating control dampers shall be analog.

O. Acceptable Manufacturers:

1. Ruskin
2. Greenheck
3. Nailor

2.16 CONTROL VALVES

A. Provide control valves of the type, body material and pressure class as determined by manufacturer, based on operating requirements and maximum pressure and temperature in the piping system.

B. Equip control valves with actuators of proper close-off rating.

C. Modulating control valves shall have equal percentage or linear flow characteristics.

D. Valve bodies shall be 2-way normally open or closed or as required. Valve bodies 2" and smaller shall be bronze, screwed type and 2½" and larger shall be iron, flanged and rated at 240°F 125 psig except where otherwise noted.

E. Valves shall have stainless steel stems and allow for servicing including packing, stem, and disk replacement, or offer a 5 year warranty on parts and labor.

F. Size valves for 50% coil pressure drop (minimum 3', maximum 12' pressure drop).

G. Two-position, two-way control valves shall have quick opening characteristics.

H. Valves shall be applicable for the rated pressure and temperature service. Close off pressures must be determined in concert with the actuators and valves shall be provided to close off against extreme anticipated conditions. Valves shall be selected such that they are not, as a practice, "oversized."

I. Modulating valves shall be carefully selected to control in a smooth and stable fashion across the range of anticipated conditions. “Split ranging” of heating and cooling valves controlled by the BACS is not acceptable. A separate output from the BACS shall be provided for all control valves. General guidelines are indicated below. When the selection criteria indicated below are not met, flow characteristic analyses shall be submitted to demonstrate reasonable correlation between stroke and flow. Valves with a CV greater than 30 may be pneumatically actuated, but should only be used if a cost benefit analysis shows they are preferred. Actuator positioning requirements are as follows for each type, if used:

1. Electric Input: 4-20 mA or 0-10 VDC.

J. Pressure independent control valves can be utilized, but are not preferred. If used, they shall be two-way pressure independent control valves such that balancing of the valves and associated branch piping shall not be required. Requirements shall be as follows:

1. Absolute flow accuracy:

   a. +/- 5% due to system pressure fluctuations across the valve in the selected operating range.
   b. +/- 5% due to manufacturing tolerances.

2. The control signal shall be modulating.
3. The valves shall accurately control the flow from 0% to 100% of full rated flow.
4. A minimum of 2 PSI shall be required to operate the valve pressure independently.
5. The valves shall require no maintenance and shall not include replaceable cartridges.
6. The valves shall be available with optional pressure/temperature ports to allow for flow verification.

K. Coil Valves, Water

1. Modulating water valves will generally be ball valves with an equal percentage characteristic. Modulating water valves shall typically be sized for 50-100% of the typical controlled circuit pressure drop at 70% wide open CV. The minimum design CV shall be no less than 1.9. CV selected to give a 2 psig drop at maximum flow.
2. Water and glycol control valves shall be rated to remain closed (zero leakage) against 120% of the full shutoff head of the pumps, when the control signal is set to "fully closed".
3. Type: Two-way, V-port ball valve with characterizing disk, 1/4 turn.
4. Packing: EPDM O-rings, lubricated.
5. Ball & Stem: Stainless steel.
6. Seat: Fiberglass reinforced Teflon.
7. Actuator: Electric, one motor only; valves 4 inches and larger shall have single operator.
8. Flow Characteristic: Equal percentage.
9. Fail positions shall generally be as follows, contact Engineer for special circumstances requiring deviation from these requirements:

   a. Terminal hot water radiation: fail last.
   b. Heat pump motorized isolation valve: fail last.

10. Acceptable Manufacturers:

    a. Belimo
    b. Valve Solutions

2.17 VALVE ACTUATORS: (ELECTRIC)

A. Valve actuators shall be electronic low voltage (24VAC), and properly selected for the valve body and service. Belimo or equivalent.

B. Actuators shall be fully proportioning (if modulating) and be spring return for normally open or normally closed operation as called out in the sequence of operations.

C. Provide a handwheel or manual positioner mounted adjacent to valve to allow manual positioning of valve in the absence of power.

D. Tri-state floating control non-spring return actuators are acceptable for terminal reheat applications for sizes less than one inch.

E. Actuators that rely on heating a medium are not acceptable.

2.18 BUTTERFLY VALVES

A. Butterfly valves used for automatic control shall be lug type rated for 125 psi non-shock water service to 180°F. Valve body shall be ductile iron with B-Nitrite (BUNA N) or EPDM molded seat and seals.

B. Disc material shall be cast bronze of aluminum-bronze with ASTM A-492 Type 416SS stainless steel stem and fittings.

C. Valves shall be tight close off suitable for end of the line service.

D. Butterfly valves used for two position control shall be line size. Valves used for modulating control shall be sized for a minimum 5 psig differential pressure at full flow. Butterfly valves shall not be used for modulating control without specific approval from the engineer.

2.19 TEMPERATURE SENSORS

A. Temperature sensors shall be Resistance Temperature Detector (RTD) or Thermistor as dictated by the requirements of this specification.

B. Duct sensors shall be rigid or averaging as specified in the sequence of operations. Averaging sensors shall be a minimum of 5 feet in length.

C. Immersion sensors shall be provided with a separable stainless steel or brass well to match pipe material.

D. Space sensors shall be equipped with setpoint adjustment and/or override switch as specified on the plans or in the sequence of operations. Space sensor shall have a portable service tool jack.

E. Accuracies shall be +/-1°F for standard applications. Where high accuracy is required, accuracies shall be +/- .2°F.

F. Duct mounted averaging sensors shall utilize a sensing element incorporated in a copper capillary with a minimum length of 20 feet. The sensor shall be installed according to manufacturer's recommendation and looped and fastened at a minimum of every 36 inches.

G. Sunshields shall be provided for outside air sensors.

1. Provide one OA sensor per mechanical room and whenever the communication rated is greater than 100 kbps.

H. Sensor Resolution: When matched with A/D converter of the controller, sensor range shall provide a resolution of no less than 0.4 °F (unless noted otherwise).

I. Room Temperature Sensor: These shall be an element contained within a ventilated cover, suitable for wall mounting. Provide an insulated base.

1. Sensing element: RTD or thermistor, +/- 0.8°F accuracy at calibration point.
2. Setpoint Adjustment: Provide where indicated. Public spaces shall not have setpoint adjustment. The setpoint adjustment shall be a warmer/cooler indication that shall be scalable via the BACS.
3. Occupancy Override: Provide a button on the room sensor enclosure where indicated, generally in office spaces that do not have occupancy sensors. Public spaces shall not have occupancy override. This shall be a momentary contact closure.
4. Display: Alphanumeric.
5. Sensors shall be provided with communication jack and appropriate cabling for connection to the BACS.

J. Single Point Duct Temperature Sensor: These shall consist of a sensing element, junction box for wiring connections, and a gasket to prevent air leakage or vibration noise. The sensor probe shall be stainless steel.

1. Sensing element: RTD or thermistor, +/- 0.5°F accuracy at calibration point.

K. Averaging Duct Temperature Sensor: These shall consist of an averaging element, junction box for wiring connections and gasket to prevent air leakage. Provide sensor lengths and quantities to result in one foot of sensing element for each, two square feet of coil/duct face area.

1. Sensing element: RTD or thermistor, +/- 0.5°F accuracy at calibration point.

L. Liquid Immersion Temperature Sensor: These shall include brass or stainless steel thermowell, sensor and connection head for wiring connections.

1. Sensing element: RTD, thermistor, or integrated circuit, +/- 0.4°F accuracy at calibration point.
2. Temperature Range: As required for resolution of 0.3°F.

M. Outside Air Temperature Sensor: These shall consist of a sensor, sun shield, utility box, and watertight gasket to prevent water seepage. On major/critical systems, one outside air temperature sensor shall be provided for each system; and one sensor shall be provided per mechanical room, or building-level controller. Generally, these shall be located on a north wall of the building and installed with stand-offs. On 100% outside air systems, locate the sensor in the outside air plenum.

1. Sensing element: RTD, thermistor, or integrated circuit, +/- 0.4°F accuracy at calibration point.

2.20 HUMIDITY SENSORS

A. Humidity sensors shall be capacitance or bulk polymer resistance type.

B. Duct and room sensors shall have a sensing range of 20 to 80% with accuracy of +/-3% R.H. Duct sensors shall be provided with a sampling chamber.

C. Outdoor air humidity sensors shall have a sensing range of 20 to 95% RH. They shall be suitable for ambient conditions of –40°F to 170°F.

D. Units shall be suitable for duct, wall (room), or outdoor mounting. Sensors shall be two-wire transmitters utilizing bulk polymer resistance change or thin film capacitance change. Units shall produce linear continuous output of 4-20 mA for % RH. Sensors shall have the following minimum performance and application criteria:

1. Input Range: 0 to 100% RH.
2. Accuracy (% RH): +/- 2% (when used for enthalpy calculation, dew point calculation, or humidifier control); or +/- 3% (when used for monitoring) between 20-90% RH at 77°F, including hysteresis, linearity, and repeatability.
3. Operating Range: As required by the application.
4. Long Term Stability: Less than 1% drift per year.
5. Acceptable Manufacturers:

    a. Vaisala
    b. Mamac
    c. Veris Industries

2.21 DIFFERENTIAL PRESSURE & CURRENT SWITCHES

A. Differential Pressure Switches shall be furnished as indicated for status purposes in air and water applications. Provide single pole double throw switch with fully adjustable differential pressure settings.

B. Sensing range shall be suitable for the application with accuracy of +/-2% of range and repeatability of +/-.5 % of range. Sensor shall be capable of withstanding up to 150% of rated pressure without damage.

C. Current switches shall be provided for status indications on variable air flow fans and variable pump speed applications. These switches shall be capable of installation and replacement without removing power wiring.

2.22 STATIC PRESSURE SENSORS

A. Static pressure sensors shall be differential pressure type. The sensor range shall be closely matched to the system static pressure, - .5 to .5 inches, -1 to 1 inches, 0 to 2.5 inches.

B. Sensor accuracy shall be plus or minus 5% of the sensing range, and repeatability of 2% of sensor range.

2.23 FREEZE PROTECTION DUCTSTATS

A. An electric freeze protection ductstat with 20 feet low temperature sensing capillary, and with manual reset, shall be located across the entering face of each cooling coil or bank of coils in the air conditioning unit or in the discharge of each heating coil in the heating and ventilating units, which shall on a fall in temperature below 35˚F., shut down its respective supply fan and close the outdoor air damper. Case of instrument shall be located outside of supply unit, within 10 feet of supply fan motor.

B. For systems with return air fans, on fan shut down, the return fan shall continue running or shall start, if not running.

2.24 PRESSURE SENSORS

A. Differential air pressure, static pressure and velocity pressure sensors shall be furnished by Modus, Air Monitor or equivalent.

B. Liquid, water or steam pressure sensing shall be furnished by Rosemount, Robinson Halpern or equivalent.

C. Pressure switches shall be furnished by United Electric, Dwyer or equivalent.

D. Air Differential Pressure Sensors

1. General: Pressure transducers shall be either diaphragm or strain gauge types.

2. Applications: Duct static pressure, filter DP, fan DP, air flow VP, etc.
3. Provide the smallest range feasible for the application. Provide zero and span adjustments.
4. Accuracy: Plus or minus 1% of full scale for static and 0.25% for air velocity.
5. Acceptable Manufacturers:

    a. Filter DP: Dwyer
    b. General and Static Pressure: Mamac, Setra, Veris Industries
    c. Air Flow: Air Monitor, Paragon

E. Liquid Differential Pressure Sensors:

1. Pressure transducers shall be either diaphragm or strain gauge types. Pressure transmitters shall gauge pressure in the form of a linear 4 to 20 mA or 0-10 VDC signal. Sensor shall be installed with a valve manifold and pressure/temperature test ports in lieu of pressure gauges. DP transmitter shall be rated for 150 PSIG static pressure. Wetted parts shall be stainless steel with a silicone fluid-filled diaphragm. Provide external span and zero adjustments.
2. Span shall be no greater than 2 times the working differential pressure of the system to allow the highest possible resolution.
3. Accuracy: 1% accuracy over the entire span.
4. Repeatability: Plus or minus 0.5% at maximum span.
5. Transmitters shall have a three-valve manifold for venting, draining, and calibration.
6. Acceptable Manufacturers:

    a. Gauge and Differential Pressure: Mamac, Setra, Veris Industries.

F. Air Differential Pressure Switches:

1. Cleveland Controls, Inc., products shall be used. The switches shall be installed in accordance with the manufacturer's installation instructions. All switches shall be mounted in accessible and, to the extent possible, vibration-free locations (i.e., not on duct work).

G. Liquid Differential Pressure Switches:

1. Barksdale Model EPD1HAA40 or Penn P74 differential pressure switches shall be provided when pressure sensing is required to determine status. All switches shall be mounted in accessible and, to the extent possible, vibration-free locations.
2. Do not use differential pressure switches for run status on pumps. Current switches shall be used on constant volume pumps and drive contacts shall be used for pumps with VFDs.

2.25 FLOW SENSORS

A. Differential pressure flow meters shall be furnished by Annubar or equivalent.

B. Vortex flow meters shall be furnished by EMCO or equivalent.

C. Flow sensors shall be carefully placed to ensure flow profiles that are required for accurate flow sensing. Designs shall specifically indicate the location of the sensors and indicate the length of unobstructed duct or pipe upstream and downstream from the sensor.

D. Water flow sensors shall meet the requirements necessary for use for test and balance duty as defined in the BACS specifications.

2.26 DIGITAL SENSORS

A. All digital inputs will be provided by dry contacts. The contacts will be wired normally open or normally closed as required.

B. Motor status (pumps, fans, etc.) by current sensing switch shall use Neilsen-Kuljian current-operated switch.

C. Pump flow status by differential water pressure shall use Penn P74 or equivalent.

D. Fan status by differential pressure shall be Dwyer or equivalent.

2.27 POWER SENSORS (CURRENT, KW, KWH)

A. Chiller amps shall be sensed by current transducers. The range of operation shall be from zero to a value not more than 50% of FLA. Use Ohio Semitronics CT-E series or equivalent.

B. Utility metered or submetered KWH or KW shall be sensed by a pulse producing transducer.

C. Current Switches (CS) for Constant Speed Motors:

1. CS shall be provided for status indication of constant speed motors.
2. Switch shall indicate loss of status when current falls below an adjustable trip point.
3. CS shall include LED indication of status.
4. Acceptable Manufacturer: Veris Industries (H708/ H908 series).

D. Current Switches for Variable Speed Motors:

1. Typically, status indication that indicates VSD or bypass operation shall be derived from contacts on the VSD. The VSD must be specified to include this option.
2. Otherwise, a current switch shall be provided for status indication. The switch shall be microprocessor based and suitable for use on a VSD.
3. Self-adjusting trip setpoint.
4. Factory programmed to detect belt loss undercurrent conditions.
5. CS shall include LED indication of status.
6. Acceptable Manufacturer: Hawkeye.

2.28 KW/KWH TRANSDUCER

A. The meter shall be capable of measuring true power demand (kW) and consumption (kWH). Output to BMS shall be via BACNET interface card.

B. The meter shall be capable of providing a field selectable pulse rate output of 1, 0.5, 0.1, or 0.05 pulses per (kWH).

C. The transducer shall receive its current inputs from safe current transformers that provide a 0-10 V output proportional to the primary current flowing in the sensed load.

D. The current transformers shall be accurate to +/- 0.5% from 1% to 100% of the rated current.

E. The voltage range shall be field selectable from 120 to 600 VAC.

F. The meter shall be accurate to +/-0.5% of the reading over a -15˚ to 40˚ C range.

G. The meter shall detect phase loss, or a low voltage situation, and provide an N.C., optically isolated FET (100 ma @ 24 VAC/DC) alarm output.

H. The transducer shall have an adjustable low voltage threshold trip point from 75-95% of the rated power of the monitored load.

I. The meter shall be mounted inside a Nema 1 enclosure.

J. The meter shall have an LCD meter mounted in the Nema 1 enclosure to display demand (kW) and consumption (kWH).

K. The meter shall be Veris Industries series H8100. Exact model number and accessories shall be matched to the characteristics of the system being metered.

2.29 CARBON MONOXIDE SENSOR

A. Carbon Monoxide Sensor shall be 3M Model CM-6, 0 to 200 PPM, 4 to 20 mA analog output.

B. Provide C.O. sensor in all rooms with combustion equipment.

C. Installation shall be per manufacturer's recommendations.

2.30 CARBON DIOXIDE SENSOR

A. Carbon Dioxide Sensor shall be Kele & Associates Model BA/AQS, 0 to 100% measuring range, 4 to 20 mA analog output.

B. Provide CO_2 sensor for all system specified, in all rooms or zones required to be measured or duct mounted for systems specified.

C. Application: Demand controlled ventilation of high density occupancy spaces, such as auditoriums, classrooms, lecture rooms, and conference rooms.

D. Acceptable Manufacturer: Vaisala

2.31 OCCUPANCY SENSORS

A. Single mode infrared sensors, with a minimum of two sensors per laboratory area, shall be used to establish occupancy/unoccupancy intervals. Schemes that utilize Time-of-Day (TOD), light switches and/or manual switches to establish lab occupancy shall be avoided. An unoccupied laboratory will be defined as having no people present in the room for a specified period of time (30 min. adjustable).

B. Occupancy sensors used in labs, classrooms, offices, and comparable spaces shall be Watt Stopper Model # CI-24 ceiling-mounted, 24VAC, passive infrared occupancy sensors. No substitutions considered.

C. Occupancy sensors used in auditoriums and comparable spaces shall be Watt Stopper Model # DT-200 wall-mounted, 24VAC, dual technology (passive infrared and ultrasonic) occupancy sensors. No substitutions considered.

D. Install no less than two occupancy sensors per space in laboratory spaces.

E. Occupancy sensors shall be installed in quantities such that unobstructed coverage of the entire space is provided.

2.32 METERING

A. Temperature and flow metering points are to be as shown on Drawings.

B. Geothermal/Condenser water BTU metering includes a flow meter, two temperature sensors, and a BTU processor. Basis of design shall use an electromagnetic meter. Acceptable manufacturers and models shall be as follows:

1. Basis of Design: Siemens Sitrans MAG 3100 (electromagnetic).
2. Alternate: Flexim FLUXUS ADM 7407 (ultrasonic).

C. Temperature sensors associated with the chilled water meter shall be Resistance Temperature Device (RTD) as manufactured by JMS Southeast, Inc. Model 3X(X=3TF3)SBK6BZZ312ZWZ2AX(X=Fully Potted). Probe shall have date of manufacture stamped on the surface. Thermowells shall be JMS model 51AT2CUK ½ inch step shank, 316 stainless steel, 0.260 bore sized to insert a minimum of 1/3 pipe diameter into flow stream. The junction box shall be a 2 x 4 handy box connected to the thermowell with CPVC nipples from the well to the head. Terminal connections shall be to a termination strip on the back of the handy box so probe can be removed through the front with the handy box cover removed. Provide a spare test well (identical to the sensing well) with brass cap and chain at all sensor locations.

D. The flow meter and temperature sensors shall be coupled to a BTU meter flow processor “FP93” as manufactured by EMCO. The flow processor shall be connected to the BMS via Ethernet.

E. If more than one building loop, or sub meters are required in a single building, multiple FP93 meters shall be connected to the BMS via Ethernet.

F. Do not disconnect existing chilled water metering until new metering or communications are in place.

2.33 DEWPOINT SENSORS

A. Units shall be suitable for duct, wall (room) or outdoor mounting with digital display. Sensors shall be two-wire transmitters utilizing bulk polymer resistance change or thin film capacitance change. Units shall produce linear continuous output of 4-20 mA for dew point temperature (°F). Sensors shall have the following minimum performance and application criteria:

1. Accuracy: +/- 1.8°F.
2. Sensor Operating Range: As required by the application.
3. Long Term Stability: Less than 1% drift per year.

B. Acceptable Manufacturers:

1. Vaisala

2.34 AIRFLOW SENSORS

A. Flow sensors shall be carefully placed to ensure flow profiles that are required for accurate flow sensing. Designs shall specifically indicate the location of the sensors and indicate the length of unobstructed duct or pipe upstream and downstream from the sensor.

B. Laboratory Air Terminal Flow Tracking: The standard manufacturer transducer typically supplied with conventional air terminals are not acceptable for use in a wet laboratory application requiring devices with a higher speed of response. The transducer shall be upgraded to a device with the following specifications:

1. Accuracy: +/- 0.25%.
2. Stability: +/- 0.5% of full scale per year or less.
3. Auto-zero capability by venting ports to atmosphere.
4. Acceptable Manufacturers: Air Monitor, Paragon.

C. Air Handling Unit, VAV box mounted, and Duct Airflow Monitoring: A pitot-tube averaging grid of a material compatible with the environment is to be used. The use of fan inlet grids are preferable where possible to measure fan flow. Fan inlet grids shall be provided by the fan vendor and shall not block or affect fan efficiency. The transducer shall have the following specifications:

1. Accuracy: +/- 0.25%.
2. Stability: +/- 0.5% of full scale per year or less.
3. Auto-zero capability by venting ports to atmosphere.
4. Acceptable Manufacturers: Air Monitor, Paragon.

2.35 CONDENSATE SENSORS

A. Application: Moisture sensing on chilled water supply systems to terminal chilled beam devices.

B. Acceptable Manufacturers and Model Numbers:

1. Siemens QXA 2000
2. Sauter EGH 102
3. Honeywell H7018A1003

2.36 CONTROL VALVES

A. Valves shall be applicable for the rated pressure and temperature service. Close off pressures must be determined in concert with the actuators and valves shall be provided to close off against extreme anticipated conditions.

B. Modulating valves shall be carefully selected to control in a smooth and stable fashion across the range of anticipated conditions. “Split ranging” of heating and cooling valves controlled by the BACS is not acceptable. A separate output from the BACS shall be provided for all control valves. General guidelines are indicated below. When the selection criteria indicated below are not met, flow characteristic analyses shall be submitted to demonstrate reasonable correlation between stroke and flow. Actuator positioning requirements are as follows for each type, if used:

1. Electric Input: 4-20 mA or 0-10 VDC
2. Electrically piloted valves shall have a pneumatic actuator with positioner

C. The BMS output to modulating valves shall be analog. In addition:

1. Terminal reheat valves shall be proportional
2. Fan coils and similar terminal device valves shall be proportional
3. Radiation valves shall be two-position or proportional
4. Unit heaters shall be two-position line voltage thermostats.

D. Two-way Pressure Independent Control Valves: Pressure independent control valves can be utilized, but are not required. If used, they shall be two-way pressure independent control valves such that balancing of the valves and associated branch piping shall not be required. In addition:

1. The absolute flow accuracy through the valve shall be:
   a. +/- 5% due to system pressure fluctuations across the valve in the selected operating range
   b. +/- 5% due to manufacturing tolerances
2. The control signal shall be modulating as described above
3. The valves shall accurately control the flow from 0% to 100% full rated flow
4. A minimum of 2 PSI shall be required to operate the valve pressure independently

5. The valves shall require no maintenance and shall not include replaceable cartridges
6. The valves shall be available with optional pressure/temperature ports to allow flow verification.

2.37 DAMPER ACTUATORS

A. General: Size actuators and linkages to operate their appropriate dampers or valves with sufficient reserve torque or force to provide smooth modulating action or two-position action and adequate close off rating as required.

B. For AHU/Duct mounted dampers:

1. Actuators shall be electronic.
2. Standard Electronic Actuators: Shall be designed for a minimum of 60,000 full cycles at full torque and be UL 873 listed. Provide stroke indicator. Actuators shall have a positive positioning circuit and selectable inputs. Full stroke shall be within 90 seconds. Where fail positions are required, provide spring return on the actuator with adequate close off force.
3. Acceptable Manufacturers:
   a. Belimo

C. For terminal unit dampers:

1. Standard Electronic Actuators: Shall be designed for a minimum of 60,000 full cycles at full torque. Provide stroke indicator. Output to modulating damper actuators shall be analog.
2. Fast Acting Electronic Actuators: Provide fast acting electronic actuators for VAV terminals on fume hood and associated tracking zone dampers. These actuators shall move full stroke in less than one second. Output to modulating dampers actuators shall be analog.

2.38 CONTROL PANELS

A. Enclosures

1. Enclosures located in mechanical rooms shall be NEMA 4.
2. Enclosures located in relatively dust free and dry spaces may be NEMA 1.
3. Enclosures located outside or on the roof shall be NEMA 4X.
4. Enclosures shall be mounted on walls or free-standing supports.

B. Power Supplies

1. The Contractor shall provide a regulated, protected power supply as required with the ability to produce at least 33% more current than required by the transmitters and controls being installed. Output regulation shall be less than 0.5mV. There shall be no overshoot on turn on or off. Operating temperature shall be -20 to +70ºC.
2. The BACS Contractor shall certify, in writing, at the time of shop drawing submittal that the DDC equipment provided will not cause, as a result of its operation, either directly or indirectly, electrical interference to be induced into the building's electrical power systems.
3. Class II transformers shall be used.

C. Panel Fabrication

1. The Contractor shall size the panel such that no more than 80% of the surface of the enclosure back plate is used.
2. Plastic wire way (e.g., Panduit) shall be used to organize all wiring in the panel.
3. Sufficient wire way shall be provided in the panel such that it is filled no more than 80% capacity.
4. Panel layout and construction shall be neat and professional.

5. All controllers, wiring, and components in the panels shall be labeled. All labeling shall match the reference numbers on the cabinet drawings that shall be provided for each panel.
6. Label the power source and circuit number for each panel.

PART 3 – EXECUTION

3.1 FUNCTION

A. Provide all components necessary to achieve the Sequences of Operation listed in Part IV and any additional industry standard functions normally required of a first class BMS/ATC installation.

B. This division shall provide a project manager who shall, as a part of his duties, be responsible for the following activities:

1. Coordination between this Contractor and all other trades, Owner, local authorities and the design team.
2. Scheduling of manpower, material delivery, equipment installation and checkout.
3. Maintenance of construction records such as project scheduling, manpower planning, and as-built drawings for project coordination and as-built drawings.

3.2 INSTALLATION METHODS

A. Install systems and materials in accordance with manufacturer's instructions, rough-in drawings and equipment details. Install electrical components and use electrical products complying with requirements of applicable Electrical sections of these specifications.

B. The term "control wiring" is defined to include providing of wire, conduit, and miscellaneous materials as required for mounting and connecting electric or electronic control devices.

C. Control Wiring:

1. Number-code or color-code conductors appropriately for future identification and servicing of control system.
2. All line voltage power wiring required because of substitution of low voltage power wiring equipment specified in this division, shall be provided by this division.
3. Comply with the applicable requirements of Division 26 for the installation of electrical wiring incidental to the temperature control system.
4. Comply with the applicable requirements of National Electrical, New York City Building Code, and Building Code for the installation of electrical wiring incidental to the temperature control system.
5. Control wiring shall be run in conduit in accordance with the electrical sections of this specification.
6. Conduit shall be run parallel to building lines properly supported and sized at a maximum of 40% fill. In no cases shall field installed conduit smaller than ½" trade size be allowed. Where conductors are not in conduit, cable rated for use in return air plenums shall be used.
7. BMS/ATC division shall provide all control transformers and all control wiring (including low voltage actuator power wiring). This division shall also provide power wiring from the control circuits to the transformer locations and all other temperature control devices requiring power wiring. Electrical Contractor shall furnish appropriate control circuits (both normal and emergency) in suitable panelboards located throughout the project.
8. BMS/ATC division shall provide UL listed surge protectors for all control circuits upstream of control transformers.

D. Equipment installed under other divisions of the specifications:

1. Furnish dampers, valves, temperature sensor wells, flow switches and other equipment to Installers at proper time.

2. Provide installation instructions.

E. Adjust low-leakage dampers so all gaskets and seals are properly compressed.

F. Provide outside air and relative humidity sensors at each outside air intake louvers for air handlers.

G. Unless specifically indicated on plans, do not install wall mounted thermostat or temperature sensor on exterior wall. For thermostats or temperature sensors located on an exterior wall, provide insulated base behind device.

H. The access panels or doors shall be a minimum size of 18 x 18 inches.

I. Devices (i.e., sensors, meters, instruments, etc.) that are resettable must be installed in a readily accessible location (e.g., the device must be accessible at floor level without the use of a ladder). No device shall require shutting down a building system for calibration.

J. Devices that are installed in an exposed location (i.e., not mounted within a cabinet) must be suitable for such installations (e.g., do not install a device that is intended to be installed in a cabinet in an exposed location).

K. Software and Hardware Updates - At the end of the first six months, and during the second six months, the Controls Contractor shall update the equipment and any controllers, servers, workstations and HMI Web servers with the latest modifications and improvements in software, firmware, and hardware that the manufacturer may have incorporated in the furnished equipment.

L. Control panels and enclosures housing the controllers shall be coordinated to the extent possible, to share vertical and horizontal wire-ways to facilitate and minimize the cost of home-runs to terminal equipment. All penetration of the controller enclosure within mechanical rooms shall be from the bottom of the enclosure with wireway and conduit stubs from the wireway up to the panel.

M. Control panels shall be located in equipment rooms, where practicable, and in locations maintaining ambient conditions between 50 and 90°F and 10 to 85% relative humidity. Control panels located in areas where conditions are outside of these ranges shall have enclosures outfitted with heating or cooling devices to provide the proper environmental conditions. Hoffman style enclosures with removable back plates and keyed, hinged covers shall be used. Enclosures shall be rated NEMA 4 when located in mechanical spaces and NEMA 1 when located in occupied spaces. Provide enclosures with key lockable doors.

N. All transformers and power supplies shall be mounted outside of the central panel.

O. Controller Installation Requirements

1. Building and system-level controllers shall be capable of operating independently, in stand-alone fashion, with no communication to other devices on the network while performing their monitoring and control routines using programs and operating parameters stored in the controllers' memory.

2. All points and functions that make up a functional system (typically that shown on one control schematic) shall be included in one controller to qualify for this stand-alone functionality. Where control sequences depend on global variables such as OAT, the controller shall have the capability of either using the last value.

3. Controller software must be capable of detecting hardware and software failures and forcing all outputs to a predetermined state, consistent with the failure mode requirements defined on the drawings. In this state it shall issue an alarm.

4. Controllers must include sufficient memory for all required operation and all required trending, when trending is buffered in the controller. Where control system operation is hindered by the shortage of memory,

contractor shall, at no cost to the Owner, either upgrade the memory or provide multiple controllers. The mix of points for multiple controllers shall not violate the stand-alone requirements. Volatile memory is required to be backed up in the event of power loss. Software stored in non-volatile memory will not have to be downloaded from the central server after an interruption of power occurs.

5. Controllers used for time-scheduled operations must be equipped with a battery backed internal real-time clock function to provide a time base for implementing time-dependent programs. Provision shall be made for the routine updating of the controllers' clocks via a time master.

6. Resumption of power after an outage shall cause the controllers to automatically restart and establish communications as needed by their applications. Controller shutdown based on a self-diagnosed failure in the power supply, hardware, or software must set each piece of controlled equipment to a predetermined failure mode.

7. Controllers shall be powered from the most reliable source that powers any of the systems it serves. In the situation where a controller will be required to continuously collect data to be transmitted to a workstation, or where it monitors critical recovery information such as the presence of emergency power, it may be necessary to provide a UPS for the controller as well as any critical sensors. Where panels are provided with a different power source as the equipment (such as when the panel is on a UPS), the panel shall be provided with a means of monitoring the power source to the controlled equipment. This can be a dedicated power monitor or a value coming from transfer switch contacts.

P. Fabrication

1. The Contractor shall size the panel such that no more than 80% of the surface of the enclosure back plate is used.
2. Plastic wire way (e.g., Panduit) shall be used to organize all wiring in the panel.
3. Sufficient wire way shall be provided in the panel such that it is filled no more than 80% capacity.
4. Panel layout and construction shall be neat and professional.
5. All controllers, wiring, and components in the panels shall be labeled. All labeling shall match the reference numbers on the cabinet drawings that shall be provided for each panel.
6. Label the power source and circuit number for each panel.

3.3 IDENTIFICATION

A. Devices Inside Panels: Either of the following:
1. Engraved labels.
2. Lettered in permanent ink with felt tip marker.

B. Exposed Devices: Engraved labels.

C. Location: On the body of the device or on the surface to which it is mounted.
1. Do not put identification on removable covers.

D. Label each remotely mounted control panel as to the device it controls.

3.4 OPERATING AMBIENT CONDITIONS

A. Electronic controls mounted in unconditioned space shall be rated for ambient operating conditions from -40°F to 155°F. Controls not meeting these limits shall be mounted in an accessible location within conditioned space.

3.5 OWNER TRAINING

A. The BAS/ATC contractor shall provide 4 copies of an operator's manual describing all operating and routine maintenance service procedures to be used with the temperature control and Building Automation System supplied. This contractor shall instruct the owner's designated representatives in these procedures during the startup and test period. The owner training shall consist of a minimum of three (3) 8 hour instruction periods scheduled by the owner over the first 12 months of system operation. The training shall be scheduled during normal working hours.

B. Follow up training shall be provided under this Division for two (2) eight hour instruction periods at six months and twelve months after building acceptance.

C. Provide minimum 40 classroom hours of factory training in programming and use of the BMS/ATC system for each of two people (designated by Owner). Provide room and board for trainees class during this period if factory is located more than 30 miles from the project. Provide this training no more than eighteen months after building acceptance.

D. Upon completion of the work and acceptance by the Owner, factory representatives of the control manufacturer shall provide instruction to the Owner's operating personnel who have responsibility for the mechanical systems and controls installed by the contractor. The amount of training that is provided shall match the size of the project (e.g., no less than twenty-four hours).

E. The contractor shall make available to the Owner regular, scheduled training courses for ongoing training of the Owner's operating personnel. Programs shall include hardware- and software-oriented courses as well as energy conservation and management courses.

F. In addition to the normal training listed above, all vendors will be required to provide two weeks of training at the BACS manufacturer's training facility for four people. This training only needs to be provided once for a particular set of installed BACS products. If a contractor has provided this training previously (on a previous project or directly with the Owner) then the additional training does not need to be provided again.

3.6 CALIBRATION AND ADJUSTMENTS

A. After completion of the installation, perform final calibrations and adjustments of the equipment provided under this contract and supply services incidental to the proper performance of the ATC and BAS system under warranty below.

3.7 OPERATION BY OWNER

A. Owner may require operation of part of the system prior to final acceptance. Operation is not to be construed as acceptance of work.

3.8 ACCEPTANCE PROCEDURE

A. General: The system installation shall be complete and tested for proper operation prior to acceptance testing for the Owner's authorized representative.

B. Upon completion of the calibration, Contractor shall startup the system and perform all necessary testing and run diagnostic tests to ensure proper operation. Test shall include a 100% point to point check-out of all BMS devices to confirm proper response to manual input. Installer shall be responsible for generating all software and entering all database necessary to perform the sequence of control and specified software routines. An acceptance test in the presence of the Owner's representative or Architect shall be performed.

1. If more than two of the first 10 devices tested, or more than 10%of the first 20 or more devices tested, fail to operate properly, the test shall be discontinued.
2. Additional testing, after corrections are made, shall be done at the Installer's expense.

C. A letter shall be submitted to the Architect requesting system acceptance. This letter shall certify all controls are installed and the software programs have been completely exercised for proper equipment operation. Acceptance testing will commence at a mutually agreeable time within ten (10) calendar days of request. When the field test procedures have been demonstrated to the Owner's representative, the system will be accepted. The warranty period will start at this time.

D. Field Equipment Test Procedures: DDC Zone and Local Controllers shall be demonstrated via a functional end-to-end test as follows:

1. All output channels shall be commanded (on/off, stop/start, adjust, etc.) and their operations verified. (Point - to- Point Checkout)
2. All analog input channels shall be verified for proper operation.
3. All digital input channels shall be verified by changing the state of the field device and observing the appropriate change of displayed value.
4. If a point should fail testing, perform necessary repair action and retest failed point and all interlocked points.
5. Automatic control operation shall be verified by introducing an error into the system and observing the proper corrective system response.
6. Selected time and setpoint schedules shall be verified by changing the schedule and observing the correct response on the controlled outputs.

E. Workstation Test Procedures: The System Workstation test procedures shall be as follows:

1. Communication with each DDC Zone and Local Controller shall be demonstrated.
2. Operator commands will be explained and demonstrated.
3. Control sequences shall be demonstrated for proper operation.
4. All available system reports and logs shall be demonstrated at the System Workstation.
5. Correct system start-up and shutdown procedures shall be demonstrated.
6. All controllers shall be demonstrated to operate in standalone mode.

F. Acceptance Test of Mechanical Systems

1. Perform at least two (2) operational tests of the entire mechanical system as described in the specifications.
2. Give each element of the system an operating test of not less than 48 hours' duration to demonstrate to the satisfaction of the Architect that the control system is functioning properly and that the system is capable of producing the required environmental conditions. During this test, operate the system entirely on automatic control and take periodic readings of the inside and outside wet and dry bulb temperatures. Obtain wet and dry bulb temperatures with a recording thermometer-hygrometer. Conduct tests with outside temperature and humidity conditions as near design conditions as practical.
3. Winter acceptance test shall be conducted when outside temperatures are at or near 10^0F, summer acceptance test shall be conducted when outside temperatures are at or near 90^0F db.
4. Conduct tests during summer and winter outdoor temperature extremes as specified above. Notify Owner seven (7) days in advance of proposed tests.
5. Record temperature and humidity at an exterior and interior location for each system as designated by the Engineer at least once every hour for 48 hours during tests.
6. Submit a report detailing the following:
    a. Instrument used:
        1) Most recent calibration date.
    b. Date of tests.
    c. Description of test apparatus locations and methods.
    d. Results of tests.
    e. Any abnormal usage of the building or abnormal system characteristics observed during the course of the test.

3.9 COMMISSIONING

A. The BACS shall be fully commissioned. All acceptance testing, documentation, and training shall be required.
B. The BACS contractor's responsibilities for commissioning and check-out include the following:

1. Provide all logic, graphics, and trends for review prior to the start of field commissioning activities.
2. Provide a complete calibration and operational check for each individual point and function contained within the BACS.
3. Conduct the checkout with the use of point/function log sheets to be prepared by the subcontractor. The Owner shall approve the log sheet format.
4. Submit log sheets to the Owner prior to the commencement of any final acceptance testing.
5. Certify, in writing, to the Owner prior to the commencement of final acceptance testing that all components of the BACS system are functioning as per the requirements of the contract documents.
6. Provide to the Owner as-built drawings and documentation at least four (4) weeks prior to the commencement of any final BACS acceptance testing.
7. The BACS contractor shall issue a report upon project completion stating that the system is complete, has been adjusted, and has had all hardware and software functions verified, that all analog control loops are tuned, and is operating in accordance with the specifications. Any deviations from specified settings or operations necessitated during system adjustment shall be specifically noted.
8. The BACS contractor shall check out the installation with the Owner and Engineer. The checkout shall consist of verifying the ability of the BACS to communicate with the central EMCS system, verifying the calibration of each sensor and/or transmitter, and verifying the operation of each control point.
9. All software processes shall be thoroughly demonstrated to the Owner. Alarm conditions shall be simulated for conformance. Analog control points shall be exercised through their entire range. All control interlocks and sequences shall be completely verified. The checkout shall be a thorough and exhaustive review of the installation to assure proper operation of the total system.

3.10 RECORD DOCUMENTS

A. Electronic Media As-Built Documentation: After a successful acceptance demonstration, the Contractor shall submit as-built drawings of the completed project for final approval. After receiving final approval, supply complete 11X17 hard copy as-built drawing sets, together with CD's to the owner. Provide (4) copies of O & M Manuals.

B. Operation and Maintenance Manuals: Submit Operation and Maintenance manuals. Include the following in each manual:

1. BMS/ATC information for insertion into the Manufacturer's catalog data and specifications on all sensors, transmitters, controllers, control valves, damper actuators, gauges, indicators, terminals, and any miscellaneous components used in the system.
2. An Operator's Manual which will include detailed instructions for all operations of the system.
3. An Operator's Reference Table listing the addresses of all connected input points and output points. Settings shall be shown where applicable.
4. A Programmer's Manual which will include all information necessary to perform programming functions.
5. A language manual which will include a detailed description of the language used and all routines used by the system.
6. Flow charts of the control software programs utilized in the Temperature Control System.
7. Flow charts of the custom software programs utilized in the Temperature Control System.
8. Complete program listing file and parameter listing file for all programs.
9. A copy of the warranty.
10. Operating and maintenance cautions and instructions.
11. Recommended spare parts list.
12. Twenty-four (24) hour service phone number and point of contact.
13. Controlled Schematic Drawings.

14. Detailed written sequences of operation.
15. Valve, damper, and laboratory airflow devices schedules.
16. Floor Plans.
17. Wiring Diagrams.
18. Sample Graphics and Trends.

3.11 WARRANTY

A. All BAS/ATC devices and installation shall be warranted to be free from defects in workmanship and material for a period of one year from the date of job acceptance by the owner. Any equipment, software, or labor found to be defective during this period shall be repaired or replaced without expense to the owner. Factory authorized warranty service shall be available within 50 miles of jobsite.

B. Except as otherwise specified, the Contractor shall warrant and guarantee all work against defects in materials, equipment, and workmanship for a period of one (1) year from the date of acceptance of the work as evidenced by a resolution to that effect by the Owner, and for that period of time noted in special or extended warranties.

C. The period of one (1) year shall be extended with respect to portions of the work first performed after substantial completion by the period of time between substantial completion and the actual performance of the work.

D. The Contractor shall provide all recommended preventative maintenance of the materials, equipment, and workmanship as necessary and as described in the operating and maintenance manuals during the warranty period. In addition, the Contractor shall provide two (2) semi-annual service visits (i.e., one visit during the peak cooling season and one visit during the peak heating season) to test and evaluate the performance of the equipment. The Contractor shall provide a written report of the test and evaluation results. The service visits shall include, but not be limited to:

1. Checking and, if necessary, correcting the calibration of the sensors, transducers, and transmitters for airflow, liquid flow, pressure, temperature, and humidity.
2. Checking and, if necessary, correcting the operation of the dampers and damper actuators.
3. Checking and, if necessary, correcting the operation (i.e., monitoring and command) of the system points.

E. Software and Hardware Updates: At the end of the first six months after acceptance, and during the subsequent six month period, the BACS contractor shall update the equipment and any controllers, servers, workstations and HMI web servers with the latest modification and improvements in software, firmware, and hardware that the manufacturer may have incorporated in the furnished equipment.

3.12 INSPECTION

A. Examine location where controls and equipment are to be installed and determine space conditions and notify architect in writing of conditions detrimental to proper and timely completion of the work.

1. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.13 INSTALLATION

A. Install in accordance with manufacturer's written instructions, and with recognized industry practices, to ensure that equipment comply with requirements and serve intended purposes.

B. Coordinate with the work as necessary to interface installation of equipment with other components of systems.

3.14 FIELD QUALITY CONTROL

A. Upon completion of installation of the automatic temperature control system and after motors have been energized with normal power source, test system to demonstrate compliance with requirement. When possible, field correct malfunctioning controls then retest to demonstrate compliance. Replace controls which cannot be satisfactorily corrected. Refer to Testing and Balancing Section of this specification.

3.15 SERVICE

A. After completion of the control system installation, the control manufacturer shall regulate and adjust all temperature sensors, control valves, damper motors, etc., and place in complete operating condition, subject to the approval of the Architect. The control contractor shall provide two complete instruction manuals, in addition to any other manuals called for in this specification, to the Owner's operating personnel. The manual shall include the function and operation of all control components on this project. Complete instructions shall be given to the operating personnel. There shall be two day's instruction given for Winter cycle and two day's instruction for Summer cycle operation.

3.16 SUBMISSION REQUIREMENTS

A. Control Schematics

1. BACS legend and abbreviations.
2. BACS one-line Architecture diagram.
3. Point names and types.
4. Normal position of output devices.
5. Setpoints.
6. Point addresses and device ranges.
7. Bill of materials listing all devices and manufacturer numbers.

B. Point and Alarm List

1. Point type (AI, BI, AO, BO, BV, AV)
2. Specific input points that must be able to be put in test mode to facilitate commissioning.
3. Listing, for each point, of any associated alarms. Control loops shall an adjustable setpoint deviation alarm based upon error and time. The alarm parameters shall be the state the point is in to cause a particular including whether the source system is also enabled. Examples of points in this list are as follows:
   a. Supply air temperature (AI) +/- 4°F from setpoint for 30 minutes.
   b. Space air temperature (AI) +/- 4°F from setpoint for 30 minutes, baseboard radiation heating system is enabled.
4. Listing, for each point, of its trending and scheduling requirements.
5. Listing of whether the point is to be included on the BACS graphics.
6. Point address.

C. Sequences of Operation

1. Sequences in all modes of operation: on, off, occupied, unoccupied, warm-up, cool-down, night setback, summer, winter, economizer, etc.
2. Sequences shall be organized into logical groupings including: run/stop, pressure, economizer, coils, discharge air, humidification, dehumidification, hydronic temperature, etc.
3. Detailed steps during mode switches.
4. Details of operation during and after a power outage. Loss of status associated with power outages are not to be indicated as failures with a subsequent alarm or lock out.
5. Specific direction on failure scenarios for loss of proof and all safety device trips.
6. Setpoints, trip points, and ranges.
7. Fire/smoke control system interfaces.

8. Schedule of operation, including Vassar holidays and breaks.
9. Fire alarm panel interlocks and special operating modes.

D. Valve Schedule

1. Manufacturer and Model Number.
2. Valve Size, valve type, and CV Rating.
3. Actuator and Model Number.
4. Type (2-way/3-way, spring return/non spring return, etc.)
5. Flow and pressure drop at design maximum flow.
6. Normal positions.
7. Position of valve at design conditions.
8. Close off rating.
9. Valve characteristic =(i.e., equal percentage, linear, etc.).
10. Valve turndown.
11. Design Flow
12. Design controlled circuit pressure differential range (BACS vendor only, coordinated with the submittals).

E. Damper Schedule

1. Manufacturer and Model Number.
2. System Served.
3. Damper Size and Leakage Class.
4. Actuator and Model Number, Pilot (Y/N), Range and Mounting Position.
5. Size and Type (parallel blade/opposed blade, etc.).
6. Design flow and pressure drop.
7. Normal positions.

F. The BACS vendor shall submit manufacturer's technical product data for each control device, panel, controller, and accessory furnished indicating dimensions, capacities, performance and electrical characteristics, and material finishes. Also include installation, start-up, calibration, and maintenance instructions as well as all cable and tubing requirements.

G. System architecture one-line diagram indicating schematic location of all controllers, workstations, LAN interface devices, gateways, etc. The ACS vendor shall indicate address and type for each control unit; as well as indicate physical media, protocol, communication speed, and type of each LAN.

H. Set of floor plans with all controllers/control panels, sensors, operator workstations, interface devices, UPS's, etc., located and identified. The BACS vendor shall indicate all network components (repeaters, routers, etc.); network wiring shall be shown and identified on the floor plan drawings.

I. Detailed Wiring Diagrams: The BACS vendor shall include detailed wiring. Indicate all required electrical wiring. Wiring diagrams shall include both ladder logic type diagrams for motor starter, control, and safety circuits and detailed digital interface panel point termination diagrams with all wire numbers and terminal block numbers identified. Provide panel termination drawings on separate drawings. Ladder diagrams shall appear on the system schematic. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed. All wiring of related components that make up a system shall be grouped together in one diagram (e.g., all wiring diagrams for the components and devices on a particular AHU shall be shown on one drawing. The supply fan components and devices should not be shown separate from return fan components and devices, etc.).

J. Operation and Maintenance Materials: The BACS vendor shall provide Operation and Maintenance (O&M) materials generally in concert with training. O&M materials shall include the following:

1. Maintenance instructions and spare parts list for each type of control device, control unit, and accessory.
2. BACS User's Guides (Operating Manuals) for each controller type and for all workstation hardware and software and workstation peripheral.
3. BACS Programming Manuals for each controller type and for all workstation software.
4. All information provided during the submittal phase; updated with as-built information. As-built panel drawings shall also be included as part of the O&M manual process. The drawings that are located in each panel shall incorporate all the systems controlled from that particular panel. The drawings shall include the system schematic and detailed panel wiring diagram. Also included (typically noted on the system schematic diagrams) should be the specific locations of any remote devices such as remote static pressure sensors, differential pressure sensors, etc.
5. Each control panel on the project shall include an as-built hard copy of all drawings and documentation associated with that panel and its field devices. This documentation shall be provided in a plastic protective pocket mounted inside the panel door.
6. The final as-built controls drawings (PDF) shall also be accessible via the web based graphics.

PART4 – SEQUENCE OF OPERATION

4.1 GENERAL

A. BMS/ATC Contractor shall design, install, program, test, commission and demonstrate a complete and fully functional system capable of meeting the Sequences of Operation detailed below. Provide additional control points and functions as required, even if not specifically called for, if normally considered necessary for a BMS/ATC installation of the size and complexity of this project or if required to implement control sequence.

B. Listed items of equipment shall be individually controlled by standalone controller. Each controller shall serve only one individual unit. The unit controller shall be supplied by the BMS Contractor and may be furnished to the equipment supplier for factory mounting. The cost to mount, calibrate, program and test the controller and actuator shall be coordinated prior to bid day and included in the BMS price.

1. VAV Box.
2. Heat Pump Unit.
3. Air Handling Unit.
4. Rooftop Unit.
5. Heat Exchangers.
6. Geothermal System.
7. Solar thermal system
8. Solar photovoltaic system

C. Multiple units may be controlled by individual standalone controllers for all other control points.

D. Sensor and transducer installation, control power and wiring and communications wiring shall be provided under this division by BMS/ATC Contractor.

E. Refer to the Systems Points List at the end of this division and equipment schedules on the drawings for required control inputs and outputs for each item of equipment listed in the Sequence of Operation.

F. Where control sequences depend on global variables such as outside air temperature, the controller shall have the capability of either using the last value or a default value.

1. All points and functions required to control an air handler with all directly associated supply, return, and exhaust fans. This excludes the terminals that may be associated with that air handler. Values that may be

received across the network include humidity, emergency power source indication, terminal based reset parameters, and smoke modes.

2. All points associated with the supply side of a hydronic system such as pumps, flow meters, temperature and pressure sensors, proof indications, valves etc. This excludes the terminals on that hydronic system. Values that may be received across the network include outside air temperature and humidity, emergency power source indication, and terminal based reset parameters.
3. All points and functions required to control one terminal system including dampers, valves, flow meters, temperature and humidity sensors, etc. This does not include the scheduling period or any outside air that may be necessary for control.

G. Trending: To support commissioning and building data mining, the BACS shall be capable of trending and archiving all points on building- and system-level controllers at a minimum of 15 minute intervals. The BACS shall also have the capability of trending at least five points on each field-level controller at an interval of 15 minutes. The trend data shall be uploaded to a central database as needed to prevent buffer overflow in the controller. Controller memory capability, network architecture, and communications bandwidth shall be designed to account for this trending. The BACS vendor shall provide control trends during start up and prior to functional performance testing of the systems. Reports shall be scheduled to output the data to a common format such as comma separated text, Microsoft formats such as Excel and Access, and portable database format. Trended data shall also be archived in an Owner-accessible SQL database.

H. Trend Graphs: Web-based software shall provide for displaying graphic plots of the trended values. The software shall support multiple scales, points and point types simultaneously. The BACS vendor shall configure these graphs in a logical manner for each system. Consult with the commissioning team members and project manager for required configuration. Provide a trend for every analog control loop that includes the setpoint, process variable, and control output.

I. Real-time Plotting: Software shall be provided for real time plotting/graphing of multiple values in user-defined time intervals. These graphs will typically be used in commissioning to observe loop responses and system reactions. The BACS vendor shall configure these graphs in a logical manner for each system. Consult with the commissioning team members and project manager for required configuration.

J. Web-based Graphics:

1. Floor Plan Screens.

    a. Provide floor plan screens for each floor and/or section of the building. Indicate the location of all equipment that is not located on the equipment room screens. Indicate the location of temperature sensors and VAV boxes associated with each temperature-controlled zone (i.e., VAV terminals, fan-coils, single-zone AHU's etc.) on the floor plan screens.
    b. Display the space temperature point adjacent to each temperature sensor symbol. Indicate room numbers as provided by Vassar University. Provide a graphic link from each zone and/or equipment symbol shown on the graphic floor plan screens to each corresponding equipment schematic graphic screen.
    c. Provide floor plan screens for each mechanical equipment room and, if mechanical equipment is situated there, the roof. Indicate the location of each item of mechanical equipment. Provide a link from each equipment symbol shown on the plan view screen to each corresponding mechanical system schematic graphic.
    d. If multiple floor plans are necessary to show all areas, provide a graphic building key plan. Use elevation views and/or plan views as necessary to graphically indicate the location of all of the larger scale floor plans. Link the graphic building key plan to larger scale partial floor plans. Provide links from each larger scale floor plan graphic to the building key plan and to each of the other graphic floor plan screens.
    e. Provide a graphic site plan with links to and from each building graphic.

f. All points indicated on control details shall be displayed on graphic.

2. System Schematic Screens:

a. Provide graphics for each air handling and heat pump system. Indicate OA temperature and relative humidity, and mode of operation as applicable (i.e., occupied, unoccupied, warm-up, cool-down, etc.). Link screens for air handlers to the heating system and cooling system graphics. Link screens for supply and exhaust systems, if they are not available in a single graphic.
b. Each I/O point in the project shall appear in at least one graphic. System graphics shall include flow diagrams with status, setpoints, current analog input and output values, operator commands, etc., as applicable. General layout of the system shall be schematically correct. I/O devices shall be shown in their schematically correct locations. Include appropriate engineering units for each displayed point value. Verbose names (English language descriptors) shall be included for each point on all graphics; this may be accomplished by the use of a pop-up window accessed by selecting the displayed point with the cursor. Indicate all adjustable setpoints on the applicable system schematic graphic or, if space does not allow, on a supplemental linked setpoint screen. All outputs shall be represented in terms of percent open and include a pop-up link to the control logic.
c. Provide a system schematic graphic for each HVAC subsystem controlled.
d. Provide a graphic for each hydronic system.
e. Provide a graphic for each terminal unit. In addition to points associated with the unit, indicate mode of operation as applicable (i.e., normal occupied, unoccupied, warm-up, maximum heating, maximum cooling, etc.). Provide links between the applicable floor plan screen and this screen. Also provide links to the graphics representing the parent systems.
f. Link screens for heating and cooling system graphics to utility history reports showing current and monthly energy usage, demands, peak values, etc.
g. Link screens to all schedules and setpoints.

K. Alarm Programming: Alarms shall be “intelligent” based upon the algorithms in this section.

1. In general, alarm programming related to DDC controlled equipment should reside at the controller level along with the functional programming for equipment control.

a. Intrinsic alarming associated with AI, AV, BI or BV objects (or any of the other 23 BACnet objects that support intrinsic alarming) shall only be used where the alarm is valid regardless of the state of the associated equipment or where there is a ready means for automatically suppressing alarm generation when the associated equipment is operationally secured.
b. Alarm points shall be separate BACnet objects (e.g., BV or EEO) actuated by associated alarm programming.
c. Alarm objects shall have descriptive BACnet object names. BACnet alarm object names shall end in “Alarm”. For detailed information on proper point naming conventions, see Vassar University Facility Services, Design and Construction Standards, 230901 Building Automation and Control System Communications and Interoperability.
d. If it is necessary for the alarm to have latching functionality, the user shall be provided easy unlatching capability from within the DDC system if appropriate, taking into account equipment safety concerns. This is in addition to any local alarm reset.
e. Alarms designated for monitoring by EMCS shall be set up in the DDC system to report to the EMCS alarm server.

2. Analog Deviation Alarms: Analog deviation alarms shall be based upon the comparison between the controlled variable and the controlled variable setpoint (whether calculated or fixed).

a. When controlled variable deviates from setpoint above or below user adjustable high or low alarm thresholds, the alarm shall be activated.

b. High and low alarm threshold values shall have associated adjustable deadbands (hysteresis values) for alarm clearing conditions as the controlled variable falls below the high alarm threshold or rises above the low alarm threshold.
c. Alarm programming shall include user adjustable alarm delays for active equipment operation.
d. Alarm programming shall include startup delays to prevent nuisance alarms during equipment startup.
e. Analog deviation alarms shall be disabled if the associated equipment is operationally secured.

3. Analog High Limit Alarms: Analog high limit alarms shall be based upon the comparison between the controlled variable and a user adjustable high limit alarm value.

a. When controlled variable rises above the user adjustable high limit, the alarm shall be activated.
b. High alarm limit value shall have associated adjustable deadband (hysteresis value) for alarm clearing condition as the controlled variable falls below the high alarm limit.
c. Alarm programming shall include user adjustable alarm delays.
d. High limit alarms shall be disabled if the associated equipment is operationally secured, unless needed due to equipment safety considerations.

4. Analog Low Limit Alarms: Analog low limit alarms shall be based upon the comparison between the controlled variable and a user adjustable low limit alarm value.

a. When controlled variable falls below the user adjustable low limit, the alarm shall be activated.
b. Low alarm limit value shall have associated adjustable deadband (hysteresis value) for alarm clearing condition as the controlled variable rises above the low alarm limit.
c. Alarm programming shall include user adjustable alarm delays.
d. Low limit alarms shall be disabled if the associated equipment is operationally secured, unless needed due to equipment safety considerations.

5. Binary Run Status Alarms: Status alarms shall be based upon the comparison between run status and equipment command where applicable.

a. Alarm Status programming shall include user adjustable alarm delays.

6. Binary Alarming: Alarms shall be triggered upon associated BI changing state to the non-normal or alarm state.

a. Alarm Status programming shall include user adjustable alarm delays.
b. Binary alarms shall be disabled if the associated equipment is operationally secured, unless needed due to equipment safety considerations.

4.2 OCCUPANCY SCHEDULES

A. Scheduled Occupancies

1. Occupied during expected occupied period
2. Unoccupied during expected occupied period.
3. Occupied during expected unoccupied period.
4. Unoccupied during expected unoccupied period.

B. Unscheduled Occupancies

1. Vacant
2. Occupancy pending

3. Occupied within past 2 hours.

C. Each room or space shall be provided with an individual heating or cooling setpoint or may participate in global setpoint values for each occupancy condition.

D. Any device utilizing on/off control or scheduling shall be capable of being programmed to conform to any of these schedules.

4.3 BUILDING LEVEL

A. At a minimum, monitoring at the building level shall consist of the following points.

- Outside Environment:
  - Outside air temperature (OAT)
  - OA dewpoint
  - OA enthalpy (calculated)
- Geothermal System:
  - Water supply and return temperatures
  - Tons
- Sanitary Service:
  - Receiver hi-level alarm (if pumped)
- Electric Service:
  - Electricity use (kW), contact
- Emergency Electric Service:
  - Generator status
  - Generator alarm
  - Transfer switch position
- Sanitary Service:
  - Receiver hi-level alarm (if pumped)

B. When power returns, the systems in the building shall be restarted in priority of criticality with a slight timing delay between starts to minimize the inrush power requirements.

4.4 BACS REQUIREMENTS FOR ZONE LEVEL CONTROL

A. General

1. This section of the guideline defines general physical Input/Output (I/O) requirements, sequences, and by inference some degree of system requirements related to how the BACS is applied to zone level control.
2. As a minimum, all zones of control will require a space sensor.
3. Without exception, temperature sensors shall correlate with the controlled zone. In zones where both heating and cooling systems are designed, it is especially important to coordinate the heating and cooling control zones.
4. Override buttons provided with sensors shall as a minimum perform the following functions:
   a. Return the zone to occupied mode and enable the equipment that serves the zone (e.g., the central air handling unit and the zone VAV box). All other zones that are not occupied shall remain at unoccupied flow setpoints, as applicable.
   b. For single zone units, the AHU (or other terminal system) serving the zone shall start and run in the occupied mode.
5. Private offices shall also include space temperature adjustment and alphanumeric display with sensor.
6. Zone temperature control shall, unless indicated otherwise, include a 5 ˚F deadband between heating and cooling setpoints to minimize energy use and avoid "fighting."
7. In all cases, the heating and cooling within a zone must be coordinated to avoid simultaneous heating and cooling.

8. Generally, controllers serving zone terminal devices shall be field-level controllers fed from normal power. Tracking laboratories will require system level controllers fed from emergency power.
9. A comprehensive package of standard zone temperature control drawings, including control schematics, points and alarms list, and sequences of operation have been developed for zone HVAC systems typically used on the Vassar campus. These drawings exist to aid the consultant in designing building control systems to meet Vassar requirements. Where a drawing exists, a drawing reference will be included. Consult Vassar for deviation from these standards, and zone control systems not covered by these drawings.
10. Fail position on the systems that serve these standard environments will generally fail to either last condition/position or heating where there is a perimeter wall or some need for heating. Where there is not a need for heating, such as in an internal zone, systems shall fail to either last position/condition or to cooling.
11. Occupied, occupied setback, and unoccupied temperature setpoints shall be designated on the design control drawings. Occupied setback mode is used where a defined building occupancy schedule is used in conjunction with occupancy sensors. A typical Vassar space temperature setpoint reset schedule is as follows:

    a. Space Cooling Temperature Setpoints:

    Occupied: 75˚F ± 1.5˚F 0+
    Occupied Setback: 75˚F + 3.0˚F
    Unoccupied: 75˚F + 6.0˚F

    b. Space Heating Temperature Setpoints:

    Occupied: 70˚F ± 1.5˚F
    Occupied Setback: 70˚F – 3.0˚F
    Unoccupied: 70˚F – 6.0˚F

12. In addition to the temperature setpoint reset, during the occupied setback mode, the minimum airflow setpoint shall also be reset to 50% of the occupied flow setpoint.

B. Conference/Meeting/Auditorium/Classroom Zones

1. Control for meeting areas must be closely coordinated with the system design, but shall include temperature and ventilation control. Space control data shall be available on the BACS network.
2. Control shall include maintaining space temperature in the comfort range as defined by ASHRAE. Adequate ventilation shall be ensured by either occupancy sensing and indexing the ventilation to the ASHRAE 62 prescribed value upon occupancy, or by active control of CO2, modulating ventilation rates to maintain space CO2 below 900 PPM. Occupancy sensing shall generally be used for smaller facilities while active control will typically be used for larger facilities.

C. Office Zone Control

1. Control shall include maintaining space temperature in the comfort range as defined by ASHRAE. Generally, ventilation shall be provided by a dedicated ventilation system, with sufficient capacity and condition to offset the expected space latent gains.
2. Generally, using VAV with reheat is limited to modifications to existing systems.
3. For zones with passive radiant heating and cooling systems, the typical Vassar occupied, occupied setback, and unoccupied temperature setpoint reset schedule shall be modified. Our experience shows that the following reset schedule is sufficient to maintain proper comfort levels given the slower response speed of these types of systems:
    a. Space Cooling Temperature Setpoints:

    Occupied: 75˚F ± 1.5˚F
    Occupied Setback: N/A
    Unoccupied: 75˚F – 4.0˚F

b. Space Heating Temperature Setpoints:

Occupied: 68˚F ± 1.5˚F
Occupied Setback: N/A
Unoccupied: 68˚F – 4.0˚F

4. The following Standard Details reference typical office conditioning control strategies used at Vassar:

a. Detail 3.7.6 – Zone Control, Four Pipe Fan Coil Unit
b. Detail 3.7.7 – Zone Control, Radiant Heating and Cooling
c. Detail 3.7.8 – Zone Control, Baseboard Heating, Passive Chilled Beam Cooling
d. Detail 3.7.9 – Zone Control, Baseboard Heating, Active Chilled Beam Cooling
e. Detail 3.7.10 – Zone Control, VAV with Reheat

D. Computer Rooms and IT closets

1. Computer Rooms: Computer rooms will be controlled to temperature.
2. Space controllers shall be networked with the system-level or building-level controllers and other space controllers. Provide coordinated control to prevent energy waste from temperature control loop fighting.
3. Liquid sensors shall be provided below raised floors.

E. Loading Docks/Shipping And Receiving Areas

1. The BACS shall control the area to temperature as dictated by the system design. Space controllers shall be networked with the system-level or building-level controllers. The installation shall also include a CO sensor to alarm upon high levels of CO and initiate additional ventilation as permitted by the system design.

4.5 DUCT HEATING COILS

A. Provide manual over-ride and setpoint control capabilities for all sensors.

B. Provide separate heating setpoints for occupied and unoccupied schedules.

C. Status report: For each coil, the BMS shall provide an operating status summary of all unit sensed values setpoints and modes.

4.6 VAV ROOFTOP UNIT

A. If communication with the BAS is lost, the air handler controllers shall use their default setpoints and operate in the Occupied mode.

B. Occupied Mode:

1. When the rooftop unit is in the Occupied Mode, the Supply Fan shall operate continuously. The Supply Fan variable frequency drive shall modulate to maintain the Duct Static Pressure.

C. Unoccupied Mode:

1. When the rooftop unit is in the Unoccupied Mode, the Supply Fan shall be OFF. The Outside Air Damper shall be closed.

D. Night Setback Mode:

1. Supply fan to operate at minimum air flow, maintain set-back space temperature setpoint offs) or lowest associated zone T-stat.
2. Outside air damper to be at minimum.
3. Maintain a 6°F (adj.) offset to setpoint:
   a. Energize heat fully and energize fan at offset. Run until setpoint is reached, then de-energize fan and electric heat.
4. Operate terminal units in "Morning Warm-Up Mode", modulate variable frequency drive to maintain duct static pressure.

E. Morning Warm-Up Mode:

1. Supply fan shall run continuously and be energized one hour (adj.) prior to scheduled occupied mode start. Energize heating to warm-up occupied space to occupied setpoint of all associated space stats.
2. O.A. dampers shall be closed.
3. Cooling shall be locked out.
4. Energize heat fully until setpoint(s) are satisfied, maintain a 95°F (adj.) discharge air temperature.
5. Revert to occupied mode when all space stats have reached occupied heating setpoint.

F. Fan Safety Controls:

1. De-energize the Supply Fans whenever the Stop/Auto interlock is open, the Discharge Air Low Limit is tripped, the fire or smoke stat has tripped, or the Supply Fan Status indicates a failure (after a two minute delay). The Fire-stat, Low Limit and the Fan Failures require a manual reset.
2. Alarm the BMS with an appropriate alarm message.

G. Supply Fan Capacity Control:

1. When the Supply Fan is on, the variable frequency drive shall slowly ramp (adjustable) up to setpoint and modulate to maintain the proper Duct Static Pressure. The unit shall stop if the Static Pressure Sensors fail and alarm BMS. The Static Pressure Sensors shall be located by this Division.
2. Submit sensor locations to engineer for review.

H. Discharge Air Temperature:

1. Provide a "cascade" type reset (via a PID loop) of discharge air temperature (D.A.T.) to maintain space temperature.
2. Space humidity sensor shall override reset control and maintain humidity with highest possible D.A.T.
3. If D.A.T. drops below 40°F (adj.), de-energize all fans and close the outside air damper.

I. Electric Coil Control:

1. Electric coil shall stage on to maintain discharge air temperature.

J. Gas Heat Control:

1. Furnace shall modulate to maintain discharge air temperature.

K. Cooling Control:

1. The compressors shall modulate to maintain the Discharge Air Temperature at the Discharge Cooling Setpoint (55 F, adj.). The compressor shall be off if the rooftop unit is in the Heating mode, the Fans are OFF, or the Discharge Air Sensors have failed.

L. Relief Fan Control:

1. Relief fan variable frequency drive shall modulate to maintain building pressure of 0.05" (adj).

4.7 VARIABLE AIR VOLUME (VAV) TERMINAL UNITS

A. Refer to Air Terminal Unit specification for additional requirements.

B. Shut-Off VAV terminals:

1. On a rise in space temperature, the unit shall modulate to provide up to it's maximum CFM to maintain setpoint. As space temperature decreases, the unit shall modulate down to it's minimum cooling CFM to maintain setpoint.
2. Each VAV box shall have a ventilation setpoint input. This setpoint shall be used along with the ASHRAE Std. 62-1989, Equation 6-1 to reset the corresponding Air Handler Outside Airflow (CFM) to maintain proper ventilation for each VAV zone. See VAV air handler sequences for interface of VAV ventilation into the building automation system.

C. Constant Volume Terminal Units

1. When the associated air handler/fan coil is operating the constant volume valve shall maintain its preset amount of outside air to the air handler/fan coil.
2. When the associated air handler/fan coil is off the constant volume valve shall close.

D. Shut-Off VAV Terminals with Heat:

1. On a rise in space temperature above the cooling setpoint, the unit shall modulate up to it's maximum CFM to maintain setpoint. As space temperature decreases, the unit shall modulate down to its minimum cooling CFM to maintain setpoint.

   As the space temperature continues to fall below the cooling temperature setpoint, the unit shall modulate to its fixed cooling minimum CFM. At the same time, the heating coil shall maintain cooling setpoint.
2. Each VAV box shall have a ventilation setpoint input. This setpoint shall be used along with the ASHRAE Std. 62-1989, Equation 6-1 to reset the corresponding Air Handler Outside Airflow (CFM) to maintain proper ventilation for each VAV zone. See VAV air handler sequences for interface of VAV ventilation into the building automation system.

E. Series Fan Powered Boxes:

1. Occupied Mode:
   a. Fan runs continuously.
   b. On a rise in space temperature the primary valve shall modulate up to its maximum CFM to maintain setpoint. As space temperature decreases the primary valve shall modulate to minimum and the electric coil shall maintain setpoint.
2. Unoccupied Mode:
   a. The primary valve shall be at minimum. Modulate the electric coil and fan to maintain the unoccupied setpoint.

F. Parallel Fan Powered Boxes:

1. Occupied Mode:
   a. Cooling
      1) Fan shall be off and heat de-energized.

2) On a rise in space temperature above cooling setpoint the unit shall modulate up to its maximum cfm to maintain setpoint as space temperature decreases the unit shall modulate to its minimum cooling setpoint.

b. Heating
1) The primary valve shall modulate to minimum position. The fan shall energize and heating coil shall modulate to maintain setpoint.

2. Unoccupied Mode:
a. Fan and heating coil shall cycle to maintain space temperature.

G. Morning Warm-Up:

1. When the respective air handler for a VAV box operates in the morning warm-up mode, the VAV box shall operate as a "heating air valve".
2. Maintain full cfm cooling airflow until the zone sensor is satisfied (space temperature rises). As space setpoint is reached, modulate air valve fully closed until AHU unit reverts to "OCCUPIED" operating mode.
3. Heating control valve shall be fully open.

H. Alarm the time, VAV box designation and duration of all VAV over-rides.

4.8 KITCHEN MAKE-UP AIR UNIT

A. Whenever the kitchen hood is energize, the make-up air unit fan motor is energized the outdoor air damper shall open, the interlocked kitchen exhaust fan shall start and the control system shall be activated. Whenever the kitchen hood is disabled, the kitchen exhaust fan is off, make-up air unit fan motor is off the outdoor air damper shall be closed and the face damper open. The BMS shall index the system between summer and winter.

B. Winter:

1. During "winter" the face and bypass dampers and the heating coil valve, shall modulate in sequence, to maintain a fan discharge temperature of 55˚F (adj.). With a rise in temperature, the face damper shall gradually close and the bypass damper shall gradually open. With a continuous temperature rise, the heating coil valve shall gradually close. A low limit temperature sensor may overcall the fan discharge temperature sensor to maintain a heating coil discharge temperature of 45˚F (adj.).

C. Summer:

1. The summer-winter switch shall be indexed to "summer" the heating coil shall be disabled, the face damper shall open and the bypass damper shall close.

4.9 PRESSURE BYPASS CONTROL

A. A differential pressure controller, sensing supply water and return water pressures for its system, shall modulate a bypass valve to maintain its setting. Valve shall be normally closed for hot water and normally open for chilled water.

4.10 CABINET HEATERS (ROOM CONTROL)

A. For each unit, a room temperature sensor set at 70˚F (adj.) shall control, in sequence, the heater fan and the heating coil valve, to maintain its setting. With a drop in temperature first the fan shall start, and next the temperature sensor shall modulate the heating coil valve open.

4.11 CABINET HEATER (RETURN AIR CONTROL)

A. A return air temperature sensor, accessible through the removable unit access panel or return grille, shall modulate a hot water control valve to maintain its setting.

4.12 EXHAUST FAN CONTROL

A. When the exhaust fan is started, a normally closed damper in the fan outlet shall open. When the fan is stopped, the damper shall close.

B. For dampers furnished by the fan manufacturer, fan manufacturer shall provide electric, totally enclosed, spring return damper motors and dampers, and control manufacturer shall wire to load side of local disconnect switch.

C. For Elevator Equipment Room, provide a room temperature sensor, set at 80˚F., to cycle its respective exhaust fan motor, on a rise in temperature. When the fan starts, its outside air intake damper shall open. For two speed motors, fan shall operate at low speed below 80˚F. and at high speed above 80˚F.

4.13 DIRECT RADIATION

A. Provide room temperature sensor where shown on Drawings, to control a hot water control valve on the water supply line to each radiation element, to maintain 72˚F.

B. In rooms with direct radiation control and reheat control, a single room temperature sensor shall control the radiation and reheat coil, in sequence, on a rise in temperature.

C. Provide self-contained control valves where shown on Drawings to maintain 72˚F.

4.14 SOLAR THERMAL SYSTEM

A. Manufacturers: Resol

B. Contractor shall provide all necessary controls and communication interfaces to control the solar thermal system (pumps, panels, etc.) and connect the solar thermal system to the building BMS system to track system status and performance. System shall be BACnet compatible.

C. Contractor shall provide all temperature probes, pressure sensors, control valves, alarm modules, flow meters, extension modules, sensors, Dataloggers (DL3), smart display (SD3) and all control interfaces required for a fully function and integrated system.

D. All hot water generation shall be trended within the BMS.

4.15 EMERGENCY GENERATOR

A. When the emergency generator starts, its bypass damper shall open, and the control system shall be energized. Outside air and spill air damper shall remain closed.

B. A room temperature sensor shall modulate the bypass, spill and outside air dampers to maintain its setting of 85˚F. As the space temperature rise, the bypass damper shall gradually close and the outside air damper and discharge air damper shall gradually open, in tandem. With a decrease in temperature, the reverse shall occur.

C. When the generator stops, all the dampers shall close.

D. Outside air and spill air dampers shall fail open on a loss of air pressure.

4.16 CONTROL OF SMOKE DAMPERS

A. Provide a normally closed automatic damper in each duct crossing a smoke barrier, as indicated on the Drawings, at the point where the duct crosses the barriers and at supply fan discharge. Whenever supply fan stops, smoke damper at the fan discharge shall close. Provide one minute time delay to prevent fan start-up until smoke damper has opened and 20 second time delay to prevent damper from closing until fan stopped. All smoke dampers on each floor, shall be connected to E-p switches on that floor, which shall close the dampers when deenergized by the smoke detection system provided under Division 16. E-p switches shall be 1/4", 3-way air valve, connected to the damper air piping system. Provide one-minute time delay to prevent fan start-up until its respective smoke dampers have opened, and 20-second time delay to prevent dampers from closing until fan has stopped. E-p switch shall be furnished under this Section of the specifications.

4.17 VARIABLE FREQUENCY DRIVES

A. The BACS shall provide for seamless integration with the control of the VFDs and associated systems. The interface shall be hardwired (point-by-point wiring to applicable terminations on the drives interface board) for start/stop, status and speed signals. The status shall be determined via contacts from the drive. The drive specification must be coordinated to ensure that the status contacts are available and are a true feedback indication that the motor is running. The speed signal shall be 0-10VDC. Digital communications via a controller LAN shall be used to gather all other available diagnostic information.

4.18 MOTOR STARTERS

A. An HOA switch shall be provided with the starter. In the hand position the motor shall start and run continuously unless a safety device trips; in the off position the motor shall stop; in the auto position the BACS shall control the motor per described sequences of operation.

B. Status shall be monitored by the BACS, preferably with a current sensor. Motor status shall be monitored via an adjustable de-bounce time. The BACS shall annunciate a “failure” alarm whenever the motor is commanded to run and status is not proved within an adjustable de-bounce time. In the failure mode, the run command shall remain, except on headered systems for which the run command will be removed requiring manual acknowledgement. In no case shall a loss of status coincident with a loss in power be alarmed as a failure. The BACS shall include controller arrangement and/or points or programming as required to accomplish the above.

4.19 DDC SYSTEM POINTS LIST

A. General: Provide individual inputs or output for each point listed in the points list (See Appendix). Provide any additional points not listed in the points list, but required to meet the sequences of operation, at no additional cost to the owner. All analog outputs shall be 4-20mA, 0-10VDC, or 0-20VDC unless otherwise indicated.

B. Points types include the following:

1. Binary Input (BI)/Digital Input (DI): An on/off indication that has a maximum cycle rate of 1 Hz. This is typically sensing a contact closure.

2. Binary Output (BO)?Digital Output (DO): A contact closure on the controller that will cause an action in the system.

3. Binary Value (BV)/Digital Value (DV): A network-visible binary point whose value is determined by a controller computation.

4. Analog Input (AI): A continuously varying voltage or amperage signal that is varied by a sensor in relation to a sensed variable. This signal is processed in the controller after an analog-to-digital converter on the controller that converts the analog signal to a digital value.

5. Analog Output (AO): A continuously varying voltage or amperage signal that is generated from the controller after digital-to-analog conversion. The voltage or amperage signal will be used, for instance, to drive a modulating actuator or reset a hardwired setpoint on a packaged device.

6. Analog Value (AV): A network-visible analog point whose value is determined by a controller computation.

7. Pulse-Width-Modulated Output (PWM): A time-based algorithm converts a standard BO into a modulating signal. Based on the duration of the pulse, the recipient of the signal positions the device proportional to the duration of the pulse.

8. Pulsed Input (PI): A binary input with increased cycle rate capabilities, capable of directly counting and buffering pulses that may emanate from a metering device.

4.20 MISCELLANEOUS DDC CONTROL

A. See the points list for additional required alarm and status points which shall be monitored by the BMS.

B. Reference mechanical equipment schedules (especially "fans") for additional control sequences.

4.21 MISCELLANEOUS NON-DDC CONTROL

A. Chemical Treatment: Provide required field wiring interlocks.

B. Unit Heater: Cycle the unit fan from a line voltage temperature sensor to maintain temperature setpoint.

END OF SECTION

SECTION 23 09 01

BUILDING AUTOMATION AND CONTROL SYSTEM COMMUNICATIONS AND INTEROPERABILITY

PART 1 - GENERAL

1.1 GENERAL

Historically, the use of building automation and direct digital control systems has been hampered by the difficulties associated with interconnecting systems from different manufacturers to one another and to the campus Energy Management and Control System (EMCS). A result has been the development of ANSI/ASHRAE Standard 135-2004, BACnet - A Data Communication Protocol for Building Automation and Control Networks. BACnet is now, also, an international standard, ISO 16484-5.

1.2 OVERVIEW

This section provides the communication and interoperability requirements for building automation and control system components to be supplied. Because the systems have evolved over many years and involve products from multiple vendors and, in several cases, multiple generations of control systems from single vendors, attention must be given to the integration of the old and the new. The objectives of this integration include: providing a mechanism for competitive procurement of building control products; assisting in meeting the environmental protection goals; improving the operational systems available to our facilities management and operations staff; reducing, if possible, overall facilities management costs; and providing an infrastructure for optimizing performance in a deregulated utility environment.

The objectives shall be met by the use, to the extent possible, of existing, widely- accepted data communication standards and practices.

1.3 APPLICABLE STANDARDS

The following standards shall govern the design and selection of equipment supplied to fulfill the requirements of this section:

A. ANSI/ASHRAE Standard 135-2004: BACnet® - A Data Communication Protocol for Building Automation and Control Networks, as amended, and hereinafter referred to as “BACnet,” American Society of Heating, Refrigerating and Air- Conditioning Engineers, Inc. 2004.

B. ATA/ANSI 878.1 (1992), ARCNET Local Area Network.

C. ISO/IEC 8802-3 (1993), Information processing systems - Local area networks - Part 3: Carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications.

1.4 DEFINITIONS

In addition to the definitions contained in the applicable standards of 1.03, the following should be noted:

A. ARCNET - Attached Resource Computer Network. See BACnet, Clause 8 and ATA/ANSI 878.1.

B. BACnet/IP - BACnet Annex J Devices. Annex J of BACnet describes how BACnet devices can make use of IP directly for communicating across IP-based internets.

C. BACnet PICS - A Protocol Implementation Conformance Statement that describes the BACnet capabilities of a specific device. See BACnet, Annex A.

D. BACS - Building Automation and Control System.

E. BBMD - BACnet Broadcast Management Device. See BACnet, Annex J.

F. BMA - BACnet Manufacturers Association.

G. BTL - The BACnet Testing Laboratories of the BMA. The organization responsible for testing products to assure that they conform to the BACnet standard. Listings of tested products are available at www.bacnetassociation.org.

H. Campus Backbone - A fiber optic data communication infrastructure on the campus. Users connect to the backbone by means of Ethernet concentrators in each building and appropriate 10/100BASE-T unshielded, twisted pair wiring. The backbone uses the Internet Protocol (IP) for routing messages to and from computers both on and off the Vassar campus.

I. CIS - Vassar Information Technologies. The organization that manages the Vassar campus networking infrastructure, including the provision of network connections in Vassar buildings.

J. Computer Section - The computer group within the Vassar Utilities and Energy Management Department. The Computer Section is responsible for the EMCS and the coordination of BACS device addressing and network numbering.

K. BIBB - BACnet Interoperability Building Block. A collection of one or more BACnet services defined for the purpose of describing communication functionality in an unambiguous way. See BACnet, Annex K.

L. Device Profile - A collection of BIBBs that describes the minimum BACnet capabilities of a particular device in order to achieve reliable communication in one of five specified “interoperability areas.” Devices include BACnet Building Controllers (B-BC), BACnet Advanced Application Controllers (B-AAC) and BACnet Application Specific Controllers (B-ASC). See BACnet, Annex L.

M. EMCS - A computer complex, housed at Chilled Water Plant 1 that provides Energy Management and Control System functions for the College. The EMCS is connected to the campus backbone and uses the IP for the routing of messages to and from individual buildings.

N. Ethernet - A carrier sensing multiple access with collision detection network technology defined by ISO/IEC 8802-3.

O. Gateway - A device that translates BACnet messages into those of a non-BACnet protocol and vice-versa.

P. Internetwork - A set of two or more BACnet networks interconnected by routers.

Q. Interoperability Area - A communications domain in which functional cooperation is desired. These areas are currently: 1) data sharing; 2) alarm and event management; 3) trending; 4) scheduling; and 5) device and network management. See BACnet, Clause 22.

R. IP - The Internet Protocol. A networking protocol originally developed by the federal Defense Advanced Research Projects Agency. BACnet messages can traverse the campus backbone by being encapsulated in routable IP packets.

S. Local - Pertaining to the requirements of a specific job or building project.

T. LAN - Local Area Network. One of the approved BACnet network technologies: Ethernet, ARCNET or MS/TP.

U. MS/TP - Master-Slave/Token-Passing Network. One of the approved BACnet LANs. See BACnet, Clause

9.

V. Network - One of the communication technologies for data communications specified in BACnet. Approved network technologies at Vassar are Ethernet, ARCNET and MS/TP.

W. PICS - Protocol Implementation Conformance Statement. A document that describes in detail a device's BACnet capabilities. See BACnet, Annex A.

X. UDP - The User Datagram Protocol. One of the IP family of protocols. UDP is used to convey BACnet/IP messages and is characterized by a "port number" for each protocol. BACnet/IP typically uses UDP port X'BAC0' or decimal 47808.

Y. VLAN - Virtual Local Area Network. A network configuration that allows devices to communicate across multiple physical local area networks (LANs) using their hardware or "medium access control" (MAC) addresses as if they shared a common networking medium. As with a physical LAN, "local" broadcast messages are also propagated to each of the participating LANs. VLAN capability depends on the configuration of the interconnecting data communication equipment. VLAN configuration is performed by CIT.

1.5 SUBMITTALS

In addition to any requirements specified elsewhere, the Contractor shall provide both proposed and as-built versions of the following:

A. Schematic drawings that represent the system architecture and configuration, in both hardcopy and editable electronic format.

B. A points list that includes, for each physical or logical point, the name, description, display units, alarm limits and definitions, along with the BACnet object description, object ID, and associated device ID. The list shall also indicate whether Trend Log or Schedule objects have been established for the point.

C. Documentation for any non-standard BACnet objects, properties, or enumerations utilized detailing their structure, data types, and any associated lists of enumerated values.

D. PICS files indicating the BACnet functionality and configuration of each device. In addition to the requirements of BACnet, Annex A, the Contractor shall provide information on any limitations on the numbers of supported objects in a given device including, specifically, Trend Log and Schedule objects.

E. Documentation on submitted products that have been tested and listed by the BACnet Testing Laboratory (BTL) or a letter on manufacturer's company letterhead indicating the anticipated date by which testing is expected to be completed. If, for any reason, BTL testing and listing has not been completed, a written commitment shall be provided to upgrade installed controls to a version that meets BTL testing and listing requirements should deficiencies be found during BTL testing.

1.6 COORDINATION

The Contractor shall be responsible for all coordination of subcontractors' work relative to the BACS. Specific questions relating to communication and interoperability shall be submitted to the Computer Section.

PART 2 - PRODUCTS

2.1 GENERAL

Each networked device supplied pursuant to this section shall be installed and configured so as to correctly execute all sequences of operation for its intended application, as defined in other sections of this specification. In addition, each networked device shall provide, at a minimum, the BACnet communication capabilities prescribed in the device profiles for devices of its type. See 2.02.

2.2 REQUIREMENTS FOR SYSTEM COMPONENTS

This clause prescribes the minimum requirements for devices supplied pursuant to this section.

A. Controller Requirements: Controller devices supplied to meet the functional and operational requirements of this specification shall conform, at a minimum, to one the BACnet device profiles contained in BACnet, Annex L: BACnet Building Controller (B-BC), BACnet Advanced Application Controller (B-AAC) or BACnet Application Specific Controller (B-ASC). The interoperability requirements of such devices are contained in BACnet, Annex L. B-BC controller devices shall communicate using BACnet/IP. Other devices may use BACnet over ARCNET or BACnet over MS/TP.

B. Router Requirements: In the event that devices are provided that do not use BACnet/IP over Ethernet as their communication technology, BACnet routers shall be provided that route between BACnet/IP over Ethernet and the other BACnet LAN type(s), whether ARCNET or MS/TP. These routers shall conform to the specifications of BACnet, Clause 6.

C. Gateways: BACS devices that use BACnet as their native protocol are preferred. The use of gateways, in circumstances where no native BACnet devices are available, requires the specific approval of the Owner in each instance.

D. Workstation Requirements: The EMCS operator interface is the responsibility of the Computer Section. If, however, a specific job requires a local workstation, the Contractor shall provide a personal computer of current design and approved by the Owner equipped with a Web browser that can display information from a Contractor-supplied Web server that interfaces with the local BACnet network and the campus backbone, as described 2.02.E.

E. Web Server Requirements: If a local workstation is required, the Contractor shall comply with 2.02.D and shall, in addition, provide a Web server computer with the Web page presentation, data acquisition and storage functionality described in this section, including the specific functions listed below. The Web server shall be configured in such a way that there is no software-imposed limit to the number of simultaneous users.

1. Data Sharing:
   - Presentation of data (i.e., user definable reports and graphics)
   - The ability to monitor and display the values of all BACnet object types, including all required and optional properties.
   - The ability to modify setpoints and parameters.

2. Alarm and Event Management:
   - Operator notification and presentation of event information
   - Alarm acknowledgment by operators
   - Alarm summarization
   - Adjustment of alarm limits
   - Adjustment of alarm routing

3. Scheduling:
   - Modification of schedules

- Display of the start and stop times (schedule) of scheduled devices.

4. Trending:
   - Modification of the parameters of a trend log
   - Display and archive of trend log data

5. Device and Network Management:
   - Display of information about the status of any device on the BACnet internetwork.
   - Display of information about any object on the BACnet internetwork.
   - Ability to silence a device on the network that is transmitting erroneous data.
   - Ability to cause a remote device to reinitialize itself.
   - Ability to backup and restore the configuration of devices on the local BACnet network.
   - Ability to query and change the configuration of local BACnet routers.

2.3 REQUIREMENTS FOR NETWORK CONNECTIONS

This clause prescribes the means of interconnecting BACS devices provided pursuant to this specification.

A. Local Area Networks (LANs)

1. All control devices meeting the B-BC device profile shall be connected to an ISO 8802-3 (Ethernet) LAN provided by the Contractor. This LAN, in turn, shall be connected to the campus backbone network. Unless otherwise specified, the connection shall be via a 10/100BASE-T port provided by the Owner. The Contractor shall also provide any additional data communication hardware, such as hubs and repeaters, which may be needed to interconnect the supplied BACS equipment and to connect to the Owner's backbone network.
2. To facilitate maintenance technician access to the LAN, the Contractor shall also provide at least one additional 10/100BASE-T access point in each mechanical room that contains BACS equipment. This requirement may be met by supplying either a hub with a spare port or a dedicated jack.
3. Control devices that meet the B-ASC profile, but do not support Ethernet, must use another approved BACnet LAN technology. These technologies are ARCNET and MS/TP. If Ethernet is not supported on any part of the internet- work, a standalone BACnet router, or a BACnet Building Controller with built- in routing capability, must be provided for routing between the Ethernet and ARCNET or MS/TP LANs.

PART 3 - EXECUTION

3.1 GENERAL

This clause provides specific interoperability and networking requirements that pertain to the use of BACnet.

3.2 REQUIREMENTS BY INTEROPERABILITY AREA

This clause provides requirements pertaining to the five interoperability areas of data sharing, alarm and event management, trending, scheduling, and device and network management.

A. Data Sharing: Data Sharing requirements apply to the exchange of information between BACnet devices for archival storage, generating graphics and reports, the sharing of common sensor or calculated values, carrying out interlocked control strategies, and the modification of setpoints or other operational parameters.

All such data to be exchanged shall be represented as BACnet objects and conveyed using BACnet messages. Only standard BACnet objects and messages may be used to implement data sharing requirements unless the non-standard extensions are explicitly approved by the Owner. Any extensions to BACnet shall be fully documented in the manner used within the BACnet standard. Submission of such documentation is a prerequisite for obtaining approval of an extension.

1. Points List:

   The Contractor shall provide devices installed and configured with all points indicated in the BACS points list. The Contractor shall provide any additional points needed to fully implement the sequence of operations and other functionality described in this specification.

2. Data Presentation:

   In the event that workstation/web server capabilities have been specified, the following characteristics shall apply to graphic displays:

   a. The graphic displays shall include schematic diagrams of the systems being displayed.
   b. When a graphic display is being viewed all values displayed shall be updated when a change of value (COV) notification is received or, if COV is not implemented, within five seconds.
   c. Any data value from any networked device shall be available for plotting at a workstation in real time. The operator shall be able to select binary and analog data concurrently and to plot multiple instances of each data type on the same screen. The operator shall be able to select sampling intervals from 1 second to 60 seconds. For devices that implement COV reporting, the operator shall be able to select this as the means to update the plot. It shall be possible to save such real-time plots for subsequent recall.

3. Monitoring of Any Property:

   The operator shall be able to display any value of any property of any object from any networked device including all properties required by BACnet, all supported optional properties, and any proprietary extensions.

4. Global Object Definitions:

   The control system shall be configured with system-wide unique BACnet objects as needed to convey all globally significant information necessary to implement the control strategy.

5. Setpoint and Parameter Modifications:

   Operators with appropriate authority shall be able to modify all control loop setpoints and tuning parameters via BACnet messages initiated through operator interaction with graphics displays.

6. Peer-to-Peer Data Dependencies:

   All BACnet devices shall be installed and configured to exchange data values directly, without the need for operator or workstation intervention, to implement the sequence of operations specified in the mechanical system drawings and to share global data values.

B. Alarm and Event Management

1. Alarm and Event Management is the exchange of data between BACnet devices related to the

occurrence of predefined conditions that meet specific criteria. Such conditions are called “events” and may be the basis for the initiation of a particular control action in response or the simple logging of the event’s occurrence. The event may also be deemed to represent a condition that constitutes an “alarm” requiring human acknowledgment and intervention.

2. All alarms and events shall be implemented using standard BACnet event detection and notification mechanisms. Either intrinsic reporting or algorithmic change reporting may be used but the intrinsic reporting method is preferred. See BACnet, Clause 13.
3. Alarm Lists:

    a. The Contractor shall provide devices installed and configured to detect alarms and events for the points indicated in the system drawings. Software logic shall be provided to avoid nuisance alarms, e.g., no temperature or status alarms shall be generated when fan systems are not running or during start-up and shut-down transitions. It shall be possible to configure a delay between the occurrence of an alarm condition and its enunciation.
    b. Alarms shall appear at the EMCS and any local operator workstation(s) within five seconds of their occurrence. The workstations shall display an alarm message window that appears on top of any other open windows. The alarm message window shall have a distinctive color and appearance to attract the operator's attention. Operators with sufficient privilege shall be able to configure the workstation to emit an audible signal (or not) when an alarm message is received.
    c. Alarms that require operator acknowledgement shall cause the alarm window to remain active until such an acknowledgement is received. If multiple alarms are received, unacknowledged alarms shall be displayed on a first come first served basis grouped by priority, with the highest priority alarms displayed first.
    d. Alarms shall be distributed using the BACnet notification class mechanism. Assignment of classes and destinations shall be configured according to details provided by the Owner. One destination shall, in all cases, be the EMCS.
    e. BACnet provides a mechanism for prioritizing alarm and event notification messages using a numerical range of 0-255 with 0 being the highest priority and 255 being the lowest priority. The priorities presented in the Table 1 are consistent with the safety requirements of UL 864 (applies to fire systems) and UL 1076 (applies to security systems).
    f. Alarm and event notification priorities shall be configured in the Priority Range as indicated in Table 1 below, and shall be conveyed using the indicated Network Priority. See BACnet, Clause 6.

Table 1. Alarm and Event Priorities

Message Group	Priority Range	Network Priority	Brief Description
Life Safety	00 - 31	Life Safety Message	Notifications related to an immediate threat to life, safety or health such as fire detection or armed robbery.
Property Safety	32 - 63	Life Safety Message	Notifications related as an immediate threat to property such as forced entry.
Supervisory	64 - 95	Critical Equipment Message	Notifications related to improper operation, monitoring failure (particularly of Life Safety or Property Safety monitoring), or monetary loss.
Trouble	96 - 127	Critical Equipment Message	Notifications related to communication failure (particularly of Life Safety or Property Safety equipment).
Miscellaneous Higher Priority Alarm and Events	128 - 191	Urgent Message	Higher-level notifications related to occupant discomfort, normal operation, normal monitoring, or return to normal.
Miscellaneous Lower Priority Alarm and Events	192 - 255	Normal Message	Lower-level notification related to occupant discomfort, normal operation, normal monitoring, or return to normal.

4. Alarm Acknowledgment:

   Alarms shall be acknowledged through the EMCS alarm acknowledgement process.

5. Alarm Summarization:

   Alarm summarization shall be handled through the EMCS alarm summarization process.

6. Alarm Parameter Adjustment:

   Operators with sufficient privilege shall be able to change alarm parameters for all standard BACnet event types.

7. Alarm Routing Adjustment:

   Operators with sufficient privilege shall be able to change alarm routing (BACnet notification classes) for each alarm including the destination for each type of alarm and alarm priority, the day of week and time of day, and the type of transition involved (TO-OFFNORMAL, TO-NORMAL, etc.).

   Initially, notification classes shall be configured in a manner that distinguishes between the EMCS and any local workstation, if provided.

C. Scheduling

Scheduling is the exchange of data between BACnet devices related to the establishment and maintenance of dates and time at which specified output actions are to be taken. All schedules shall be implemented using BACnet objects and messages.

1. Schedule Lists:

   a. The Contractor shall provide devices installed and configured with start/stop, mode change, and night setback schedules as defined in the sequence of operations. As part of the installation process, the Contractor shall configure vacation, holiday, and any special event schedules as provided by the Owner.
   b. The system shall have the ability to program alterations to programmed operating schedules based on the priority of events and shall include the following scenario:

      - Based on operator privileges, the operator shall have the ability to temporarily override the programmed schedule of equipment. Operational override of a programmed schedule shall be for a specific duration following which the schedule shall revert back to the preprogrammed schedule.

2. Display of Start and Stop Times and Actions:

   An operator shall be able to inspect the content of any schedule and determine the specific control actions that will occur at any time, on any date. For any particular device or system parameter that is the subject of a schedule, an operator shall be able to determine the schedule of actions related to that particular device or parameter.

3. Modification of Schedules:

   All calendar entries and schedules shall be modifiable from the EMCS or local workstation by an operator with sufficient privilege.

D. Trending

Trending is the accumulation of (time, value) data pairs at specified rates for a specified duration. Trends are distinguished from real-time plotting of data by the fact that the data are destined for long-term storage.

1. Archival Storage of Data:

Archival storage of data will be handled by the EMCS. However, the Owner may specify local trend archiving and display through the use of BACnet Trend Log objects.

2. Modification of Trend Log Parameters:

An operator with sufficient privilege shall be able to change the data points to be logged, the sampling rate, and the duration of a trend log.

E. Device and Network Management

Device and network management is the exchange of data between BACnet devices concerning the operation and status of specific devices. If local workstation capabilities are provided, the following functions shall be available:

1. Display of Device Status Information:

Operators shall be able to display at any time the operational status of any device on the BACnet internetwork.

2. Display of BACnet Object Information:

Operators shall be able to display, at any time, any property of any BACnet object. Operators shall be able to display property values of objects grouped by object type, object location, and building system.

3. Silencing Devices that are Transmitting Erroneous Data:

Operators shall be able to direct a field device to stop transmitting event, alarm or COV notifications until a subsequent command to resume transmissions is received.

4. Time Synchronization:

Operators shall be able to set the time and date in any device on the network that supports time-of-day functionality. The operator shall be able to select to set the time and date for an individual device, or all devices on a single local network.

5. Remote Device Reinitialization:

Operators shall have the ability to issue reinitialization commands to any device that supports remote reinitialization.

6. Backup and Restore:

Operators shall have the ability to backup and restore all BACnet devices on the network that

support this capability.

7. Configuration Management of Half-Routers, Routers and BBMDs:

Operators shall have the ability to display and modify the routing table entries in all supplied BACnet half-routers and routers and the broadcast distribution and foreign device registration tables in all BBMDs.

3.3 USE OF BACNET OBJECTS

This clause provides requirements that are specific to the representation of data and functionality using BACnet objects.

A. Naming Conventions: The following sections list the requirements for the assignment of names and identifiers for BACnet objects:

1. Device Names:

The EMCS uses a system for naming its control devices based on facility name, location within a facility, the system or systems that the device monitors and/or controls, or the area served. Names can be up to 254 characters in length, without embedded spaces. Only the characters A-Z, 0-9, ".", and "-" may be used. The goal is the shortest descriptive, but unambiguous, name. For example, if there is only one chilled water pump "P1", a valid name would be "DUFFIELD.CW.P1.CONTROL".

If there are two pumps designated "P1", one in the basement mechanical room and one in the penthouse mechanical room, the names could be "CHP.BSMT.CW.P1.CONTROL" or "CHP.PENT.CW.P1.CONTROL". In thecase of unitary controllers, for example a VAV box controller, a name might be "COURT.122.TV-LOUNGE". These names should be used for the value of the "Object_Name" property of the BACnet Device objects of the controllers involved so that the BACnet name and the EMCS name are the same.

2. Device Instance Numbers:

a. BACnet allows 4194305 device instances per BACnet internetwork, each of which must be unique. Vassar's unique device instances are formed as follows: Device Instance = "FFFFNDD" where:

FFFF	=	Facility Code (see below)
N	=	0-9 This allows up to 10 networks per facility or building.
DD	=	00-99 This allows up to 100 devices per network.

b. Facility Code assignments are currently:

0000-0999	Open
1000-1999	Statutory Facilities
2000-2999	Endowed Facilities
3000-3999	Housing and Dining Facilities 4000-
4999	Off-Campus Facilities
5000-5999	Utilities

c. Some facilities have a facility code with an alphabetic suffix to denote wings, related

structures, etc. The suffix will be ignored. Network numbers for facility codes above 4193 will be assigned in the range 0000- 0999.

d. The Contractor shall contact the Computer Section for assignment, or confirmation, of the Facility Code to be used prior to beginning device configuration.

3. Non-Device Object Names:

Objects other than Device objects shall be named in a manner analogous to Device objects. The names shall consist of a facility.[sub-facility.]system.[sub- system.]point designation.

4. Non-Device Object Instance Numbers:

The instance numbers for objects other than Device objects may be assigned at the Contractor's discretion subject only to the constraint that they be unique for a given object type within a given device.

B. Commissioning/Diagnostic Mode

In order to support commissioning and troubleshooting functions, the Out_Of_Service property of all Analog, Binary, Multi-state, Loop, and Program objects shall be writable using BACnet services.

C. Using Object Descriptions

1. Each device object and every object in BACnet Building Controllers (B-BC) shall be configured with a Description property. The descriptions used shall be submitted to the Owner for approval.

2. For all object types in all devices that support Description properties, the available string length and whether or not the Description is writable using BACnet services shall be specified in the device's PICS.

D. Issues Relating to Specific BACnet Object Types

This clause provides requirements that pertain to the use of specific BACnet object types.

1. Analog Input, Output, and Value:

All Analog_Input, Analog_Output, and Analog_Value objects shall have the capability of using the change of value (COV) reporting mechanism and the COV_Increment property shall be writable using BACnet services.

2. Binary Input:

The Inactive_Text and Active_Text properties of Binary Input objects shall be configured with text string values as indicated on the points list. Binary Input objects shall support COV reporting.

3. Binary Output:

The Inactive_Text and Active_Text properties of Binary Output objects shall be configured with text string values as indicated on the points list. All Binary Output objects associated with motor on/off status shall track changes of state and runtime. Binary Output objects shall support COV reporting.

4. Binary Value:

   The Inactive_Text and Active_Text properties of Binary Value objects shall be configured with text string values as indicated on the points list. Binary Value objects shall support COV reporting.

5. Calendar:

   1. Devices providing scheduling capability shall also provide at least one Calendar object with a capacity of at least ten entries. Operators shall be able to view the calendar object and make modifications from any BACnet workstation on the network.

   2. If the Calendar's Date_List property is writable using BACnet services, all calendar entry data types shall be supported.

6. Loop:

   All control loops using any combination of proportional, integral, and/or derivative control shall be represented by BACnet Loop objects. Operators with sufficient authority shall be able to adjust at least the Update_Interval, Setpoint, Proportional_Constant, Integral_Constant, and Derivative_Constant using BACnet services. Loop objects shall support COV reporting.

7. Multi-state Input, Output, and Value:

   The text to be used for the Multi-state object types shall be determined from the points list. Feedback_Value shall be determined by sensing the actual condition or mode of the device. All Multi-state objects shall support COV reporting.

8. Schedule:

   All building systems with date and time scheduling requirements shall have schedules represented by BACnet Schedule objects. All operators shall be able to view the entries for a schedule. Operators with sufficient privilege shall be able to modify schedule entries from any BACnet workstation. Required schedules are shown on the drawings as part of the occupied and unoccupied modes.

E. Dynamic Object Creation

   BACnet Building Controllers shall be configured to allow the dynamic creation of Trend Log, Calendar, and Schedule objects by means of the BACnet CreateObject service. This shall be possible from any supplied BACnet workstation by operators with appropriate authority.

3.4 USE OF BACNET SERVICES

This clause provides requirements that are specific to the use of BACnet communication services.

A. Interoperable Commands

   All dampers, valves, fans, or other mechanical equipment that may need to be controlled by more than one application shall be represented as commandable BACnet objects. The application programs interacting with this equipment shall be configured to use the command priorities listed in Table 2. If implementing the sequence of operations or other required functionality requires using a command priority not listed in Table 2, the priority assignment must be approved by the Owner.

Table 2. Command Priorities

Priority Level	Application	Priority Level	Application
1	Manual-Life Safety	9	Available
2	Automatic-Life Safety	10	Available
3	Available	11	Load Shedding
4	Available	12	Available
5	Critical Equipment Control	13	Available
6	Minimum On/Off	14	Available
7	Available	15	Available
8	Manual Operator	16	Available

B. Alarming

This clause provides requirements that are specific to the use of BACnet for alarm processing.

1. Alarm Priorities:

All alarm and event notification priorities shall be configured as indicated in 3.02.B.1.

2. Notification Classes:

The EMCS shall be designated as a recipient for all alarm notifications.

The Priority, Ack_Required, and Recipient_List properties of Notification Class objects shall be writable over the network using BACnet services.

3. Event Notification Message Texts:

Alarm and event processing shall be configured to convey descriptive text messages along with the notification.

C. Operator Authority Levels

If local workstation capability is provided, there shall be at least three levels of authority:

Administrator - All privileges
Control Shop - All programming and configuration Building Coordinator -
Read only

D. Change of Value Processing

1. All local workstations shall be able to display property values based on the receipt of confirmed and unconfirmed Change of Value notifications. Operators shall have the ability from any workstation to subscribe to COV notifications for all objects that support COV subscriptions.

2. After initialization, all graphic display screens shall update the displayed values using COV notifications if COV notification capabilities are available from the data source.

3. The COV increment shall be adjustable by an operator using BACnet services.

3.5 LOCAL AREA NETWORKS

This clause provides requirements that are specific to the integration of multiple BACnet networks, possibly on different LAN types, into a single BACnet internetwork.

A. Network Numbering

1. Vassar BACnet network numbers are based on a "facility code, network" concept. The "facility code" is the Vassar-assigned numeric value assigned to a specific facility or building. See 3.03.A.2 above. The "network" typically corresponds to a "floor" or other logical configuration within the building. BACnet allows 65535 network numbers per BACnet internetwork.

2. Vassar's network numbers are thus formed as follows: Network Number = "FFFFN" where:
FFFF = Facility Code
N = 0-9 This allows up to 10 networks per facility or building.
N = 0 will generally be assigned to a facility's BACnet Ethernet LAN. Normally, this network is connected to the campus backbone. The additional N-numbers will be assigned to any ARCNET or MS/TP networks as required.

3. The Contractor shall contact the Computer Section for assignment, or confirmation, of the Network Number(s) to be used prior to beginning device configuration.

B. IP Address Assignments

1. Vassar maintains specially configured VLANs for the purpose of securely transporting BACS communication traffic. Address assignments are coordinated by the Computer Section.

2. The Contractor shall contact the Computer Section for assignment of IP addresses (and possibly non-standard UDP ports) prior to beginning device configuration.

3.6 BACNET ROUTERS

This clause provides requirements that are specific to the use of BACnet routers.

A. Error Message Destination

The Contractor shall configure each BACnet router to transmit network layer (routing) error messages to the EMCS.

END OF SECTION

SECTION 23 09 02
INTERGRATED ROOM AUTOMATION SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Provide a complete, integrated room automation system using wired or wireless technology for the following the following:

1. HVAC equipment
2. Lighting
3. Central electronic room access control
4. Central interface (CI) server application
5. Remote room monitoring and communications

B. RELATED WORK

1. Examine contract documents for requirements that affect work of this section. Other Specification sections that relate directly to work of this section include, but are not limited to:

a. Division 8--Door Openings
b. Division 23--Heating, Ventilating and Air Conditioning (HVAC)
c. Division 26--Electrical Power Wiring to System Hardware
d. Division 27--Communications
e. Division 28--Electronic Safety and Security
f. 33--Utilities.

C. SUBMITTALS

1. Product Data: Submit the Manufacturer's product data and installation instructions for each component and system.
2. Shop Drawings: Submit list of components and equipment to be supplied, including proposed locations, clearances and power requirements.
3. Operations and Maintenance Manual: Submit the Manufacturer’s standard operations and maintenance manual, including emergency maintenance provider.
4. Qualifications: Submit documentation from the Manufacturer and Installer indicating qualifications listed in Section 1.4, Quality Assurance.
5. Warranty: Submit the Manufacturer’s standard one-year labor and parts warranty for turnkey installation.

D. QUALITY ASSURANCE

1. Qualifications of Manufacturer: The Manufacturer shall have a minimum of 20 years documented experience manufacturing integrated room automation systems having similar or more stringent requirements than the system for the current project. The Manufacturer shall submit a list of at least 15 completed projects using similar integrated room automation systems.
2. Qualifications of Installer: Submit a letter signed by the Manufacturer stating that the Installer is licensed by or acceptable to the Manufacturer of the integrated room automation system.

E. DELIVERY, STORAGE AND HANDLING

1. Deliver materials and products in unopened, factory-labeled packages. Store and handle in strict compliance with the Manufacturer's instructions and recommendations. Protect from damage. Sequence deliveries to avoid delays, but minimize on-site storage.

F. COORDINATION

1. Conference: Convene a pre-installation conference to establish procedures to coordinate this work with related and adjacent work.
2. Coordination: Furnish inserts and anchors that must be built into other work. Work closely with installers of finish materials so that units are properly aligned with adjacent materials.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Acceptable Manufacturer: INNCOM by Honeywell, 12 Clintonville Rd, Northford, CT 06472, USA. Tel:+1 (860)739-4468; www.inncom.com.

2.2 A. HVAC CONTROLS:

A. HVAC Type: The control strategy will be dependent on the type of HVAC equipment that is being proposed. The control equipment shall be compatible with most HVAC equipment with 5 relay control including WSHPs (Water Source Heat Pump). The following control strategies shall be applied:
   1. Water Source Heat Pumps (WSHP): The System shall control one WSHP in each room. The System shall directly control a 1-, 2-, or 3-speed, line-voltage or low-voltage interface. The System will also control the compressor and associated heating equipment. INNCOM will provide the WSHP Vendor with the necessary control card or connectors to be installed at point of manufacture or in the rooms. The System shall provide automatic switchover from heating to cooling operation at each room.
B. HVAC Control Strategies: Provision shall be made to prevent the system from switching repeatedly from cooling to heating and back while attempting to maintain a constant target temperature. The System’s temperature-control

performance shall meet the requirements defined below for proportional valves. The System's humidity-refresh performance shall meet the requirements defined below.

1. Temperature Control: The System in the room shall employ a PID algorithm to minimize fan speed and valve changes and to reduce servo-loop error. Such error, measured as the temperature difference between the set target temperature and the measured room temperature, shall not exceed 1.0°F (+/- 0.5°C) under steady-state conditions and will automatically compensate for changes in the heat/cooling load of the room. The temperature control algorithm shall be capable of using the full resources of the WSHP to maintain target temperature. Proportional-only algorithms that set the fan speed in proportion to the error shall not be accepted (as they cause a temperature control error that increases with the fan speed).
2. Humidity Refresh: The System in the room shall be capable of maintaining a maximum level of humidity. The refresh cycle will activate in unoccupied rooms only.
3. Humidity Refresh Cycle: The room air conditioning shall be activated on a pre-defined duty cycle to remove excess humidity. The System shall monitor, via central sensors or individual room sensors, the air temperature and relative humidity. When the relative humidity exceeds a preset threshold, the room AC shall be activated if the AC has been shut down for a period of time that exceeds a programmable time value (for example, if the AC has not run for the last one hour).
4. Fan Speed Control: Fan speed shall be selected automatically by the System to match the heat gain/loss in the room. Fixed-fan operation shall also be available to the guest. Fan speeds shall be field-programmable to allow limiting fan speeds to a desired range of speeds. For example, if the High Fan of the FCU is objectionable to the guest due to the noise level it creates, the System shall be capable of being programmed on a room-by- room basis to maintain Medium Fan speed and not enter into the High Fan speed under any condition. Fan operation shall be configurable to provide for "Continuous Fan" or "Automatic Fan." Continuous Fan means that the fan shall run even when the target temperature has been satisfied. Automatic Fan means that the fan shall run only on active heating or cooling call.
5. Multiple HVAC Zone Rooms (Suites): The System shall be capable of supporting multi-zone rooms, where the rooms are not separated by a door yet each room has multiple HVAC units. The System shall be able to link the thermostats and bedside panel (if provided) in these rooms so that they track. This prevents having one room call for heat while the other is calling for cooling.
6. Temperature History: The System shall have the capability to store the temperature, valve, and fan states for each room for at least three months, with all changes being reported.
7. Energy Conservation:
    a. The System shall provide optimized energy conservation measures with minimum inconvenience to the guest. At least four setback strategies shall be employed: two when a room is unrented (either occupied by staff or unoccupied), and two more when a room is rented (either occupied or unoccupied).
    b. The System shall obtain rented status automatically from the Property Management System (PMS). No manual data entry shall be required by the hotel to update the room-rented status.
    c. The System shall determine room occupancy automatically. The System shall keep the room status as occupied even while the guest is asleep.
    d. Setback values and related parameters shall be independently adjustable for rented and unrented modes. For example, a room may be declared unoccupied 15 minutes after door closure if rented and no motion was detected, but it may take only two minutes to return the room to the unoccupied mode if the room is unrented.

e. Reduced on/off switching during the night or “night setback” shall be available for implementation by choice of the property as a means to further reduce energy consumption while the guest is asleep.

f. The System will also implement setback strategies or cycle off HVAC equipment when exterior doors or windows are opened and the space is trying to maintain a target temperature. Switches will be applied to all active exterior windows and doors. They can be either wired or wireless.

g. The System shall also offer occupancy based lighting control which is coupled with a Master Light Switch installed by the entry door.

h. The System shall include peak demand controls that will interface with the Building Management System (BMS) or use an integrated peak demand limiting module. Load shedding strategies will be initiated in the following hierarchy: Unrented rooms will be set back first; then rented, unoccupied rooms; and finally rented, occupied rooms. Demand parameters and load shedding sequences shall be adjustable to allow for minimal guest discomfort while optimizing energy conservation efforts.

8. Digital Thermostat (Model E7): the unit shall be modular in construction so that each of the modules can be added at a later time if not installed initially.

a. The System shall include a wall-mounted, illuminated digital thermostat. The thermostat will be able to display current room temperature, target temperature, and outside temperature in degrees F and degrees C, as well as the humidity level.

b. The thermostat shall be easy to operate and shall allow changing the target temperature in steps of 1° F or 0.5° C. Clear indication shall be provided when the HVAC has been turned off.

c. The thermostat will support in-room voice control.

d. The thermostat shall provide proximity detection and a light sensor to provide a dynamic user interaction with dimmable display.

e. The thermostat shall have the capacity to work with a built-in Passive Infrared (PIR) motion sensor OR a remote PIR motion sensor OR combinations of both.

f. The thermostat shall be capable of directly controlling HVAC units operating on voltages ranging from 24VAC to 277VAC without the requirement of secondary control relays for the higher voltage applications.

g. The thermostat shall also be provided with an RF and Bluetooth transceiver that will allow remote control of lamps that are equipped with RF/Bluetooth receiving modules, an RF/Bluetooth capable Entry Light Switch, and the Electronic Door Lock (EDL).

h. The thermostat shall be connectable to the System via RF or a 2-conductor, low-voltage cable. The thermostat shall also have the capability of connecting to the HVAC equipment wirelessly via RF or Infrared signals.

i. The thermostat shall be capable of controlling HVAC units wirelessly RF (Zigbee-compatible) technology.

j. The thermostat shall have an ecoMODE® button that the guest can use to opt-in to the property’s sustainability practices.

k. The thermostat shall provide a SMART wall plate that captures room thermostat configuration to allow easy, no reprogramming thermostat replacement.

C. Lighting Controls:

1. Lighting control strategy is dependent on the building codes in effect at the location of the property and the period during which it is constructed, the intent of the lighting design, and the type of lighting fixtures or lamps being proposed. Most lodging lighting designs employ one or more of the following approaches:

a. Master Electrical Load Relay (X05B/X06): The high capacity relay by the entry door shall act as the automatic means of turning off all lights and switched receptacles within the guestroom and guestroom bathroom spaces, independently of one another. The relay shall respond to the signal sent from the thermostat-sensor within the guestroom and the occupant sensor within the guestroom bathroom to turn off the lights within the guestroom and guestroom bathroom, respectively.

b. Light Switch: The main light switch by the entry door shall turn off all lights and switched receptacles in the guestroom living space. The main light switch within the guestroom bathroom shall turn off all lights within the guestroom bathroom.

c. Thermostat-sensor: The built-in sensor within the Incomm thermostat shall detect vacancy of the guestroom space and send a signal to the guestroom relay to turn off all lights and switched receptacles within the space (after 20 minutes).

d. Bathroom Sensor: The Incomm sensor shall detect vacancy of the guestroom bathroom and send a signal to the guestroom relay to turn off all lights within the space (after 30 minutes).

2. Access Control: The System shall seamlessly integrate with select third party (Hafele, Saflok, Salto, TimeLox, or Vingcard) Electronic Door Locks (EDLs) to create a centrally controlled access control system. The integrated access system shall meet the following requirements:

a. Wireless Link: The EDL shall communicate with the System via an RF or Bluetooth wireless wall-mounted entry light, a wireless ceiling-mounted RF transceiver or a wireless wall-mounted RF transceiver or directly via RF/Bluetooth equipped thermostats.

1) If the locks are equipped with INNCOM approved RF or Bluetooth transceivers provided by the respective manufacturers, then the locks shall communicate with INNCOM RF/Bluetooth equipped room devices. The information packets shall be received from the locks and transmitted via the common INNCOM backbone network (wired or wireless).

b. Fast Response: The link between the System and the EDL shall provide a 0.5-second response time to meet the functional requirements defined herein.

c. EDL Battery Life: The addition of the required circuitry in the EDL to facilitate wireless communication with the System shall not materially reduce the service life of the batteries that power the EDL. Under no condition shall the service life be less than 18 months. A low battery warning shall be provided as a system alarm.

d. Door Status: The linked EDL shall report to the System any change in the status of the door opening. Such information shall be used by the System in its Occupancy logic, as defined herein. Note that said link shall alleviate the need for the installation of a separate door contact.

e. Staff Access Restriction: In addition to the normal staff access rights as controlled by the door locks, the EDL shall deny access to low-level staff cardkeys when a guest occupies the room.

f. Staff Access Cancellation: The System shall allow instantaneous cancellation of any staff card, without affecting the access rights of other staff cards. The cancellation shall take effect in specific rooms, a group of rooms, or the entire property within three seconds. The System shall automatically update the cancellation list in replaced locks to prevent access by unexpired, cancelled staff cards.

g. Guest Card Cancellation: The guest card shall be denied access to a room immediately upon the guest checkout, even if the card's date of expiration has not yet been exceeded.

h. VIP Guest Cards: The System shall accept pre-issued VIP cards for access to the guestroom. Authorization for the use of VIP cards shall be passed to the System from the Property Management System (PMS). The System shall transmit this authorization to the appropriate EDL.

i. Alarms and Reports: The System shall report the following exception conditions:

1) Low EDL Battery: The System shall generate a report of all EDL that have a low battery condition. Replacing the battery in the EDL will automatically clear the alarm condition in the central computer.

2) Door Open Too Long: The System shall generate an alarm if the guestroom door has been left open for a period exceeding a preset time-period.

3) Door Ajar: The System shall generate an immediate alarm if the guestroom door is partially closed, but not latched.

4) Access History: Every access or attempted access from any guestroom door shall be reported and stored within 15 seconds at the server level. This data shall be available for retrieval by date, room number, or card number from the EDL server. Staff card access information shall also be accessible for retrieval by staff member name.

j. Central Interface (CI) Server Application:

Each guestroom system or sub-system will communicate in real time with a central server running INNcontrol™3 application software shall provide a comprehensive list of room status information and alarms and shall also interface with other systems in the hotel, including the PMS and the Maintenance Management System (MMS).

1) PMS Interface: The software shall interface with the PMS computer through a serial link or TCP/IP. The PMS will provide the INNcontrol™3 software with current sale status of the guestrooms (rented/unrented and check-in/checkout). This information shall be transferred from the INNcontrol™3 software to the room within five seconds and will be used to determine the operation of the HVAC, lights, and other loads in the room. The INNcontrol™3 server shall also be linked and interfaced with the EDL server.

2) Management Display: The INNcontrol™3 application, or terminals connected to the INNcontrol™3 server, shall provide access to management to view and control such parameters as room temperature, room target temperature, HVAC operation, light control, and other conditions and statuses. In general, the INNcontrol™3 application shall provide access to any function of the room control system that is available to the guest in the room. The System shall be capable of interfacing with the Hotel Ethernet System via TCP/IP interface.

3) 3D Real-Time Display: The INNcontrol™3 application, or terminals connected to the INNcontrol™ 3 server, shall be able to provide a 3D view of real-time information such as door openings, guest interactions with room automation devices, and other events. The display shall display the property as an accurate representation of the property and the rooms shall be displayed in colors that represent the status of various devices in the rooms. The color display shall also show in gradients of color the aging of guest service requests and equipment alarms.

4) Remote Access/Diagnostics: The application shall provide full support of a remote terminal connected via TCP/IP to the server. The server software architecture shall be of a client/server structure. The remote terminals shall be PCs operating under Windows XP or later. The application shall be capable of running complete diagnostics of the System from a remote service center via dial-up phone lines or TCP/IP.

5) Alarm Outputs: The application software shall be programmable to route alarm conditions to a file, hard disk, third-party interface, or the PMS.

6) The user shall have the option of not logging on, which will allow View (read-only) use of the software, or logging on, which will allow Control functions based on the logon identification.

7) The software shall open to a pre-determined default language. It shall also be possible to choose another language available from the list.

8) The INNcontrol™3 application, or terminals connected to the INNcontrol™3 server, shall provide access to management to view and control such parameters as room temperature, room target temperature, HVAC operation, light control, and other conditions and statuses. In general, the INNcontrol™3 application shall provide access to any function of the room control system that is available to the guest in the room. The System shall be capable of interfacing with the Hotel Ethernet System via TCP/IP interface is opened is the 'Quick View' screen. Each guestroom selected for Quick View display shall be represented by a block on the screen. The block shall be numbered to correspond to the actual room number. The resulting menu shall allow the display of Butler calls, Valet requests, Pick-Up-Tray requests, Privacy/Service indications, SOS indications, and possibly one or two other requests if desired by the property—for example, cab request.

9) All service requests shall be displayed at once on the Quick View screen. The color coding shall allow easy recognition of each type of call.

10) The software shall display Housekeeping Calls to show a list of rooms requesting the indicated service. Other types of information shall also be optionally shown in the communication area, including clean/dirty room status, notifications, and issues to be handled by the front desk.

11) The software shall offer a Dynamic Suite Linking option and it shall display rooms that are linked as suites. The linked rooms shall be color-coded, and the type of link (common door or connecting door) shall be shown displayed in the room blocks.

12) The software shall be able to display as a minimum the following room conditions:

    a) Rented: Shows which rooms are currently rented.

    b) Occupancy: Shows which rooms are currently occupied, either by guests or staff.

    c) Rented + Occupancy: Shows which rooms are rented and occupied.

    d) Measured Room Temperature: Shows the temperature of each room on the block grid.

    e) Target Room Temperature: Shows the desired room temperature for each room on the block grid.

    f) AC Mode: Shows the operational status of the air conditioning system for all rooms on the block grid.

    g) Measured, Target and AC Mode: Shows all the above on the block grid.

    h) HVAC Equipment Operation: Shows heating, cooling and fan operation for each room on the block grid.

    i) Second Stage Operation: Shows forced, ready, active and normal status for each room on the block grid.

    j) Peak Demand/Load Shedding/Fire: Shows high, medium, low, and normal for peak demand/load shedding, and shows HVAC response to fire.

    k) Open Doors or Windows: Shows which rooms have open doors or windows.

    l) ETM: Shows rooms that have no energy management devices currently operating.

    m) VIP/Lowered Energy Management (LEM): Indicates room thermostat is not being controlled by the system.

    n) HVAC Trouble: Shows all rooms on the block grid with active HVAC alarms.

PART 3 - EXECUTION

3.1 GENERAL

A. Assemble and install in accordance with manufacturers written installation instructions and details on drawings.

B. Coordinate all control interconnects with all other trades.

END OF SECTION

SECTION 23 21 13

HYDRONIC PIPING AND ACCESSORIES

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. This Section covers water piping carrying water at 200ºF or less, used in the following systems:

1. Geothermal/Condenser water system
2. Solar thermal system

1.2 SUBMITTALS

A. Submit manufacturer's product data on the following:

1. Pipe
2. Accessories

PART 2 - PRODUCTS

2.1 GENERAL

A. All pipe shall be new, free from scale or rust, of the material and weight specified under the various services. Each length of pipe shall be properly marked at the mill for proper identification with name or symbol of manufacturer.

B. All steel piping, except where otherwise rated, shall be standard or extra strong weight, in conformance with the ASTM A-53 Grade B seamless.

C. All brass piping shall be standard or extra heavy weight 85% red brass semi-annealed seamless-drawn, in conformance with the ASTM B-43, as manufactured by Anaconda, American Brass Co., Chase Brass and Copper Co., or Revere Copper and Brass, Inc.

D. All copper tubing shall be of weight as required for service specified, with conformance with ASTM B-88 for Type "L" and "K" tubing, as manufactured by Chase, Anaconda, Revere, or approved equal. Tubing and fittings shall be thoroughly cleaned with sand cloth and treated with an approved non-corrosive flux before solder is applied.

E. All galvanized steel piping shall be standard or extra strong weight, as specified, in conformance with the ASTM A-53 Grade B. Pipe shall be hot-dripped zinc-coated with Prime Western smelter and not wiped.

F. Fittings shall be of material conforming to the following schedule:

1.	Malleable Iron Fittings	ASTM A-197
2.	Cast-Iron Fittings	ASTM A-126
3.	Brass Fittings	ASTM B-62
4.	Solder Fittings	ASTM B-88
5.	Steel Welding Fittings	ASTM B16.9.
6.	Wrought Copper	ASTM B16.22

G. Dielectric Fittings: Install dielectric nipple, coupling or flange, to prevent galvanic action between ferrous and non-ferrous piping. Dielectric fittings shall be accessible for inspection and service. Provide dielectric fittings at all connectors to dissimilar metals, including at air handling unit coil connections.

H. All fittings used at expansion loops or bends shall be extra heavy.

I. Cast-iron, malleable-iron, and bronze fittings shall be of Crane manufacturer or approved equal.

J. Flanges shall be raised face, of the same weight as the fittings in each service category. All flanges shall be drilled to "US Standard" hex nuts and washers. Bolting shall conform to ASTM 193 Grade B-7, threads Class 7 fit. Nuts shall be semi-finished hexagonal, ANSI B18.2 ASTM A194 Grade 2H.

K. Provide permanent signage on expansion tank of hydronic systems treated with chemicals that include the chemical type, concentration system volume and direction to drain to sanitary drain.

2.2 PIPE AND FITTINGS

Piping Types and Materials

Service & Location	Pipe Size	Pipe Material & Weight	Joint Type	Fitting Material
Solar Thermal Water (<250°F)				
Inside Building	3" or smaller	Copper, Type L, ASTM B88	Soldered below 175 PSI, Brazed above 175 PSI	Wrought Copper
	4" or larger	Steel, Schedule 40, ASTM A53, Type S, Grade B	Welded	Steel
Outside Building	3" or smaller	Copper, Type L, ASTM B88	Soldered below 175 PSI, Brazed above 175 PSI	Wrought Copper
	4" or larger	Steel, Schedule 40, ASTM A53, Type S, Grade B	Welded	Steel
Geothermal/Condenser Water				
Inside Building	3" or smaller	Copper, Type L, ASTM B88	Soldered below 175 PSI, Brazed above 175 PSI	Wrought Copper
	4" or larger	Steel, Schedule 40, ASTM A53, Type S, Grade B	Welded	Steel
Outside Building	3" or smaller	Copper, Type L	Soldered below 175 PSI, Brazed above 175 PSI	Wrought Copper
	4" or larger	Steel, Schedule 40, ASTM A53, Type S, Grade B	Welded	Steel
Below Ground	All Sizes	See Geothermal Spec	-	-
Refrigerant				
Inside Building	All Sizes	Copper Tube, Type ACR, ASTM B280	Brazed (silver solder (45% min cadmium free)	Wrought Copper, 300#
Outside Building	All Sizes	Copper Tube, Type ACR, ASTM B280	Brazed (silver solder (45% min cadmium free)	Wrought Copper, 300#

Air Conditioning Coil Condensate				
All Locations	All Sizes	Copper, Type M, Drawn, ASTM B88	Soldered	Wrought Copper

2.3 PRESS FIT JOINING SYSTEM

A. Manufacturer

1. Design Basis: Viega ProPress
2. Other acceptable manufacturers:
   a. Elkhart Products, Express

B. Material

1. Press Fittings: Copper press fittings. Must comply with ASME B16.18 or B16.22.
2. O-Rings: EPDM
3. Fittings shall be rated for 0°F to 250°F, and 250 psi.

C. Application

1. Locations where Engineer has determined that traditional hot joining methods are not possible at a specific location.

D. Press-Connect Fitting: Copper press-connect fittings shall conform to the material and sizing requirements of ASME B16.18 or ASME B16.22 O-rings for copper press-connect fittings shall be EPDM.

E. Copper press-fittings shall be installed in accordance with the manufacturer's installation instructions. The tubing shall be fully inserted into the fitting and marked at the end of the fittings. The fitting alignment shall be checked against the mark on the tubing to insure the tube is fully engaged (inserted) in the fittings. The joints shall be pressed using a pressing tool and jaws, or jaw set, approved by the manufacturer.

F. Alignment of the correct area on the fittings with the corresponding correct area of a crimping sling is critical.

When the installer has confirmed that positioning and alignments are correct and other proper installations procedures have been followed, crimping can take place with the band remaining in the groove.

Installer shall use manufacturer provided alignment and dimension guides or employ equivalent measures when none are provided by manufacturer.

G. Tools used to complete joint shall be manufacturer approved for the fitting being installed.

2.4 WELDING PIPING AND FITTINGS

A. All fittings for welded piping shall be as manufactured by Tube Turn, Anvil, Bonney Forge or equal as approved by the Architect. The fittings shall be of the same weight and material as the piping to which they are attached.

B. For piping 3" and larger, full size branch connection shall be made with manufactured welding tees, branch connections for less than full size, shall be made with welding tees or with Weldolet forged branch outlet fittings. Fishmounting, shaped nipples, and stubbing not permitted.

C. Welding outlet fittings shall be Weldolets as manufactured by Donney Forge, Inc., or approved equal 2 or 3 and smaller branches shall be made with thredolets as made by Bonney Forge or approved equal.

D. Welding fittings shall be of the same material and schedule as the pipe to which they are welded. Welding elbows shall be long radius pattern unless clearance conditions necessitate the use of standard radius pattern. Welding fittings shall be as made by Tube-Turn.

E. All flanges shall be welding neck flanges ANSI B16.5 ATM 181 Grade I. All systems, except where otherwise noted - 150 lbs. Class, forged steel.

2.5 STRAINERS

A. Manufacturers:

1. Design Basis: Armstrong
2. Other Acceptable Manufacturers:
   a. Mueller
   b. Sarco
   c. Hoffman
   d. Dunham Bush

B. Size 2" and Smaller: 250-lb cast iron, threaded.

C. Size 2½" and Larger: 125-lb cast iron, flanged.

D. Screens:

1. Final Screen:
   a. Material: Type 304 stainless steel.
   b. Perforations: 0.045" diameter, 233 holes per square inch.
2. Roughing Screen:
   a. Material: Carbon steel.
3. Provide roughing screens at all circulation pumps and at any additional strainers upstream of primary plant equipment such as boilers, chillers, etc.
4. Screen shall be removable without removing piping.

2.6 EXPANSION TANKS

A. Manufacturers:

1. Design Basis: Amtrol Inc.
2. Other Acceptable Manufacturers:
   a. ITT Bell & Gossett
   b. Taco
   c. GFC Corp
   d. J.J. Finnigan
   e. Woods
   f. Wessels

B. Type: Bladder

C. Design Temperature: Per schedule

D. Maximum working pressure: Coordinate with pressure of system

E. Design pre-charge pressure: Same as boiler make-up water PR fill valve.

F. Bladder or Diaphragm Material: EPDM, compatible with propylene glycol.

2.7 AIR PURGERS

A. Manufacturers:

1. Design Basis: Bell & Gossett
2. Other Acceptable Manufacturers:
   a. Amtrol
   b. Taco
   c. Thrush

B. Model: 107

C. Float actuated, non-modulating, rated at 250 psig at 250ºF.

2.8 AIR VENTS

A. Manufacturer:

1. Design Basis: Amtrol
2. Other Acceptable Manufacturers:
   a. Bell & Gossett
   b. Taco
   c. Thrush
   d. Armstrong

B. Resilient Parts: EPDM

C. Vents on Pipes Size 2" and Smaller: Model 706

D. Vents on Pipes Size 2½" and Larger: Model 706

E. Vents on Air Purgers: Model 706

F. Provide manual air vents on system high points located in finished spaces, on all systems that contain glycol, and on all chilled water systems.

G. Provide automatic air vents on water system high points located in unfinished spaces.

H. Air vents shall be a minimum of ½" and furnished with brass hose connectors and cap.

2.9 PRESSURE REDUCING FILL VALVES

A. Manufacturers:

1. Design Basis: Bell & Gossett
2. Other Acceptable Manufacturers:
   a. Taco
   b. Thrush
   c. Watts

B. Size: ¾"- for systems up to 300 gallons
   1" - for systems larger than 300 gallons

C. Model:

1. 8 psig to 25 psig: No. 12

2. 25 psig to 60 psig: No. 7

2.10 PRESSURE TEMPERATURE TAPS

A. Manufacturers:

1. Design Basis: Sysco
2. Other Acceptable Manufacturers:
   a. Universal Lancaster, Inc.
   b. Petes Plug

B. Model: BNO-500, ¼" NPT, or ½" NPT.

C. Construction:

1. Body and Cap: Brass
2. Pressure: 500 psig
3. Temperature: 350ºF
4. Core: Hot water – EDPM, Glycol – EPDM, Chilled Water – Neoprene, Cold Water - Neoprene
5. Cap: Gasketed, threaded.

D. Thermometer:

1. Number required: 1
2. Dial diameter: 2"
3. Range: 0º to 220º

E. Pressure Gauge Adapter:

1. Number required: 1
2. Model: GA-125

F. Pressure Gauge:

1. Number required: 1
2. Dial diameter: 4½"
3. Range: 0 to 100 psig
4. Accuracy: ½%

G. Provide manual vents (accessible from floor) piped to sinks or floor drains for all glycol systems. This may result in significant lengths of pipe.

2.11 THERMOMETERS

A. Manufacturers:

1. Design Basis: American, Trerice
2. Other Acceptable Manufacturers:
   a. Ernst
   b. Marsh
   c. Marshalltown
   d. Weksler
   e. Weiss

B. Housing: 9" adjustable angle stem.

C. Tube: Lens front, red liquid.

D. Range:

1. Geothermal/Condenser water, 0ºF to 120ºF.
2. Solar Thermal, 30ºF to 240ºF.
3. Dial thermometers shall be 5 inch hermetically sealed, bimetal with stainless steel cases, antiparallax dials with raised jet black figures, stainless steel stems, and brass separable sockets unless otherwise specified. Thermometers for duct mounting shall have union connections in lieu of separable sockets. Separable wells shall be stainless steel for steel pipe and brass for copper pipe. Separable wells shall be standard type for uninsulated pipe and locking extension type of proper length for insulated pipe. Stem shall extend a minimum of 2-1/2" into the fluid.

E. Thermometers for duct mounting shall have union connections in lieu of separable sockets. Separable wells shall be stainless steel for steel pipe and brass for copper pipe. Separable wells shall be standard type for uninsulated pipe and locking extension type of proper length for insulated pipe. Stem shall extend a minimum of 2-1/2" into the fluid.

F. The accuracy of all thermometers shall be within 1% of the scale range.

G. Thermowells: All thermowells for steam service shall be stainless steel and for water service shall be brass. Thermowell length shall be in accordance with ISA standards and shall include the appropriate extension to allow for pipe installation. Extension neck shall be included when required to match thermowell and insulation thickness.

H. Locking adjustable angle body and a case of aluminum or non-metallic material. Thermometer shall be secured to well by tapered bushing and not by set screws. Provide the following characteristics:

1. Scale Graduations: 2˚F.
2. Range: Select to provide a mid-scale reading at normal operating temperature.
3. Accuracy: 1%.

I. Industrial light-powered digital thermometer with adjustable-angle stem and a case of aluminum or high impact ABS plastic. Thermometer shall be secured to thermowell by tapered bushing and not by set screws. Installation shall insure that thermometer is accessible and has been adjusted to be readable from a 5-foot level as viewed from the floor. Display shall be LCD with digits a minimum of 0.5-inch high with the following characteristics:
1. Resolution :0.1 °F.
2. Range; -40 to 300 °F.
3. Sensor: Glass passivated thermistor.
4. Accuracy: 1%

J. Acceptable Manufacturers

1. Trerice
2. Weiss Instruments
3. Weksler

2.12 PRESSURE GAUGES

A. Design Basis: Trerice

1. Other Acceptable Manufacturers:
   a. Ernst
   b. Marsh
   c. Marshalltown
   d. Winters
   e. U.S. Gauge
   f. Weksler

g. Ashcroft
h. Or approved equal.

B. Model: 800LF Series. Liquid filled.

C. Dial Face 4½ inch diameter; 270º arc.

1. Range: As required to keep normal operating point in mid 2/3 to ¾ of dial.
   a. Use 30" vacuum to 100 psi gauge for pumps designed to operate at pressures up to 75 psig total pressure. (Total pressure = required pump-off static pressure plus scheduled pump head).
   b. Geothermal/Condenser water: 0 to 100 psig.
   c. Solar Thermal water: 0 to 100 psig.
   d. Discharge side of water pressure reducing valve: 0 to 100 psig.

2. Use higher pressure ranges as required such that scheduled total pressure does not exceed an operating point above ¾ range of dial.

D. Accuracy: 2% of full scale over middle of range.

E. The gauges shall have silicone filled stainless steel casings with chrome plated bezels or rims. The gauges shall have white faces with black filled engraved numerals and adjustable pointer. The diameter of the dial shall not be less than 3-1/2 inches. Gauges shall have brass bronzed brushed rotary type movement.

F. Provide isolating ball valve, not a gauge cock.

2.13 FLOW MEASURING DEVICES (ANNULAR/VELOCITY AVERAGING)

A. Manufacturers:

1. Design Basis: Veris
2. Other Acceptable Manufacturers:
   a. Presso
   b. Barco Division
   c. Aeroquip Corp.

B. Accessories:

1. Stop valves
2. Quick disconnects
3. Caps

C. This shall be a coordinated system, including Venturi flow stations and portable master meter, supplied by one manufacturer. Each Venturi station shall be complete with pressure tap nipples, quick disconnect valve and safety shut-off valves, indented metal identification tag on chain, giving pipe side, Venturi series, station identification, and meter reading at specified flow rate. Venturi stations shall be one piece brass screwed 1/2" through 2". Sizes 2-1/2" through 8" shall consist of plated cast iron Venturi insert held between specially machined self-centering 150# steel weld neck units. Sizes 10" and larger shall be fabricated steel plated, with welding ends. Venturi size and series shall be selected so that design flow rate shall be between 10" and 40 inches of water pressure differential on a 0-50" meter with permanent pressure loss of not more than 10% indicated flow rate differential pressure. Minimum flow rates of 2-1/2 FPS are permissible. Venturi stations shall be compatible with temperatures and pressure of the system.

D. Master meter shall consist of 6" round dial, dry type meter supplied with scale reading zero to 50 inches of water differential pressure and shall be mounted in a portable water and rot-proof fiberglass carrying case complete with 10 ft. lengths of 1/4" high pressure high temperature connecting hose, quick disconnect socket valves, venting valves, installation and operating instructions and capacity curves. Master meter shall become property of the Owner.

E. Master Meter shall be high pressure, high temperature type rated at 50 psig and 400F, Venturi looseleaf charts shall be supplied for correction to master reading for HTHW.

2.14 FLOW MEASURING DEVICES (TURBINE)

A. Manufacturers:

1. Design Basis: Onicon
2. Other Acceptable Manufacturers: Approved equivalent

2.15 POT FEEDERS

A. Manufacturers:

1. Design Basis: H-O-H
2. Other Acceptable Manufacturers:
   a. Dearborn

B. Model: HV

C. Size: 2 gal.

2.16 AIR SEPARATORS

A. Manufacturers:

1. Design Basis: Bell & Gossett
2. Other Acceptable Manufacturers:
   a. Taco
   b. Spirotherm

B. Model: “Rolairtrol”

C. Constructed and nameplated for 125 psig working pressure and stamped in compliance with ASME boiler and pressure vessel code.

D. Provide blow-down connection.

2.17 AUTOMATIC FLOW CONTROL VALVES (AUTOMATIC BALANCING VALVES)

A. Flows Under 3 gpm:

1. Manufacturers:
   a. Design Basis: Flow Design Inc.
   b. Other Acceptable Manufacturers: Hayes
2. Pressure Drop Range: 15 to 150 psi.

B. Flows 3 gpm or Greater:

1. Manufacturers:
   1) Design Basis: Flow Design Inc.

   Other Acceptable Manufacturers:
   2) Autoflow
   3) Griswold
2. Type: Spring loaded piston.

3. Materials and Connections: Match pipes.
4. Pressure Drop Range: 2 to 40 psi.

C. Body: DZR brass, optional Y or T body construction to allow removal of flow cartridge without breaking main piping

D. Optional Integral Shutoff:

1. Ball: Chrome plated or stainless steel
2. Stem: blowout proof wit EPDM O-ring and adjustable Teflon packing nut, optional stainless steel as well as extensions for insulation
3. Seat: Reinforced TFE
4. Handle Style: Steel lever, optional reinforced plastic tee handle for vapor seal

E. End Connections: Threaded or sweat as required. Return side shall have union connection

F. Pressure Gage Connections: Dual Pressure Temperature test ports, brass body EPDM internal seals with retained safety cap, rated 1000 PSI at 275 F. Optional extensions for insulation

G. Flow Cartridge:
1. Body: Series 300 Stainless Steel wear surface, CNC machined piston and cylinder
2. Spring: Stainless Steel
3. Calibration: Integral adjustable factory set threaded locking nut to calibrate spring compression for design flow performance throughout spring range.

H. CWP Rating: 400 PSIG

I. Maximum Operating Temperature: 250 F

J. Accuracy: Factory pre set flow +-5% over defined pressure differential range or spring range as defined by manufacturer and determined by pump head calculations.

K. Factory Test:
1. Performance: 100% spring test of all flow control cartridges at the factory to verify design performance.
2. Leak Test: Every complete valve, factory leak tested at 100 psi under water

2.18 RELIEF VALVES

A. Manufacturers:

1. Design Basis: Bell & Gossett
2. Other Acceptable Manufacturers:
   a. Taco
   b. Thrush
   c. Watts

B. Type: ASME

C. Size: Maximum input capacity of system at design pressure.

D. Setting: Operating pressure of system plus 2 psi.

2.19 GEOTHERMAL DISTRIBUTION MANIFOLDS

A. Material:
1. High density polyethylene, type PE4710, ASTM D3035, DR 11.
2. Comply with ASTM D 3035 with minimum working pressure rating of 200 psi at 73 degrees F.

3. ASTM D3350 cell classification PE445574C
4. Long Term Hydrostatic Design Basis: 1600 psi at 73 degrees F, when tested in accordance with ASTM D2837; appropriate listing in current edition of PPI TR-4 will constitute evidence of compliance with this requirement; otherwise, submit independent test results.

B. Joints and Fittings:
1. Polyethylene of same type as pipe, of sizes and types suitable for the pipe being used; use only heat fusion or stab-type mechanical fittings that are quality controlled to provide a leak-free union between piping ends that is stronger than the piping itself. Do not use other barbed fittings or hose clamps.
a. Electrofusion Type Fittings: Comply with ASTM F1055.
b. Butt Fusion Fittings, 1-1/2" pipe and above: Comply with ASTM D3261.

C. Holes shall be tapped for connections. Outlet ports shall be fusion welded onto the body of the manifold, with integrated fittings for connection to the borehole field. Fusion welding shall be done in a factory setting to ensure quality of the manifold.

D. Manifold shall be pressure tested and with no indication of leaks.

E. Balancing Manifolds

1. Manifolds shall be equipped with supply and return manifold butterfly isolation valves, pressure gauge, thermometer, and air vent/fill ports.
2. Each circuit shall be supplied with circuit supply and return isolation valves, supply balancing valve, and P&T yap.

2.20 PROPYLENE GLYCOL

A. Manufacturers:

1. Design Basis: Dow Chemical Company
2. Other Acceptable Manufacturers:
a. Dupont

B. Model: Dowfrost

C. Type: Propylene Glycol based with corrosion inhibitors.

2.21 VENTURIS

A. Manufacturers:

1. Gerand
2. Barco
3. Presso

B. Identification:

1. Provide engraved metal tag indicating Beta Ratio or flow curve.
2. Hang on chain to clear insulation.

C. Size:

1. Select Beta ratio to provide 10" to 30" water gauge meter reading.

2.22 EXPANSION COMPENSATORS, TWO INCH AND SMALLER

A. Manufacturers - Design Basis: Flexonics

B. Other Acceptable Manufacturers:

1. Adsco
2. Keflex
3. Metraflex

C. Stroke: ¼" extension, 1¾" compression.

D. Model: HB-XXX-FFS for copper tube, all bronze.

E. Model: H-XXX-MMT for steel pipe with stainless steel bellows, steel shroud and fittings.

2.23 FLEXIBLE PIPE CONNECTORS

A. Manufacturers - Design Basis: Mason

1. Other Acceptable Manufacturers:
   a. Metraflex
   b. Flexonics
   c. Victaulic
2. Model: MFTNC, Twin Sphere 225 psi.

B. Pipe Alignment Guides:

1. Manufacturers - Design Basis: Flexonics
2. Other Acceptable Manufacturers:
   a. Adsco
   b. Keflex
3. Model: PG
4. Material:
   a. Spider: Steel for steel pipe, bronze for copper tubing.
   b. Ring: Steel
   c. Travel: 3"

C. Victaulic Style 177, 75, or 77 flexible couplings may be used in lieu of flexible connectors for vibration isolation and noise reduction at equipment connections. Three (3) couplings, for each connector, shall be placed in close proximity to the source of vibration.

2.24 SLEEVES

A. Steel-Pipe Sleeves: Fabricate from Schedule 40 steel pipe. Remove burrs.

B. Iron-Pipe Sleeves: Fabricate from service weight cast-iron pipe. Remove burrs.

C. Sheet-Metal Pipe Sleeves: Fabricate from galvanized sheet-metal, closed with lock-seam joints.

1. For following pipe sizes, provide gauge indicated:
   a. Three Inch Pipe and Smaller: 20 gauge
   b. Four Inch to Six Inch Pipe: 16 gauge
   c. Over Six Inch Pipe: 14 gauge

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine location where these specialties are to be installed and determine space conditions and notify Architect in writing of conditions detrimental to proper and timely completion of the work.

B. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install HVAC Specialties where shown, in accordance with manufacturer's written instructions and with recognized industry practices, to ensure that HVAC Specialties comply with requirements and serve intended purposes.

B. Coordinate with other work as necessary to interface installation of HVAC Specialties with other components of systems.

C. All coils and heat exchangers shall be equipped to measure and adjust flow. Adjustable valves with flow measuring taps are preferred. The balancing valve shall not be used for coil isolation--provide ball or butterfly isolation valves in addition to the balancing valves.

3.3 FIELD QUALITY CONTROL

A. Upon completion of installation of HVAC Specialties, test HVAC Specialties to demonstrate compliance with requirements. When possible, field correct malfunctioning units, then retest to demonstrate compliance. Replace units which cannot be satisfactorily corrected.

3.4 PIPE INSTALLATION

A. Install horizontal piping level (except drain piping and as otherwise noted) and parallel to building construction. All vertical piping to be plumb.

B. Make any changes in direction with fittings, do not kink or bend piping. Elbows are to be long radius type wherever possible.

C. Regardless of how shown on schematic piping diagrams, do not install a tee so that flow enters from opposite directions.

D. Do not rearrange piping in a manner to increase pressure drop without written approval from Architect/Engineer.

E. Install drains with cap and brass hose connector at all low points and traps of the system.

F. Vent piping from the high temperature hot water system shall comply with all requirements of high temperature hot water piping specified herein before. This shall also apply for the high temperature water safety valve discharge piping.

G. General:

1. Install pipe, tube and fittings in accordance with recognized industry practices which will achieve permanently-leakproof piping systems, capable of performing each indicated service without piping failure.
2. Install each run with a minimum of joints and couplings, but with adequate and accessible unions for disassembly, maintenance or replacement of valves and equipment.
3. Reduce sizes by use of reducing fittings.
4. Install piping without springing or forcing.
5. Provide sufficient swing joints, anchors, expansion loops and devices necessary to permit free expansion and contraction without causing undue stresses.

6. Support piping independently at equipment so its weight will not be supported by the equipment.
7. Support piping to maintain a consistent slope as indicated on the drawings without sagging or pocketing of any kind. Where not otherwise indicated, all horizontal piping shall slope a minimum of 1/16 inch per foot to drain at system low points.
8. Provide air vents at high points of all pumped piping systems. Provide drains at all low points and traps.
9. Install horizontal piping parallel to building construction, make any changes in direction with fittings.

H. Location:

1. Locate piping runs, except as otherwise indicated, both vertically and horizontally to allow for complete drainage of piping system (pitched to drain).
   a. Avoid diagonal runs wherever possible.
   b. Orient horizontal runs parallel with walls and column lines.
2. Hold piping close to walls, overhead construction, columns and other structural and permanent-enclosure elements of the building.
   a. Limit clearance to 0.5" where furring is shown for enclosure or concealment of piping, but allow for insulation thickness, if any.
   b. Where possible, locate insulated piping for 1.0" clearance outside insulation.
3. Wherever possible in finished and occupied spaces, conceal piping from view by locating in column enclosures, in hollow wall construction or above suspended ceilings.
   a. Do not encase horizontal runs in solid partitions, except as otherwise indicated.

I. Electrical Equipment Spaces: Do not run piping through transformer vaults and other electrical or electronic equipment spaces and enclosures.

1. Exception: where shown on drawings or where accepted by the Engineer, provide drip pan under piping, and conform to NEC.
2. In no case shall piping run directly above transformers, electrical panels or switchgear.

J. Unless otherwise specified, all flanged joints shall be fitted with Manville or equal ring gaskets designed for the intended service.

K. Coordinate with other work as necessary to interface installation of piping with other components of systems.

L. Provide and erect in a workmanlike manner, according to the best practices of the trade, all piping shown on the Drawings or required to complete the installation intended by these Specifications.

M. All piping taps shall be from the top of the pipe unless approved by the Engineer.

N. The Drawings indicate schematically the size and location of piping. Piping shall be set up and down and offset to meet field conditions and to provide adequate maintenance room and headroom in the Mechanical Rooms.

O. Study the General Construction Specifications and Plans, of the exact dimension of finished work and of the height of finished ceilings in all rooms where radiation, units, equipment or pipes are to be placed and arrange the work in accordance with the Schedule of Interior Finishes, as indicated on the Architectural Drawings.

P. All exposed piping shall be run perpendicular and/or parallel to floors, interior walls, etc. Piping and valves shall be grouped neatly and shall be run so as to avoid reducing headroom or passage clearance. All valves, controls and accessories concealed in furred spaces and requiring access for operation and maintenance shall be arranged to assure the use of a minimum number of access doors.

Q. All pipe lines made with screwed fittings must be provided with a sufficient number of flanges or unions to make possible any taking down of the pipes without breakage of fittings.

R. All piping shall be erected as to insure a perfect and noiseless circulation throughout the system. No bull head tees will be permitted.

S. All valves and specialties shall be so placed as to permit easy operation and access.

T. Provide proper provision for expansion and contraction in all portions of pipework, to prevent undue strains on piping or apparatus connected therewith. Provide double swings at riser transfers and other offsets wherever possible, to take up expansion. Arrange riser branches to take up motion of riser.

U. Approved bolted, gasketed, flanges (screwed or welded) shall be installed at all apparatus and appurtenances, and wherever else required to permit easy connection and disconnection. Screwed unions shall be used on piping 2 ½ " or less.

V. All piping connections to coils and equipment shall be made with offsets provided with screwed or welded bolted flanges so arranged that the equipment can be serviced or removed without dismantling the piping.

W. If, after plant is in operation, any coils or other apparatus are stratified or air bound (by vacuum or pressure), they shall be repiped with approved and necessary fittings, air vents, or vacuum breakers at no extra cost. If connections are concealed in furring, floors, or ceilings, bear all expenses of tearing up and refinishing construction and finish, leaving same in as good condition as before it was disturbed.

X. Fittings shall be of the eccentric reducing type, where changes of size occur in horizontal piping to provide for a proper drainage or venting. Steel pipe bends shall be made of the very best grade open hearth, low carbon steel, leaving uniform exterior and interior surface. Pipe bends shall be made with seamless steel pipe, having a minimum radius of not less than five (5) pipe diameters.

Y. Tubing shall be erected neatly in a workmanlike manner. Bends in soft copper tubing shall be made by benders to prevent deformation of the tubing in the bends. Approved seat-to-pipe threaded adapters shall be provided for junctions with valves and other equipment having threaded connections.

Z. Vertical sections of main risers shall be constructed of pipe lengths welded together. No couplings shall be used.

AA. The ends of all pipe and nipples shall be thoroughly reamed to the full inside diameter of the pipe and all burrs formed in the cutting of the pipe shall be removed.

BB. Piping shall be installed in accordance with the latest edition of the ASME Code for Pressure Piping.

CC. All piping shall be concealed above furred ceilings in rooms where such ceilings are provided (except where specifically indicated otherwise on the drawings, or in walls or partitions, except as otherwise indicated).

DD. Piping at all equipment and control valves shall be supported to prevent strains or distortions in the connected equipment and control valves. Piping shall be supported to allow for removal of equipment, valves and accessories with a minimum of dismantling and without requiring additional supports after these items are removed.

EE. Pipe nipples - Any piece of pipe 3" in length and less shall be considered a nipple. All nipples shall be extra heavy. Only shoulder nipples shall be used. No close nipples will be permitted.

FF. Screw threads shall be cut clean and true; screw joints made tight without caulking. No caulking will be permitted. A non-hardening lubricant shall be used. No bushings shall be used. Reductions, otherwise causing objectionable water or air pockets, to be made with eccentric reducers or eccentric fittings.

GG. Provide vents with hose connector and cap at all high points.

3.5 WELDING

A. Before any operator shall perform any pipe welding, also submit the operator's qualification record in conformance with provisions of the code having jurisdiction, showing that the operator was tested and certified under the Procedure Specification as before mentioned.

B. Welding:

1. Conform to the latest revision of the applicable code, whether it is the ASME Boiler and Pressure Vessel Code, Code for Pressure Piping ANSI B31, or such state or local requirements as may supercede codes mentioned above.
2. All pipe welding operators shall comply with the requirements of the American Welding Society.
3. Machine cut and bevel piping ends for v-type joints.
4. Use recommended bevels and spacing between ends of pipe to assure full penetration complete to inside diameter of pipe.

C. Welded Joints:

1. Will be observed visually by the Architect/Engineer.
2. Any weld judged defective from a visual observation, shall be ordered tested at the expense of the Contractor or chipped out for full depth and re-welded.
3. Welded joints shall be x-rayed at a frequency determined by ASME codes. Welds that prove deficient shall be chipped out to full depth and replaced.

D. Welding Fittings:

1. Unless otherwise noted, make all changes in direction and branch take offs with manufactured fittings.
   a. Use long radius (R=1.50) fittings wherever possible.

2. Shop Fabricated Fittings:
   a. Branches more than two pipe sizes smaller than main line may be made with "weld-o-let" type pre-manufactured saddle fittings.
   b. Where specifically allowed by the Engineer, angles of less than 22½° and branch piping from headers may be made by shop fabricated or manufactured metered fittings.
   c. Submit shop drawings.
   d. Thoroughly clean fittings to remove slag.
   e. Fittings shall be available for observation by the engineer prior to installation.
3. In no case will field made miters or weld-o-let fittings be allowed. Exception: Temperature control wells and water treatment taps may be made with weld-o-let fittings in pipe 3" or larger in diameter.

E. Installation

1. Weld ells shall have a center line radius not less than diameter of the pipes.
2. Instrumentation connections 3/4" and smaller on all systems shall be provided by welding threaded 2000# forged steel half couplings to the pipe.
3. All pipe to be welded shall be cut off clean and beveled. All welding shot shall be removed.
4. Composition of welding electrodes shall be in accordance with manufacturer's recommendations.
5. Assume responsibility for the quality of welding done and repair or replace any work not in accordance with these specifications.
6. Cut weld test plugs at locations selected at random by the Architect. The test plugs shall be tested by the testing agency approved for this project. Failure of the test plugs to meet the standards of the specified codes and agencies shall result in the complete removal and replacement of the joint and retesting of the operator who performed the welding. The removal and replacement of the joints shall be at no additional cost to the Owner.

3.6 COPPER TUBING JOINTS AND FITTINGS

A. Unless otherwise noted, make all couplings, changes in direction, branch outlets, and transitions to other materials or joining methods with standard manufactured fittings.

B. Do not expand or swage piping in lieu of proper solder fittings.

C. Do not extrude or “pull” branch outlets with “tee-drill” type equipment.

D. Do not use self tapping type branch outlets.

1. See “hot taps” below.

3.7 THREADED JOINTS AND FITTINGS

A. All threaded joints shall be made in accordance with American National Standard B2.1.

1. Do not overthread pipe.
2. Apply pipe joint compound on male threads only.
3. Do not use right and left hand threaded joints to make a “union”.

B. Do not thread steel pipe schedule 10 or lighter.

1. UL listed light wall pipe may be threaded in accordance with its listing.

C. Screwed Piping

1. All connections to apparatus with screwed piping shall be made with 250 pound brass seat unions.
2. All screwed nipples shall be Schedule 80 nipples.

3.8 PRESS FIT SYSTEMS

A. Fittings and piping shall be joined in accordance with manufacturer’s installation guidelines.

1. Tubing shall be fully inserted into fitting.
2. Mark all tubes at shoulder of fitting.
3. Press joints using manufacturer approved tool.

B. All press fit systems shall have a preliminary water pressure test at 50 psi to confirm all fittings are properly pressed. This test is in addition to the that required by the system.

3.9 POLYETHYLENE PIPING

A. Join piping and fittings using heat fusion or electrofusion; do not use solvents, adhesives, or mechanical fittings.

B. Provide flanges or unions to connect heat exchanger piping to equipment or piping of different type; locate all transitions between piping of different types inside the building or otherwise accessible (i.e. above grade).

C. Keep dirt and debris out of pipe assemblies; cap or plug open ends until connected to adjacent piping.

D. Do not bend piping to shorter radius than recommended by pipe manufacturer; do not kink piping; use elbow or other fittings for sharp bends.

3.10 EQUIPMENT CONNECTIONS

A. Do not allow weight of piping or expansion of piping to put stress on equipment connections.

B. Pipe equipment to allow for servicing (coil pull, tube pull, etc.) with minimum of disruption to piping.

C. Provide unions or flanges at all equipment connections.

3.11 FREEZE PROTECTION

A. Fill systems with indicated solution by volume of propylene glycol and water.

B. Pre-mix all solutions before injection into system.

3.12 AIR VENTS

A. Install automatic air vents at high points.

B. In installing water piping systems and all equipment, carefully plan the actual installation in such a manner that high points and air pockets are kept to a minimum and are properly vented where they are unavoidable. All air elimination devices called for on the Drawings and in these Specifications shall be provided and properly installed. In addition, furnish and install all other air elimination devices which may be required due to job conditions. Assume responsibility for a proper, continuous and automatic air elimination to assure even and balanced distribution of water to all equipment.

3.13 RELIEF VALVES

A. Install pressure relief valves on all vessels, which may be isolated from other relief valves by closing valves. Pipe discharge full size to nearest floor drain.

3.14 PRESSURE TEMPERATURE TAPS

A. In Pipes 2” and Smaller: Install taps in tee at change in direction so inserted thermometer stem will be parallel to center line of pipe.

1. Add extra change in direction if necessary.
2. Allow clearance for insertion of thermometer.
3. Insure that gauge or thermometer will be in a readable position.

B. Furnish and install in each supply and return runout to each reheat coil and where indicated on the Drawings, a 1/4" MPT fitting to receive either a temperature or pressure probe 1/8" OD. Fitting shall be solid brass with valve core of Nordel (Max. 275˚F), fitted with a color coded and marked cap with gasket, and shall be rated at 1000 psig.

C. In addition, the installing contractor shall supply the Owner with six pressure gauge adapters with 1/8" OD probe and 6 five inch stem pocket testing thermometers; 25-125˚F for chilled water and six 50-500˚F for hot water.

D. Provide one pressure and temperature test kit consisting of one 0-60 PSI, water pressure gauge and one 0-30 psi water pressure gauge each with no. 500 gauge adapter attached, a 25-120˚F pocket testing thermometer, a 0.220 F. pocket test thermometer, a No. 500 gauge adapter, and a protective carrying case. Provide one additional 0-60 psi pressure gauge and one additional 0 - 30 psi pressure gauge.

E. Test kit shall be used by the Balancing Contractor to balance the systems and then it shall be turned over to the Owner.

F. Test stations and test kit shall be manufactured by Paterson Engineering Company, Inc. or approved equal.

3.15 HOT TAPS

A. Installing a branch line in piping while under service or static pressure (hot taps) shall only be done where specifically authorized

B. Submit the proposed method of procedure for each fluid service and pipe material.

1. Hot tap procedure shall remove a plug of main tap material and retrieve it. The plug shall be a maximum of 1 pipe size smaller than the branch size. Hang the removed plug by a chain at the completed tap.
2. Hot tap procedure shall not affect the temperature or pressure rating of the piping system.
3. Hot tap procedure shall be done through a gate or ball valve.

3.16 CLEANING

A. All piping systems shall be thoroughly flushed out with the approved cleaning chemicals to remove pipe dope, slushing compounds, cutting oils, and other loose extraneous materials. This also includes any piping systems which are not listed as requiring water treatment.

B. Develop plan for flushing and cleaning piping. Submit plan for approval prior to completion of piping. Provide all temporary and permanent piping, equipment, materials necessary to complete flushing and cleaning.

C. Prior to flushing, temporarily isolate or bypass dirt sensitive equipment and devices, including the following:

1. Automatic flow control valves
2. All coils
3. Heat pumps
4. Heat Exchangers
5. Flow measuring devices

A full size bypass pipe with shut-off valve shall be installed at each piece of hydronic equipment, as noted above, and at the end of risers serving fan coil units and fin tube radiation.

D. Prior to flushing, install fine mesh construction strainers at inlet to all equipment with connections 2-1/2” and larger. Install fine mesh construction element in permanent strainers. During flushing and cleaning, remove and clean strainers periodically. At completion of final flush, clean permanent strainers, remove construction strainers.

E. Circulate flush water and clean strainers prior to installing cleaning chemicals. Following flushing, install cleaning chemicals and circulate through the entire system for a minimum of one hour, or as directed chemical supplier. Take water sample for owner’s use. Drain system, including all low points. Flush, drain and fill system, circulate for one hour, sample for owner’s use. Drain, flush, fill, circulate and sample until system is free of cleaning chemicals, as indicated by analysis of samples.

F. Clean all water piping and chiller tubes as follows:

1. All new equipment and piping needs to be pre-cleaned to remove the oils of manufacture prior to equipment start-up.
2. The cleaning of new systems is accomplished with an alkaline phosphate cleaner supplied by the water treatment supplier. Coordinate with the Chemical Water Treatment section of this specification.
3. Upon completion of a system cleaning, the system should be flushed until the ortho phosphate is within 1 PPM of City Water. If the flushing occurs over an extended period of time (more than 24 hours) the flush water shall be treated water.
4. The system should then be immediately sterilized and treated. Systems containing copper should boost azole levels to 20 PPM.
5. Systems that contain piping that cannot be isolated for alkaline phosphate cleaning must be cleaned by adding a surfactant for 48 hours to the system. This will help remove the oils of manufacture.

6. New chillers require the following cleaning:
    a. Remove both heads
    b. Punch tubes with reversible tube brushing machine with “Christmas Tree Brushes” and appropriate torque setting for specific tube size. Brushes shall be changed every 5-10 tubes.
    c. Inject alkaline phosphate cleaner into each tube during punching to remove oils of manufacture.
    d. Inspect a minimum of three cleaned tubes with boroscope to confirm removal of all oils. A minimum of one hot, one high flow, and one low flow tube must be inspected.
    e. Tubes shall not be left open to atmosphere for more than one week after exposure to water.
    f. Upon flooding of tubes, azole levels shall be bumped to 20 PPM to insure re-passivation of the copper.

G. After flushing, contractor shall remove all temporary strainers and hang on strainer bodies for inspection.

H. Chemical cleaning and flush water shall be circulated at a minimum velocity of 6 feet per second. Contractors are responsible to supply temporary pumps as required for circulation of water at requisite velocities. Use of system pumps for circulation of cleaning and flush water, where available, is acceptable.

I. The chemical supplier shall verify that all chemicals utilized during cleaning are compatible with the materials in the systems. The chemical supplier shall instruct as to the proper feed rates, shall check that the cleaning solution is actually in each system, shall instruct the contractor as to when to flush the system and shall check each system following flush to insure all cleaning chemicals have been removed from each system.

J. A certificate of cleaning shall be submitted by the cleaning chemical supplier to the Owner’s representative.

3.17 CORROSION PROTECTION

A. Provide dielectric unions at unions between piping of different materials.

B. See water treatment program requirement elsewhere in this specification.

C. All components of system shall be compatible with propylene glycol and water solution.

D. At no time should water be introduced to a system without inhibitor being added.

E. Vapor phase inhibitor shall be used in any case where a system will be drained down prior to turnover.

3.18 PRESSURE GAUGES

A. Pressure/temperature test ports shall be provided on each coil bank, heat exchanger, heat pump, at the base of each riser in the Inn adjacent to the isolation valves, and at all permanent pressure gauge locations. Use extended body style to allow for insulation thickness. Seals shall be appropriate for operating water temperature and pressure as follows.

1. Solar Thermal, Glycol - Nordel Seat
2. Geothermal/Condenser Water - Neoprene Seat

B. Pump assemblies: Use a single gauge with multiple taps to pumped system (strainer inlet, strainer outlet, pump suction and pump discharge) per the detail on the drawings.

C. Allow clearance for removal of gauge.

D. Insure that gauge will be in a readable position.

E. Furnish and install where indicated on the Drawings and where specified herein.

F. All gauges shall be installed so as to be easily readable from the floor. Where conditions are such that gauges on piping would not be readable from the floor, the gauges shall be installed on panelboards.

G. Panel mounted gauges shall be designed for flush mounting with back connections and shall be provided with an engraved nameplate mounted below each gauge to identify its service. The nameplates shall be chrome plated with black filled letters.

H. Differential pressure switches, pressure sensing pipe taps, furnished by temperature control manufacturers shall be installed under this Section.

I. All gauges on water lines shall be fitted with filter type pressure snubbers consisting of 3/8" dia. x 1/8" thick, micro metallic stainless steel filter, as manufactured by Operating and Maintenance Specialties or approved equal. All gauges on steam lines shall be fitted with pigtails.

J. A pressure gauge shall be installed in the suction and discharge of each water pump. A pressure gauge shall be installed in the chilled water and condenser water inlet and outlet of each refrigerating machine. A pressure gauge shall be installed in the inlet and outlet of each heat exchanger and coil. Additional pressure gauges shall be installed where indicated on the Drawings.

K. On devices such as pumps, strainers, coils, etc., where the differential pressure is the desired information, install only one pressure gauge with valved connections to the upstream and downstream pressure taps. Include a P/T test port in addition to the pressure gauge. Provide a second set of isolating valves at the gauge if gauge location is not within reach of tap points.

3.19 THERMOMETERS

A. Furnish and install, where indicated on the Drawings and where specified herein, thermometers as manufactured by American Trerice, Weksler, Weiss or approved equal.

B. All thermometers shall be installed in such a manner as to cause a minimum of restriction to flow in the pipes and so that they can easily be read from the floor.

C. All instrument wells for controls and indicators furnished by the temperature control manufacturer shall be installed under this Section.

D. Where conditions are such that thermometers would not be readable from the floor, remote bulb dial thermometers shall be mounted on panelboards. The thermometers shall be 5 inch dials and shall be vapor actuated. The thermometers shall have separable wells. Panel mounted thermometers shall be provided with an engraved nameplate mounted below each thermometer to identify its service. The nameplate shall be chrome plated with black filled letters.

E. A thermometer shall be installed in the water inlet and outlet of each heat exchanger, heat pump and at the base of each riser in the inn adjacent to the isolation valves. A thermometer shall be installed in the water inlet and outlet of each refrigerator machine. Additional thermometers shall be installed where indicated on the Drawings.

3.20 MACHINERY GUARDS

A. Moving parts of machinery exposed to contact by personnel shall be guarded by barrier to a type which complies with OSHA Code.

B. Exposed moving parts such as belts and couplings shall have not less than 3/4" No. 16 gauge metal guards with all edges rounded an gauge, material and construction shall be in accordance with OSHA standards - paragraphs 7173.3, 7173.5 and 7174.1. Guards shall have 1-1/4" x 1-1/4" x 1/8" angle iron frame properly supported.

C. All machinery guards covering the ends of motor or equipment shafts shall have openings for the insertion of a tachometer. Machinery guards shall be painted with two coast of machinery gray enamel.

3.21 EXPANSION TANKS

A. Expansion tanks shall be welded, and of the size as indicated on the Drawings. Tanks shall be galvanized after fabrication. Tanks shall be steel with dished heads and equipped with connections for fill, drain and system connections. Water column and connections shall be furnished. Tanks shall be constructed in accordance with ASME Code for Unfired Pressure Vessels and so stamped.

B. Tanks shall be provided with gauge glasses for full height, and for closed tanks provide combination air charger and tank drainer. Gauge glasses shall have protective shield.

C. Furnish and install as shown on the Drawings, EX-TROL Pressurized Diaphragm Type Expansion Tanks as manufactured by AMTROL INC. It shall be air precharged to the initial fill pressure of the system. It shall be suitable for a maximum working pressure in excess of anticipated system pressure at maximum operating temperature and shall be furnished with ASME stamp and certification papers. It shall have a sealed-in elastomer diaphragm suitable for an operating temperature of 240°F. Horizontal tanks to be furnished with saddles for horizontal installation where applicable.

3.22 EXPANSION JOINTS, LOOPS, ANCHORS AND GUIDES

A. Provisions for expansion in piping mains, branches, and risers shall be made by the installation of offsets, expansion loops, or compensators as indicated on the Drawings or as required by these specifications. Every 100'-0" horizontal steam and hot water piping shall have expansion loop and anchors. Minimum loop shall be 8'-0" by 6'-0" if not indicated on the Drawings.

B. All piping with loops or compensators shall be anchored so as to throw all expansion toward the loops or compensators.

C. Guides shall be installed on both sides of each expansion loop and compensator. Guides shall be Flexonics pipe alignment guides or approved equal. Anchors and guides shall be secured to beams, columns or concrete slabs.

D. Pipe hangers and rollers are not considered guides.

E. Provide 12" long guides for each expansion joint. Guides shall be located 3'-0" on each side of the expansion joints.

F. For copper piping: Furnish and install as shown on plans, or where necessary to absorb max. 1-3/4" expansion and max. 1/4" contraction between two anchor points in copper lines, up to and including 2-1/2", Flexonics Model HB Expansion Compensators having two-ply phosphor bronze bellows and brass shrouds and end fittings, as manufactured by Flexonics Division of Calumet and Heela, Inc., Bartlett, Illinois. All internal parts shall be of non-ferrous metals. Service pressure shall be external to the bellows. Compensators shall have internal guide extending the full length of the bellows travel. Compensators shall have internal positive anti-torque devices to prevent twist or torque on installation and shall have properly located positioning clip to insure installation of correct end-to-end dimension to allow full rated traverse. Compensator shall be for max. 125 psig. working pressure. Test pressure shall not exceed 175 psig.

G. For steel piping: Furnish and install as shown on plans, or where necessary to absorb max. 1-3/4" expansion and max. 1/4" contraction between two anchor points in iron and steel pipe lines up to and including 2-1/2", Flexonics Model II Expansion Compensators having two-ply stainless steel bellows and carbon steel shrouds and end fittings, as manufactured by Flexonics Division of Calumet & Heela, Inc., Bartlett, Illinois. Service pressure shall be external to the bellows. Compensators shall have properly located positioning clip to insure installation at correct end-to-end dimension to allow full rated traverse. Compensator shall be for Max. 150 psig. working pressure. Test pressure shall not exceed 200 psig.

H. Expansion joints in 3" and above piping shall by hydraulically formed bellows type with internal sleeves and external covers for insulation. Expansion joints, except where otherwise noted, shall be of the self-equalizing type having fully-contoured, cast iron equalizing rings.

Provide non-equalizing type expansion joints with internal sleeves on low pressure service (up to 15 psig including test pressure) such as diesel engine exhaust, or flexible cooling tower connections.

I. Manufacturer shall note on all submittal forms the resultant anchor loads due to pressure thrust and compressive forces at design conditions. Expansion joints shall be as manufactured by ADSCO, Zallea, Flexonic, or approved equal.

3.23 AUTOMATIC FLOW-CONTROL VALVES

A. The Contractor shall provide and install for each heat pump and fan coil unit, one "Autoflow" model FVT or Griswold compact pressure compensating flow control valves in one piece configuration consisting of ground joint union and flow control valve and Petes plugs. Petes plugs shall be provided on both sides of condenser flow heat pumps only.

B. All valves are to be factory set to control the flow rate within 4% of the selected rating over an operating pressure differential of at least ten times the minimum required for full flow conditions.

C. The valves shall be all metal with threaded or seat connections. Metallurgy shall be all brass and stainless steel.

D. Performance certification of valves by an independent laboratory shall be furnished.

E. All valves shall have unions to allow field-exchange of internal components without removing the valve body from the pipeline.

F. All valves shall be permanently marked to show direction of flow and flow rates.

3.24 AIR SEPARATORS

A. Furnish and install the air separators for water system where indicated on the Drawings. The separators shall be Rolairtrol, as manufactured by Bell and Gossett or equal as approved by the Architect.

B. The units shall be of ASME construction and shall be stamped 125 psig W.P.

C. The units shall be furnished without integral strainers.

D. The units shall have a flow capacity greater than or equal to the total system design flow rate.

E. The units shall be installed in strict accordance with the manufacturer's recommendations. The units shall be supported on 2" pipe legs and shall be provided with a 3/4" drain gate or ball valve with hose end and cap.

3.25 STRAINERS FOR WATER SYSTEM

A. Furnish and install a full size Y-pattern strainer on the inlet of each control valve at each water pump and where indicated on the Drawings.

B. An approved blow-out connection with gate valve shall be made to each strainer. The valves shall be located not higher than 8 feet above the floors. All drain connections shall be piped to floor drains.

3.26 REDUCING AND SAFETY VALVES FOR WATER SYSTEM

A. Furnish and install pressure reducing and safety valves for makeup water systems and where indicated on the drawings.

B. The reducing valve shall be Model 7 pressure reducing valve with field adjustable setting as manufactured by Bell & Gossett or equal as approved by the Architect.

C. The safety valves shall be of size and capacity as indicated on the Drawings. The valves shall be made by Bell and Gossett or approved equal and shall have 150 pound raised face flange on the inlet and discharge for all sizes 2-1/2" and above 2" and below shall be screwed.

D. The safety valve shall be steel valves with stainless steel trim. The bonnet shall be enclosed and equipped with a packed lifting lever. The spring shall be carbon steel rated for 450˚F.

E. The vertical discharge line from the safety valves shall be installed as close to the safety valves as possible and piped to drain.

3.27 FLOW MEASURING DEVICES

A. Provide complete Venturi flow measuring system as manufactured by Barco Division, Aeroquip Corp., or approved equal.

B. Upstream pipe diameters of straight pipe shall be five (5) minimum and downstream pipe diameters shall be two (2) minimum as recommended by manufacturer.

C. For location of Venturi flow stations refer to the Drawings.

3.28 PIPE SLEEVES

A. Install pipe sleeves where piping passes through walls, floors, ceilings, roofs and structural members, except soil pipe penetrations through concrete slab on grade.

B. Where possible pour sleeve in place or grout.

C. Provide sleeves of adequate size, accurately centered on pipe runs, so that piping and insulation (if any) will have free movement in the sleeve in non-fire rated penetrations.

D. In fire rated penetrations, size sleeves such that the resulting annular space is in accordance with the application requirements of the fire stopping system. All above grade floor penetrations shall be considered to be fire-rated.

E. Install length of sleeve equal to thickness of construction penetrated, except extend floor sleeves 0.25” above floor finish and, where floor surface drains to a floor drain, extend floor sleeve 0.75” above floor finish.

F. Provide temporary support of sleeves during placement of concrete and other work around sleeves.

G. Provide temporary closure to prevent concrete and other materials from entering pipe sleeves.

H. Except as otherwise indicated, install steel pipe sleeves.

I. At interior partitions and ceiling, install sheet metal sleeves.

J. At exterior penetrations below grade, install iron pipe sleeves.

K. Seal exterior sleeve penetrations at grade weather tight.

L. Caulking:

1. Where water seal or sound seal, but not fire seal, is needed, (foundation walls, slab on grade): fiberglass backing and heavy bead of silicone caulking compound.
2. Where sleeve pierces a fire separation: Fire stop material in accordance with manufacturer’s directions and UL listing.

M. Install escutcheon plates at pipe sleeves where piping is exposed to view in occupied spaces of the building, on the exterior, and elsewhere as indicated.

N. Compensators: Install where shown or where required because piping arrangement does not provide sufficient flexibility.

1. Protect compensators from over-travel and over-stress during remaining installation and testing.

O. Flexible Connectors: Install at right angles to displacement. Install one end immediately adjacent to isolated equipment and anchor other end.

P. Guides: Install where shown and where required in accordance with expansion compensators published requirements. As a minimum, install one guide within four pipe diameters of compensator, and one guide 14 pipe diameters from first guide.

3.29 TEST

A. Hydronic piping systems other than ground source heat pump loop shall be hydrostatically tested at one and one half times the system design operating pressure unless a higher pressure is required elsewhere, but not less than 100 psi. The duration of each test shall be not less than 4 hours.

B. See additional requirements elsewhere in this specification.

END OF SECTION

SECTION 23 21 23

HVAC PUMPS

PART 1 - GENERAL

1.1 MOTOR HORSEPOWER

A. Do not increase or decrease motor horsepower from that specified without written approval from Architect/Engineer. See Section 23 05 01.

B. Select pumps so that for single pump application at a minimum, brake horsepower does not exceed motor horsepower at rating point, and does not exceed motor horsepower plus service factor on impeller curve at 125% rated flow. For parallel pump application motor horsepower shall be selected such that pump can operate at any point on the pump curve without overloading.

C. Pumps shall be selected such that motor can operate at 60 Hz speed without overloading at any point on the pump curve.

1.3 PARALLEL PUMP SELECTION

A. Select pumps for parallel pump application such that a single pump can operate and not exceed the end operating point of the pump curve.

1.4 SUBMITTALS

A. Submit each item in this article according to the Conditions of the Contract and Division 1 Specification Sections.

B. Submit manufacturer’s installation instructions under provisions of General Conditions and Division 1.

1. Operation and Maintenance Data: Include installation instructions, assembly views, lubrication instructions, and replacement parts lists.
2. Under provisions of commissioning documentation, testing of pumps, as well as training of owner’s operation and maintenance personnel may be required in cooperation with the commissioning consultant.

C. Manufacturers Product Data: Submit manufacturer’s product data on pumps.

1. Include pump curve and mark rating point. Also include single pump operating point for a parallel pump application.

2. Show maximum allowable operating temperature and pressure.
3. Power and control wiring diagram
4. System profile analysis including pump curves, system curve, and variable speed pump curves
5. Note in red any deviations from specified construction.
6. Show impeller diameter indicate maximum impeller diameter for pump volute provided, and indicate if impeller is machined down.

D. Hanging and support requirements should follow the recommendations in the manufacturer's installation instructions

E. A detailed weighted average pump efficiency-Part Load Efficiency Value (PLEV) - Pump Rating Report shall be submitted for each pump. Pump PLEV shall be based on the standard load profile developed in AHRI 550/590-1998 also known as IPLV or Integrated Part Load Value. The pump PLEV Rating shall be based points A: 100%, B: 75%, C: 50% and D: 25% with each Pump Efficiency ratings shown with flow matched to load percentage and Specified Control Head.

F. Specified Control Head shall be 30% TDH or calculated minimum control head specified within the equipment schedule

G. All pumps controlled by variable frequency drives shall have shaft grounding kits.

H. Pump PLEV shall be expressed with load weighting Pump
PLEV = 1/(0.01/A+0.42/B+0.45/C+0.12/D) where

A= Pump Efficiency at 100%
B= Pump Efficiency at 75%
C= Pump Efficiency at 50%
D= Pump Efficiency at 25%

Actual job specific load profile weighting may be substituted for standard IPLV weighting

I. Submittals that are "rejected" as being "non-compliant" will be re-reviewed once with all time for subsequent reviews back charged to the contractor in accordance with the engineer's current prevailing rate schedule. If a rate schedule for additional services is included, as part of the contract with the owner that rate schedule shall be used in lieu of the "current prevailing" rate schedule.

1.5 QUALITY ASSURANCE

A. All equipment or components of this specification section shall meet or exceed the requirements and quality of the items herein specified, or as denoted on the drawings.

B. Ensure pump operation, at specified system fluid temperatures without vapor binding and cavitation, is non-overloading in parallel or individual operation, and operates to ANSI/HI 9.6.3.1 standard for Preferred Operating Region (POR) unless otherwise approved by the engineer.

C. Ensure pump pressure ratings are at least equal to system's maximum operating pressure at point where installed but not less than specified.

D. Equipment manufacturer shall be a company specializing in manufacture, assembly, and field performance of provided equipment with a minimum of 20 years experience.

E. Equipment provider shall be responsible for providing certified equipment start-up and, when noted, an in the field certified training session. New pump start-up shall be for the purpose of determining pump alignment, lubrication, voltage, and amperage readings. All proper electrical connections, pump's balance, discharge and suction gauge readings, and adjustment of head, if required. A copy of the start-up report shall be made and sent to both the contractor and to the Engineer.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to the site in such a matter as to protect the materials from shipping and handling damage. Provide materials on factory provided shipping skids and lifting lugs if required for handling. Materials damaged by the elements should be packaged in such a matter that they could withstand short-term exposure to the elements during transportation.

B. Store materials in clean, dry place and protect from weather and construction traffic. Handle carefully to avoid damage.

C. Use all means necessary to protect equipment before, during, and after installation.

D. All scratched, dented, and otherwise damaged units shall be repaired or replaced as directed by the Architect Engineer.

1.7 WARRANTY:

A. Provide a minimum One (1) year warranty on materials and installation under provision of Section 01 78 36

PART 2 - PRODUCTS

2.1 IN-LINE CIRCULATOR FOR HEATING (Small - Horizontal Motor)

A. Manufacturers:

1. Design Basis: Bell & Gossett
2. Other Acceptable Manufacturers:
   a. Taco
   b. Armstrong
   c. Aurora

B. Design Conditions:

1. Pressure: 125 psig
2. Temperature: 225ºF

C. Construction:

1. Motor Mount: Resilient.
2. Bearings: Sleeve, bronze, oil lubricated.
3. Casing: Cast iron.
4. Impeller: Steel, cadmium plated, cast iron, or bronze.
5. Shaft: Steel with copper sleeve or stainless steel.
6. Seal: Mechanical.
7. Coupler: Spring or flexible sleeve.
8. Motor: Open, Drip Proof

D. The pumps shall be of the horizontal, oil-lubricated type, specifically designed and guaranteed for quiet operation. Suitable for 125# working pressure.

E. The pumps shall have a ground and polished steel shaft with a hardened integral thrust collar. The shaft shall be supported by two horizontal sleeve bearings designed to circulate oil. The pumps are to be equipped with a watertight seal to prevent leakage. The motor shall be non-overloading at any point on pump curve. Impellers shall be of bronze construction.

2.2 SPLIT COUPLED VERTICAL IN-LINE PUMPS WITH INTEGRATED CONTROLS

A. Manufacturers

1. Design Basis: Bell & Gossett
2. Other Acceptable Manufacturers:
   a. Armstrong
   b. Peerless
   c. Grundfos

B. Supply and install pumps as shown and scheduled. The pumps shall be single stage, single or double suction type, vertical inline design. The seal shall be serviceable without disturbing the motor or the piping connections. The capacities and characteristics shall be as outlined in the plans and specifications. The complete pump unit shall be labeled with ETL listing certification that the product conforms to UL Std 778 and is certified to CSA Std C22.2 No.108.

C. Components

1. The pumps shall be a split-coupled, inline for vertical installation, in cast iron stainless steel fitted construction specifically designed for quiet operation. Suitable standard operations at 250° F and 175 PSIG working pressure. Working pressures shall not be de-rated at temperatures up to 250°F. The pump internals shall be capable of being serviced without disturbing piping connections.

2. The pumps shall have a 416 stainless steel shaft that is guided by a carbon graphite lower throttle bushing.

3. Pump shall be equipped with a Unitized inside mechanical seal assembly with flush line. The seal assembly shall have an EPR elastomer bellows and a positive metal-to-metal drive system to reduce torsional stress on the bellows. The bellows will be pressure supported without creases or folds for long life. The mechanical seal shall have a rotating carbon face against a stationary ceramic face.

4. Pump shaft shall connect to a stainless-steel impeller. Impeller shall be hydraulically and dynamically balanced to Hydraulic Institute Standards ANSI/HI 9.6.4.5-2000. The allowable residual imbalance conforms to ANSI grade 6.3, keyed to the shaft and secured by a stainless steel locking capscrew or nut.

5. The pump shall include a spacer coupling of high tensile aluminum, split to allow the servicing of the mechanical seal without disturbing the pump or motor. Coupling shall incorporate tapered washer shaft jacking design.

6. The combination motor bracket and volute coverplate shall be a one-piece unit to ensure concentric alignment of the motor to the pump casing. A carbon steel coupler guard conforming to both ANSI B15.1-2000 and OSHA 1910.219 standards shall be mounted on the motor bracket for safety.

7. Pump volute shall be of a Class 30 cast iron design for heating systems rated for 175 PSIG with integral cast iron flanges drilled for 125# ANSI companion flanges. Volute shall include gauge ports at nozzles, and vent and drain ports. The volute shall be designed with a base ring matching an ANSI 125# flange that can be used for pump support.

8. Motors shall be NEMA Premium efficient and shall be the size, voltage, and enclosure called for on the plans. Motors shall have heavy-duty grease lubricated ball bearings, completely adequate for the maximum load for which the pump is designed.

9. Pumps shall conform to ANSI/HI 9.6.3.1 standard for Preferred Operating Region (POR) unless otherwise approved by the engineer.

10. Pump shall be of a maintainable design and for ease of maintenance should use machine fit parts and not press fit components.

11. Pump manufacturer shall be ISO-9001 certified.

12. Each pump shall be factory tested and name-plated before shipment.

13. As an option, the pump may include an internal stainless-steel casing wear rings.

14. Where noted on schedule pumping equipment may require one or all of the following optional tests: Certified Lab tests (unwitnessed), Hydraulic Institute Level B tests, or Witnessed Tests.

D. Accessories

1. Provide one mechanical seal for each model type of primary pump.

2. All pumps controlled by variable frequency drives shall have shaft grounding kits.

3. Sediment Separator shall be furnished for installation on the flushing line between the pump discharge flange and the seal area. The sediment separator is installed to increase the overall life expectancy of the seal on inherently dirty systems. The separator shall remove dissolved solids from the flushing medium before the fluid enters the seal area where it can damage and shorten the life of the seal.

E. Integrated VFD with Sensorless Pump Control

1. Integrated Pump Controller shall be factory mounted, wired, with a mains disconnect switch and menu-driven graphical interface.

2. Integrated Pump Controller shall provide near unity displacement power factor (cos Ø) without need for external power factor correction capacitors at all loads and speeds using VVC-PWM type integrated controls.

3. Integrated Pump Controller shall include dual DC link reactors equivalent to 5% impedance line reactors, for reduction of mains borne harmonic currents and DC link ripple current to increase DC link capacitor lifetime.

4. Integrated Pump Controller shall have EMI/RFI filters conforming to DIN EN61800-3 to ensure integrated controls meets low emission and immunity requirements.

5. System pressure to be maintained as scheduled. Pressure setpoint shall be able to be field adjusted.

6. Integrated Pump Controller shall support direct communication with the building management system (BMS) with built-in support for the following protocols: (Modbus RTU, BACnet™ MS/TP, Metasys N2). Mechanical contractor to coordinate control protocol with control contractor.

7. Integrated Pump Controller shall be provided in an Enclosure rated to UL Type 12 suitable for indoor operation.

8. Integrated Pump Controller shall support Programmable skip Frequencies and adjustable switching frequency for noise and vibration control.

9. Integrated Pump Controller shall provide a temperature controlled Fan for cooling of the heat sink in the back panel.

10. Integrated Pump Controller shall be rated to operate in ambient working conditions of [14°F to +113°F], up to 3300 feet above sea level.

11. Integrated Pump Controller shall provide 2 Analog inputs (current or voltage) and 1 current output.

12. Integrated Pump Controller shall provide 6 programmable Digital inputs with 2 configurable as outputs.

13. Integrated Pump Controller shall support 2 programmable pulse inputs

14. Integrated Pump Controller shall provide 2 programmable relay outputs

15. Integrated Pump Controller shall provide 1 RS485 communication port

16. Integrated Pump Controller system software shall be capable of sensorless control in variable volume systems without need for pump mounted (internal/external) or remotely mounted differential pressure sensor.

17. Integrated Pump Controller Sensorless control shall operate under Quadratic Pressure Control (QPC) to ensure head reduction with reducing flow conforms to quadratic control curve.

18. Integrated Pump Controller shall support a minimum head of 40% of design duty head.

19. Integrated Pump Controller shall provide user adjustable control mode settings and minimum/maximum head set points using built-in programming interface.

20. Integrated Pump Controller integrated control software shall be capable of controlling pump performance for non-overloading power at every point of operation.

F. Integrated Pump Controller integrated control software shall be capable of maintaining flow rate data.

2.3 CONDENSATE PUMP

A. Condensate pump shall be heavy duty vertical type pump with rust resistant polymer condensate collecting tank. Constructed of materials providing maximum resistance to corrosion including high impact polymer pump base, stainless steel shell and epoxy coated metal tank cover and switch housing.

B. Pump shall discharge 1-1/4 quarts of water per cycle.

C. Pump shall automatically start when water level reaches approximately 3-3/8" from bottom of tank, and stop pumping when level drops to 2".

D. Unit shall include fan cooled motor, integral sump tank, control float, and safety float/switch which shall be wired to shut off low voltage thermostat controlling air conditioner if malfunction occurs.

E. Provide condensate pump and electrical connection for each air conditioning unit or air handler not specifically shown to be piped by gravity to a floor drain.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General:

1. Install equipment in accordance with manufacturer’s instructions.
2. Install pumps to allow complete removal without dismantling connecting piping.
3. Provide air cock and drain connection on pump casing.
4. Decrease from line size with long radius reducing elbows or concentric reducers, or suction diffusers.
5. Support piping adjacent to pump so that no weight is carried on pump casings.

6. Comply with manufacturers recommendations for support of inline pumps. Provide support for motors when mounted horizontally. Verify Manufacturer's allowable motor position and install accordingly.
7. Provide supports under elbows on pump suction and discharge line.
8. Provide pressure gauge with piping and gauge cock to measure pressure of strainer inlet, pump suction, and pump discharge.
9. Manufacturer's representative shall verify proper pump operation.
10. Provide gate valves to allow isolation of pump from system.
11. Provide check valve as pump discharge.

B. Motor Mount – Inline Pumps:

1. Verify motor position (vertical or horizontal) with manufacturer's installation instructions.
2. Provide proper pump support in accordance with manufacturer's installation instructions. Do not support pump from equipment.
3. Provide adequate clearance around pump for motor and shaft removal.

C. Reduction from line size to pump connection size shall be made with eccentric reducers attached to the pump with tops flat to allow continuity of flow.

D. Furnish and install triple duty valves on the discharge side of all pumps and furnish and install a line size shut-off valve on the suction side of all pumps. Anywhere that 5 straight pipe diameters of pipe cannot be provided on the inlet side of a pump a suction diffuser shall be used to provide appropriate flow distribution into the eye of the pump's impeller.

E. Provide temperature and pressure gauges where and as detailed or directed.

F. Proper access space around a device should be left for servicing the component. No less than the minimum recommended by the manufacturer.

G. Lubrication: After completion of the system and before start-up, lubricate the pumps.

H. Impeller Trim: Remove impeller and machine down if more than 25% of the total pump head must be throttled by the pump discharge valve.

I. For inline pumps with motors 7.5 HP and larger, provide a suitable lifting point (eye bolt, strut channel) directly over the motor to aid in removal of the rotating element.

J. Pipe drip pan base to floor drain.

K. On components that require draining, contractor must provide piping to and discharging into appropriate drains.

L. Circulating pump shall have sufficient capacity to circulate the scheduled GPM against the scheduled external head (feet) with the horsepower and speed as scheduled and/or as denoted on the drawings. Motors shall be of electrical characteristics as scheduled, denoted and/or as indicated on the electrical plans and specifications. Pump characteristics shall be such that the head of the pump under varying conditions shall not exceed the rated horsepower of the drive motor.

M. On systems where the final balancing procedure requires the triple duty valve to be throttled more than 25% to attain design flow (on a constant speed pumping system), and no future capacity has been built into the pump, the pump impeller must be trimmed to represent actual system head resistance. The pump provider and engineer of record, based on the balancing contractor's reports, shall determine the final impeller trim diameter.

N. All piping shall be brought to equipment and pump connections in such a manner so as to prevent the possibility of any loads or stresses being applied to the connections or piping. All piping shall be fitted to the pumps even though piping adjustments may be required after the pipe is installed.

O. Power wiring, as required, shall be the responsibility of the electrical contractor. All wiring shall be performed per manufacturer's instruction and applicable state, federal, and local codes.

P. Control wiring for remote mounted switches and sensor / transmitters shall be the responsibility of the control's contractor. All wiring shall be performed per manufacturer's instructions and applicable state, federal, and local codes.

Q. Fully grout base mounted pumps to housekeeping pads or inertia base per manufacturer's recommendations.

R. All pump casings shall be hydrostatically tested at 1-1/2" times design working pressure. The pump manufacturer shall be responsible for his service department aligning in the field prior to start-up of all flexibly coupled units. Alignment shall be with dial indicator with accuracy of plus or minus .002 inches. The pump manufacturer must submit a written report certifying that the alignment work had been performed by his personnel and that the pumps are ready for operation.

S. A factory authorized service representative shall be engaged to train the Owner's maintenance personnel to adjust, operate, and maintain hydronic pumps. Training shall include proper alignment techniques and maintenance requirements.

END OF SECTION

SECTION 23 22 14 - GEOTHERMAL HEATPUMP PIPING AND VERTICAL HEAT EXCHANGERS

PART 1 – GENERAL

1.1 SECTION INCLUDES

A. Ground-coupled heat exchanger and connections to building piping system.

1.2 REFERENCE STANDARDS

A. APHA (EWWW) - Standard Methods for the Examination of Water and Wastewater; 2017 (23rd Edition).
B. ASTM D2683 - Standard Specification for Socket-Type Polyethylene Fittings for Outside Diameter-Controlled Polyethylene Pipe and Tubing; 2014.
C. ASTM D2837 - Standard Test Method for Obtaining Hydrostatic Design Basis for Thermoplastic Pipe Materials or Pressure Design Basis for Thermoplastic Pipe Products; 2013, with Editorial Revision (2014).
D. ASTM D3035 - Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Controlled Outside Diameter; 2015.
E. ASTM D3261 - Standard Specification for Butt Heat Fusion Polyethylene (PE) Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing; 2016.
F. ASTM D3350 - Standard Specification for Polyethylene Plastics Pipe and Fittings Material; 2014.
G. ASTM F714 - Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Outside Diameter; 2013 (Reapproved 2019).
H. ASTM F1055 - Standard Specification for Electrofusion Type Polyethylene Fittings for Outside Diameter Controlled Polyethylene and Crosslinked Polyethylene (PEX) Pipe and Tubing; 2016a.
I. IGSHPA (GROUT) - Grouting Procedures for GHP Systems; International Ground Source Heat Pump Association; 1991.
J. PPI TR-4 - PPI Listing of Hydrostatic Design Basis (HDB), Hydrostatic Design Stress (HDS), Strength Design Basis (SDB), Pressure Design Basis (PDB), and Minimum Required Strength (MRS) Ratings For Thermoplastic Piping Materials or Pipe; 2017.
K. ANSI/CSA/IGSHPA C448 Series-16 - Design and installation of ground source heat pump systems for commercial and residential buildings

1.3 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Meeting: Convene one week before starting work of this section. Require attendance by all installers involved with site work and HVAC work.

1.4 SUBMITTALS

A. Product Data, Polyethylene Piping: Provide manufacturer's data for piping and pipe fittings, showing compliance with specified requirements.
   1. Provide manufacturer's recommendations for fusion jointing.
   2. Include certification of long term hydrostatic basis, or test reports.
B. Product Data, Heat Exchange Fluid: Provide data showing compliance with specified requirements.
   1. Provide manufacturer's Material Data Safety Sheets.
   2. Provide results of biodegradability studies conducted in accordance with APHA (EWWW):
      a. Statement of ecological behavior.
      b. Total oxygen demand, in pounds (kg) of oxygen per pound (kg) of fluid.
      c. Percent of fluid degraded in five days.
C. Product Data, Grout and Slurry: Provide information including thermal conductivity, density, mixture, etc of proposed materials.
D. Product Data, Interior Valves and fittings: Provide information on valves and fittings to be used inside the building. Refer to other Division 23 technical specifications for interior piping, valves, fitting, gauges and insulation requirements.
E. Shop Drawings: Show complete piping layout, depths of excavation, final depths of piping, backfill placement, point of entrance to building, test point locations, and fittings used for all joints and connections.
F. Test Reports, Piping: Indicate test method and results of hydrostatic pressure tests.
G. Record Documents: Record actual locations of all underground piping installed relative to Owner's permanent structure on same property.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Company specializing in performing the work of this section with minimum five years of documented experience and accredited by IGSHPA.
B. Well driller qualifications: Geothermal well drillers shall have a minimum of five years' experience in the installation of geothermal well field installation and shall be licensed in the jurisdiction where the project is located.
C. Heat Fusion Technician Certification: IGSHPA training and certification, certified within three years from the date of project commencement.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver piping and fittings to project site in shipping containers with labeling in place.
   1. Verify that labels on piping indicate manufacturer's name, pipe or tube size, and PE cell classification.
   2. Verify that piping complies with specifications and is undamaged.
B. Deliver chemicals for heat exchange fluid to project site in unopened shipping containers with labeling in place; comply with local and state regulations.
C. Protect from weather, humidity and temperature variations, dirt and dust, and other environmental contaminants.
D. Store piping capped or plugged until time of installation.

1.7 PROJECT CONDITIONS

A. Existing utilities: do not interrupt utilities serving facilities occupied by the owner or others unless permitted by the affected parties and then only after arranging to provide temporary utility services according to the requirements indicated:
   1. Notify the owner not less than two days in advance of proposed utility interruptions.
   2. Well drilling water: contractor shall be responsible for providing water for the drilling purpose.
   3. Well driller shall be responsible for removing all drilling mud, fluid and waste material generated by drilling operations.
   4. Reasonable care shall be taken to avoid damage to tree roots and canopies, especially those over 6" in diameter.

PART 2 - PRODUCTS

2.1 WELL CASING

A. Well casings: AWWA C200, single ply, steel pipe with threaded ends and threaded couplings for threaded joints.

2.2 HEAT EXCHANGER

A. Install the ground-coupled heat exchanger as designed and laid out on the Contract Documents.
B. Heat Exchanger Configuration: Closed system; polyethylene piping in vertical boreholes located as indicated on drawings.
   1. Pipe Type: SDR11 High density polyethylene.
   2. Pipe Diameter: 1-1/4 inch.
   3. Shank Spacing: 1/8 inch.
   4. Borehole Depth: 500 feet.
   5. Borehole Diameter: 6 inches .
   6. Borehole Spacing: 25 feet, minimum.
   7. Total Number of Boreholes: 56 (55 new bore holes and 1 existing bore hole from site conductivity test).

2.3 MATERIALS

A. Pipe: High density polyethylene pipe, type PE4710, ASTM D 3035, DR 11.
   1. Comply with ASTM D 3035 with minimum working pressure rating of 200 psi at 73 degrees F.
   2. ASTM D3350 cell classification PE445574C
   3. Long Term Hydrostatic Design Basis: 1600 psi at 73 degrees F, when tested in accordance with ASTM D2837; appropriate listing in current edition of PPI TR-4 will constitute evidence of compliance with this requirement; otherwise, submit independent test results.

4. Joints and Fittings: Polyethylene of same type as pipe, of sizes and types suitable for the pipe being used; use only heat fusion or stab-type mechanical fittings that are quality controlled to provide a leak-free union between piping ends that is stronger than the piping itself. Do not use other barbed fittings or hose clamps.
   a. Electrofusion Type Fittings: Comply with ASTM F1055.
   b. Butt Fusion Fittings, 1-1/2" pipe and above: Comply with ASTM D3261.
   c. Socket Type Fittings, up to 1-1/4" pipe: Comply with ASTM D2683.
   d. Where threaded fittings must be used for connection to equipment or dissimilar piping, use fittings and thread sealant compatible and effective with antifreeze used.
   e. Provide pre manufactured, molded U-bend at bottom of vertical bore designed for geothermal application.

B. Heat Exchange Fluid: Water and antifreeze solution, 25 percent propylene glycol by weight.

C. Detectable Underground Tape: Magnetic detectable conductor in 2 inch (50 mm) wide rot-resistant plastic tape or mesh, brightly colored, imprinted with "Water Line" in large letters.

D. Grout for Vertical Boreholes: Thermally-enhanced bentonite/high-grade silica sand grouting compound with a minimum thermal conductivity value of 1.2 btu/hr-ft-°f as determined when tested in accordance to ASTM D 5334. Grout mixture shall have a maximum permeability rate of less than 1x10^-7/ cm/s as determined by ASTM D 5084. Grout mixture shall be geo-pro TGlite 1.2 or approved equal with a maximum density of 10.5 lb/gal.

E. Interior piping, valves and fittings: Refer to Division 23 specification sections for interior piping, valve, fittings, gauges and accessories.

PART 3 - EXECUTION

3.1 EXCAVATION

A. Excavate in accordance with requirements of authorities having jurisdiction.

B. Remove rock as required to achieve specified depths.

C. Vertical Boreholes: Drill to depths as detailed on contract drawings.
   1. Provide continuous steel casing on upper portion of borehole until bedrock is reached. Casing is not required within bedrock.
   2. Set casings within bores plumb and true to line.
   3. Piping: Assemble heat exchanger piping and test before grouting and covering.

D. Trenches: Excavate trenches for piping to lines and grades shown on drawings.
   1. Excavate to accommodate grade changes.
   2. Maintain trenches free of debris, material, and obstructions that may damage pipe.
   3. Piping: Assemble heat exchanger piping and test before backfilling.

3.2 POLYETHYLENE PIPING

A. Join piping and fittings using heat fusion or electrofusion; do not use solvents, adhesives, or mechanical fittings.

B. Provide flanges or unions to connect heat exchanger piping to equipment or piping of different type; locate all transitions between piping of different types inside the building or otherwise accessible (i.e. above grade).

C. Keep dirt and debris out of pipe assemblies; cap or plug open ends until connected to adjacent piping.

D. Do not bend piping to shorter radius than recommended by pipe manufacturer; do not kink piping; use elbow or other fittings for sharp bends.

E. Partially backfill radius bends in narrow trenches by hand to ensure that piping is properly supported and to prevent kinking.

F. The loop tubes and the tremie pipe shall be installed into the vertical borehole heat exchanger the same day the vertical borehole heat exchanger is constructed.

3.3 GROUTING

A. After installation and testing of piping within bore, place grout continuously, from bottom to top surface to ensure filling of annular space in one operation.

B. The loop tube shall be pressurized with water during the entire grouting process to protect it against shear forces caused by the grout. The hydrostatic pressure level shall be adapted with grout density and borehole depth.

C. Grout shall be placed in the borehole by pressure pumping through a tremie pipe after enough water or other drilling fluid has been circulated in the annular space to clear obstructions;
D. Tremie grouting of the entire vertical borehole using the grout material specified and shall be completed within a timeframe to ensure total loop well grouting and ensure aquifer protection;
E. The tremie pipe shall be lowered to the bottom of the borehole, raised slowly as the grout is introduced and should be continuously submerged in the grout.
F. Once the grout has settled for a minimum of 48 h, the ground source heat pump system contractor shall ensure that the vertical borehole heat exchanger(s) are filled with grout to the top of the vertical borehole heat exchanger; and regular verification of the grout mixture shall be carried out as follows:
    1. Verification of grout mix ratio, mixing procedures, grouting, and topping off of vertical borehole heat exchanger with grout shall be undertaken on an ongoing basis during ground source heat pump installation
    2. Density and water content, or alternatively, grout thermal conductivity of the samples, shall be measured to ensure the grout mixture is in accordance with the specified grout recipe.

3.4 TESTING

A. At several stages of the installation the pipe installed shall be pressure tested with result documented and turned over to owner and engineering for approval. If deficiencies are found, the point of leakage shall be found, repaired and test repeated. This procedure shall be followed until the piping systems have been proved absolutely tight.
B. Caution shall be exercised to prevent direct sunlight or significant air temperature changes from affecting the results.
C. The use of any chemicals, any "Stop-Leak" compounds, any mastic or any other temporary means shall not be used for repairing leaks during or subsequent to these tests.
D. Pressure tests for polyethylene pipes shall be conducted in accordance with ASTM F2164, which provides information on apparatus, safety, pre-test preparation, and procedures for conducting field tests of PE pressure piping systems by filling them with a liquid and applying pressure to determine if leaks exist in the system.
E. The duration of the pressure test shall be no less than 1 h after the stabilization of pressure. If no visual leakage is observed and pressure during the test phase remains steady (within 5% of the test phase pressure), a passing test is indicated.
F. Loops must pass the test at the following milestone:
    1. Prior to insertion of the vertical piping into the bore holes, the contractor shall assemble the "U-Bend" and piping, cap both ends, and pressure test the piping to a pressure of 100 psig. Reduce pressure to 0 psig before lowering into borehole.
    2. After each runout has been assembled, including connection to the grouted vertical borehole heat exchangers and before backfilling, test piping to a pressure of 50 psig.
    3. After the complete ground-heat exchanger has been installed, flushed, and purged of air and debris and before the ground heat exchanger has been filled with glycol connected to the building system, test piping to a pressure of 50 psig.
G. Contractor is responsible to provide evidence of and certification of pressure testing, and acceptance of all work performed by signature of contract inspector.
H. After the conclusion of the ground heat exchanger pressure test, the ground heat exchanger shall be left filled with ultimate fluid to be used in the system and be maintained under pressure until final connection to the building system.

3.5 FLUSHING, PURGING AND CHARGING

A. All geothermal piping systems shall be thoroughly cleaned before placing in operation to rid the system of dirt, piping compound, mill scale, oil, and any and all other clean and balance the piping installed under his contract.
B. Extreme care shall be exercised during construction to prevent all dirt and other foreign matter from entering the pipe or other parts of the system. Pipe stored on the project to have the open ends capped and equipment to have all openings fully protected. Before erection, each piece of pipe, fittings, or valve to be visually examined and all dirt removed.
C. The ground heat exchanger shall be flushed with potable water by means of a flushing unit equipped with a tank for air separation, suitable filters, a water flow meter, pressure gauges and valves to reverse the flow. All flushing flow shall pass through a suitable filter until the water is observed to be clear and clean.

D. Each supply and return circuit shall be flushed and purged in the forward and reverse directions with water at a minimum velocity of 2 ft/s through each piping section. A calibrated flow meter shall be used to verify the flow velocity.
E. To verify the effectiveness of a purge, the valve leaving the borehole field shall be closed while monitoring the make-up water level in the purge tank. If the level does not go down, there is little air in the system. The system should be pressurized to 50psig after purging is complete. When the borehole field is connected to the system the residual pressure will ensure that the system is intact and that no air has been introduced into the system.
F. Prior to specifying water treatment and selecting an anti-freeze solution for the system, a sample of the local water shall be analyzed to identify existing local water chemistry. Where applicable and permitted by the authority having jurisdiction, the heat transfer fluid may contain chemical inhibitors to protect the biological and chemical integrity of the solution to prevent corrosion of system pipes.
G. Charge system with specified glycol mixture after all testing, flushing and purging has occurred and been accepted by the owner.
F. Install system label at purging valves, indicating:
    1. Heat exchange fluid, including antifreeze type and concentration.
    2. Service date.
    3. Company name.
    4. Company phone number and responsible person.

3.6 BACKFILLING

A. Install in compliance with local authorities having jurisdiction.
B. Vertical Boreholes: Backfill after pipe installation in accordance with IGSHPA (GROUT) - IGSHPA Grouting Procedures for GHP Systems.
C. Trenches:
    1. Provide minimum 5 foot cover over piping.
    2. Backfill trenches after pipe has been installed and tested, using fill free of rocks and other debris.
    3. Install detectable tape continuously 6 inches (150 mm) above top of all buried pipe.
    4. Backfill and compact using the procedures specified.
    5. Backfill to original grades with sufficient overfill to allow for settlement.
D. Protect piping from displacement.

3.7 CLEANING

A. Leave adjacent paved areas broom clean.
B. Clear debris, including excess backfill and excavated dirt and rock, from heat exchanger area.

3.8 PROTECTION

A. Protect area during excavation from excess runoff and erosion. Ensure that mud pit will not leak or overflow into streams or wetlands. When well is accepted, remove mud and solids in mud pit from project site and restore site to finished grade.
B. Provide casings, seals, sterilizing agents, and other materials to eliminate contamination.
C. Protect pipe protrusions from damage until connections to building systems are installed.

3.9 IDENTIFICATION

A. Install continuous underground detectable warning tape for underground piping. Locate below finished grade, directly over piping.

END OF SECTION

SECTION 23 23 00

REFRIGERANT PIPING

PART 1 - GENERAL

1.1 QUALITY ASSURANCE

A. Installer: A firm with at least five years of successful installation experience on projects with refrigerant piping similar to that required for this project.

1.2 REGULATORY/REQUIREMENTS

A. Comply with applicable requirements of the Clean Air Act and City and local Regulations concerning handling of refrigerants.

PART 2 - PRODUCTS

2.1 REFRIGERANT PIPING

A. Type ACR copper tube with wrought copper fittings, brazed, 300#, Silver Solder.

1. The silver solder on all connection in the suction, discharge, and liquid lines shall be cadmium-free with a minimum of 45% silver. When soldering components such as vibration eliminators, ball valves, etc., the manufacturer's instruction for brazing or soldering must be followed (wrapping device in a wet cloth, etc.). At all times during brazing or soldering, nitrogen purge shall be used.

B. End Caps:

1. Provide factory applied plastic end caps on each length of pipe and tube.
2. Maintain end caps through shipping, storage and handling as required to prevent pipe end damage and eliminate dirt and moisture from inside of pipe and tube.

C. All joints shall be in accessible locations. All 90° fittings shall be of the long radius type. Close ruff or short turn ells will not be permitted on any installation. Quick connect couplings are not permitted in any systems.

2.2 SHUT-OFF VALVES

A. Manufacturers:

1. Design Basis: Henry
2. Other Acceptable Manufacturers:
   a. Mueller
   b. Superior
   c. Imperial

B. Size 7/8 Inch and Smaller:

1. Model: Series 600.
2. Type: Pack-less diaphragm.
3. Material: Bronze.
4. Flow: Non-directional.

5. Servicing: Diaphragm changeable under line pressure.

C. Size 1-1/8 Inch and Larger:

1. Model: Series 200.
2. Type: Wing cap, back seating.
3. Material: Bronze.

2.3 FLEXIBLE PIPE CONNECTORS

A. Manufacturers:

1. Design Basis: Mason
2. Other Acceptable Manufacturers:
   a. Metraflex
   b. Flexonics

B. Braided bronze with copper tube ends, compatible with refrigerant type for system

C. Flexible connector shall be line size or connection size, whichever is larger.

2.4 REFRIGERATION SPECIALTIES

A. Filter Drier:

1. Conform to ARI Standard 710.
2. Sizes ½" and larger - interchangeable core, full flow.
3. Sizes smaller than ½" - sealed type.
4. Minimum burst pressure - 1500 psig.
5. Refrigerant Filter-Dryer: Refrigerant filter-dryers shall be replaceable core "Catch All" type, as manufactured by Sporlan Valve Company.

B. Sight Glass:

1. Double port moisture indicating, reversible color indicator.
2. Removable sight glass and moisture indicating element.
3. Furnish with a protective cover.

C. Expansion Valve:

1. Thermostatic type, diaphragm or bellows operated.
2. External superheat adjustment factory set for 10ºF superheat (adjustable).
3. Compatible with refrigerant type for the project.
4. Pressure rated per project requirements.
5. Power elements and valve size shall be as recommended by the manufacturer, for the service intended.
6. Thermal expansion valves shall be Type "MVE-G", as manufactured by Sporlan Valve Company, or approved equal, with external equalizer and remote bulb with refrigerant 22 charge.

D. Solenoid Valve:

1. Provide solenoid valve for systems 25 tons and larger.
2. Compatible with refrigerant type for the project.
3. Valve shall fail in closed position (power open).
4. Valves to have stainless steel diaphragm-welded and lead-proof construction, replaceable thermostatic element and tight seating. Valve shall be as manufactured by Sporlan Valve Company or approved equal.

E. Moisture and Liquid Indicator: Provide combination liquid and moisture indicators type "See All", as manufactured by Sporlan Valve Company.

F. Refrigerant Strainers: Provide Refrigerant Strainers. Strainers shall be as manufactured by Henry Valve Company, Type 895.

1. Acceptable Manufacturers:

a. Alco
b. Sporlen

PART 3 - EXECUTION

3.1 INSTALLATION

A. Run piping level or plumb, except slope gas piping to compressor with a minimum number of elbows.

B. Provide oil traps at bottom of suction risers. Size risers for proper oil return.

C. Size lines for total pressure drop not to exceed 2ºF saturation temperature.

D. Provide necessary flexibility for vibration and expansion with offsets and loops, not expansion joints.

E. Provide flexible connectors at all unit connections.

F. Replace air in pipe with dry nitrogen to prevent corrosion during soldering.

G. Install valves, sight glasses, filter-driers, and accessories, furnished by equipment supplier, but not factory installed.

H. Insulate all underground refrigerant lines with ½" flexible foam. Use unslit covering and carefully cement all joints.

3.2 HANGERS

A. For insulated piping, provide hangers of size to fit outside insulation.

B. For non-insulated piping, provide hangers with elastomer insert to prevent damage to piping from vibration.

C. All refrigerant lines must be supported by Unistrut (or equal) hangers and supports. Horizontal suction lines (insulated) may lie on hangers without being clamped, provided they are reasonably fee of movement and secure from vibration. All vertical liquid and suction lines must be clamped. All discharge piping to and from remote air cooled condensers shall also be securely clamped to supports. Clamp assemblies shall be manufactured by Hydra-Zorb, or approved equal.

D. All lines that require clamping shall be installed according to the following recommend spacing:

Line Size	Maximum Span
5/8" and smaller	5'-0"
1-1/8"	7'-0"
1-3/8"	8'-0"
1-5/8"	9'-0"
2-1/8"	10'-0"

3.3 TESTING AND DEHYDRATION

A. Refrigeration piping shall be tested in accordance with the recommendation of the refrigeration equipment manufacturer and in the following sequence for a period of 24 hours:

High Side – Nitrogen at 300 psi
Low Side – Nitrogen at 150 psi
Entire System – Refrigerant at 5 psi

B. No visible leaks, losses in pressure or increase in vacuum shall occur during test period.

C. Use the following procedure to test and hydrate the systems:

1. Isolate any elements which would be damaged by test pressures.
2. Test system with trace gas using an appropriate leak detector.
3. Repair or replace leaking elements of system and re-test.
4. After system has been proven to be free of leaks, evacuate it with a high efficiency vacuum pump to 2.5 mm of mercury absolute, to blow off the pressure in the system to atmosphere and provide final evacuation. Use a Zimmerli gauge to read vacuum. Remove all moisture from the system. Operate the vacuum pump until a vacuum of 2.5 mm Hg. is achieved.
5. Allow the system to stand under vacuum for 24 hours.
   a. Then, if a vacuum of 2.5 mm can be drawn within 30 minutes, the system shall be considered dry.
   b. If not, the procedure shall be repeated. Break the vacuum with oil pumped, dry nitrogen, open the compressor suction and discharge service valves and re-evacuate the system to 2.5 mm Hg. absolute. If no noticeable rise in pressure has taken place after 24 hours, the system shall be charged.
6. Break the final vacuum by charging with the correct refrigerant. Refrigerant shall be charged in strict accordance with CFR 40 requirements for refrigerant handling.

3.4 START-UP AND CHECK-OUT

A. In additional to the manufacturer's recommended start-up procedures, the following parameters are to be recorded once the system is stabilized.

Compressor voltage (all phases)
Compressor current (all phases)
Compressor suction pressure/temperature (and superheat)
Compressor discharge pressure/temperature
Evaporator coil suction superheat (not to exceed 10°F)
Outside air temperature

These readings are to be included in the O&M Manual when start-up is complete.

B. All replaceable core filter and filter-drier elements shall be replaced by the Contractor thirty (30) days after system start-up.

C. A final acceptance will only be made after inspection by an authorized representative of Vassar from the Department of Planning, Design and Construction.

END OF SECTION

SECTION 23 25 13

CLOSED SYSTEM WATER TREATMENT

PART 1 - GENERAL

1.1 SCOPE

A. Furnish and install chemical treatment systems for closed hydronic systems where shown on the Drawings and as specified in this section.

B. Work under this section shall include providing equipment, chemicals, and service related to water treatment for the geothermal/condenser and solar thermal water systems.

C. The Contractor shall engage the services of a water treatment contractor who shall provide a complete water treatment service. The service shall include furnishing and application of all chemicals, at least one visit a month to collect samples for chemical analysis at the water treatment company's laboratory, and all necessary inspection, adjustment, and maintenance of the chemical treating devices. Complete chemical control of the treatment shall be included. Reports shall be furnished to Architect after each visit.

D. Water treatment shall be applied concurrently with the operation of each circulating water system for a period of one year. An initial dose of treatment chemical shall also be applied immediately after each system is initially filled with water if operation is to be delayed after filling. In addition to the chemicals indicated, slimicides and algeacides shall be provided as necessary. Chromate and phosphate will not be acceptable. All chemicals shall be approved by local and state agencies having jurisdiction.

E. The firm's water treatment laboratory shall be equipped to analyze water in accordance with the statement methods of the American Public Health Association.

F. Water treatment contractor shall provide chemical feeding devices during the period of this contract. At the termination of the contract, the treatment equipment shall belong to the Owner.

G. Provide a water treatment program for the following systems:

Geothermal/Condenser water systems.
Solar thermal water system.

H. Provide a comprehensive program of cleaning and flushing for geothermal/condenser water system.

I. All chemicals and formulations prescribed for the cleaning and treatment of process water systems must meet the following specified criteria:

1. They must be ecologically compatible so that any discharge will not create an environmental impact.
2. They must be industrial and toxicologically safe so as to minimize personnel and equipment exposure to hazardous conditions.
3. Every effort must be made to maintain a sense of uniformity in chemical formulation to insure a line of continuity.

J. Provide permanent signage on hydronic systems treated with chemicals that include the following information:

1. Chemical type, concentration, and system volume.
2. Direction to drain system to sanitary drain.

K. Chemical type, concentration and system volume shall be stenciled on the system expansion tank in a visible location.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Section 23 21 13 Hydronic Piping And Accessories

1.3 QUALITY ASSURANCE

A. The chemical treatment program shall be administered by a firm regularly engaged in the field of water treatment with a minimum of five years experience in the immediate area of the job site location, and similar sized projects.

B. The water treatment contractor shall have laboratory facilities, both central and field, to service the Owner's account.

C. The water treatment contractor shall have local warehousing and will not be allowed to overstock chemical on premises.

D. A single water treatment company shall be responsible for all products and services.

E. Approval Process: All materials proposed for application must have the prior approval of the Engineer and Owner. In order to thoroughly evaluate the products performance, it is recommended that the following be submitted at the time of proposal:

1. Material Safety Data Sheets for all products that are to be applied, which shall contain the complete formulation. Further documentation of qualitative composition must be included if Material Safety Data Sheets do not supply all product(s) components.
2. Product Data Sheets specifying overall product description and application guidelines.
3. Methods of analysis for determining product residuals. Proposals should specify specific qualitative and quantitative procedures of evaluating actual product levels. They should also include recommended parameters for all products, expressed in either terms of parts per million or milligrams per liter.
4. Expected performance levels of products; this should include expected corrosion rates, expressed in mils per year. If the product is of a biostatic nature, what levels of biological growth should be expected if the product is applied at recommended dosages.
5. Provisions should be submitted for the removal for any unused chemicals. In addition, provisions must be provided for the disposal of all empty containers.

F. The above mentioned criteria will serve as a guide as to the minimum information required for approval of any chemical treatment. No water treatment shall be purchased, delivered, or applied without consideration of the previously mentioned guidelines.

1.4 SUBMITTALS

A. Provide product data for each piece of equipment installed the system and for each chemical used.

B. Provide shop drawings for control panel, including internal and external wiring diagrams, dimensions, etc.

C. Provide operation and maintenance manuals for all equipment.

D. Material Data Safety Sheets shall accompany all chemicals delivered to the job site.

PART 2 - PRODUCTS

2.1 PRE-STARTUP CLEANER

A. Furnish pre-startup liquid detergent dispersant cleaner for flushing and cleaning of water systems to remove oil and foreign matter from piping and equipment prior to final filling of systems. Chemical shall not be injurious to persons, piping, pipe joint compounds, packings, coils, valves, pumps, and their mechanical seals, tubes, or other parts of the system.

B. This work shall include the internal cleaning and protective coating of all distribution systems on this construction such as, but not limited to, solar thermal, geothermal/condenser water and solar thermal water systems and components.

C. This method of cleaning and treating is to be applied to all piping supply and return and then back to the source of equipment.

D. In all systems the process shall be completely circulated throughout, and afterwards the system is to be drained, flushed and protective coated. The Contractor shall engage the services of a cleaning firm, for the purpose of removing lime, oil, grease, oxides and other wastes therefrom. Strainers and all points of piping systems shall be effectively flushed. After the removal of these impurities, a protective coating shall be applied to all inner surfaces, which will inhibit oxidation as well as protect the metals against impurities that may be present in the water. This coating shall be guaranteed for five years from date of completion at no cost to the Owner, covering labor and materials. Valve-off heat exchangers to avoid coating surfaces.

E. The cleaning and testing materials use for this purpose must have been in use successfully for at least five years in comparable systems. Building system pumps shall not be used in system cleaning procedures.

F. It shall be compounded of non-corrosive, non-toxic, non-alkaline and non-injurious ingredients that have been investigated and reported as a "Neutral Compound" by a recognized engineering firm or laboratory, other than the submitting company's own laboratory. Brochures and unbiased test reports shall be submitted to the Architects within 90 days from job acceptance for approval. This cleaning and treating firm shall show proof, that said firm has been established and accepted for this work, for a minimum of 10 years. The ingredients used shall have no deleterious effects on seals, O-rings, glands, packing, etc.

G. It shall be the sole responsibility of the approved firm for the application of this process. He shall supply all labor, materials, and equipment for this purpose. A competent supervisor and/or equipment operator shall be kept at the site from commence of his work until completion. None but experienced men shall operate this pumping equipment. Any repairs or servicing of components of these systems shall be done by the Contractor.

H. Cleaning procedures for newly installed systems shall be as follows:

1. Step 1: Adjust all control valves and balancing valves to full open position during the cleaning and treatment process.
2. Step 2: Fill system and add standard 12% hypochlorite bleach for a residual of 2-3 parts per million (ppm) chlorine. This should require approximately one quart of bleach per 10,000 gallons of water. Test for concentration. Circulate solution for a minimum of eight hours. Clean strainers and dead end piping legs, then drain to sanitary sewer
3. Step 3: Fill system and add a general dispersant for iron, mud, silt, and microbiological matter at a concentration of 500-1000 parts per million (ppm), or approximately seven gallons of product per 10,000 gallons of water. Test for concentration. Circulate solution for a minimum of eight hours. Flush system using bleed and feed until the bleed water pH and iron levels are consistent with the feed domestic water levels. Clean strainers and dead end piping legs.
4. Step 4: Arrange for inspection by a representative from the Facilities Management Pipe Shop before proceeding to chemical treatment.

I. For extensions to existing building systems, the above cleaning procedures shall be followed if the extension contains ferrous piping materials. Provide temporary piping, valving, and pumping system isolated from the existing building system as needed to perform cleaning procedures prior to final connection to the existing building system.

2.2 CHEMICALS

A. A buffered Molybdate and/or Nitrite based corrosion inhibitor shall be provided to initially treat the closed systems and added as required for 1 year from date of owner acceptance. This treatment must contain a copper inhibitor and a borate buffer.

B. Any treatment must be compatible with glycol installed in glycol/water systems.

C. Treatment chemicals for hydronic solar thermal and geothermal/condenser water cooling systems shall be as follows:

1. Non-Glycol Systems: After cleaning and inspection, immediately add a molybdate based corrosion inhibitor. Acceptable corrosion inhibitors shall include a combination of sodium molybdate, sodium hydroxide, tolytriazole and organic polymers. Test for residual concentrations as follows:

   a. Molybdate: 100 ppm
   b. pH: 8.3-9
   c. Tolytriazole: 5 ppm

2. Glycol Solar Thermal Systems: After cleaning and inspection, drain system then refill with Metro PG#36 propylene glycol (PG) solution at a concentration of 50% propylene glycol to 50% water. The water to be added to glycol solutions shall meet manufacturer's standards for quality.
3. Glycol Geothermal Water Systems (Ground Loop): After cleaning and inspection, drain system then refill with Metro PG#36 propylene glycol (PG) solution at a concentration of 25% propylene glycol to 75% water, in accordance with manufacturer's recommendations. The water to be added to glycol solutions shall meet manufacturer's standards for quality.
4. Glycol Condenser Water Systems (Building Loop): After cleaning and inspection, drain system then refill with Metro PG#36 propylene glycol (PG) solution at a concentration of 30% propylene glycol to 70% water, in accordance with manufacturer's recommendations. The water to be added to glycol solutions shall meet manufacturer's standards for quality.

D. Arrange for inspection by a representative from the Facilities Management Pipe Shop prior to final acceptance.

2.3 POT FEEDER

A. Provide a five (5) gallon pot feeder piped around the main Solar Thermal Water and Geothermal/Condenser Water circulating pumps as indicated on the drawings. The feeder shall consist of a steel tank with operating pressure of 200 psi. A 3½" quick open cap with "O" ring seal shall be provided to add water treatment chemicals.

2.4 COUPON HOLDER

A. Provide coupon rack with coupon holders, flow control and isolation valves. Coupon racks shall be installed in all closed and open systems that are being treated.

B. Coupon Holders shall be similar to Pulsafeeder, Inc. Model CCR-4.

C. The Water treatment contractor shall install the coupons in the coupon holders and submit a written report to the Owner at the end of each 90 days, during the one year warranty period as to the condition of each system being treated.

2.5 CLOSED SYSTEMS – GLYCOL FEEDER

A. Glycol Feeder Assembly

1. Provide and install equipment for the automatic feed of a glycol solution. System components shall be as specified.
2. Feeder storage tank assembly shall consist of one (1) 55 gallon polyethylene tank with cover equipped with two (2) 3/4" bulkhead fittings located 3" from the bottom of the tank for pump suction and drain. The storage tank shall be mounted on a steel tank stand equipped with a side mounting platform for the glycol pump. Tank and stand assembly shall be H-O-H Model S-50 or equal.
3. Glycol feed pump shall be Oberdorfer Model 992MJ-07, ½ HP, 1725 RPM.
4. Glycol control panel with red low level warning light, alarm bell, alarm silence switch and hand/off/auto switch, prewired with terminal strip connections in NEMA 1 enclosure. Glycol system control panel shall be H-O-H Model GLC-10 or equal. Provide level alarm at BMS.
5. Pressure relief valve shall be Neptune Model RV316-1 or equal, relief setting shall be as required for the project.
6. Pressure switch for glycol pump control shall be adjustable to provide glycol pump start/stop. Ranges: 5 to 65 psi differential 12 psi – Furnas Model 69WA4.
7. Low level drum caddy shall shut off glycol pump in the event of low glycol level in storage tank. Caddy shall be wired for pump disconnect and warning device activate circuits, and shall be LMI Low Level Switch.

B. Glycol

An inhibited industrial grade propylene glycol shall be furnished for proper percentage of glycol solution within the system. Refer to Section 23 21 13 for glycol requirements.

C. Test Equipment

Furnish a hydrometer type test kit for the determination of percent/freeze point of glycol solutions.

2.6 WATER TREATMENT CONTROL TESTING EQUIPMENT

A. Provide a test set complete with apparatus and chemical regents for the determination of phosphonate (ortho), ph (7.6 - 9.2), nitrite and any additional test as required by water treatment company.

PART 3 - EXECUTION

3.1 Provide a one year supply, from date of startup, of the recommended formulas for the prevention of scale, corrosion, and biological growth in the recirculating system.

3.2 All formulations must be compatible with system construction materials and meet or exceed all environmental requirements.

3.3 The water treatment company will supply all testing equipment and reagents, necessary to properly maintain the treatment program.

3.4 The water treatment company will provide a water treatment service program for a period of one year from system startup. This program shall include: startup assistance, plant personnel training, monthly service calls and inspection of system equipment. Provide owner with copy of field service report including performance test required levels vs. Field measurements.

3.5 Provide quarterly laboratory analysis and report of coupons.

END OF SECTION

SECTION 23 31 13

DUCTWORK

PART 1 - GENERAL

1.1 INDUSTRY STANDARDS

A. Fabrication and installation shall be by a single firm specializing and experienced in metal ductwork for not less than 10 years.

B. Comply with SMACNA (Sheet Metal and Air Conditioning Contractors National Association) recommendations for fabrication, construction and details, and installation procedures, except as otherwise indicated.

C. Comply with American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE), except as otherwise indicated.

D. Compliance with SMACNA and ASHRAE is a minimum requirement. In case of disagreement between sheet metal work described in this Section and SMACNA or ASHRAE, the specification shall govern, unless the requirements of SMACNA or ASHRAE are of greater value.

E. Comply with SMACNA “HVAC Air Duct Leakage Test Manual” for testing of duct systems.

F. Comply with New York State Energy Conservation Code for UL Listing of products.

G. Comply with NFPA 90A.

1.2 SUBMITTALS

A. Detailed ductwork shop drawings, which include sizes, layouts, and pressure classifications, must be properly submitted. Any ductwork installed without prior written approval by the engineer of record shall be replaced at the expense of the contractor.

B. Shop Drawings: Submit shop drawings for:

1. Transition elbows.
2. Seal and reinforcing schedule for all ductwork fabrication types.
3. Turning vane and turning vane installation.
4. Coordinated duct routing and sizes.

C. Product Data: Submit manufacturer’s product data including VOC content on the following:

1. Duct lining.
2. Duct lining adhesive.
3. Duct sealant

1.3 PRODUCT HANDLING

A. Protect shop fabricated ductwork, accessories and purchased products from damage during shipping, storage and handling. Protect ends of ductwork and prevent dirt and moisture from entering ducts and fittings.

B. Where possible, store ductwork inside and protect from weather. Where necessary to store outside, store above grade and enclosed with waterproof wrapping.

1.4 QUALITY ASSURANCE

A. The contractor must comply with the specification in its entirety. If on inspection, the engineer of record finds changes have been made without prior written approval, the contractor will make the applicable changes to comply with this specification at the contractor's expense.

B. At the discretion of the engineer of record, sheet metal gauges and reinforcing may be randomly checked to verify all duct construction is in compliance.

C. All ductwork and fittings must have a computer generated label affixed to each section detailing all applicable information including the duct dimensions, gage, reinforcement type/class, and connector type of systems manufacturer. In addition, galvanizing thickness and country of origin must be clearly displayed on each duct section.

D. Duct sealing shall be sealed as per requirements of SMACNA Air Duct Leakage Test Manual.

1.5 GUARANTEE

A. Contractor will guarantee all work for one year from the date of acceptance against all defects in material, equipment and workmanship. This guarantee shall include repair of damage to any part of the premises resulting from leaks or other defects in material, equipment or workmanship.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR DUCTWORK

A. Construct ductwork to meet the functional criteria defined in Section VII of the 2005 SMACNA "HVAC Duct Construction Standards, Metal and Flexible," Second Edition.

B. All ductwork must comply with any applicable local, state, and federal code requirements.

C. Furnish and install the size, connections and run of ducts as indicated on the Drawings. All dimensions represent inside clear dimensions.

D. While the drawings shall be adhered to as closely as possible, the Engineer reserves the right to vary the run and size of ducts during the progress of the work if required to meet structural conditions.

E. Install all ductwork in strict adherence to the ceiling height schedule indicated on the Architect's Drawings. Consult with the Electric and Plumbing Contractors, and in conjunction with the above Contractors, establish the necessary space requirements for each trade.

F. The sheet metal ductwork shall, whether indicated or not, rise and/or drop and/or change in shape to clear any and all conduits, lighting fixtures, plumbing and heating mains to maintain the desired ceiling heights.

G. The ductwork shall be continuous, with airtight joints and seams presenting a smooth surface on the inside and neatly finished on the outside. Ducts shall be constructed with curves shown on the Drawings, the inside radius of all curves and bends shall be not less than width of ducts in plane of bend.

H. All shower exhaust ductwork up to a distance as indicated on the drawings but not less than 15'-0" from the registers shall be aluminum construction. All joints shall be sealed tight with Foster 32-19, Childers CP-146 or Ductmate PROseal UL 181B-M listed sealer or approved equal. Ductwork shall pitch toward the registers.

I. Gauge of stainless steel duct shall be same as for steel duct. Seal with Foster 32-19, Childers CP-146 or Ductmate

PROseal or approved equal.

J. Provide 12" x 12" access doors for every 50'-0" run of supply and return air duct and at the base of each vertical riser for cleaning purpose.

K. All outside air intake ducts between intake point and air handling unit or mixed air duct or plenum shall be aluminum or stainless steel construction with all joints sealed with Foster 32-19, Childers CP-146 or Ductmate PROseal UL 181B-M listed sealer.

L. All air ducts exposed to the weather and not insulated shall be constructed of aluminum or stainless steel and shall be properly braced and supported and secured to the building construction. All seams shall be sealed with Foster 32-19, Childers CP-146 or Ductmate PROseal UL 181B-M listed sealer.

1. The construction of ductwork shall be same as conventional ductwork except where transverse reinforcing angles not required, provide 1" x 1" x 1/8" black iron bracing angles matched angles at joint and 1" x 1" x 1/8" black iron between joints 4'-0" from joints.
2. Provide 1/8" thick gasket (3M EC-1202 or equal) for all matched angles.
3. Edge of ducts shall be bent 1/2" over matched angles to obtain watertight seal.
4. Rivet angles to duct and seal with Foster 32-19, Childers CP-146 or Ductmate PROseal UL 181B-M listed sealer.
5. Paint bare steel iron angles black after installation.

M. Where dimensions, sizes, and arrangements of elements of duct assembly and support systems are not provided in these standards the contractor shall select configurations suitable for the service.

N. The contractor shall follow the application recommendations of the manufacturer of all hardware and accessory items and select them to be consistent with the duct classification and services.

O. Where sealing is required it means the following:

1. The use of adhesives, gaskets, tape systems, or combinations of these to close openings in the surface of the ductwork and field-erected plenums and casings through which air leakage would occur or the use of continuous welds.
2. The prudent selection and application of sealing methods by fabricators and installers, giving due consideration to the designated pressure class, pressure mode (positive or negative), chemical compatibility of the closure system, potential movement of mating parts, workmanship, amount and type of handling, cleanliness of surfaces, product shelf life, curing time, and manufacturer-identified exposure limitations.
3. That these provisions apply to duct connections to equipment and to apparatus.

P. Transverse joints for all supply, return, make-up air and outside air ducts serving an application that requires ductwork to be inspected and cleaned periodically shall be gasketed flanged Vanstone joints with minimum 1.5 inch flanges fastened 6 inches on center or “Ductmate” transverse sheet metal duct connection system with manufacturer-furnished gasketing system. Gasket shall be “440 Gasket Tape” by Ductmate Industries, inc. or approved equal.

Q. Duct transverse and longitudinal joints (except for the above requirements) shall be selected and used consistent with the static pressure class, applicable sealing requirements, materials involved, duct support intervals and other provisions for proper assembly of ductwork outlined in the SMACNA HVAC Duct Construction Standards – Metal and Flexible. Transverse joints T-15 through T-24, shown in Figure 2-1 are acceptable construction. Type L-2 (button punch snap lock) or Type L-3 (grooved seam) longitudinal seams, shown in Figure 2-2, are not acceptable.

R. Seal all ductwork seams, joints, fastener penetrations and fitting connections with sealants in accordance with SMACNA Seal Classification as required by SMACNA Duct Pressure Classification. All ductwork, regardless of pressure classification, shall have a minimum Seal Class A. Where ducts are not continuously welded, provide liquid, mastic, and embedded fabric tape type sealants or combination, and gaskets as required to meet the specified

duct leakage allowance. Sealant composite fire and smoke rating, when tested in accordance with ASTM E 84, NFPA 255 or UL 723, shall not exceed Flame Spread of 25 and Smoke Developed of 50.

S. The aspect ratio (ratio of width to height) of rectangular ducts should be minimized to reduce pressure losses and initial costs. Duct aspect ratios should not exceed 4:1.

2.2 DUCT PENETRATIONS THRU FLOOR

A. Provide 4" high and 4" wide concrete pad all around opening at duct penetrations thru floors. Fill in space between duct and floor construction with mineral wool and fire rated sealant.

2.3 DUCTWORK MATERIALS

A. All interior ducts shall be constructed with G-90 or better galvanized steel (ASTM A653/653M) LFQ, chem treat. Exterior ductwork or duct exposed to high humidity conditions (i.e. kitchen exhausts) shall also be G-90 or better galvanized steel LFP, chem treat.

B. Stainless steel duct shall be fabricated from lock forming grade, 300 series, ASTM-AI67, No. 4 general purpose finish. Protect finish with mill applied adhesive protective plastic/paper throughout construction.

C. Ungalvanized carbon steel shall be lockforming grade, hot rolled steel conforming to ASTM A366 or A619.

D. Flexible Duct shall be factory constructed and listed in accordance with UL 181. Integral fiberglass or mineral fiber insulation shall provide a U value of .25.

2.4 PERMITTED DEFLECTION

A. Joints

1. Up to 48" wide – ¼"
2. 49" – 120" – W/200

B. Sheet

1. 12" and less – 3/8"
2. 13" – 18" – ½"
3. 19" – 24" – 5/8"
4. 25" – 84" – ¾"
5. 85 and larger – 1"

C. Reinforcement

1. Provide mid-panel tie rod, reinforcement and /or where required to control deflection within indicated limits. Details of construction and attachment shall be per SMACNA.

2.5 RECTANGULAR DUCT

A. Construct rectangular ductwork in accordance with Section II and to meet all functional criteria defined in Section VII, of the SMACNA "HVAC Duct Construction Standards Metal and Flexible", 2005 Edition. All ductwork must comply with all local, state and federal code requirements.

B. All rectangular ductwork, unless otherwise noted, shall be built from galvanized sheet steel and thoroughly braced and stiffened

C. Where the standard allows the choice of external reinforcing or internal tie rods, only the external reinforcing options shall be used.

D. Pittsburgh lock shall be used on all “rectangular” duct longitudinal seams. All longitudinal seams shall be sealed with an approved sealant or pre-sealed with an encapsulated mastic or butyl E.P.D.M. rubber on all rectangular duct.

E. Pittsburgh lock shall be used on all longitudinal seams. All longitudinal seams will be sealed with mastic sealant. Snaplock is not acceptable.

F. Ductmate or W.D.C.I. proprietary duct connection systems will be accepted. Duct constructed using these systems will refer to the manufacturers guidelines for sheet gauge, intermediate reinforcement size and spacing, and joint reinforcements.

G. Formed on flanges (T.D.C./T.D.F./T-25A/T-25B) shall be constructed as SMACNA T-25 flanges, whose limits are defined on Page 1.36 1995 SMACNA Manual, Second Edition. No other construction pertaining to formed on flanges, will be accepted. Formed on flanges shall be accepted for use on ductwork 42” wide or less, 2” static (positive) or less and must include the use of corners, bolts and cleat.

H. Ductmate type systems that use a butyl Rubber Gasket which meets Mil-C 18969B, Type II Class A, TT-C-1796 A, Type II Class A, and TTS-S-001657 must also pass UL-723. This material, in addition to the above, shall not contain vegetable oils, fish oils, or any other type vehicle that will support fungal and/or bacterial growth (as defined in 21CFR 177, 1210 closures with sealing gaskets for food containers).

I. Aluminum duct shall be fabricated using the aluminum thickness equivalence table in the standard. Simply increasing the thickness by two gauges is not acceptable.

J. Fittings shall be constructed and reinforced as ductwork according to the longest span.

K. For duct construction pressure 2” w.g. or below based on external static pressure of fan:

1. Flat areas of duct over 18 in. wide shall be stiffened by cross breaking or beading.
2. All joints to have corner closures.
3. All joints shall be sealed with Foster 32-19, Childers CP-146 or Ductmate PROseal UL 181B-M listed mastic.

L. For duct construction pressure 2-5” w.g. based on external static pressure of fan:

1. All seams on fitting shall be continuously welded. If the zinc coating is burned off the steel during welding, apply zinc chromate paint to prevent corrosion.
2. Companion angles shall be bolted to each other with 1/4 in. x 3/4 in. stove bolts, spaced not more than 6 inches apart.
3. Hangers shall be as described for conventional ducts, except that they shall be fastened to the reinforcing angles, or angle connections. Where this is not feasible cradle hangers with a bottom angle shall be used; angle shall be suspended by angles or rods. Piercing of ducts by hangers, pipes, fasteners, etc., will not be permitted.

2.6 ROUND AND OVAL DUCT

A. Round and oval duct shall be galvanized steel, constructed in accordance with SMACNA “Duct Construction Standards, Metal and Flexible”, except as noted. Duct shall be minimum 22 gauge. Submit product data sustaining the equivalency of such duct into SMACNA standard duct.

B. Provide flat side reinforcement of oval ducts as recommended by SMACNA standards. Do not use internal tie rod reinforcement unless specifically approved by Engineer.

C. Round ductwork shall be spiral lock seam for round ductwork systems higher than 2". Example: Ductmate, Greenseam or approved equal. Gauges shall be in accordance with SMACNA Duct Construction Standard and fittings in accordance with SMACNA Duct Construction Standard, except as noted.

1. Joints 0"-20" diameter, interior slip coupling beaded at center, fastened to duct with sealing compound applied continuously around joint before assembling and after fastening. Wrap joints with 3-inch wide duct tape.
2. Joints 21"-72" diameter, use 3 piece, gasketed, flanged joints consisting of 2 internal flanges (with integral mastic sealant) split to accommodate minor differences in duct diameter, and one external closure band designed to compress gasketing between internal flanges. Example: Ductmate Spiralmate or equal.
3. Hangers shall be as described for conventional ducts, except that they shall be fastened to the reinforcing angles, or angle connections. Where this is not feasible cradle hangers with a bottom angle shall be used; angle shall be suspended by angles or rods. Piercing of ducts by hangers, pipes, fasteners, etc., will not be permitted.

D. Fittings shall be continuously welded, standing seam, or spot welded and sealed. Metal thickness and reinforcing shall be equivalent to the requirements of the largest span.

1. All elbows greater than 45" shall be radius type, R=1.5 times duct diameter.
2. Elbows less than 12" shall be of die stamped construction. Elbows 12" or greater shall be 5-piece construction.
3. Diverging and converging flow fittings shall be constructed with no excess material projecting from the body into the branch tap entrance. All such fittings shall be 45° "shoe" entrance, wye plus elbow, or 45° lateral branch. Special fittings such as heel tapped elbows and bullhead tees may be used only where shown on drawings. Adjustable elbows and straight saddle taps shall not be used. Low pressure adjustable elbows acceptable.
4. Provide bell mouth, conical tees or taps, laterals, reducers, and other low loss fittings as shown in SMACNA standard.
5. Coat galvanized areas of fitting damaged by welding with corrosion resistant aluminum paint or galvanized repair compound.

E. For duct construction pressure 2" w.g. or below:

1. Longitudinal seam sealed, self-locking snaplock duct is acceptable for round ductwork systems of 2" w.g. and lower.
2. All round snaplock pipe longitudinal seams shall be sealed with an E.P.D.M. rubber on all round self-locking longitudinal round pipe. Approved Manufacturer: Ductmate Industries "Green Seam" self-locking longitudinal round pipe or approved equal.

2.7 KITCHEN HOODS (GREASE LADEN DUCT)

A. All ductwork shall be constructed with continuously welded seams and continuously welded joint connections as per NFPA 96. The exterior of all kitchen hood exhaust ducts shall have 1-1/2" x 1-1/2" x 1/8" welded angles, punched for securing block insulation. Where kitchen hood exhaust duct risers pass vertically through floors of the building, provide angle clips welded to the duct of required sizes to support the weight of the riser sections on the building's structure at each of the floor levels. Provide and install all supplementary structural steel in shafts to properly support exhaust ductwork from building construction. The portion of ductwork exposed to view in the kitchen shall be 12 gauge and the same material as the hood. Hood ducts shall conform to NFPA #96.

B. All interior exhaust ductwork shall be 12 gauge welded black iron.

C. All exterior exhaust ductwork shall be 16 gauge welded stainless steel. Provide a permanent sign identifying the facility from which the duct originates at the base of each duct and at its termination point.

D. Maintain all clearance requirements as specified by the NYCBC.

E. All horizontal kitchen exhaust ductwork shall be pitched towards the hood or toward an approved grease reservoir.

1. Horizontal duct runs less than 75 feet in length shall be pitched not less than ¼" per foot (2% slope).
2. Horizontal duct runs 75 feet and greater in length shall be pitched not less than 1" per foot (8.3% slope).

F. Provide a residue trap at the base of each vertical riser with provision for cleanout in accordance with NFPA 96 and NYCBC.

G. Provide 18" x 12" insulated double wall access door (cleanout) on the side or top of duct. Access doors shall seal tightly and be designed so that they are operable without the use of a tool. Cleanout openings shall meet all the requirements of the NYCBC.

H. Provide access doors at the following locations:

1. Every change in direction.
2. Within three feet of the exhaust fan.
3. At the base of a vertical riser and at every floor.
4. At a 12' spacing along length of duct.
5. As indicated in the NYCBC.

I. All access doors shall located in serviceable locations.

J. Exhaust outlets terminating above the roof shall have a discharge opening located not less than 42" above the roof surface. Flows shall be directed away from the surface of the roof.

K. All kitchen exhaust ductwork shall be permanently labeled "CAUTION: KITCHEN EXHAUST SYSTEM".

L. Duct located within 24" of doors or windows or where accessible to the public shall be provided with insulation or guards to prevent contact with the duct.

M. Duct joints shall be welded butt joints ground clean on the duct interior. Overlapping joints shall be constructed in accordance with code requirements limiting impingement on air stream and overlap.

N. Provide approved fire dampers at locations where grease duct system is extended to serve a device other than a kitchen hood.

O. Ductwork shall be wrapped with zero-clearance, 2-hour, UL rated, duct wrap. Provide a minimum of two layers for zero clearance and a vertical chase to maintain the "separate chase" definition of the NYC modified IBC. Access doors shall be constructed to allow removal and reinstallation without damage to firewrap.

2.8 ALUMINUM DUCTWORK

A. Where transverse reinforcing angles are not required provide 1"x1"x1/8" black iron matched angles at joints and between joints at a maximum spacing of 4 feet.

B. Provide 1/8" thick gasket at all matched angles. Edge of duct shall be bent ½" over matched angle to obtain watertight seal. Rivet angle to duct and seal with listed sealer. Paint black iron angles prior to installation.

C. Aluminum ductwork shall be fabricated using the aluminum thickness specified in the standard. Increasing galvanized gauge by 2 gauges is not acceptable.

D. Aluminum duct shall be fabricated from lock forming grade, ally 3003-HI4, ASTM B209. Reinforcing angles, bars, tie rods, and other structural members shall be alloy 6061-T6. Hangers shall be 6061-T6 aluminum, or galvanized or

painted steel with a dielectric isolation pad between the dissimilar metals.

2.9 EXTERIOR INSULATED DUCTWORK

A. Exterior insulated ductwork shall be constructed as double wall aluminum duct with a 2" interstitial space packed with insulation.

B. Top of duct shall be sloped to drain at ¼" per foot.

C. Ductwork observed to pond water shall be replaced by contractor at his expense.

D. Wrap exterior of ductwork in one layer of EPDM roofing with seams sealed to prevent water entry. Seams shall be arranged to shed water.

2.10 EXTERIOR UNINSULATED DUCTWORK

A. Top of duct shall be sloped to drain at 1/4" per foot.

B. Any ductwork observed to pond water shall be replaced by contractor at his expense.

2.11 SOUND LINED DUCTWORK

A. Sound lined ductwork shall be constructed with an exterior layer suitable for environment and a perforated inner wall constructed of the same material as the duct. Inner lining shall be 3/32" diameter holes approximately 22% open area.

B. Sound lining shall be installed in a minimum 2" interstitial space between layers.

2.12 FLEXIBLE DUCTWORK

A. Duct shall conform to NFPA 90 and be UL listed.

B. Insulation shall be on the exterior of duct.

C. Maximum length shall be 6 feet or less.

D. Flexible ducts shall be listed by Underwriters Laboratories, Inc., complying with UL 181. Ducts larger than 200 mm (8 inches) in diameter shall be Class 1. Ducts 200 mm (8 inches) in diameter and smaller may be Class 1 or Class 2.

E. Factory made including mineral fiber insulation with maximum C factor of 0.25 at 24 degrees C (75 degrees F) mean temperature, encased with a low permeability moisture barrier outer jacket, having a puncture resistance of not less than 50 Beach Units. Acoustic insertion loss shall not be less than 3 dB per 300 mm (foot) of straight duct, at 500 Hz, based on 150 mm (6 inch) duct, of 750 m/min (2500 fpm).

2.13 VAPOR LADEN DUCT

A. Material: 22-gauge aluminum.

B. Seams: Seal all seams watertight.

C. Ducts shall be pitched to be self-draining. Where necessary pitch is not possible provide a trapped drain pocket piped to sanitary sewer at all low points. Provide access door at all drain pockets.

D. Provided welded stainless steel duct upstream and downstream of humidifier. Duct shall be 3 feet long upstream of humidifier and 6 feet downstream of the humidifier.

2.14 DISHWASHER HOOD

A. Ductwork for dishwasher hood: Ductwork for dishwasher hood shall be of 18 gauge stainless steel type 304 all welded construction and pitched back to hood. Low points, base of riser, and bottom of fan scrolls shall be piped to drain.

B. Drainage:

1. Provide 1" gutter on all sides.
2. Provide ¾" coupling and plug in bottom of gutter.

2.15 MISCELLANEOUS DUCTWORK MATERIALS

A. General: Provide miscellaneous materials and products of the types and sizes indicated, and where not otherwise indicated, provide type and size required to comply with ductwork system requirements including proper connection of ductwork and equipment.

B. Double wall turning vanes shall be Harper double wall turning vanes fabricated from the same material as the duct. Tab spacing shall be SMACNA standard. Rail systems with non-standard tab spacings shall not be accepted. All tabs shall be used, do not skip tabs. Mounting rails shall have friction insert table, which align the vanes automatically. Vanes shall be subjected to tensile loading and be capable of supporting 250 lbs. when fastened per the manufacturers instructions. Approved Systems: Ductmate PRO-Rail.

C. Single wall splitter and turning vanes shall be custom fabricated as specified below.

D. Ductwork Support Materials: Except as otherwise indicated, provide galvanized steel fasteners, anchors, rods, straps, trim and angles for support of ductwork.

E. Duct Sealant:

1. Products:

a. United McGill
b. Ductmate Industries, Inc., PROSeal
c. Hardcast, Versa-grip 181
d. Precision
e. Uni-Mastic 181 Duct Sealer, UL Listed - Indoor
f. Unicast, PROseal - Outdoor

2. Description: Non-hardening, liquid or mastic elastic sealant.
3. Fire Rating: UL 289U listed and NFC 220(b).
4. UL listed: UL 181A/B listed

2.16 DUCT TAPE ROLLED SEALANT SEALING SYSTEM

A. Manufacturers:

1. Design Basis: Hardcast. Foil-Grip 1402 181B-FX, UL listed.

B. Model:
1. Tape: DT
2. Indoor Adhesive: FTA-20

3. Outdoor Adhesive: RTA-50

2.17 FIBERGLASS DUCTBOARD

A. Fiberglass ductboard is not accepted without prior written approval from the specifier.

2.18 ACCESS DOORS

A. Wherever necessary in ductwork, casings or sheet metal partitions, provide suitable access doors and frames to permit inspections, operation and maintenance of all valves, coils, humidifiers, controls, smoke dampers, smoke detectors, fire dampers, filters, bearings, traps, or other apparatus concealed behind the sheet metal work. All such doors shall be of double construction of not less than No. 20 gauge sheet metal and shall have sponge rubber gaskets around their entire perimeter. Doors in insulated ducts of insulated casings shall have rigid fiberglass insulation between the metal panels.

B. All access doors in sheet metal ducts shall be hung on heavy flat hinges and shall be secured in the closed position by means of cast zinc clinching type latches. Where space conditions preclude hinges, use four heavy window type latches.

C. Doors into ducts shall in general not be smaller than 18" x 18" except for access door to fire dampers which will depend on size of fire damper.

D. Provide insulated or acoustically lined doors to prevent condensation where applicable.

E. Systems 3” w.g. or less shall utilize a hinged, cam, or hinged & cam square-framed access door.

F. Grease exhaust duct doors shall be grease and air tight, UL 1978 listed, meet NFPA 96 standards and all mechanical codes. Grease duct access doors can be sandwich type or with a weld on frame, with/without hinge. Approved Manufacturer: Ductmate Industries “Ultimate” style door or approved equal.

G. All grease duct access doors used must be accompanied by independent testing in conjunction with each manufacturer’s respective wrap system for high temperature applications.

2.19 FLEXIBLE DUCT CONNECTOR

A. Flexible duct connector shall be used where ductwork connects to fans of apparatus, or apparatus casing to fans so as to prohibit the transfer of vibration from fans to ductwork connecting thereto. Connectors will meet NFPA 90A and 90B specifications and provide an airtight and waterproof seal. Indoor installations shall be Neoprene or vinyl coated fabrics. Outdoor installations shall use Hypalon coated fabric. Connector shall be Ductmate PROFlex or approved equal.

B. The flexible connections shall be a minimum of 12" long including bands using extra wide fabric as specified and held in place with heavy metal bands, securely attached, to prevent any leakage at the connection points. The fabric shall have a maximum length of 10”.

C. Flexible connections shall be fabricated from an approved flame retardant fabric each having a maximum flame spread index/rating of 25 and a maximum smoke developed ration of 50.

Range hood exhaust Installations shall be Flame-Proof Silvaseal by Duro Dyne, Ductmate PROflex Neoprene, or equal.

Low Pressure Systems	- neoprene coated glass fabric - 30 ounce/sq. yd.
Medium & High Pressure Systems	- neoprene coated glass fabric - 30 ounce/sq. yd.

D. Flexible connections shall not be painted.

E. Flexible connections shall be installed between all rigid ductwork or casing and all air handling equipment.

2.20 ROOF MOUNTED DUCT SUPPORTS

A. Duct on roof shall be supported by an engineered prefabricated system specifically designed to be installed on the roof without roof penetrations, flashing or damage to the roofing material. The system shall consist of linear curbs with spread bases located along the length of the duct with a trapeze constructed to support the underside of the duct. The system shall be custom designed to fit the duct to be installed and the actual conditions of service. Loading shall not exceed 15 PSF of bearing surface.

B. Duct finishes shall be constructed independently of the support system and shall not be enveloped in the support system.

C. Curbs shall be located to bear on structural elements of the roof deck, not the roof deck itself.

2.21 SEISMIC RESTRAINTS

A. Provide seismic restraints as required for seismic zone.

2.22 HANGER AND SUPPORT MATERIALS

A. Hang and support ductwork as defined in Section 5 of the 2005 SMACNA Manual, “HVAC Duct Construction Standards, Metal & Flexible” Third Edition or as defined within.

B. Aircraft cable hanging system with easy lightweight mechanical adjustment system shall not be used for hanging HVAC and other mechanical applications.

C. Supports, bar / angle reinforcements, and other products that are not part of the duct that are manufactured of uncoated mild steel shall either be painted with two coats of primer or shall be manufactured of a galvanized equivalent material.

D. Hanger spacing not to exceed 8 feet.

2.23 FABRICATION

A. Construct rectangular ductwork to meet all functional criteria defined in Section VII, of the SMACNA “HVAC Duct Construction Standards Metal and Flexible” 2005 Edition. This shall be subsequently referred to as the SMACNA Manual. All ductwork must comply with all local, state and federal code requirements.

B. Ducts shall be neatly finished on the outside with all sharp edges removed.

C. Inside surfaces shall be smooth with no projections into the air stream except where otherwise indicated.

D. Transverse joints shall be made airtight with all laps in the directions of air flow.

E. All fasteners and attachments shall be made of the same material as the ducts.

F. Furnish test wells 12" on the center horizontally and vertically in the suction and discharge duct of each fan. Test wells shall consist of a 1" x 3/4", 125 lb., bronze, screwed hex bushing, secured to the duct with a bronze hex locknut on the inside of the duct. A 3/4" x 2" long standard weight bronze, screwed nipple and cap shall be fitted to the housing on the outside of the duct. Test wells shall be no. 699 as made by Ventlok or approved equal.

G. Make all changes in direction using 1.5 radius elbows where possible. Use splitter vanes or mitered rectangular elbows with turning vanes otherwise.

1. Use single thickness splitter vanes for all radius elbows less than 1.5 D = r.
   a. D = diameter of duct or width of duct (in plane of change-in-direction).
   b. r = radius of duct at duct center-line.
   c. Use “Curve Ratios” of 0.45 or greater (as defined by figure 3-7 of the 1989 ASHRAE Fundamentals Handbook).
2. Use single thickness turning vanes with no trailing edges in accordance with SMACNA Standards.
   a. All mitered, rectangular elbows in series.
   b. All mitered, rectangular elbows less than 36” in width (in plane of change-of-direction).
3. Use double width, airfoil type turning vanes with no trailing edges for all, rectangular elbows greater than 36” in width (in plane of change-of-direction).
   a. Isolated elbows have a minimum of 3D straight duct upstream and downstream of the change-in-direction.

H. Fabricate transition elbows with turning vanes at correct angle so entering and leaving edges are parallel or tangent to air flow.

I. All square elbows shall have factory-designed and built turning vanes with hollow vanes having different inside and outside curvature, similar to Tuttle and Bailey, Inc., "Ducturns". Shop fabrication vanes will not be approved. Where turning vanes are in conflict with the access doors to fire dampers. They shall be made movable, so that fire dampers shall be accessible.

J. All branch duct take-offs shall use 45° laterals or 45° “pants-leg” type fittings.

K. Dissimilar metals shall be connected with flanged joints made up with fiber or neoprene gaskets to prevent contact between dissimilar metals. Flanges shall be fastened with bolts protected by ferrules and washers made of the same materials as the gaskets. Where an aluminum duct is to be connected to a galvanized steel duct, the end of the galvanized steel duct shall be coated with heavy black asphaltum paint before connecting it to the aluminum duct.

L. Changes in shape and dimension shall conform to the following: Except where otherwise noted, for increases, in cross-sectional area, the shape of the transformation shall not exceed 1" in 7". Except where otherwise noted, for reductions in area, the slope shall not be less than 1" in 4" but 1" in 7" preferred.

M. Wherever it may be necessary to make provisions for vertical hangers of the ceiling construction passing through ducts, provide streamlined shaped sleeves around such ceiling construction hangers as to fully protect the duct from being punched with holes for the passage of such hangers. Any such streamlined sleeves shall be made air tight at top and bottom of ducts. In no case shall there be more than two rods in any 9 sq. ft. area. No rods shall pierce ducts smaller than 12" in horizontal area.

N. Fastener material shall match duct material.

2.24 DUCT CONSTRUCTION SCHEDULE

	Material	Gauge	Joints	Pressure Class	Seal Class
Rectangular supply air duct upstream of VAV	Galv.	SMACNA	SMACNA	10”	A
Round and oval supply air duct upstream of VAV	Galv	SMACNA	SMACNA	10”	A

	Material	Gauge	Joints	Pressure Class	Seal Class
Supply air duct downstream of VAV	Galv	SMACNA	SMACNA	2”	A
Round and oval supply air duct downstream of VAV	Galv	SMACNA	SMACNA	2”	A
Return air duct	Galv	SMACNA	SMACNA	-4”	A
Rectangular constant volume supply duct	Galv	SMACNA	SMACNA	6”	A

Shower exhaust duct	Aluminum	SMACNA	SMACNA Watertight	4”	A
Dishwasher,	Stainless	SMACNA	Welded	4”	N/A
Exterior exhaust duct unless SST	Aluminum	SMACNA	SMACNA Watertight	-6”	A

2.25 FIRE DAMPERS

A. Galvanized steel, interlocking blade type, UL listing and label, 1-1/2 hour rating, 70 degrees C (160 degrees F) fusible line, 100 percent free opening with no part of the blade stack or damper frame in the air stream.

B. Fire dampers in wet air exhaust shall be of stainless steel construction, all others may be galvanized steel.

C. Minimum requirements for fire dampers:

1. The damper frame may be of design and length as to function as the mounting sleeve, thus eliminating the need for a separate sleeve, as allowed by UL 555. Otherwise provide sleeves and mounting angles, minimum 1.9 mm (14 gage), required to provide installation equivalent to the damper manufacturer’s UL test installation.
2. Submit manufacturer’s installation instructions conforming to UL rating test.

2.26 SMOKE DAMPERS

A. Maximum air velocity, through free area of open damper, and pressure loss: Low pressure and medium pressure duct (supply, return, exhaust, outside air): 450 m/min (1500 fpm). Maximum static pressure loss: 32 Pa (0.l13 inch W.G.).

B. Maximum air leakage, closed damper: 0.32 cubic meters/min/square meter (4.0 CFM per square foot) at 750 Pa (3 inch W.G.) differential pressure.

C. Minimum requirements for dampers:

1. Shall comply with requirements of Table 6-1 of UL 555S, except for the Fire Endurance and Hose Stream Test.
2. Frame: Galvanized steel channel with side, top and bottom stops or seals.
3. Blades; Galvanized steel, parallel type preferable, 300 mm (12 inch) maximum width, edges sealed with neoprene, rubber or felt, if required to meet minimum leakage. Airfoil (streamlined) type for minimum noise generation and pressure drop are preferred for duct mounted dampers.
4. Shafts: Galvanized steel.
5. Bearings: Nylon, bronze sleeve or ball type.
6. Hardware: Zinc plated.
7. Operation: Automatic open/close. No smoke damper that requires manual reset or link replacement after actuation is acceptable. See drawings for required control operation.

D. Motor operator (actuator): Provide pneumatic or electric as required by the automatic control system, externally mounted on stand-offs to allow complete insulation coverage.

2.27 COMBINATION FIRE AND SMOKE DAMPER

A. Combination fire and smoke dampers: Multi-blade type units meeting all requirements of both fire dampers and smoke dampers shall be used where shown and may be used at the Contractor's option where applicable.

2.28 INSTRUMENT TEST FITTINGS

A. Manufactured type with a minimum 50 mm (two inch) length for insulated duct, and a minimum 25 mm (one inch) length for duct not insulated. Test hole shall have a flat gasket for rectangular ducts and a concave gasket for round ducts at the base, and a screw cap to prevent air leakage.

B. Provide instrument test holes at each duct or casing mounted temperature sensor or transmitter, and at entering and leaving side of each heating coil, cooling coil, and heat recovery unit.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine location where ductwork is to be installed and determine space conditions and notify Architect in writing of conditions detrimental to proper and timely completion of the work.

B. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF DUCTWORK

A. Assemble and install ductwork in accordance with recognized industry practices, which will achieve air-tight and noiseless systems, capable of performing each indicated service.

B. Duct sizes shown on the Drawings at connection to fans or other equipment may vary in actual installation. Contractor shall provide transition pieces as required.

C. Fittings shall be configured to provide the least possible pressure drop.

D. Install each run with a minimum of joints.

E. Align ductwork accurately at connections, within 1/8" misalignment tolerance and with internal surfaces smooth.

F. Support ducts rigidly with suitable ties, braces, hangers and anchors of the type, which will hold ducts true-to-shape to prevent buckling. Supports shall be placed at each joint and change in direction up to a maximum spacing of 8

feet on centers.

G. Seal ducts in accordance with SMACNA requirements for pressure class indicated.

1. Indoor Ducts: Use liquid or mastic sealant, or tape system.
2. Outdoor Ducts: Use tape system.
3. Approved manufactured joining systems with gaskets may be used in lieu of transverse sealing.

H. Locate ductwork runs, except as otherwise indicated, vertically and horizontally and avoid diagonal runs wherever possible. Casing and hangers shall be installed straight and level and all shall be free of vibration and noise when fans are operating.

I. Hold ducts close to walls, overhead construction, columns, and other structural and permanent-enclosure elements of the building.

1. Limit clearance to 0.5” where furring is shown for enclosure or concealment of ducts, but allow for insulation thickness, if any.
2. Where possible, locate insulated ductwork for 1.0” clearance outside of insulation.

J. Ducts at ceilings shall be suspended from inserts in concrete slabs except where otherwise indicated. Inserts shall be Grinnel Fig. 279, 282, or 152 as required. Each duct shall be independently supported and shall not be hung from or supported by another duct, pipe, conduit or equipment of any trade. Duct hung below slabs less than 4” thick shall be supported from supplemental steel.

K. All fastenings to building structure shall be adequate to insure permanent stability of sheet metal work and shall be capable of resisting all applied forces.

L. Vertical ducts in shafts or passing through floors shall be supported by steel angles or channels, welded, riveted, screwed or bolted to ducts and fastened to building structural members at each floor level. Provide safeing to close all floor openings around ductwork - pack annular space with rockwool and 18 gauge sheet metal safeing. Floor openings in plenums shall have 1/2 inch diameter steel bars constructed in a 6”x6” grid.

M. Rigid connections between ductwork and non-rotating equipment shall be 12 inch on centers and shall be made with flanged joints, sealed with fireproof material (Fiber or Neoprene gaskets).

N. In finished spaces, conceal ductwork by locating in mechanical shafts, hollow wall construction or above suspended ceilings.

O. Where possible, avoid locating ducts on or near floor.

1. Where ducts must be located low, provide metal trestle to protect duct at places where duct will be climbed over.
2. Ducts at floor shall be supported by steel angles suitably anchored to floor construction.

P. Coordinate the layout with suspended ceiling and lighting layouts and similar finished work as well as other components of systems.

Q. Install access doors where necessary for inspection and maintenance.

1. Provide additional 12” x 12” access door at each low leakage damper.
2. Arrange access doors so that:
   a. They open against the system air pressure wherever feasible.
   b. Their latches are operable from either side, except where the duct is too small to be entered.

R. Where ducts pass through non-fire-rated interior partitions below ceiling and exterior walls:

1. Conceal the space between the construction opening and the duct or duct-plus-insulation with sheet metal flanges of the same gauge as the duct.
2. Overlap the opening on all sides by at least 1-1½".

S. Provide volume dampers at all branch take-offs.

T. Provide conical or tapered taps with balancing dampers on all round ductwork takeoffs.

U. Where space permits, round or oval ductwork of equivalent diameter may be substituted for unlined rectangular ductwork.

V. Provide 22-gauge aluminum ductwork for the first 20 feet downstream of any aluminum grille. Slope duct towards grille at 1/8" /ft.

W. It is the intent to obtain ductwork construction with minimum leakage. The construction noted in Specifications can produce low or high leakage rates, depending upon the workmanship, particularly with regard to the connection at the top of the ducts. Guarantee that total diffuser volume, measured by means of velometer, shall be at least 95% of actual fan supply (measured by means of a duct traverse tank with a Pitot tube and water manometer). Seal the ductwork at joints with suitable sealers Ductmate PROseal sealant and tape. Use of "HARDCAST" or any other material is subject to Architect's approval.

X. Provide duct transitions, offsets and connections to dampers, coils, and other equipment in accordance with SMACNA Standards, Section II. Provide streamliner, when an obstruction cannot be avoided and must be taken in by a duct. Repair galvanized areas with galvanizing repair compound.

Y. Provide bolted construction and tie-rod reinforcement in accordance with SMACNA Standards.

Z. Construct casing, eliminators, and pipe penetrations in accordance with SMACNA Standards.

AA. Install fire dampers, smoke dampers and combination fire/smoke dampers in accordance with the manufacturer's instructions to conform to the installation used for the rating test. Install fire dampers, smoke dampers and combination fire/smoke dampers at locations indicated and where ducts penetrate fire rated and/or smoke rated walls, shafts and where required by the Resident Engineer. Install with required perimeter mounting angles, sleeves, breakaway duct connections, corrosion resistant springs, bearings, bushings and hinges per UL and NFPA. Demonstrate re-setting of fire dampers and operation of smoke dampers to the Resident Engineer.

BB. Seal openings around duct penetrations of floors and fire rated partitions with fire stop material as required by NFPA 90A.

CC. Flexible ducts shall not penetrate any fire or smoke barrier which is required to have a fire resistance rating of one hour or more. Flexible duct length shall not exceed 1.5 (5 feet). Provide insulated acoustical air duct connectors in supply air duct systems and elsewhere as shown.

DD. Temperature range: -18 to 93 degrees C (0 to 20 degrees F) internal.

EE. Maximum working velocity: 1200 m/min (4000 feet per minute)

FF. Minimum working pressure, inches of water gage: 2500 Pa (10 inches) positive, 500 Pa (2 inches) negative.

GG. Duct Clamps: 100 percent nylon strap, 80 kg (175 pounds) minimum loop tensile strength manufactured for this purpose or stainless steel strap with cadmium plated worm gear tightening device. Apply clamps with sealant and as approved for UL 181, Class 1 installation.

HH. Flexible duct installation: Refer to SMACNA Standards, Chapter 3. Ducts shall be continuous, single pieces not over 4 feet long (NFPA 90A), as straight and short as feasible, adequately supported. Centerline radius of bends shall be not less than two duct diameters. Make connections with clamps as recommended by SMACNA. Clamp per SMACNA with one clamp on the core duct and one on the insulation jacket. Flexible ducts shall not penetrate floors, or any chase or partition designated as a fire or smoke barrier, including corridor partitions fire rated on hour or two hour. Support ducts SMACNA Standards.

II. Where diffusers, registers and grilles cannot be installed to avoid seeing inside the duct, paint the inside of the duct with flat black paint to reduce visibility.

JJ. Control Damper Installation:

1. Provide necessary blank-off plates required to install dampers that are smaller than duct size. Provide necessary transitions required to install dampers larger than duct size.
2. Assemble multiple sections dampers with required interconnecting linkage and extend required number of shafts through duct for external mounting of damper motors.
3. Provide necessary sheet metal baffle plates to eliminate stratification and provide air volumes specified. Locate baffles by experimentation, and affix and seal permanently in place, only after stratification problem has been eliminated.
4. Install all damper control/adjustment devices on stand-offs to allow complete coverage of insulation.

KK. Air Flow Measuring Devices (AFMD): Install units with minimum straight run distances, upstream and downstream as recommended by the manufacturer.

3.3 DUCT HANGERS

A. Low pressure ducts up to 24" on a side or up to 20" diameter shall be suspended with 16 gauge, galvanized strap hangers, 1" wide.

B. Low pressure ducts 25" to 40" on a side or 21" to 40" diameter shall be suspended with galvanized strap hangers 1" wide by 1/8" thick.

C. Strap hangers shall be bent 90˚, extended down sides of ducts and turned under bottom of ducts a minimum of 2". Strap hangers shall be fastened at ceiling with nuts, bolts and lock washers and to sides and bottom of ducts with sheet metal screws.

D. Rod type hangers shall be 3/8" diameter black steel rods threaded at both ends and bottom bracing angles on ducts, with nuts and lock washers.

E. Angle type hangers shall be extensions of side bracing angles on ducts, bent 90 at ceiling and fastened with nuts, bolts and lock washers.

F. Hangers for vertical ducts shall be as per SMACNA Duct Manual.

G. Stainless steel ductwork shall be supported with rod or angle type hangers, so that there will be no penetration of the stainless steel ducts.

H. Provide supplemental steel to span structure in areas where duct cannot be otherwise supported from primary structure.

I. Do not support ductwork from pipe, other ducts, ceiling system, metal deck, metal roof deck or furring.

J. Do not hang lighting or pipes from ductwork.

K. Do not use perforated hanger straps to support ductwork.

3.4 GREASE EXHAUST DUCTS

A. Install in accordance with Local Building Code and NFPA 96. Connect to hoods in accordance with the manufacturer's listing.

B. Horizontal duct less than 75 feet in one run shall be pitched at ¼" per foot towards the hood or a drain point. Those portions over 75 feet shall be pitched at 1" per foot.

C. Enclose entire run of grease duct from hood to exterior wall or roof curb in fire barrier system. See detailed requirements elsewhere in this section and Insulation Section.

1. Install duct so a minimum of 6" and a maximum of 12" is maintained between duct and enclosure.

D. Use no turning vanes, tie rods, dampers or other internal structures which will collect grease. All changes in direction shall be made with radius fittings.

E. Provide cleanouts as follows:

1. Cleanouts shall be installed in the side or top of the duct, whichever is more accessible.
2. When installed on the side, the bottom of the opening shall be a minimum of 1-1½" above the bottom of the duct.
3. Ducts serving hoods with integral fire dampers shall have a clean out opening with in 18" of the collar.
4. Horizontal ducts shall either have one opening large enough for personnel entrance or at 12' intervals.
5. Vertical ducts shall either have one opening at the top large enough for personnel entrance and descent or a minimum 12" x 12" openings at every floor.
6. Openings shall have a flanged frame, extending 1" off the ductwall. Closure panels shall be attached to the flange by means of threaded studs welded to the flange, protruding through holes in the panel and fastened by means of wing nuts. Provide "Fiber Frax" or equivalent high temperature (1500°F) rope type gasket bonded to either the gasket or panel.
7. Provide access doors in the enclosure at all cleanouts.
   a. Use UL listed methods for blanket type fire rated enclosures.
   b. Use UL listed fire rated access doors in shaft wall enclosures.
8. Provide access doors at each change in direction.

3.5 DRYER EXHAUST DUCT

A. Assemble duct with no sheet metal screws, and no protrusions into the duct. All interior surfaces are to be smooth.

B. All elbows are to be radius type.

C. Ducts, which pass through fire rated walls, must be enclosed in a rated enclosure. Fire dampers are not allowed.

D. Provide interlocked exhaust fan where developed length of duct exceeds U.L. Listing of dryer(s).

3.6 DUCT LEAKAGE TESTING

A. Installed ductwork shall be pretested prior to installation of access doors, take-offs, etc.

B. All leak testing shall be witnessed by the Engineer or representative of the Engineer. The Contractor shall give the Engineer 72 hours notice prior to testing. Any testing not witnessed by the Engineer or his/her representative, shall be considered invalid and will be redone.

C. Test the ductwork leakage for each system (air handler, exhaust fan, return fan, etc.) and totalize leakage on a per system basis.

D. Use the leakage formula from section 4 of the SMACNA HVAC Air Duct Leakage Testing Manual, 1st edition, for calculating the allowable leakage for each section of ductwork based on the leakage classifications listed below:

1. Pressure classification 4" and over- Leakage Class 6
2. Pressure classification 3" - Leakage Class 12
3. Pressure classification 2" - Leakage Class 24

E. All volume dampers, fire and fire smoke dampers, and duct access doors shall be installed prior to the testing; no additional leakage rates will be allowed for these components. In-duct coils and VAV boxes are not to be included in the leakage testing.

F. Provide summary reports for each system on a single table which list each section tested, surface area of tested section, allowable leakage, and measure leakage. Include the measured velocity pressure from the testing rig and a legible copy of the nomegraph used to determine the actual flowrate.

G. The final testing shall be performed as follows:

1. Perform testing in accordance with HVAC Air Duct Leakage Test Manual.
2. Use a certified orifice tube for measuring the leakage.
3. Define section of system to be tested and blank off.
4. Determine the percentage of the system being tested.
5. Using the percentage, determine the allowable leakage (cfm) for that section being tested.
6. Pressurize to 1.5 times operating pressure and repair any significant or audible leaks.
7. Repressurize and measure leakage.
8. Repeat steps 6 and 7 until the leakage measured is less than the allowable defined in step 5.

NOTE: It is recommended that the first 100'-300' of ductwork installed be tested to insure the quality of the workmanship at an early stage.

H. All transverse joints and longitudinal seams shall conform to SMACNA's Class A sealing requirements.

I. Constant Volume Systems/Supply Ductwork
Allowable Leakage 1% of design cfm

J. Constant Volume Systems/Return Ductwork
Allowable Leakage 2% of design cfm

K. Variable Air Volume Systems/Supply Ductwork
Fan to VAV Boxes 1% of design cfm
VAV Boxes to Registers 2% of design cfm

L. Variable Air Volume Systems/Return Ductwork
Allowable Leakage 2% of design cfm

M. Exhaust Systems 2% of design cfm

3.7 GREASE DUCT LEAKAGE TESTING

A. The test shall be performed prior to the concealment of any part of the system.

B. The grease duct shall be tested via a light test or an approved equivalent test, to confirm all joints are liquid tight. A light test shall be performed by passing a lamp having a power rating of not less than 100 watts through the entire section of duct work to be tested. The lamp shall be open so as to emit light equally in all directions perpendicular to the duct walls.

C. Any joint where light can be seen from outside the duct shall be considered a defect. All defects shall be corrected, and the system shall be retested until no defects are found.

D. Test shall be performed for the entire grease duct system, including the hood-to-duct connections. The test may be performed on sections of duct, provided that each joint in the system is tested.

E. The contractor shall be responsible for providing the necessary equipment for performing the leakage test as described.

3.8 DUCTWORK STORAGE AND CLEANING

A. Cleaning:

1. Clean ductwork internally, unit-by-unit as it is installed, of dust and debris.
2. Clean external surfaces of foreign substances which might cause corrosion of metal or deterioration of paint.

B. Protection:

1. Store duct a minimum of 4" above ground or floor to avoid damage from weather or spills.
2. When internally cleaning duct work prior to installation or shipment to the jobsite, all duct ends and openings must be covered prior to transporting with a dual Polyethylene protective film. Film must be securely affixed to protect against dirt and debris and must be translucent to facilitate inspection of interior surfaces without removing film. Film must have a minimum elongation of 600%, contain no VOC and leave no residue on duct after removal. Approved Manufacturer: Ductmate Industries ProGuard or approved equal.
3. Cleaning of new and existing supply ductwork in existing buildings. After completion of ductwork installation purge ductwork as follows:

    a. Cover all supply registers and diffusers with oil cheese cloth.
    b. Use supply fan and install temporary fan to provide air to the system for twelve (12) hours at 200% design flow.
    c. Remove oil cheese cloth.

C. Ductwork contaminated or damaged above "shop" or "mill" conditions shall be cleaned, repaired or replaced to the Engineer's satisfaction.

1. Ductliner pre-installed in stored duct which has become wet may be installed if first allowed to completely dry out.
2. Ductliner in installed ductwork, which has become wet must be completely removed and replaced.
3. Torn ductliner may be replaced by coating with adhesive if damaged is minor and isolated. Extensively damaged liner shall be replaced back to a straight cut joint.

3.9 ACCESS DOORS

A. Install access doors where necessary for inspection, adjustment or servicing. In no case shall access to any items of equipment requiring inspection, adjustment, or servicing require the removal of nuts, bolts, screws, wing nuts, wedges, or any other screwed or loose device. Access doors shall be minimum 18"x 18" unless duct size requires a smaller door.

B. Arrange access doors so that:

1. They open against the system air pressure, wherever feasible.
2. Their latches are operable from either side, except where the duct is too small to be entered.

C. Provide access doors as follows:

1. Downstream and upstream side of coils within 3'-0" of coil.
2. Upstream and downstream of each humidifier.
3. Every 50’ along length of duct requiring cleaning.
4. At each automatically controlled damper, fire damper, smoke damper or fire/smoke damper.
5. In paint spray booth exhaust, provide access door at each sprinkler head.
6. Every 12” along length of kitchen exhaust duct.
7. On actuator side of each motorized damper.
8. At the base of all risers.
9. At all intake plenums.
10. At all smoke detectors.
11. At all valves, controls, filters, bearings, traps, drains, etc.

D. Hinges shall be Ventlok No. 150 or 260 with or without screw holes or approved equal. Latch for walk-in access doors shall be No. 260 as made by Ventlok Co. or approved equal. Latch for access door in ductwork shall be Ventlok No. 100 or approved equal.

E. Provide 4” high and 4” wide concrete pad all around opening at duct penetrations thru floors. Fill in space between duct and floor construction with mineral wool and fire rated sealant.

END OF SECTION

SECTION 23 33 00

DUCTWORK ACCESSORIES

PART 1 - GENERAL

1.1 INDUSTRY STANDARDS

A. Comply with SMACNA (Sheet Metal and Air Conditioning Contractors' National Association) latest recommendations for fabrication, construction and details, and installation procedures, except as otherwise indicated.

1.2 SUBMITTALS

A. Product Data: Submit manufacturer's product data on the following:

1. Flexible duct
2. Ceiling dampers
3. Fire dampers
4. Smoke dampers
5. Louvers
6. Lint Collector

PART 2 - PRODUCTS

2.1 FLEXIBLE DUCT ACOUSTICAL

A. Manufacturers:

1. Flexmaster Type 8M, or approved equal.

B. Construction:

1. CPE Liner film mechanically locked without adhesives.
2. Insulation: Minimum 1-½" thick fiberglass blanket with a polyethylene vapor barrier. Map 0.23 'c' factor, factory installed.
3. Helix: Corrosion resistant galvanized steel.

C. Pressure rating: 6" w.g. positive, 1" w.g. negative at maximum 180°F operating temperature.

D. Standards: NFPA90A UL-181, Class I, ASTM E-96 - Procedure A.

E. Insertion loss shall be at least:

	OCTIVE BAND (Hz)					
Duct Size	125	230	400	1000	2000	4000
6"	7	31	40	38	40	27
8"	13	29	36	35	38	22
12"	21	28	29	33	26	12
	DB reduction for 10 foot length tested in accordance with ASCME 477.					

2.2 FLEXIBLE DUCT, HIGH PRESSURE

A. Manufacturers:

1. Design Basis: Flexmaster Type 3
2. Other Acceptable Manufacturers:
   a. Thermaflex, MKC
   b. Genflex, IGE
   c. American/Elgen

B. Construction:

1. Insulated: Reinforced inner liner, mechanically locked or bonded together by a corrosive resistant galvanized steel helix, Min. 1-½" thick fiberglass blanket with polyethylene vapor barrier. Max. 0.23 'c' factor.
2. Uninsulated: Mechanically locked without adhesives with a corrosion resistant galvanized steel helix.
3. Aluminum: Mechanical lock without adhesives.

C. Pressure rating: 12" w.g. positive, 1" w.g. negative at 180^0F.

D. Standards: NFPA90A, UL-181 Class I, ASTM E96 - Procedure A.

2.3 FLEXIBLE RUN-OUTS

A. The run-outs from medium or high pressure duct to terminal units such as Variable air Volume or Constant Air Volume boxes, induction units, or air mixing boxes may be flexible duct.

B. Flexible metal duct shall be all-metal, boundable, self-supporting and mechanically interlocked to be totally leak proof under operating conditions without manufacturing use of adhesives.

C. Flexible ducts shall be type AL006 uninsulated or Type AL006-150 insulated as made by United Sheet Metal or approved equal. The flexible run-outs shall take all bends without kinking. The run-outs shall be flame resistant, shall have a low friction loss, and shall have working pressure minimum off 10 inch W.G. Flexible run-outs shall be no longer than 5'-0" and shall comply with Local Union Requirements. Any additional lengths necessary to connect the flexible duct to the high or medium pressure ductwork shall be made with spiral lockseam sheet metal duct of the same size as the flexible ductwork.

D. The flexible run-out duct shall meet all requirements of the National Fire Protection Association 90A - Latest Edition. Flame spread not over 25, smoke developed not over 50.

E. Each flexible run-out duct shall be sealed to its male outlets on both ends with 3M EC-800 sealer, or sealing compound as recommended by the flexible air duct manufacturer. The flexible air duct shall be sealed and covered to a minimum depth of 2 inches of its mating metal coupling, branch take-off lap or duct at each of its ends. A Wraplock Ideal No. 5900 Strap-Clamp shall be furnished and installed at each end of the flexible duct.

F. Complete installation shall be airtight.

2.4 LOUVERS

A. Louvers are specified in the Architectural Division. This division is responsible for coordinating all duct connections, damper sizes, etc. with the louvers specified. Where a louver is required, but none is specified by the Architect, a louver meeting the requirements detailed below shall be provided.

B. Where Louvers are not specified by the architect, provide the following.

1. Manufacturers:

a. Design Basis: Greenheck
b. Other Acceptable Manufacturers:
1) Arrow
2) Pottorff
3) Moore
4) Ruskin
5) United Air

2. Screens: ½" mesh, .063" aluminum wire.

3. Blades: Of depth shown by schedule, drainable.

4. Rating Basis:

a. AMCA Standard 500, based on 15 minute test of 48" x 48" louver. Provide louvers with water penetration and pressure drop no greater than specified louver, and with free area no less than specified louver.
b. Manufacturer shall provide test data under actual performance conditions to support the published performance data upon request by engineer or architect.

2.5 PREFABRICATED CURBS

A. General: Except where curbs are provided with equipment, provide prefabricated curbs for all roof mounted equipment.

B. Manufacturers:

1. Design Basis: Pace
2. Other Acceptable Manufacturers:
a. Thycurb

C. Model for grease-laden exhaust fans: ES-2.

1. Coordinate to fit vibration isolation rail.

D. Coordinate with roofing Contractor. Exterior insulation, cants, flashing and counter flashing shall be furnished and installed under roofing work, Division 7.

E. Model: As required.

F. Roof Curbs

1. Roof curbs shall have a minimum height of 14" or as specified on the drawings, whichever is greater.
2. Roof curb insulation shall match the insulation requirements of the ductwork.
3. Roof curbs for kitchen exhaust ductwork shall include vented curb extension similar to Greenheck model VCE.

2.6 INSULATING AND SOUND REDUCING DUCT LINING FOR LOW PRESSURE DUCTWORK

A. Furnish and install all soundproofing material specified, indicated or necessary to that all systems will comply with requirement of quiet operation. In general, noise level in any part of building (except in machinery rooms), due to air conditioning or ventilating equipment, ducts, and outlets, shall not exceed 40 decibels at 1200-2400 cycles per second, except as otherwise hereinafter specified.

B. Furnish and install sound-absorptive lining in ductwork for locations and lengths as indicated and/or hereinafter specified. All soundproofing material, installation and arrangement, shall be as approved. Where ducts are acoustically lined, insulation shall be omitted for extent of acoustic lining. Dimensions noted for lined ducts are inside clear dimensions. Duct sizes shall be increased for liner.

C. Sound Absorbent Duct Lining for Low Pressure Ductwork - furnish and install as herein specified and/or shown on the drawings (except where otherwise noted) 1-1/2 lb. density, fibrous glass or polyester duct lining meeting the requirements of NFPA 90A.

1. 1" thick when installed in conditioned space
2. 1.5” thick, R-6 when installed in unconditioned space
3. 2” thick, R-8 when installed outside.

D. Liner shall be adhered to all interior sides of duct with minimum 100% coverage of fire-retardant adhesive similar to Benjamin Foster4 or PROtack spray by Ductmate Industries and with weld pins and washers or equivalent mechanical fastening starting 3" from edges and sides, 12" on center all sides. Minimum one row per side for duct size of 12" or less. Mechanical fasteners shall cause quilting of surface. Coated surface or FSK facing shall be toward air stream. Before installing liner, seal all butting edges and final edges with heavy coat of adhesive to seal off air between lining and duct. All exposed edges of lining shall be installed with sheet metal nosing 1-1/2" wide, two gauges heavier than duct. Installation shall be suitable for duct velocities up to 5,000 fpm. Low pressure duct lining shall be provided where specified and/or where shown and noted on the drawings. Liner support pins on aluminum duct shall be riveted to duct wall with closed end rivits.

E. Duct sizes indicated on drawings are clear inside dimensions. Increase sheet metal sizes as required to install acoustic lining.

F. The following ductwork shall be acoustically lined whether or not shown on Drawings.

1. Ductwork 15’ downstream of mixing box and terminal units.
2. Single wall built-up casing walls and ceiling except that lining shall be 2" thick 4 lb. density, and inner liner of perforated galvanized sheet metal (7/64" dia. holes on 3/16" staggered centers) shall be used for all systems.
3. All supply air ductwork within 25' of fan discharge.
4. All return air ductwork within 25' of fan intake.
5. All exhaust ductwork within 20' of fan intake.
6. Return air fan and toilet exhaust plenum walls and ceiling, except lining shall be 2 inch thick 4 lb. density, and inner liner of perforated galvanized sheet metal (7/64" dia. holes on 3/16" staggered centers) shall be used.
7. Outside air duct to air handling units.
8. All supply, return and exhaust ductwork installed exposed to conditioned space.

G. All ductwork not indicated to be lined shall be externally insulated.

2.7 ACOUSTICAL PERFORMANCE SPECIFICATIONS - GENERAL

A. It is the intent of this Specification that noise levels due to air conditioning and/or ventilating equipment, ducts, grilles and registers, diffusers and air light fixtures, will permit attaining sound pressure levels in occupied spaces conforming to the following NC curves as explained in the ASHRAE Guide and Data Book.

Classrooms	NC-25
Office and Conference Rooms	NC-30
Lobby	NC-35
Hotel Room & Suites	NC-25

B. Grilles, Registers, Diffusers

1. The maximum permissible sound power levels of air terminal devices when installed and operating per plans and specifications shall be as follows:

	Maximum PWL re 10-12 Watts		
Octave Band	NC-30	NC-35	NC-40
1	62	64	66
2	52	56	60
3	44	49	54
4	41	46	51
5	38	43	48
6	37	42	47
7	36	41	46
8	37	42	47

C. Sound Power Levels shall be tested in accordance with ASHRAE Standard 6=36-72.

2.8 ACOUSTICAL PERFORMANCE WITHIN EQUIPMENT SPACES

A. Equipment room noise levels and noise transmission to adjacent buildings shall comply with all Federal, State, and City Noise Ordinances.

B. Motor Acoustical Performance:

1. Motor drives for pumps and refrigerator machine when installed per plans and specifications shall operate with noise levels not to exceed 80 decibels.

2. Noise levels shall be determined in accordance with IEEE Standard #85 test "procedure for Air-Borne Noise Measurements on Rotating Electric Equipment".

2.9 BALANCING DAMPERS

A. At each main branch take-off and in such other locations where required to properly balance the low pressure system, furnish and install volume dampers of the opposed blade, multi-louvered type, which shall be operated by indicating quadrants and set screws, for adjusting the system.

B. Volume dampers shall be constructed as follows: Damper blades shall not be wider than 12", shall be complete with heavy angle iron frames, connecting and operating links, brass trunnions, and bronze bearings. Dampers, unless otherwise noted, shall be fabricated with not less than No. 16 gauge sheet steel. Blades shall overlap and shall be provided with continuous stops on all four sides of dampers to prevent leakage. Blades shall be galvanized. Blades of dampers shall be set into a flat steel frame with frame securely bolted to the duct. All dampers shall be fitted with a hexagonal brass spindle which shall extend through the exterior of duct and be fitted with an indicating self-locking regulator. Regulator shall be similar to Ventlok 641 or approved equal. All hardware shall be Ventlock or approved equal. For insulated ductwork provide No. 644 self-locking regulator as made by Ventlok or approved equal.

C. Maximum of two blades without a frame: Over two blades, use a manufactured 16 gauge galvanized stiffened, opposed blade damper in a 14 gauge galvanized steel frame. All hardware shall be galvanized except bronze iolite bearings; Pottorff Model MD-42 or approved equal.

D. All automatic dampers shall be furnished as a part of the automatic temperature control system by the automatic temperature control manufacturer. Install dampers and provide safeing in ductwork for automatic dampers smaller than duct size.

E. Movable splitter dampers shall be provided at each and every supply take-off and wherever else indicated. Dampers shall be airfoil, double-wall type. Splitter damper assembly shall be Ventlok 603 Ball Joint Bracket and 600 Blade Bracket or approved equal. All hardware shall be Ventlok or approved equal. Blades to be spot welded or pivoted to shafts. Elevated regulators shall be provided for insulated ductwork.

F. For stainless steel and aluminum ductwork provide dampers of same material as ductwork.

G. All dampers shall be made accessible from building construction. Access doors in building structure shall be furnished or provided as herein before specified.

H. Maximum pressure drop in full open position (@3000 fpm): 0.55

I. Maximum leakage: 32 cfm/sf at 4" W.C.

J. Provide cable operated dampers for all balancing dampers located above hard/inaccessible ceilings. Manufactured by Young Regulator or approved equal. Termination options are subject to Architect's approval.

2.10 FIRE DAMPERS

A. Manufacturers:

1. Design Basis: Ruskin
2. Other Acceptable Manufacturers:
   a. Prefco
   b. Air Balance
   c. Safe-Air
   d. United Air
   e. United Sheetmetal
   f. National Controlled Air
   g. Air Control Products
   h. Greenheck

B. Rating: UL555 dynamic 1-½ hours (2 hour wall), or 3 hours (3 or 4 hour wall), UL555S Class II leakage rated. Match construction penetrated. FM approved.

C. Size: Metal-to-metal for lined and unlined ducts.

D. Fusible link only. Use Type B "Top Hat" wherever possible.

E. Clearly indicate fire damper location on shop drawings. Provide access doors in the ducts and furnish access doors or panels at building construction at each damper of sufficient size and type to permit inspection and replacement of linkage. Assume responsibility to coordinate all locations of duct access doors with the General Contractor to conform with whatever architectural openings may be necessary and furnish access doors or panels in building construction. Provide shop drawings indicating location of access panels or doors for Architect's approval.

F. It is the intention of these plans and specifications to be complete. However, it is the responsibility of this Division, as being completely cognizant of local regulations, to determine where fire dampers are required and to advise the Architect prior to bid as to any discrepancies or questions in the plans or specifications.

G. Fire dampers shall be enclosed in integral UL/FM approved sleeve of fourteen gauge metal set and grouted into fire partitions. Sleeve shall be secured at both sides of fire partitions with 1-1/2 x 1-1/2 x 1/4 ga. mounting angles secured to sleeves only. Provide duct breakaway connections, see detail on drawings. Sleeves shall be continuously welded with the transverse joint sealed. Flanged duct/sleeve connection shall be UL listed.

H. Dampers shall be steel plate, mounted to turn freely, in steelplate frame inserted in duct. Dampers shall be proportioned and weighted to close at once, if released from link with spring catches to hold closed, until manually reset. Dampers and frames to have suitable eyes, standard fusible-links, normally holding them open, but releasing upon contact with fire. Damper blades shall be mounted on corrosion resisting bearings. Damper shall close by gravity, moving with the air stream to full closed position against one-eighth (1/8) inch angle stop. Steel spring catch shall hold damper closed. Radius arm on shaft shall show position of damper. Submit details for approval. Dampers shall be outside of air stream where space permits.

I. In stainless steel ductwork, provide stainless steel construction fire dampers similar to Fire Seal Model 119D.

2.11 FIRE/SMOKE DAMPERS AND DAMPER OPERATORS

A. Manufacturers:

1. Design Basis: Ruskin
2. Other Acceptable Manufacturers:
   a. National Controlled Air
   b. Johnson Controls
   c. Safe Air
   d. Prefco
   e. Air Balance
   f. Greenheck

B. Fire Damper Rating: UL Standard 555 Dynamic, 1-½ hour or 3 hours. FM approved.

C. Smoke Damper Rating: UL Standard 555S, Class II.

D. Each combination fire/smoke damper shall be 1-1/2 or 3 hour fire rated under UL Standard 555, and shall further be classified by Underwriters Laboratories as a Leakage Rated Damper for use in smoke control systems under the latest version of UL555S, and bear a UL label attesting to same. Damper manufacturer shall have tested, and qualified with UL, a complete range of damper sizes covering all dampers required by this specification. Testing and UL qualifying a single damper size is not acceptable. The leakage rating under UL555S shall be leakage Class 2 (10 cfm/ft. at 1" w.g.).

E. Jackshaft penetrations shall be provided with a factory installed shaft seal, field sealing of the shaft is not acceptable.

F. Damper Assembly:

1. Type: 120 volt.
2. Listing: UL 555S, UL555.
3. Rating: Match wall rating.
4. Failure Position: Fail closed.
5. Fusible Link: 165°F fusible link.

6. Blade: Air foil.
7. Seals: Mechanically fastened, rated up to 450°F.
8. Smoke Detector: Duct mounted within 4' of damper. Activation of detector shall close damper and alarm fire alarm system.

G. Where part of Smoke Control System.

1. Provide end switch for positive indication of damper position.
2. Provide means to re-open damper remotely in the event thermal link trips. Allow for re-open up to elevated rating of 350°F, after which the elevated temperature high-limit override shall close the damper.

H. Combination fire/smoke dampers shall meet or exceed the following specifications. Frame shall be a minimum of 16 gage galvanized steel formed into a structural hat channel shape with tabbed corners for reinforcement. Bearings shall be stainless steel sleeve turning in an extruded hole in the frame. The blades shall be airfoil shaped double skin construction with 14 gage equivalent thickness. Blade edge seals shall be silicone rubber designed to withstand 450˚F and jamb seals shall be stainless steel flexible metal compression type. Blade action must be parallel blade or opposed as required.

I. As part of the UL qualification, dampers shall have demonstrated a capacity to operate (to open and close) under HVAC system operating conditions, with pressures of at least 4" w.g. in the closed position, and 2000 fpm air velocity in the open position.

J. In addition to the leakage ratings already specified herein, the combination fire smoke dampers and their operators shall be qualified under UL555S to an elevated temperature of 250˚F, 350˚F, or 450˚F depending upon the operator. Appropriate electric operators shall be installed by the damper manufacturer at time of damper fabrication. Damper and operator shall be supplied as a single entity which meets all applicable UL555 and UL555S qualifications for both dampers and operators. Manufacturer shall provide factory assembled sleeve of 16" minimum length (contractor to verify requirement). Sleeve shall be 20 gage for dampers through 36" x 48" and 18 gage above 36" x 48". Sleeve shall be continuously welded or sealed and the transverse joint shall be sealed. Flanged duct sleeve connection shall be UL approved. Damper and operator assembly shall be factory cycled 10 times to assure operation.

K. Each combination fire/smoke damper shall be equipped with a UL Classified Firestat equal to Ruskin model TS150. Firestat shall electrically and mechanically lock damper in a closed position when duct temperatures exceed 212˚F and still allow appropriate authority to override Firestat and operate damper as may be required for smoke control functions. Damper must be operable while temperature is above 250˚F. Firestat package shall include two damper position indicator switches linked directly to damper blade to provide capability of remotely indicating damper position. One switch shall close when damper is fully open; the other switch shall close when the damper is fully closed. Firestat and position indicator switches shall be capable of interfacing electrically with smoke detectors, building fire alarm systems, and remote indicating/control stations. Provide damper test switch and remote annunciation indicator. Dampers shall be Ruskin Model FSD36 with TS150 Firestat package.

L. Provide 3-function actuators where dampers are used to modulate air flow during normal operation.
1. Fire function
2. Smoke function
3. Modulating position control function

2.12 SMOKE DAMPERS

A. Manufacturers:

1. Design Basis: Ruskin
2. Other Acceptable Manufacturers:

a. Air Balance
b. Greenheck
c. Johnson Controls
d. National Controlled Air
e. Pottorff
f. Prefco
g. Safe Air

B. Smoke Damper Rating: UL Standard 555S, Class II.

C. Each smoke damper shall be classified by Underwriters Laboratories as a Leakage Rated Damper for use in Smoke Control Systems under the latest version of UL555S, and shall bear a UL label attesting to same, as (Class II Rating). Damper manufacturer shall have tested, and qualified with UL, a complete range of damper sizes covering all dampers required by this specification. Testing and UL qualifying a single damper size is not acceptable. The leakage rating under UL555S shall be leakage Class II (10 cfm/ft. at 1" w.g.).

D. Operator:

1. Type: 120 volt.
2. Listing: UL Smoke Damper Operator Label.
3. Failure Position:
   a. Smoke control system dampers: As shown on plans.
   b. Others: Closed
4. Smoke Detector: Duct mounted within 4' of damper. Activation of detector shall close damper and alarm fire alarm system.

E. Blade: Air foil.

F. Seals: Steel.

G. Where part of smoke control system:

1. Provide end switches for positive indication of damper position, open and closed.

H. Furnish and install at locations indicated on plans, or as described in schedules, or as required by applicable codes, smoke dampers meeting or exceeding the following specifications. Frame shall be aluminum of 16 gage galvanized steel formed into a structural hat channel shape with tabbed corners for reinforcement. The blades shall be single skin 16 gage minimum galvanized with three longitudinal grooves for reinforcement. Bearings shall be stainless steel sleeve turning in an extruded hole in the frame. Blade edge seals shall be silicone rubber designed to withstand 450˚F and jamb seal shall be stainless steel flexible metal compression type.

I. As part of the UL qualification, dampers shall have demonstrated a capacity to operate (to open and close) under HVAC system operating conditions, with pressures of at least 4" w.g. in the closed position, and 3500 fpm air velocity in the open position for normal operation.

J. In addition to the leakage ratings already specified herein, the dampers and their actuators shall be qualified under UL555S to an elevated temperature of 350˚F. Electric actuators shall be installed by the damper manufacturer at time of damper fabrication. Damper and actuator shall be supplied as a single entity which meets all applicable UL555S qualifications for both dampers and actuators. Factory supplied caulked sleeve shall be 20 gage for dampers through 84" wide and 18 gage above 84" wide. Damper and actuator assembly shall be factory cycled 10 times to assure operation. Dampers shall be Ruskin Model SD36 or approved equal.

K. Each smoke damper shall be equipped with Ruskin SP100 Switch Package or equal. The Switch Package shall include two position indicator switches linked directly to the damper blade to provide the capability of remotely indicating damper blade position.

L. Provide 3-function actuators where dampers are used to modulate air flow during normal operation.

1. Fire function
2. Smoke function
3. Modulating position control function

2.13 LINT COLLECTOR

A. Manufacturers:

1. Design Basis: LFSystems Model ILC, or approved equal.

B. Construction:
1. 20-ga stainless steel
2. Replaceable polyester multifilament 200-micron filter bag
3. Access panel

PART 3 - EXECUTION

3.1 INSTALLATION OF ACCESSORIES

A. Install fire, smoke and ceiling dampers in accordance with manufacturer's instructions and the latest version of the Fire, Smoke and Radiation Damper Guide for HVAC Systems, published by SMACNA.

B. Use HIGH PRESSURE flexible duct where shown upstream of VAV boxes.

C. Notify fire alarm provider of smoke damper control requirements and fire alarm interlocks.

D. Install flexible ductwork without tight bends and free of kinks.

1. Flexible ductwork shall not exceed 6' in length.
2. Flexible ductwork shall be installed with a "minimum length of straight duct" upstream of the diffuser neck inlet. "A minimum length" shall mean a length equal to three (3) duct diameters. "Straight duct" shall mean the center-line of the duct shall be aligned with a line perpendicular to the plane of the diffuser neck opening at the center point of the opening.
3. Conform to the detail on the drawings.

E. Install all dampers, including those furnished by control contractor.

1. Caulk damper frames to ductwork.
2. Make sure dampers are free to operate properly.
3. Install parallel blade mixing dampers to two streams impinge on each other to facilitate mixing.

F. Provide balance dampers at all branch take-off and where required to minimize balancing performed at diffuser face.

G. Louvers shall be made easily removable without impacting finishes where access is required to service and maintain equipment installed behind.

H. Provide all balance dampers as shown on plans and any additional dampers necessary to provide a balanced system meeting all sound requirements.

I. Fire and smoke dampers shall be provided with an approved means of access, large enough to permit inspection and maintenance. The access shall not reduce the fire-resistance rating of the assembly. Access point shall be permanently identified on the exterior by a label having letters not less than ½" in height reading: SMOKE DAMPER, FIRE DAMPER or FIRE SMOKE DAMPER.

END OF SECTION

SECTION 23 34 00

FANS

PART 1 - GENERAL

1.1 QUALITY CONTROL

A. Provide fans with AMCA performance certification and label.

B. Grease exhaust fan shall comply with NFPA 96 and be UL listed.

1.2 MOTOR HORSEPOWER

A. Do not increase or decrease motor horsepower from that specified without written approval from Architect/Engineer. See Section 23 05 01.

1.3 SUBMITTALS

A. Manufacturer's Data: Submit manufacturer's product data including:

1. Performance
2. Size
3. Type
4. Options provided
5. Fan curves
6. Indicate Compliance with Section 1.1 where applicable.

PART 2 - PRODUCTS

2.1 CENTRIFUGAL FANS (CLASS I)

A. Manufacturers:

1. Design Basis: As scheduled.
2. Acceptable Manufacturers:
   a. Greenheck
   b. Buffalo
   c. Trane

B. Furnish and install as shown on the plans non-power overloading centrifugal fans with airfoil blades in sizes 24 and larger and plate-type blades in sizes 22 and smaller. Fans shall be of the specified size, arrangement, class and capacity. Fans having outlet velocities greater than those shown will not be acceptable.

C. Housings of fans, Class I, having wheel diameters 36" and smaller shall be convertible for various directions of discharge. Side sheets shall be fastened to scroll sheets by means of a deep lockseam. Housing supports shall be of one-piece welded constructed. Housing for Class I fans, having wheel diameters over 36", shall have side sheets welded to scroll sheets. Housings shall be split into two or more sections with heavy flanges on each section for bolting together. Flanges joints shall be gasketed for air-tightness. Sealer shall be applied to joints between housing, inlet and housing support to prevent air leakage. The cutoff shall be of the rolled slope type and shall be wider and closer to the shaft at the suction side, then the drive side, for single width fans. Inlet collars on all sizes of single width fans shall extend beyond the fan housing to provide a continuous duct connection. Inlet collars on

convertible housings shall be round and on nonconvertible housing shall be square. Both inlet and discharge duct collars shall be drilled or punched at uniform intervals. Inlet cones shall be spun or die-formed to provide smooth air flow into the wheel with minimum shock and turbulence.

D. Fans wheels shall be constructed of twelve deep airfoil blades, plate type blade in sizes 22 and smaller, backward inclined from the direction of rotation. Blades shall be securely welded to the spun rim and hub plate. Hubs shall be of close grined cast iron, securely riveted to the hub plate. All wheels shall be carefully trued after assembly and shall be carefully trued after assembly and shall be dynamically balanced.

E. Fan shafts shall be of SAE 1040 hot rolled steel, accurately turned, ground and polished. Close tolerances shall be maintained where shaft makes contact with bearings and fan wheel hub. All fans shall have adjustable belt and drives and shall be driven by a minimum of two belts.

F. Fans shall be equipped with precision anti-friction extra heavy duty bearings of the self-aligning, grease-packed, pillow block type having a grease seal that will prevent loss of lubricant and exclude dirt from the bearings. Lubrication fittings shall be provided on exterior of cabinet or housing. Average bearing life shall be min. 200,000 hours.

G. All fans shall be given a bonding coat before painting. After the cleaning and surface conditioning process, but before assembly, parts shall be spray painted with one coat of grey primer-finisher. A second coat of the same paint shall be applied to the exterior and all accessible interior surfaces after the fan is assembled. Shafts shall have a rust-preventive coating.

H. Fan ratings shall be based upon tests performed in strict accordance with the test code adopted jointly by the Air Moving and Conditioning Association and the American Society of Heating, Refrigeration and Air Conditioning Engineers. Each fan shall carry, near the manufacturer's nameplate, the seal authorized by AMCA indicating that ratings are certified. Fans not bearing this seal will not be acceptable.

I. Fans shall be as scheduled on the Drawings.

J. Provide 2" wire mesh inlet screens with each fan.

2.2 IN-LINE CENTRIFUGAL FAN

A. Manufacturers:

1. Design Basis: As scheduled
2. Acceptable Manufacturers:
   a. Greenheck
   b. Cook
   c. Trane
   d. Aerovent
   e. Carrier
   f. Jenn Air
   g. Penn
   h. American Coolair
   i. Powerline
   j. Twin City
   k. Carnes

B. Cabinet: Steel, insulated, baked enamel finish with access panel.

C. Wheel: Cast aluminum Airfoil, statically and dynamically balanced. Cast aluminum hub.

D. Bearings: Heavy duty pillow black in enclosed duct with external grease fittings.

E. Guards: Belt.

F. Drive: See Schedule.

G. The fans shall be the square shaped and of heavy gauge formed steel. One of the sides shall be hinged and shall support the entire drive assembly (motor only for direct drive fans) and wheel allowing the assembly to swing out for cleaning, inspection or service without dismantling the unit in any way.

H. For direct drive fans, the motor shall be isolated from the air stream by a motor enclosure and shall draw cooling air from outside the fan housing.

I. For belt drive fans, the motor shall be mounted on the hinged side exterior isolated from air stream. The belt and pillow block ball bearings shall be protected from air stream by an enclosure. The shaft shall be keyed to both the wheel and pulley.

J. The fan inlet shall be spun Venturi throat overlapped by a backward curved centrifugal wheel with spun cone for maximum performance.

K. Air and sound shall be A.M.C.A. certified.

L. Install fan with spring type vibration isolators, threaded rods and expansion shields.

2.3 POWER ROOF VENTILATORS, CENTRIFUGAL

A. Manufacturers:

1. Design Basis: As scheduled
2. Acceptable Manufacturers:
    a. Greenheck
    b. Cook
    c. Carnes
    d. Aerovent
    e. Ammerman
    f. Hurricane
    g. Jenn Air
    h. Penn
    i. Powerline

B. Features:
1. Spun aluminum housing.
2. Internal rubber vibration isolators.
3. Ball bearings.

C. General:

1. Provide:
    a. Bird screen.
    b. Gravity back-draft damper:
        1) 0.2 inches WC max. pd.
    c. Motorized type backdraft damper where indicated.

D. Roof Curb:

1. Provide dimension data to Supplier of roof curbs.
2. Provide factory fabricated roof curb of height required by local authorities.

E. Sound Criteria:

1. Required sound levels may be attained by use of sound attenuating curbs.
2. Fan shall have specified capacity with curb in place.
3. Curb pressure drop is not included in specified ratings.

2.4 UP-BLAST ROOF EXHAUSTER

A. Manufacturers:

1. Design Basis: As scheduled
2. Acceptable Manufacturers:
   a. Ammerman
   b. Carnes
   c. Cook
   d. Greenheck
   e. Hurricane
   f. Jenn Air
   g. Penn
   h. Powerline

B. Features:

1. Spun aluminum housing.
2. Outside air motor cooling.
3. Grease trough.
4. Internal rubber vibration eliminators.
5. UL listed for grease laden air where noted on drawings.

C. Accessories:

1. Bird screen.

D. Provide factory fabricated curb of height required by local code.

2.5 KITCHEN EXHAUST FANS

A. Standards
1. AMCA 99, "Standards Handbook"
2. ANSI/AMCA Standard 204-96, "Balance Quality and Vibration Levels for Fans"
3. ANSI/AMCA Standard 210-99, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating"
4. AMCA Publication 211-05, "Certified Ratings Programme - Product Rating Manual for Fan Air Performance"
5. AMCA Standard 300-96, "Reverberant Room Method for Sound Testing of Fans"
6. AMCA Publication 311-05, "Certified Ratings Programme - Product Rating Manual For Fan Sound Performance"
7. AMBA - Method of Evaluating Load Ratings of Bearings ANSI-11 (r1999).
8. OSHA guideline 1910.212 - General requirements for Machine Guarding. (www.osha.gov)
9. OSHA guideline 1926.300 - General requirements for safe operation and maintenance of hand and power tools. (www.osha.gov)

10. OSHA guideline 1910.219 - General requirements for guarding safe use of mechanical power transmission apparatus. (www.osha.gov)
11. UL Standard 705, "Power Ventilators"
12. UL Standard 762, "Power Roof Ventilators for Restaurant Exhaust Appliances."

B. All fans not entirely welded shall be UL 762 rated for outdoor use only. Drain connections and access doors shall be provided. All fans UL 762 listed shall be in the upblast orientation.

C. Temperature Rating:

1. 500° F maximum temperature for a minimum of 8 hours of operation.

D. Submittals

1. Provide dimensional drawings and product data on each centrifugal fan.
2. Provide fan curves for each fan at the specified operation point, with the flow, static pressure and horsepower clearly plotted.
3. Provide outlet velocity of centrifugal fans and both inlet and outlet sound power readings for the eight octave bands.

E. Quality Assurance

1. Performance ratings: Conform to AMCA standard 211 and 311. Fans must be tested in accordance with ANSI/AMCA Standard 210-99 and AMCA Standard 300-96 in an AMCA accredited laboratory. Fans shall be certified to bear the AMCA label for air and sound performance.
2. Classification for Spark Resistant Construction Conform to AMCA 99.
3. Each fan shall be given an electronic vibration analysis in accordance with ANSI/AMCA Standard 204-96, while operating at the specified fan RPM. The vibration signatures shall be taken on each bearing in the horizontal, vertical and axial direction. The maximum allowable fan vibration shall be 0.15 in/sec peak velocity, filter-in as measured at the fan RPM. Report shall be provided at no charge to the customer upon request.

F. Delivery, Storage, and Handling

1. Delivery: Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly indicating manufacturer, material, products included, and location of installation.
2. Storage: Store materials in a dry area indoor, protected from damage, and in accordance with manufacturer's instructions.
3. Handling: Handle and lift fans in accordance with the manufacturer's instructions. Protect materials and finishes during handling and installation to prevent damage. Follow all safety warnings posted by the manufacturer.

G. General

1. Base fan performance at standard conditions (density 0.075 Lb/ft3).
2. Fans selected shall be capable of accommodating static pressure and flow variations of +/-15% of scheduled values.
3. Each fan shall be belt in AMCA arrangement 1, 3, 9 or 10 according to drawings.
4. Fans are to be equipped with lifting lugs.
5. After fabrication all carbon steel components shall be cleaned and chemically treated by a phosphatizing process to insure proper removal of grease, oil, scale, etc. Fan shall then be coated with a minimum of 2-4 mils of Permatector (Polyester Urethane), electrostatically applied and baked. Finish color shall be industrial gray. Coating must exceed 1,000-hour salt spray under ASTM B117 test method.

H. Fan Housing and Outlet

1. Fan housing is to be aerodynamically designed with high-efficiency inlet, engineered to reduce incoming air turbulence.
2. Fan sizes 7 through 49, in class I and II, shall be of airtight PermaLockTM Construction with the scroll panel material formed and embedded into the side panels. The housings on all fan sizes greater than 49 shall be of continuously welded heavy gauge steel. All interior and exterior surface steel shall be coated with a minimum of 2-4 mils of Permatector (Polyester Urethane), electrostatically applied and baked. Finish color shall be gray. No uncoated metal fan parts will be allowed.
3. Housing and bearing support shall be constructed of welded structural steel members to prevent vibration and rigidly support the shaft and bearings.
4. An OSHA compliant belt guard shall be included to completely cover the motor pulley and belt(s).
5. Provide a grease trap designed to collect grease residue to avoid drainage onto roof surface. It shall be contain a built-in water separating baffles.

I. Fan Wheel

1. The fan wheel shall be of the non-overloading single width backward inclined centrifugal type. Wheels shall be statically and dynamically balanced to balance grade G6.3 per ANSI S2.19.
2. Fan wheel shall be manufactured with continuously welded steel blades and coated with a minimum of 2-4 mils of Permatector (Polyester Urethane), electrostatically applied and baked. Finish color shall be industrial gray.
3. The wheel and fan inlet shall be carefully matched and shall have precise running tolerances for maximum performance and operating efficiency.

J. Fan Motors and Drive

1. Motors shall meet or exceed EPACT (Energy Policy ACT) efficiencies. Motors to be NEMA T-frame, 1800 or 3600 RPM, Open Drip Proof (ODP) or Totally Enclosed Fan Cooled (TEFC) with a 1.15 service factor.
2. Drive belts and sheaves shall be sized for 150% of the fan operating brake horsepower, and shall be readily and easily accessible for service, if required.
3. Fan shaft to be turned and polished steel that is sized so the first critical speed is at least 25% over the maximum operating speed for each pressure class.
4. Fan shaft bearings shall be Air Handling Quality, bearings shall be heavy-duty grease lubricated, self-aligning or roller pillow block type.
5. Air Handling Quality bearings to be designed with low swivel torque to allow the outer race of the bearing to pivot or swivel within the cast pillow block. Bearings shall be 100% tested for noise and vibration by the manufacturer. Bearings shall be 100% tested to insure the inner race diameter is within tolerance to prevent vibration.
6. Bearings shall be selected for a basic rating fatigue life (L-10) of 80,000 hours at maximum operating speed for each pressure class.
7. Bearings shall be fixed to the fan shaft using concentric mounting locking collars, which reduce vibration, increase service life, and improve serviceability. Bearings that use set screws shall not be allowed.
8. Bearings shall have Zerk fittings to allow for lubrication.

2.6 DRYER MAKEUP FAN

A. Manufacturers:

1. Design Basis: As scheduled
2. Acceptable Manufacturers:
   a. Trane
   b. Carrier
   c. York

d. Greenheck

B. Casing Construction

1. All unit panels shall be 2-inch solid, double-wall construction to facilitate cleaning of unit interior. All exterior and interior AHU panels will be made of galvanized steel. Motor and drive locations can be on the same side as the unit coil connections or on the opposite side. The casing shall be able to withstand up to 6" w.g. positive or negative static pressure. The unit panels shall not exceed .005 inch deflection per inch of panel span at 6" w.g. positive or negative static pressure.

C. Floor Construction

1. The unit floor shall be of sufficient strength to support a 300.0 lb load during maintenance activities and shall deflect no more than .005 inch per inch of panel span when sitting on a support structure.

D. Insulation

1. Panel insulation shall provide a minimum thermal resistance (R) value of 13 ft2*h*ºF/Btu throughout the entire unit. Insulation shall completely fill the panel cavities in all directions so that no voids exist and settling of insulation is prevented. Panel insulation shall comply with NFPA 90A.

E. Drain Pan

1. All units shall be provided with an insulated assembly of polymer material or stainless steel. To address indoor air quality (IAQ), the drain pan shall be designed in accordance with ASHRAE 62.1 being of sufficient size to collect all condensation produced from the coil and sloped in two planes promoting positive drainage to eliminate stagnant water conditions. The outlet shall be located at the lowest point of the pan and shall be sufficient diameter to preclude drain pan overflow under any normally expected operating condition. All drain pan connections shall be visible external to the unit.

F. Access Door Construction

1. Access doors shall be 2-inch double-wall construction. Interior and exterior door panels shall be of the same construction as the interior and exterior wall panels, respectively. Surface-mounted handles shall be provided to allow quick access to the interior of the unit. Handle hardware shall be designed to prevent unintended closure. Access doors shall be hinged and removable for quick, easy access. Door handle hardware shall be adjustable and visually indicate locking position of door latch external to the section.

G. Filters

1. 2-inch pleated media filters made with 100% synthetic fibers that are continuously laminated to a supported steel-wire grid with water repellent adhesive shall be provided. Filters shall be capable of operating up to 625 fpm face velocity without loss of filter efficiency and holding capacity. The filters shall have a MERV 8 rating when tested in accordance with the ANSI/ASHRAE Standard 52.2.

H. FAN SECTION

1. The fan assembly shall be a direct-drive plenum fan with high efficiency welded-aluminum impeller that is dynamically balanced as an assembly. Fan shall be maintenance free throughout its operating life. Fans shall be balanced to G6.3 per AMCA 204. No external vibration isolation is necessary. Access to motor and fan assembly through hinged access door. Access door shall be sized for removal of entire motor and fan assembly. Motor contains integrated PID controller and accepts 0-10VDC input for variable speed control. Signal is wired back to the UC600 controller or terminal strip.

I. Fan Isolation

1. All fans, including direct drive plenum fans, shall be internally isolated to inhibit noise and vibration through the ductwork and building structure. A flexible connection shall be installed between fan and unit casing to ensure complete isolation. If fans and motors are not internally isolated, then the entire unit shall be externally isolated from the building, including supply and return duct work, piping, and electrical connections. External isolation shall be furnished by the installing contractor in order to avoid transmission of noise and vibration through the ductwork and building structure.

J. Control Interface

1. A control interface is available that includes:
   a. Fan motor disconnect switch
   b. Transformer(s)
   c. Customer terminal strip for field-provided controls

2.7 DRYER EXHAUST FAN

A. Design Basis: Enervex

B. The Enervex modulating dryer exhaust system shall meet UL-705, 'Standard for Power Venters', and shall have a capacity as shown on the schedule. The exhaust system shall have a two-year factory warranty for parts and be of highest quality workmanship and construction. The system shall have the following features:

1. The box ventilator (BEFx) shall be suitable for indoor and outdoor installation. The BEFx shall have an insulated galvanized steel housing with a statically and dynamically balanced aluminum backwards curved centrifugal impeller. The BEFx shall have a hinged door for easy cleaning and service. The BEFx shall be designed to meet Type B, Spark Resistant Construction, and to exhaust lint-laden air from single or multiple Type I or Type II clothes dryers. The BEFx shall be equipped with an air-cooled, maintenance-free variable speed permanent magnet motor with pre-lubricated and sealed bearings. The BEFx's motor with MSC EDrive Motor Controller (EDrive) shall be rated at 92% efficiency and able to operate as low as 50 rpm. The motor shall be protected from overloading, blocking, over voltage, under voltage, and overheating. The motor shaft shall be internally isolated to eliminate the need for external shaft grounding. The motor shall be located outside the exhaust air stream to comply with the International Code Council's requirements for commercial dryer exhaust.

2. The modulating exhaust control shall be a true PID microprocessor-based control and shall be able to maintain a constant negative pressure with a tolerance of 0.01"W.C., by modulating the BEFx's motor speed via the EDrive. The control shall include a pressure transducer, silicone tubing and a duct probe. The duct's pressure shall be referenced just downstream of the clothes dryers. For multistory applications, the duct's pressure shall be referenced in the lower portion of the exhaust riser while the building's pressure shall be referenced in the lower portion of the building. The control shall operate the BEFx continuously. The control shall have a safety function to notify building management in case of insufficient pressure or ventilator failure, and indicate this with a visual alarm. The control shall have a display of the actual pressure.

3. Furnish a NEMA 4X-enclosed disconnect switch with a maximum rating of 25A and 600V for the box ventilator.

4. Contractor shall install structural, mechanical, electrical, and control connections as designed by the manufacturer and in accordance with the terms of the manufacturer's warranties.

5. Follow all pertinent national, state, and/or local codes where applicable

PART 3 - EXECUTION

3.1 NOISE AND VIBRATION

A. Insure that fans are properly supported on vibration isolators. Reference Section 23 05 48 for Vibration Isolation Requirements.

B. Insure that flexible duct connections are properly made.

C. Check fan for improper balance and have fan re-balanced if necessary.

D. Check for proper rotation.

E. Check for unusual noise or vibration and correct as necessary.

3.2 ACCESS

A. Provide for proper access to all parts of fan needing inspection or service with access doors in fan or ductwork.

3.3 INSTALLATION

A. Install units level and plumb.

B. Provide necessary auxiliary supporting steel.

C. Mount motor and drives so belts run true.

D. Provide necessary lubrication.

E. Provide flexible duct connections on inlet and discharge.

F. Provide 460v/120v transfer to serve controls and convenience outlet at all 460v fans.

G. Provide unfused disconnect of suitable capacity. Disconnect shall be weatherproof where installed outside or in a location subject to wetness.

H. Provide vibration isolators as recommended by manufacturer and other sections of this specification.

I. Provide a hinged base at all up-blast and roof curb mounted fans.

3.4 CURBS

A. Provide necessary dimensions and details so roof opening can be provided at the proper time.

B. Coordinate delivery of curb with roofing contractor so project is not delayed.

C. Provide vented roof curbs for all kitchen exhaust penetrations through roof.

D. Provide a weatherproof installation:

1. Seal all joints including, but not limited to:
   a. Unit and curb.
   b. Unit and ducts.

END OF SECTION

SECTION 23 36 00

AIR TERMINAL UNITS

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Variable and constant volume terminal units.

B. Variable volume regulators.

C. Integral heating coils.

D. Integral damper motor operators.

E. Integral controls.

1.2 PRODUCTS FURNISHED BUT NOT INSTALLED UNDER THIS SECTION

A. Section 23 09 00 – Building Automation and Automatic Temperature Control Systems: Thermostats and control components.

1.3 REFERENCES

A. NFPA 90A - Installation of Air Conditioning and Ventilation Systems.

B. UL 181 - Factory-Made Air Ducts and Connectors.

C. ARI 880 - Air Conditioning and Refrigeration Institute Standard Rating Conditions for Air Terminals.

D. UL - Shutoff terminal must be UL listed as a Room Air Terminal.

E. ASTM A 527 (Steel Sheet, Zinc Coated Galvanized)

1.4 SUBMITTALS

A. Submit shop drawings and product data sheets indicating configuration, general assembly, and materials used in fabrication.

B. Submit product data indicating configuration, general assembly, and materials used in fabrication. Include catalog performance ratings which indicate air flow, static pressure, and radiated sound power levels (2nd through 7th octave bands) at design maximum operating conditions. Also submit Radiated Sound NC values.

Shall be calculated at design conditions with the following path attenuation credits:

CORRECTION TO OCTAVE BAND SOUND POWER VALUE						
	2	3	4	5	6	7
Env Adj	-3	-2	-1	-1-	-1	-1
Mineral Fiber Ceiling Tile	-9	-10	-12	-14	-15	-15
Space Effect Factor	-10	-11	-12	-13	-13	-14

This transfer function represents modeling assumptions based on ARI 885-90.

C. Submit manufacturer's installation instructions.

1.5 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing the products specified in this section with minimum ten years experience.

1.6 WARRANTY

A. Provide one year manufacturer's parts warranty.

PART 2 - PRODUCTS

2.1 OUTSIDE AIR SINGLE DUCT VARIABLE VOLUME (VAV)

A. Manufacturers:

1. Design Basis: Ruskin Company
2. Other Acceptable Manufacturers:
   a. Phoenix Controls

B. Construction:

1. Frame Material: Galvanized steel.
2. Frame Fabrication: Minimum 20 gage.
3. Blade: Modulating Air Control.
   a. Style: Butterfly, single-piece of double laminated steel.
   b. Material: Galvanized steel. 14 gage equivalent thickness. Mill finish.
   c. Seals: Polyethylene foam seal sandwiched between two layers of blade. Seal fully encompasses blade edge. Glue-on or clip-on seals not permitted.
4. Flow Sensing Blade:
   a. Style: Bullet nose, flow cross (up to 16 inches diameter).
   b. Material: Two-piece fused ABS plastic (up to 16 inches diameter).
   c. Style: Airfoil-shaped, single-piece.
   d. Material: Anodized extruded aluminum.
5. Axle: Minimum 1/2 inch diameter plated steel, mechanically attached to blade.
6. Bearings: Self-lubricating stainless steel sleeve.

C. Actuator:

1. Electric, 24 V, 60Hz, modulating

D. Controller:

1. Re-settable Constant Volume (RCV) Controller:
   a. Digital Controller Integral to Damper Actuator: Application specific controller. Programming logic and calibration in nonvolatile EPROM.
      1) Controller uses generic 0 - 10 vdc inputs and outputs for interface to building automation system.

2) Controller capable of BACnet integration to building management system for control and monitoring
3) Controller maintains CFM flow setpoint and also contains min and max CFM settings

E. Performance Data:

1. Assembly: Factory assemble damper components and furnish as a single factory calibrated unit.
2. Operating Range: 400 to 4000 feet per minute air velocity.
3. Operating Temperature: -40 degrees F to +200 degrees F (-40 degrees C to +93 degrees C).
4. Capacity: Verify capacity of damper/airflow monitor.
5. Monitor airflow within accuracy of 5 percent.
6. Leakage: Maximum .15 cubic feet per minute per inch at 4 inch w.g. of blade perimeter.

2.2 SINGLE DUCT CONSTANT (C.A.V.) AND VARIABLE (V.A.V.) VOLUME AIR TERMINAL UNITS (COMFORT)

A. Manufacturers:

1. Design Basis: Titus
2. Other Acceptable Manufacturers:
   a. Anemostat
   b. Metal Aire
   c. Enviro-Tec
   d. Carnes

B. Sound Criteria:

1. Conform to ARI 880 performance test standard.
2. Discharge Sound:
   a. 0.2” SP: NC40
   b. 1.0” SP: NC53
3. Radiated Sound:
   a. 0.2” SP: NC27
   b. 1.0” SP: NC41
4. Sound levels may be attained using attenuators, but pressure drop of attenuator must be included as part of unit pressure drop.
5. Units will discharge into lined or fiberglass ductwork, credit for which cannot be claimed in sound criteria.

C. Duct Connections:

1. Duct connections shown on drawing are minimum.
2. Units with larger connections may be used to meet pressure or sound requirements.
3. Flexible duct shall be same size as unit connection.

D. Construction:

1. The terminal casing shall be minimum 22-gauge galvanized steel, internally lined with engineered polymer foam insulation which complies to UL181 and NFPA 90A. Insulation shall be 1½ pound density, closed cell foam. Exposed fiberglass is not acceptable. The insulation shall be mechanically fastened to the unit casing. The discharge connection shall be slip and drive construction for attachment to metal ductwork.
2. Maximum leakage not exceeding 1% design flow.
3. The damper shall be heavy gauge steel with shaft rotating in Delrin® self-lubricating bearings. Nylon bearings are not acceptable. Shaft shall be clearly marked on the end to indicate damper position. Stickers or other removable markings are not acceptable. The damper shall incorporate a mechanical stop to prevent overstroking and a synthetic seal to limit close-off leakage to the maximum values.

4. Actuators shall be capable of supplying at least 35-inch lbs. of torque to the damper shaft and shall be mounted externally for service access. Terminals with internal actuator mounting or linkage connection must include gasketed access panel, removable without disturbing ductwork.

E. At an inlet velocity of 2000 fpm, the minimum static pressure required to operate any terminal size shall not exceed 0.13-inch wg for the basic terminal.

F. Heating Coils:

1. Refer to Section 23 82 16 – Air Coils.
2. Proof of flow shall be by sail switch.
3. Electric Heating Coils (SCR)
   a. Electric coils shall be supplied and installed on the terminal by the terminal manufacturer.
   b. Coils shall be ETL listed.
   c. Proportional, modulating electric coils shall be supplied and installed on the terminal by the terminal manufacturer. Coils shall be ETL listed. Coils shall be housed in an attenuator section integral with the terminal with element grid recessed from unit discharge a minimum of 5 inches to prevent damage to elements during shipping and installation. Elements shall be 80/20 nickel chrome, supported by ceramic isolators a maximum of 3.5 inches apart, staggered for maximum thermal transfer and element life, and balanced to ensure equal output per step.
   d. The integral control panel shall be housed in a NEMA 1 enclosure with hinged access door for access to all controls and safety devices
   e. Electric coils shall contain a primary automatic reset thermal cutout, a secondary manual reset thermal cutout, proportional electronic airflow sensor for proof of flow, and line terminal block.
   f. The proportional electronic airflow sensor shall be totally independent of the duct static pressure and shall adjust the heater capacity according to the available airflow. The heaters shall deliver maximum heating when needed with normal minimum airflow, reduce heating with lower than minimum airflow and stop heating with no airflow. Unit shall include an integral door interlock type disconnect switch which will not allow the access door to be opened while power is on. Non-interlocking type disconnects are not acceptable.
   g. All individual components shall be UL listed or recognized.
   h. Heaters shall be equipped with a proportional SCR controller to modulate the heater load according to the temperature control signal. The electronic controller shall be compatible with the following input signals:

      1) Variable voltage signal 0-10 VDC
      2) Pulse width modulation AC or DC

G. Control:

1. Electronic, using velocity sensor, with compensation or correction for distorted flow at inlet.
2. Maximum and minimum volume controls shall be:
   a. Factory set (with allowance for altitude of project).
   b. accurate within 10%.
3. Units shall be normally open with reversing relay for use with direct acting thermostat.
4. Provide electric motor. Coordinate voltage with controls contractor, if 120V, provide integral disconnect switch in VAV box controller and transformer.
5. Coordinate spring range with Automatic Temperature Control Section.
6. Coordinate controls on CAV and VAV units with control contractor.
7. Provide CFM output to BMS.

2.3 SOUND PERFORMANCE

A. Terminal units shall not exceed the following sound criteria.

Permitted Radiated Sound Performance				
Flow	Air Pressure Drop			
	.5”	1.0”	1.5”	2”
100	11	15	17	18
200	15	21	23	25
300	22	28	25	28
400	21	27	30	33
500	22	24	27	29
600	23	27	27	29
700	22	25	29	31
800	19	23	26	29
1000	22	28	31	34
1400	22	28	28	30
1800	25	27	29	33

Permitted Discharge Sound Performance				
Flow	Air Pressure Drop			
	.5”	1.0”	1.5”	2”
100	28	29	30	31
200	29	31	34	35
300	29	33	30	33
400	25	30	34	35
500	25	29	31	34
600	26	30	34	36
700	29	33	35	38
800	25	29	30	31
1000	29	31	33	34
1400	26	30	26	29
1800	29	25	28	30

2.4 FAN POWERED BOX

A. Manufacturers:

1. Design Basis: Titus
2. Other Acceptable Manufacturers:
   a. Anemostat
   b. Enviro-Tec
   c. Carnes
   d. Metal Aire

B. Construction:

1. Galvanized steel, leakage less than 1% nominal CFM.
2. Filter rack on plenum inlet.
3. Back draft damper on fan discharge.
4. Internally insulated with minimum ½”, 1½” PCF lining per NFPA-90 and UL-181.

C. Fan:

1. Forward curved, direct drive.
2. PSC motor, permanently lubricated.
3. 3 speed selector switch.
4. P/E switch for fan on/off.

D. Coil:

1. Factory mounted air coil per Section 23 82 16.
2. Proof of flow shall be by sail switch.

E. Control:

1. Pressure independent using velocity sensor, with compensation or correction for distorted flow at inlet.
2. Maximum and minimum volume controls shall be:
   a. Factory set (with allowance for altitude of project).
   b. Accurate within 10%.
3. Units shall be normally open with reversing relay for use with direct acting thermostat.
4. Provide electrical damper motor.
5. Coordinate spring range with automatic temperature controls.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's instructions.

END OF SECTION

SECTION 23 37 00

AIR INLETS AND OUTLETS

PART 1 - GENERAL

1.1 CEILING CONSTRUCTION

A. Provide products compatible with ceiling construction.

1.2 SUBMITTALS

A. Submit catalog data including throw, sound, pressure drop, physical dimensions and color.

1.3 INDUSTRY STANDARDS

A. Provide products tested in accordance with ASHRAE 70-1991 150 Standard 5219, 150 Standard 3741.

PART 2 - PRODUCTS

2.1 LINEAR SLOT DIFFUSER:

A. Manufacturers:

1. Design Basis: Titus Series ML
2. Other Acceptable Manufacturers:
   a. Carnes Series CH
   b. Krueger
   c. Metal Aire Series 6000
   d. Anemostat

B. Material: Extruded aluminum except:

1. Where noted otherwise.
2. Where required otherwise for fire rating.

C. Finish: Baked enamel with color selected by Architect. Flat black diffuser vanes and frame interior.

D. Inlet Size: Match duct size.

E. Diffuser lengths shall be as indicated on mechanical drawings or as scheduled, whichever is greater. These are the minimum lengths required for performance. Additional lengths of inactive diffuser (“blank-off sections”) may be required by architectural scope. Contractor shall review architectural drawings for additional quantities and provide all diffusers required to meet HVAC and architectural scope.

F. Match frame and border types to ceiling system. Frame type to be appropriate to installation with diffuser elements being removable from frame. Both air pattern and flow rate adjustments with air pattern having full 180° adjustment. Single slot diffuser vanes segmented on 2 or 3 foot centers. Coordinate frame & border type with Architectural ceiling / mounting details

G. Sheet metal contractor to provide [internal sound lined] [exterior insulated] plenum, size to match drawings and/or schedule.

2.2 SLOT DIFFUSERS WITH FACTORY-SUPPLIED PLENUMS

A. Manufacturers:

1. Design Basis: Titus
2. Other Acceptable Manufacturers:
   a. Anemostat
   b. Carnes DA
   c. Kruger Series S
   d. Metal Aire Series 5000 or 5500

B. Material: Steel or aluminum except:

1. Where noted otherwise.
2. Required otherwise for fire rating.
3. Diffusers in locker rooms, showers and toilet rooms to be aluminum.

C. Finish: Baked enamel with color selected by Architect. Flat black interior.

D. Inlet Size: Match duct size.

E. Vane Air Pattern: Full 180˚ adjustment.

F. Provide [internally sound lined] [exterior insulated] plenum.

G. Match frame and border types to ceiling system.

2.3 GRILLES AND RECTANGULAR DIFFUSERS

A. Manufacturers:

1. Design Basis: Titus
2. Other Acceptable Manufacturers:
   a. Carnes
   b. Anemostat
   c. Metal Aire

B. Material: Steel or aluminum except:

1. Where noted otherwise.
2. Where required otherwise for fire rating.
3. Grilles and diffusers in locker rooms, showers and toilet rooms to be aluminum.

C. Finish: Baked enamel with color selected by Architect.

D. Refer to Drawings for required performance.

E. Match frame and border types to ceiling system.

2.4 SQUARE CEILING DIFFUSERS:

A. Manufacturers:

1. Design Basis: Titus OMNI
2. Other Acceptable Manufacturers:
    a. Carnes Series SK or SE
    b. Krueger Series S
    c. Metal Aire Series 5000
    d. Anemostat
    e. EH Price Model AMD

B. Material: Steel or aluminum, louvered face furnished with frame type appropriate to installation, except:

1. Where noted otherwise.
2. Where required otherwise for fire rating.
3. Grilles and diffusers in locker rooms, showers and toilet rooms to be aluminum.

C. Finish: Baked enamel except where noted, color by Architect.

D. Louver cones shall be one-piece construction with no corner joints.

E. Directional blow pattern as shown on the drawings and/or as scheduled.

F. Refer to the Drawings for required performance.

G. Match frame and border types to ceiling system.

2.5 SQUARE CEILING RETURN/EXHAUST GRILLES:

A. Manufacturers:

1. Design Basis: Titus series 350(return/exhaust)
2. Other Acceptable Manufacturers:
    a. Carnes model R series
    b. Krueger series 880
    c. Metal Aire
    d. Anemostat
    e. EH Price

B. Material: Steel or aluminum except:

1. Where noted otherwise.
2. Where required otherwise for fire rating.
3. Grilles and diffusers in locker rooms, showers and toilet rooms to be aluminum.

C. Finish: Baked enamel except where noted, color by Architect.

D. Fixed blade (0°, 45°) core return and exhaust registers and grilles.

E. Opposed blade volume control damper return registers, operable from face.

F. Register and grille sizes as shown on drawings and/or as scheduled.

G. Screw holes on surface counter sunk to accept recessed type screws.

H. Refer to the Drawings for required performance.

I. Match frame and border types to ceiling system.

2.6 SIDE –WALL REGISTERS AND GRILLES:

A. Manufacturers:

1. Design Basis: Titus series 300(supply) and series 350(return/exhaust)
2. Other Acceptable Manufacturers:
   a. Carnes model R series
   b. Krueger series 880
   c. Metal Aire series V4000 or H4000
   d. Anemostat
   e. EH Price model NM22S/T or C22S/3

B. Material: Steel or aluminum except:

1. Where noted otherwise.
2. Where required otherwise for fire rating.
3. Grilles and diffusers in locker rooms, showers and toilet rooms to be aluminum.

C. Finish: Baked enamel except where noted, color by Architect.

D. Double deflection type blade supply registers and supply grilles allow deflection adjustment in all direction.

E. Opposed blade volume control damper supply registers, operable from face.

F. Fixed blade (0°, 45°) core return and exhaust registers and grilles.

G. Opposed blade volume control damper return registers, operable from face.

H. Register and grille sizes as shown on drawings and/or as scheduled.

I. Screw holes on surface counter sunk to accept recessed type screws.

J. Refer to the Drawings for required performance.

PART 3 – EXECUTION

3.1 GENERAL

A. Refer to architectural reflected ceiling plan for exact locations and ceiling types.

B. Install grilles, registers and diffusers as shown on drawings, in accordance with manufacturer's written instructions, and with recognized industry practices, to ensure that equipment complies with requirements and serve intended purposes.

C. Coordinate with other work as necessary to interface installation of equipment with other components of systems.

D. Furnish diffusers with equalizing grids where it is not possible to maintain minimum 2 duct diameter straight duct into diffuser. Equalizing grids shall consist of individually adjustable vanes designed for equalizing airflow into diffuser neck and providing directional control of airflow.

E. Unless otherwise indicated, size ductwork drops to diffusers or grilles to match unit collar size.

F. Seal connections between ductwork drops and diffusers/grilles airtight.

G. Blank off unused portion of linear slot diffusers and linear bar diffusers and grilles.

H. Where diffusers, registers and grilles cannot be installed to avoid seeing inside duct, paint inside of duct with flat black paint to reduce visibility.

I. Where registers and/or grilles cannot be installed to avoid seeing above the ceiling, paint the above the ceiling in the area of the register and/or grille with flat black paint to reduce visibility.

J. Exposed mounting screws:

1. Use tamper proof screws in countersunk holes.
2. Point screws to match frame.

K. Install security type devices in accordance with manufacturer's directions.

3.2 INSPECTION

A. Contractor shall examine location where this equipment is to be installed and determine space conditions and notify architect in writing of conditions detrimental to proper and timely completion of the Work.

B. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.3 FIELD QUALITY CONTROL

A. Upon completion of installation of equipment, energized with normal power source, test equipment to demonstrate compliance with requirement. When possible, field correct malfunctioning units, then, retest to demonstrate compliance. Replace units which cannot be satisfactorily corrected. Refer to Testing and Balancing.

END OF SECTION

SECTION 23 40 00

AIR CLEANING

PART 1 - GENERAL

1.1 SUBMITTALS

A. Submit manufacturer's product data including:

1. Media:
   a. Description
   b. Efficiency
   c. Test method
2. Enclosure
3. Support requirements
4. Weight
5. Electrical data
6. Drawings showing dimensions

1.2 QUALITY CONTROL

A. All filters shall be listed as class II per UL Standard 900.

PART 2 - PRODUCTS

2.1 GENERAL

A. Furnish and install the air filters shown on the Drawings. The filters shall be component sections of air handling units or shall be installed in ductwork as indicated on the drawings.

B. Filters shall be as manufactured by: CamFill Farr Filtration Group Viledon Tri-Dim Corp.

C. The filter arrangements shall be as indicated in the schedule on the Drawings.

D. Fans and systems shall not be operated until protective filters have been installed. Filters which are required for operation before the Owner's acceptance of the systems shall be provided by this Contractor.

E. At the time of acceptance by the Owner, the Contractor shall install new filtering media in the high efficiency sections and shall provide new filter media rolls for all of the automatic roll type filter in which the rolls have been operated fifty percent or more of the rated capacity.

F. Air filters for built-up air handling systems shall be a combination of prefilter and after filters made by the same manufacturer and are to be so designed that the holding frames for the cartridge type after filters are installed in the structural frame of the automatic type prefilter.

G. When systems are operated during construction and balancing, prior to turning the installation over to the Owner, the after filter shall be of the dry type having an efficiently of not less than 40% an atmospheric dust by the National Bureau of Standards Dust Spot Test Method.

H. After balancing and prior to acceptance by the Owner each 40% efficient after filter cell shall be replaced with filter of the efficiency specified.

2.2 MEDIUM CAPACITY MERV 8 PLEATED AIR FILTER

A. Filters shall be medium capacity extended surface pleated air filters.

B. Filters shall be available in standard nominal depths of 1", 2", and 4".

C. Filter shall be the Camfil Farr 30/30, or an approved equal.

D. This type of filter is employed as a pre-filter in dry environments.

E. Media shall be 100% synthetic or polyester/cotton blend, mechanical media that does not support microbial growth.

F. Frame shall be a heavy duty, high strength, moisture resistant paperboard with a cross member design that increases filter rigidity and prevents breaching. Frame shall be made with 100% recycled paperboard with an average of 35% post-consumer content. Frame shall be recyclable.

G. Filters shall have a paperboard or expanded metal support grid bonded to the air-exiting side of the filter to maintain pleat uniformity and prevent fluttering. Paperboard and metal support grid shall be recyclable and contain a significant amount of post-consumer and pre-consumer content.

H. Filters shall be MERV 8 in a medium capacity configuration when fully tested in accordance with the ASHRAE 52.2-2007 Test Standard.

I. Initial resistance of filters shall not exceed the following, based on the following face velocities:

Filter Depth	Airflow Velocity	Init Pressure Drop
1”	375 fpm	0.23”w.g
2”	500 fpm	0.31” w.g
4”	500 fpm	0.31” w.g.

J. Filters shall have a recommended maximum final resistance of 1.0" w.g.

2.3 THREE-PLY MERV 8 DEPTH LOADING WIRE-RING-FRAME AIR FILTER

A. Filters shall be high capacity depth-loading wire ring panel or link filter.

B. Filters shall be available in standard nominal depths of 2".

C. Filter shall be the Tri-Dim Tri-Dek 15/40, or an approved equal.

D. This type of filter is used in primary-filtration applications where high moisture resistance is desired and where the lack of room in in the existing air handler limits the use of deeper, more efficient filters.

E. Filters shall be MERV 8 when fully tested in accordance with the ASHRAE 52.2-2007 Test Standard.

F. Initial resistance of filters shall not exceed the following, based on the following face velocity:

Filter Depth	Airflow Velocity	Init Pressure Drop
2”	500 fpm	0.48” w.g

G. Filters shall have a recommended maximum final resistance of 1.0” w.g.

2.4 HIGH PERFORMANCE RIGID-POCKET FILTER

A. Filters shall be high capacity depth-loading rigid pocket filters.

B. Filters shall be available in 18" and 26" pocket depth.

C. Filters shall be the Viledon T-60 and MF-70 products, or approved equals.

D. This type of filter is employed as primary filtration. Typical office/classroom application: MERV 10. Typical lab application: MERV 13.

E. Filter frame shall be high-impact plastic.

F. The filter media shall be manufactured from three distinct layers of organic synthetic fibers and microfibers. The pre-filter layer shall be thermally bonded to prevent fiber shedding and break-off. The micro-fiber layer shall be constructed from synthetic microfibers. Filters containing either urea-extended phenolformaldehyde binders, air-laid microfiberglass, or cotton fibers are not acceptable. The filter media shall be progressively structured to enhance depth loading and to provide lower average static resistance and longer life.

G. The filter media shall be hydrophobic and operate unaffected at relative humidity up to 100% and completely impervious to mechanical (handling) damage.

H. The filter pockets shall be injection molded into a hard polyurethane header to ensure a leak-proof seal. Pockets that are crimped into metal headers are not acceptable.

I. Filter must be supplied with factory-applied closed-cell neoprene gasketing as required for each application (either side-load gasket or down-stream gasket) to prevent air leakage and bypass. Open-cell foam is unacceptable.

J. Pockets shall be self-supporting.

K. The filter shall be fully tested in accordance with the ASHRAE 52.2-2007 Test Standard, and have a MERV Rating and Pressure drop as listed in the following table:

Filter Efficiency	Airflow Velocity	Initial Pressure Drop
MERV 13	500 fpm	0.23" w.g.

L. The filter shall have a documented wet burst strength of no less than 12" w.g.

2.5 HIGH PERFORMANCE EXTENDED SURFACE RIGID CELL

A. Filters shall be high capacity eight-panel "V" bank air filters.

B. Filters shall be available in 12.5" depth.

C. Filter shall be the Viledon MV-Series, or an approved equal.

D. This type of filter is employed as primary-filtration. Typical office/classroom application: MERV 12. Typical lab application: MERV 13.

E. Frame shall be high-impact plastic and shall contain no metal parts.

F. The filter media shall be 100% synthetic and manufactured from two distinct layers of polyester and polypropylene microfibers. The integral pre-filter layer shall be a spunbond polyester which allows the product to operate without

pre-filtration. Filter medias of wet-laid fiberglass, air-laid fiberglass, or single-layer synthetics shall be deemed unacceptable.

G. The filter media shall be hydrophobic and operate unaffected at relative humidity up to 100% and completely impervious to mechanical (handling) damage.

H. The filter media packs shall be potted within the top and bottom horizontal end caps, while the media packs shall be sealed to nonwoven vertical support stabilizers with hot melt glue that creates a molecular bond to the nonwoven vertical supports, eliminating any possibility of internal air filter bypass.

I. The filter shall incorporate a 1" offset to improve air intake performance.

J. The filter shall be independently tested to ASHRAE test standard 52.2 and have a MERV Rating and Pressure drop as listed in the following table:

K. The filter shall have a documented wet burst strength of no less than 12" w.g.

Filter Efficiency	Airflow Velocity	Initial Pressure Drop
MERV 13	500 fpm	0.23" w.g.

2.6 FILTER GAUGES

A. Provide draft gauges for each after-filter and pre-filter for measuring the resistance of the air through the filters.

B. Dwyer Mangehelic Series 2000.

C. Provide mounting bracket, tubing, static pressure tips and vent valves.

D. Gauges shall be neatly mounted on the side of the filter housing.

PART 3 – EXECUTION

3.1 INSPECTION

A. Contractor shall examine location where this equipment is to be installed and determine space conditions and notify architect in writing of conditions detrimental to proper and timely completion of the work.

B. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install filters and hosings where shown, in accordance with manufacturer's written instructions, and with recognized industry practices, to ensure that equipment comply with requirements and service intended purposes.

B. Coordinate with other work as necessary to interface installation of equipment with other components of systems.

C. Provide vertical and horizontal stiffening bars, blank offs, angle flashing as necessary to install built up filter banks in plenum. Gasket or caulk between frame members, flashings, and blank offs.

D. Provide filter gauges to measure pressure drop of all filter banks with Type B or C filters.

E. Electric filters shall be field tested by the filter manufacturer. Filter manufacturer shall provide start up for the filters.

F. Contractor shall provide a filter replacement matrix schedule for each unit indicating size and filter type.

G. Provide and install a clean set of filters in all equipment prior to turn over to owner and one spare filter for each unit. For units with multiple filters provide a spare filter for each type.

END OF SECTION

SECTION 23 52 01

ELECTRIC BOILER

PART 1 - GENERAL

1.1 QUALITY CONTROL

A. ASME Code Symbol Stamps: Provide boilers and safety (pressure relief) valves complying with ASME Code and stamped with appropriate code symbols.

B. Equipment must be approved for installation in the city of New York and one with permanently mounted labels as required in the city of NY.

C. Hydronics Institute Insignia: Provide cast-iron boilers, which have been I-B-R (Institute of Boiler and Radiator Manufacturers) performance rated and have affixed the I-B-R insignia of the Hydronics Institute.

1.2 SUBMITTALS

A. Submit manufacturer's product data.

B. General Requirements for Boiler Suppliers:

1. The Boiler Representative shall be an authorized representative of the Boiler manufacturer and shall have been actively engaged with this manufacturer and in this field of operation for not less than five years. The installing contractor or boiler supplier shall have a service department as a permanent and integral part of his company with 24-hour service available at all times. The contractor or boiler supplier's stocking warehouse shall be no more than 100 miles from the jobsite and stock standard replacement parts for the boiler.
2. The entity responsible for boiler service during the warranty period and his 24 hour service phone number shall be specified in the O & M manual.
3. The boiler representative shall provide a factory trained and factory authorized representative to perform the following:
    a. Verify proper installation of boiler.
    b. Verify proper wiring of controls and for proper operation of the controls in accordance with the boiler listing, manufacturer's directions and Sequence of Operation given in Section 23 09 00.
    c. The above tests must be certified by the factory authorized representative performing the test.
    d. Provide free inspection and adjustment of the burner installation for the full warranty period of the installation.

1.3 WARRANTY

A. 3 year limited tank warranty with 1 year parts warranty.

PART 2 - PRODUCTS

2.1 ELECTRIC BOILER

A. The boiler vessel shall be constructed in accordance with Section IV of the ASME Boiler and Pressure Vessel Code requirements, "H" stamped and registered with the National Board of Boiler and Pressure Vessels. The vessel shall be equipped with a threaded 3" inlet, a threaded 3" outlet, safety valve and drain nozzle connections as required.

B. The vessel shall be enclosed in a rectangular 16-gauge jacket and be completely insulated with a 4" blanket of fiberglass insulation. The assembled electric boiler jacket shall have an acrylic enamel finish. Jacket shall have a full-length hinged access door with key lock for access to heating elements and controls. The assembled boiler shall have a structural steel base for ease of installation and to provide proper support as a permanent base.

C. All field electrical wiring connections to the boiler shall be made to a main terminal block. All internal wiring shall be made to solderless terminal lug wiring connections. Wiring to be color coded or numbered for ease of servicing. All power circuits to heating elements shall be fused with cartridge type fuses having a minimum 100,000 amp interrupting capacity. Operation of the heating elements shall be switched by a three pole magnetic contactors operated by a 120 volt control circuit. The control circuit shall use a built-in transformer to reduce line voltage to 120 volts for operation of the control circuit components. The control circuit shall be fused on the primary side as well as fused and grounded on the secondary side.

D. Temperature control shall be with On-Off thermostats for up to four stages of control. A proportional solid state step control shall be provided to balance heat input to demand on boilers with more than four stages of control. The hot water boiler shall be provided with an adjustable auto reset high limit control and an additional manual reset high limit control (on units with more than two stages of control).

E. The immersion heating elements shall be low watt density with an incoloy outer sheath material for long life. The heating elements shall be a three beam design and mount in individual tank flanges.

F. The electric hot water boiler shall be a complete factory package with the following trim furnished as standard: On-Off pilot switch with pilot light to manually operate the 120 volt control circuit, status pilot light for each stage of operation, preheat switch with pilot light on units above 240 kW, probe type electronic low water cut-off, pressure gauge with cock, temperature indicator, drain valve and an ASME rated pressure relief valve(s). The boiler shall be factory assembled, wired and tested. The entire hot water boiler shall be U.L. Listed and provide a 3 year limited warranty on the vessel and a 1 year limited warranty on parts.

G. Controls: Main Power Disconnect, Fused Disconnect or Automatic Breaker, Ground Fault Detector, Low Temperature Switch, Alarm Bell, Manual Limiting Switches per Step, Flow Switch, Ammeter, Voltmeter, Watt-hour Meter, Time Clock, Safety Door Interlock, High / Low Pressure Switches, Dial Temperature Gauge, Dial Pressure Gauge, Auxiliary Low Water Cut-off (float or probe type), Manual Reset Low Water Cut-off, Auto Air Vent Installed, Vacuum Breaker Installed.

H. Boiler shall be furnished with a BACnet card capable of integrating unit with the BMS.

PART 3 - EXECUTION

3.1 FIELD ASSEMBLY

A. Assemble boiler at the job site in an area designated by the Owner, convenient for installation.

B. Comply with all manufacturers' requirements.

C. Upon completion of assembly, contact Engineer and manufacturer's representative for field observation.

3.2 CLEANING

A. Flush and clean boilers upon completion of installation in accordance with manufacturer's instruction.

B. Include boiler in system for cleaning covered in Section 23 21 13.

3.3 FIELD QUALITY CONTROL

A. Test assembled boiler, boiler piping and accessories, including, but not limited to, safety and safety relief valves, gauges, etc., in accordance with applicable sections of ASME Boiler and Pressure Vessel Code.

B. Arrange with Owner's insurance carrier and State Boiler Inspector for inspection and certification of completed boiler unit.

C. Instruct the Owner's Representative in the proper operation of the boiler in the presence of the Boiler Representative.

3.4 START UP

A. Manufacturer representative shall provide factory trained personnel to start up and checkout boilers. Adjust burner to provide optimum combustion as determined from flue gas analysis.

END OF SECTION

SECTION 23 55 22

HEATING CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. The requirements of the General Conditions, Supplementary Conditions and Division 26 Materials and Methods, Grounding, and Wires and Cables.

1.2 SUMMARY

A. Furnish and install all electric heating cable systems as specified herein and as required for freeze protection, and heating of piping, valves, fittings, drains, etc., as indicated on the Drawings. Division of work shall be as follows:

1. Plumbing and HVAC Contractors shall provide the heating cables and power distribution panels with alarm breakers, and ground fault protection.
2. The Electrical Contractor shall receive the power distribution panels and heating cables from the plumbing Contractor and install and provide power wiring to the heat trace cables.
3. The Temperature Controls Contractor shall provide and install low voltage wiring to the BMS system and assign alarm points for each panel.

1.3 REFERENCE STANDARDS

A. Each electric heating cable system and all components shall be designed, manufactured and tested in accordance with the latest applicable UL, NEMA, and ANSI Standards as well as NFPA 70 - National Electrical Code (NEC) UL508A, with City of New York Amendments.

B. All equipment and material to be furnished and installed on this Project shall be UL or ETL listed and bear an MEA listing as necessary for the City of New York in accordance with the requirements of the authorities having jurisdiction, and suitable for its intended use on this Project.

1.4 SUBMITTALS

A. The following submittal data shall be furnished according to the General Conditions and shall include, but not be limited to:

1. Electric Heat Tracing System including cables, fittings, thermostats, installation details, circuit capacities, operational details, power distribution panel for group control, etc.

B. Submit Shop Drawings for review prior to installation. Shop Drawings shall show the overall system and each circuit, control locations, cable lengths, current required for each circuit and feed points. Provide a summary sheet of the entire system with capacity data for each line, valve, etc. See Section 26 05 02 for Shop Drawing requirements.

1.5 WARRANTY

A. Comply with the requirements of the General Conditions and Section 26 05 02.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Manufacturers:

1. Design Basis: Raychem.
   a. Model: XL-Trace for freeze protection applied between pipe and insulation.
   b. Model: Ice stop for freeze protection applied inside storm drain leaders and down spouts.
2. Other acceptable manufacturers:
   a. Thermon
   b. Nelson
   c. Chromalox

2.2 ELECTRIC HEAT TRACING SYSTEM FOR WATER PIPING

A. Heat tracing system shall be designed to maintain the water temperature within the piping to at least 40ºF, but not greater that 80 ºF, with an ambient temperature of 0ºF ambient, to maintain 40ºF pipe temperature. The piping will be insulated as specified in Division 22 in Section titled “Plumbing Insulation”.

B. Heating cables shall be UL listed electrical heating strips. The electric heat tracing may be a self regulating type of parallel circuit construction consisting of a continuous inner core of self regulating conductive material between two parallel copper bus wires suitable for operation on 120, 208 or 277 Volts, 60 hertz, single phase power. The heat tracing strips shall be capable of being cut to the desired length in the field. Operating energy shall be conserved by the self regulating feature of the heater materials, which automatically controls heat output in proportion to the heat requirement.

1. Self regulating at all points along its length.
2. 90% power reduction from 40ºF pipe temperature to 150º pipe temperature.
3. No overheating if crossed.
4. Provide outer jacket and braided copper shield for use inside roof drain leaders or on piping without a ground path.
5. UL listed and approved for use in New York City.
6. Provide tee, splice, and end seal kits as required by the manufacturer.
7. Provide ambient sensing thermostat in a NEMA 4x enclosure, with three (3) contacts rated at 22 amps each.

C. The heat trace cabling shall be controlled by power distribution panels specifically designed and built dedicated for heat trace systems. Panel shall include a 100A main breaker, rated 480 volt 3 phase, 4 wire with 277 volt branch breakers, 12 circuits with ground fault 30 mA trip, NEMA 4 panel with panel front H-O-A switch and status lights. Two sets of contacts shall be wired to the BMS, one to globally engage/disengage the heat tracing system and one alarm output.

.

PART 3 - EXECUTION

3.1 SCOPE AND REQUIREMENTS

A. Furnish and install a complete electric heating cable system, including but not limited to cable, panels, ambient air sensors, aquastats, and controls, on all water piping, fittings, drains, valves, and valve bonnets as indicated on the Drawings. The Electrical Subcontractor shall coordinate the cable installation with the Mechanical and Plumbing Subcontractors. See drawings for scope and locations.

B. All installation and materials furnished shall meet the NEC requirements and be Underwriters Laboratories listed for the application.

C. The installation and all materials, conductors, conduit, etc. utilized between the electric heating cable system, controls and distribution panels shall be as specified.

D. After the piping has been successfully pressure tested, heating cables shall be installed parallel to the pipe or by spiraling the strip to obtain the heating capacity required. All cables and components shall be installed as recommended by the manufacturer by properly trained personnel using the manufacturer specified tools and procedures and as specified herein. The heating cables shall be banded to the pipe with fiberglass tape per manufacturer recommendations. After the piping has been insulated, appropriate caution signs or markings shall be provided at frequent intervals along the pipeline in accordance with NEC requirements.

E. Heat trace cable shall be installed by a licensed electrician. HVAC or Plumbing contractor shall subcontract this work to a licensed electrician if HVAC contractor is not a licensed electrician.

F. Apply the heat trace cable on the pipe after pressure testing.

1. Do not spiral wrap on pipe.
2. Make one wrap at valves.
3. Secure to pipe with methods approved by manufacturer.

G. Apply “Electrically Traced” signs on outside of insulation.

H. Heat trace shall be sized as follows, based on 0ºF ambient, to maintain 40ºF pipe temperature:

PIPE SIZE	1” INSULATION	2” INSULATION
Less than 2”	3 w/ft.	3 w/ft
2”, 2½”, 3”	5 w/ft	3 w/ft
4”, 5”, 6”	8 w/ft	5 w/ft
8”, 10”, 12”	(2 cable circuits) 8 w/ft ea.	8 w/ft

I. Provide heat tracing on all pipes installed within the intake, relief and exhaust shafts.

J. Provide heat trace on all pipes installed in enclosed perimeter shafts where separated from the exterior only by precast panels.

K. After the piping has been successfully pressure tested, heating cables shall be installed parallel to the pipe or by spiraling the strip to obtain the heating capacity required. All cables and components shall be installed as recommended by the manufacturer by properly trained personnel using the manufacturer specified tools and procedures and as specified herein. The heating cables shall be banded to the pipe with fiberglass tape per manufacturer recommendations. After the piping has been insulated, appropriate caution signs or markings shall be provided at frequent intervals along the pipeline in accordance with NEC requirements.

L. The Electrical Subcontractor shall test all electric heating cable systems for short circuits, grounds and insulation resistance. Test with 1000 VDC to a minimum resistance of 20 mega ohms.

3.2 FIELD TESTING

A. Refer to Section 26 05 03 for additional testing requirements for electric heating cable systems.

END OF SECTION

SECTION 23 56 01

SOLAR THERMAL DEVICES

PART 1 - GENERAL

1.1 SUBMITTALS

A. Submit manufacturer's product data on the following:

1. Solar collectors.
2. Heat Exchanger
3. Drain Back Tank

1.2 RATINGS

A. Provide performance of collectors to be rated in accordance with ANSI/ASHRAE 93-1977.

1.3 WARRANTY

A. Provide manufacturer's standard five years written warranty on collectors.

PART 2 - PRODUCTS

2.1 SOLAR COLLECTORS

A. Manufacturers:

1. Design Basis: SunEarth
   a. ThermoRay model TRB-40.

B. Collector array size and performance:

1. Number of collectors: 7
2. Total gross area: 286.62 square feet
3. Orientation: 0
4. Tilt Angle: 40
5. Collector Field Yield: 80,112.9 kBtu
6. Irradiation onto collector area: 149,826 kBtu
7. Collector efficiency: 53.5%

C. Collectors shall be of the glazed liquid flat plate type.

D. Collectors shall be tested in conformance with ASHRAE 93-2003 and Solar Rating and Certification Corporation (SRCC)100-10, ISO 9806-1 & 9806-2 and have their thermal performance rated according to Solar Rating and Certification Corporation (SRCC) 100-10, and have their thermal performance rated according to SRCC Document RM-1. The collectors shall be certified by SRCC and listed by the International Association of Plumbing and Mechanical Officials (IAPMO).

E. General:

1. The collector dimensions shall be 122.2 inches in length, 51.37 inches in width and 3.25 inches in depth.

2. The collector casing shall be an anodized aluminum extrusion (alloy 6063 T6), minimum thickness 0.060 inch, with an architectural dark bronze finish.
3. The casing shall have notched framewalls for ease of plate removal and reinstallation. Sheet metal screwed fasteners shall be stainless steel (18-8 #10).
4. The backsheet shall be painted textured aluminum not less than 0.014 inch thickness.
5. A 1 inch vent plug shall be installed in each of the four corners of the backsheet to minimize condensation.
6. An integral mounting channel shall allow the solar collector to be mounted without penetration of the extruded aluminum casing.

F. Glazing:

1. The collector glazing shall be one sheet of low iron tempered glass, with a minimum of (0.15625 inch on EP-40-1.5), and a minimum transmissivity of 91 percent (89 on EP-40-1.5). The glazing shall be thermally isolated from the casing by a continuous EPDM gasket. There shall be a continuous secondary silicone seal between the glass and casing capstrip to minimize moisture from entering the casing.

G. Insulation:

1. The insulation shall be foil-faced polyisocyanurate foam sheathing board of a minimum 1 inch thickness, siliconed in place to the aluminum backsheet, covered by low-binder fiberglass of a minimum 1 inch thickness, providing thermal isolation of the foam from the absorber plate. Total thermal resistance shall be a minimum of R-12. The sides and ends of the collector shall be insulated with a minimum of 1 inch foil-faced polyisocyanurate foam sheathing board.

H. Absorber Plate and Piping:

1. The absorber shall consist of an aluminum plate of no less than .017 inch thickness.
2. Risers shall be a minimum of .50inch O.D. copper with a wall thickness of .025 inches on no more than 4.7 inch centers continuously laser welded to the plate.
3. The risers shall be brazed to 1.125 inch O.D. Type M copper manifolds utilizing a copper phosphorous brazing allow with no less than a minimum 5 percent silver content, and conforming to the American Welding Society's BCuP-3 classification.
4. EPDM grommets shall isolate the manifold from the aluminum casing.
5. The absorber plate shall be designed from a 160 psig maximum operating pressure and 400F maximum operating temperature.

I. Absorber Coating And Performance Curve:

1. The absorber coating shall be a moderately-selective black paint with a minimum absorptivity of 95 percent and a maximum emissivity of 5 percent. The instantaneous efficiency of the collector shall have a minimum Y-intercept of 0.753 and a slope no less than -0.735 BTU/ft2.hr. F.

2.2 DRAIN BACK TANK

A. Manufacturers:

1. Design Basis: HTP

B. Construction: 316L stainless steel

C. Provide site glass to monitor water level

D. Warranty: 5 year against leaks

2.3 DOUBLE WALLED BRAZED PLATE HEAT EXCHANGER

A. Manufacturers:

1. Design Basis: Line DW

B. Construction: SS316L stainless steel heating plates
1. Heat exchanger shall be double walled

C. Brazing Materials: Copper

D. Maximum working pressure: 481 psi

E. Maximum Working Temperature: 445 F

PART 3 - EXECUTION

3.1 COLLECTORS

A. Follow manufacturer's published installation instructions.

B. Coordinate with Architectural drawings for mounting requirements.

1. Provide necessary auxiliary support.

C. Coordinate with Control Contractor for the installation of collector temperature sensing element.

END OF SECTION

SECTION 23 57 00

HEAT EXCHANGERS

PART 1 - GENERAL

1.1 QUALITY ASSURANCE

A. ASME construction:

1. Provide exchanger with ASME “U” stamp.
2. Provide inspection certificate.

B. Submittals: Submit manufacturer’s product data.

1. Include the following:
   a. Materials.
   b. Design working pressure and temperature.
   c. Entering and leaving conditions…
   d. Fouling factors.
   e. Flow rates.
   f. Pressure drops.

PART 2 - PRODUCTS

2.1 PLATE AND FRAME HEAT EXCHANGERS

A. Manufacturers:

1. Design Basis: Kelvion.
2. Other Acceptable Manufacturers:
   a. Alfa-Laval
   b. Bell & Gossett
   c. Graham
   d. Tranter

B. Frame Components:

1. Preference will be given to single pass designs with all connections on the fixed cover.

2. The fixed and movable covers shall be of sufficient thickness for the design pressure and code requirements and shall have no welded reinforcements or stiffeners.

3. The carrying and guide bars shall be designed to allow for expansion of at least 15%.

4. The carrying and guide bars guiding system shall be precision manufactured of stainless steel to prohibit corrosion and facilitate movement of the plates. Painted or plated surfaces are not permitted.

5. Entire frame shall be bolted together to allow unit to be field assembled to permit rigging into place. Welding of the frame components is not permitted.

6. Plate and carrying bar design shall permit the removal or access to any plate in the plate pack without the need to remove any other plates.

7. Provide lifting lugs designed to allow lifting of the entire units flooded weight.

8. All steel surfaces shall be thoroughly cleaned and prepared for painting per SSPC-SP1063T, painting over mill scale is not acceptable. All steel components shall be Aliphatic Acrylic Polyurethane coated.

9. The fixed cover and rear support column shall be provided with carbon steel support feet.

C. Connections:

1. Connections equal to or less than 2" shall be stainless steel NPT type.

2. To avoid leakage on port area, studded port design should be provided on heat exchangers with connections greater than 2". Flanged nozzle connections are not acceptable.

3. The connection ports shall be lined with 316 stainless steel liners.

D. Compression Bolts:

1. Compression bolts shall not require special tools and shall be equipped with lock washers at the movable cover to facilitate opening and closing of the unit from the fixed cover.

2. Compression bolts shall be equipped with captive nuts at the fixed cover and threaded nuts at the movable cover. Welding of the nut to the closure bolt is prohibited.

3. Bolts shall be provided with rolled threads to reduce galling and double width hex nuts to adequately distribute the load, plus ball bearing box washers at all critical closing bolts on all units greater than 50" in height.

4. Bolts shall be liberally coated with LUBRIPLATE FML-2 for lubrication and rust prevention, and covered with a plastic protective sleeving for protection from the environment and to prevent bodily injury. Zinc plating is prohibited.

5. The bolting system shall be designed so that only (4) compression bolts are required opening and closing of the unit.

E. Plates:

1. The plate and frame heat exchanger shall consist of pressed type ALLOY 316 to provide the required heat transfer area to meet the operating conditions specified.

2. The heat transfer plates shall be at least the minimum thickness required to satisfy the unit design pressure or the plate thickness specified for the project application.

3. Individual plates shall be pressed from a homogeneous single metal sheet in one step. No multi-stage pressing of one sheet is allowed.

4. Each heat transfer plate to be with herringbone corrugations to optimize heat transfer with nominal pressure loses. Corrugations to be designed to provide support to adjacent plates at evenly distributed support points to allow pressurization of each circuit to a full differential of 1.3 times the design pressure for one hour without buckling or deformation of the heat transfer plates.

5. All plates and gaskets shall be permanently marked to identify quality and material.

6. Each heat transfer plate shall have a built-in self-aligning system to accurately locate the plates in the frame assembly and prevent lateral plate movement and maintain maximum gasket contact under pressure.

7. Plates shall be reinforced on the upper and lower mounting slots to avoid bending hangers on the plates.

8. The plate and frame heat exchanger shall be designed to perform the capacities and pressure drops as shown on the schedule. Plates to be ALLOY 316 with 2B finish and tapered gasket grooves.

9. The plate pack shall be covered with an aluminum shroud in accordance with OSHA.

F. Gaskets:

1. Gaskets shall have relieving grooves to prevent intermixing of fluids and cause leak to flow to outside of unit.

2. One piece molded CLIP-ON gaskets are required and shall fit around both the heat transfer area and the port holes.

3. Preference shall be given to non-glued gasketing systems.

4. If an adhesive is necessary, it shall be compatible with the gasket material and the fluids. The adhesive shall be a 2 component epoxy glue and heat cured.

G. Insulation:

1. Removable insulation with metal shroud.

PART 3 - EXECUTION

3.1 INSTALLATION OF PLATE TYPE HEAT EXCHANGERS

A. Coordinate with piping arrangement so that plates may be removed.

END OF SECTION

SECTION 23 81 19

SELF CONTAINED WATER COOLED AIR CONDITIONING UNITS AND HEAT PUMPS

PART 1 - GENERAL

1.1 WORK INCLUDED

A. Packaged Heat Pumps

1.2 RELATED WORK

A. Section 23 05 13 – Motors and Starters

B. Section 23 05 30 – Electronic Speed Controllers

C. Section 23 09 00 – Building Automation and Automatic Temperature Control Systems

1.3 REFERENCES

A. ARI 430 – Standard for Central Station Air Handling Units.

B. NFPA 90A – Installation of Air Conditioning and Ventilation Systems.

C. ANSI/AFBMA 9 – Load Ratings and Fatigue Life for Ball Bearings.

D. SMACNA – HVAC Duct Construction Standards.

E. ARI 410 – Standard for Forced Circulation Air-Cooling and Air-Heating Coils.

F. ANSI/UL 900 – Test Performance of Air Filter Units.

G. AMCA 301 – Method for Publishing Sound Ratings for Air Moving Devices.

H. ARI 320.

I. ASHRAE 90.1 – Energy Efficiency

1.4 QUALITY ASSURANCE

A. All Self Contained Air Conditioners and Heating Pump Units: Product of manufacturer regularly engaged in production of components who issues complete catalog data on total product offering.

B. Certify capacity, static pressure, fan speed, brake horsepower and selection procedures in accordance with ARI.

C. Air Coils: Certify capacities, pressure drops and selection procedures in accordance with ARI 410-87.

1.5 SUBMITTALS

A. Submit as-built drawings and product data.

B. As-built drawings shall show unit configuration in direction of airflow, and shall indicate assembly and unit dimensions.

C. Product data shall indicate dimensions, weights, capacities, fan performance, motor electrical characteristics, and finishes of materials.

D. Submit product data of filter sizes and quantities, filter performance, and filter frames.

E. Submit manufacturer's installation instructions under provisions of Section 01 __ __.

F. Provide fan curves with specified operating point clearly plotted.

G. Submit sound power levels for air handling unit(s) at scheduled conditions. If unit exceeds sound power levels at scheduled conditions, manufacturer must provide additional sound attenuators.

1.6 OPERATION AND MAINTENANCE DATA

A. Submit operation and maintenance data.

B. Include instructions for lubrication, filter replacement, motor and drive replacement, spare parts lists, and wiring diagrams.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store and protect products under provisions of Section 23 05 03.

B. Store in clean dry place and protect from weather and construction traffic. Handle carefully to avoid damage to components, enclosures, and finish.

1.8 ENVIRONMENTAL REQUIREMENTS

A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Basis of Design: ClimateMaster

2.2 GENERAL

A. Any exceptions to the specifications must be clearly defined. The contractor shall be responsible for any additional expenses that may occur due to any exception made.

B. Factory fabricate draw-thru type units suitable for the scheduled air pressure operation.

C. Factory fabricate units with fan section coil sections filter sections, access sections, as called for on the drawings and in accordance with this specification.

D. Factory fabricate and test air handling units of sizes, capacities, and configuration as indicated and specified. Units shall be fully assembled up to practical shipping limitations. On units not shipped fully assembled, manufacturer shall tag each section to indicate location in direction of airflow to facilitate assembly at the job site. Unit shall be shipped in sections as required to allow delivery and installation in final location.

E. Equipment shall be specifically designed for applications within conditioned interior areas.

F. Filters, threaded female water inlet and outlet connections, threaded female condensate connection, thermostat field interface terminal ship, discharge duct collar and all safety controls shall be furnished and factory installed.

G. Capacities shall be rated in accordance with ARI.

H. Equipment shall be ETL or CSA approved.

I. All equipment shall have decals and labels to aid in servicing and indicate caution areas.

2.3 DUCTED HEAT PUMPS (CLIMATEMASTER MODEL TCH)

A. General:

1. Units shall be supplied completely factory built capable of operating over an entering water temperature range from 20° to 120°F (-6.7° to 48.9°C) as standard. Equivalent units from other manufacturers may be proposed provided approval to bid is given 10 days prior to bid closing. All equipment listed in this section must be rated and certified in accordance with Air-Conditioning, Heating and Refrigeration Institute/International Standards Organization (AHRI/ISO 13256-1). All equipment must be tested, investigated, and determined to comply with the requirements of the standards for Heating and Cooling Equipment UL-1995 for the United States and CAN/CSA-C22.2 NO.236 for Canada, by Intertek Testing Laboratories (ETL). The units shall have AHRI/ISO and ETL-US-C labels.

2. Where required to allow low leaving water temperatures, the jumper wire shall be clipped in accordance with manufacturer's recommendations.

3. All units shall pass a factory acceptance test. The quality control system shall automatically perform factory acceptance test via computer. A detailed report card from the factory acceptance test shall ship with each unit.

B. Cabinet Construction:

1. Horizontal units shall have one of the following air flow arrangements: Left Return/Back Discharge, Left Return/Straight Discharge, Right Return/Back Discharge, Right Return/Straight Discharge as shown on the plans. Units can be field converted without requiring new panels or belts.

2. Compressor section interior surfaces shall be lined with 1/2 inch (12.7mm) thick, 1-1/2 lb/ft3 (24 kg/m3) acoustic type glass fiber insulation. Air handling section interior surfaces shall be lined with 1/2 in (12.7mm) thick, 1-3/4 lb/ft3 (28 kg/m3) foil backed fiber insulation for ease of cleaning. Insulation placement shall be designed in a manner that will eliminate any exposed edges to prevent the introduction of glass fibers into the air stream.

3. Units shall be fabricated from heavy gauge galvanized steel with powder coat finish on front access panels.

4. Standard insulation must meet NFPA Fire Hazard Classification requirements 25/50 per ASTM E84, UL 723, CAN/ULC S102-M88 and NFPA 90A requirements; air erosion and mold growth limits of UL-181; stringent fungal resistance test per ASTM-C1071 and ASTM G21; and shall meet zero level bacteria growth per ASTM G22.

5. Horizontal units to have discharge air duct collar, 1" (25.4mm) or 2"(50.8mm) filter rails with filters factory installed, and factory installed hanger brackets. Vertical units to have discharge air duct collar shipped loose, and 1"(25.4mm) 2"(50.8mm) or 4"(101.6mm) full filter frame with filters factory installed.

6. All units must have an insulated panel separating the fan compartment from the compressor compartment. Units with the compressor in the air stream are not acceptable. Horizontal units shall have factory installed filter rails with filter removal from either side. Vertical units shall have factory installed full filter frame with filter removal from bottom. The contractor shall purchase one spare set of filters and replace factory shipped filters on completion of start-up. Filters shall be standard sizes. If units utilize non-standard filter sizes then the contractor shall provide 12 spare filter sets for each unit.

7. Cabinets shall have separate knockouts on front and sides for entrance of line voltage and low voltage control wiring. All factory-installed wiring passing through factory knockouts and openings shall be protected from sheet metal edges at openings by plastic ferrules. Supply and return water connections shall be copper FPT fittings, connections on both sides (installer to choose side and plug opposite) and shall be securely mounted flush to the cabinet side allowing for connection of a flexible hose without the use of a back-up wrench. Water connections that protrude through the cabinet or require the use of a backup wrench shall not be allowed. Water connections on only one side will not be accepted. All water connections and electrical knockouts must not interfere with the serviceability of unit. Contractor must ensure that units can be easily removed for servicing and coordinate locations of electrical conduit and lights with the electrical contractor.

8. Unit shall be provided with UltraQuiet package shall consist of high technology sound attenuating material that is strategically applied to the compressor and air handling compartment casings and fan scroll in addition to the standard ClimaQuiet system design, to further dampen and attenuate sound transmissions. Compressor is mounted on specially engineered sound-tested isolators.

C. Fan and Motor Assembly:

All units shall have belt-driven single centrifugal fan. Fan motor shall be premium duty, VFD compatible, permanently lubricated with thermal overload protection. Units supplied without permanently lubricated motors must provide external oilers for easy service. The fan and motor assembly must be capable of overcoming the external static pressures as shown on the schedule. Airflow/Static pressure rating of the unit shall be based on a wet coil and a clean filter in place. Ratings based on a dry coil and/or no filter, or on an ESP less than indicated shall NOT be acceptable.

D. Refrigerant Circuits:

1. All units shall contain an EarthPure® (HFC-410A) sealed refrigerant circuit including a high efficiency scroll compressor designed for heat pump operation, a thermostatic expansion valve for refrigerant metering, an enhanced corrugated aluminum lanced fin and rifled copper tube refrigerant to air heat exchanger, reversing valve, coaxial (tube in tube) refrigerant to water heat exchanger, and safety controls including a high pressure switch, low pressure switch (loss of charge), water coil low temperature sensor, and air coil low temperature sensor. Access fittings shall be factory installed on high and low pressure refrigerant lines to facilitate field service. Activation of any safety device shall prevent compressor operation via a microprocessor lockout circuit. The lockout circuit shall be reset at the thermostat or at the contractor supplied disconnect switch. Units that cannot be reset at the thermostat shall not be acceptable.

2. The scroll compressors shall have a dual level vibration isolation system. The compressor(s) will be mounted on specially engineered sound-tested EPDM vibration isolation grommets to a large heavy gauge compressor mounting plate, which is then isolated from the cabinet base with rubber grommets for maximized vibration attenuation. Compressor shall have thermal overload protection. Compressor shall be located in an insulated compartment isolated from air stream to minimize sound transmission.

3. Refrigerant to air heat exchangers shall utilize enhanced corrugated lanced aluminum fins and rifled copper tube construction rated to withstand 625 PSIG (4309 kPa) refrigerant working pressure. Refrigerant to water heat exchangers shall be of copper inner water tube and steel refrigerant outer tube design, rated to withstand 625 PSIG (4309 kPa) working refrigerant pressure and 500 PSIG (3445 kPa) working water pressure. The refrigerant to water heat exchanger shall be “electro-coated” with a low cure cathodic epoxy material a minimum of 0.4 mils thick (0.4 – 1.5 mils range) on all surfaces. The black colored coating shall provide a minimum of 1000 hours salt spray protection per ASTM B117-97 on all external steel and copper tubing. The material shall be formulated without the inclusion of any heavy metals and shall exhibit a pencil hardness of 2H (ASTM D3363-92A), crosshatch adhesion of 4B-5B (ASTM D3359-95), and impact resistance of 160 in-lbs (184 kg-cm) direct (ASTM D2794-93).

4. The unit water circuit is protected by two high pressure switches set at 300 PSI [2067 kPa]. Switches will reset automatically when pressure is reduced. Units that do not have auto-reset water high pressure switches are not acceptable.

5. Refrigerant metering shall be accomplished by thermostatic expansion valve only. Expansion valves shall be dual port balanced type with external equalizer for optimum refrigerant metering. Units shall be designed and tested for operating ranges of entering water temperatures from 20° to 120°F (-6.7° to 48.9°C). Reversing valve shall be four-way solenoid activated refrigerant valve, which shall default to heating mode should the solenoid fail to function. If the reversing valve solenoid defaults to cooling mode, an additional low temperature thermostat must be provided to prevent over-cooling an already cold room.

6. The unit shall be supplied with extended range Insulation option, which adds closed cell insulation to internal water lines, and provides insulation on suction side refrigeration tubing including refrigerant to water heat exchanger.

E. Drain Pan

1. The drain pan shall be constructed of stainless. This corrosion protection system shall meet the stringent 1000 hour salt spray test per ASTM B117. If plastic type material is used, it must be HDPE (High Density Polyethylene) to avoid thermal cycling shock stress failure over the lifetime of the unit. Drain pan shall be fully insulated. Drain outlet shall be located at pan as to allow unobstructed drainage of condensate. Drain outlet for horizontal units shall be connected from pan directly to 3/4" FPT fitting. For vertical units drain pan hose assembly can be connected to either side, drain outlet to be 1"FPT fitting. The unit as standard will be supplied with solid-state electronic condensate overflow protection. Mechanical float switches will NOT be accepted.

F. Valve & Hose Kit Assembly

1. The contractor shall have the option to provide a valve and hose kit assembly provided by the manufacturer in lieu of field provided and installed piping. The contractor shall include explicit reference to the method included in the bid price.
   a. Provide 3 ft long, braided stainless steel, fire-rated hoses complete with adapters. Hose kit shall include the following components already assembled to the hose:

1) Supply hose
   a) "Y" strainer with blowdown valve
   b) Ball valve with PT port
2) Return hose
   a) Automatic flow regulator with PT port
   b) Ball valve

b. All required components as shown on the contract drawings not listed above shall be provided by the contractor and field installed.

G. Electrical:

1. A control box shall be located within the unit compressor compartment and shall contain a 75VA transformer with load side circuit breaker protection, 24 volt activated, 2 or 3 pole compressor contactor, terminal block for thermostat wiring and solid-state controller for complete unit operation. Reversing valve and fan motor wiring shall be routed through this electronic controller. Units shall be name-plated for use with time delay fuses or HACR circuit breakers. Unit controls shall be 24 Volt and provide heating or cooling as required by the remote thermostat/sensor. Two compressor units shall have a solid-state time delay relay and random start to prevent both compressors from starting simultaneously.

2. Disconnect Switch, Non-Fused, classified as motor disconnect.

H. Solid State Control System (CXM):

1. Units shall have a solid-state control system. Units utilizing electro-mechanical control shall not be acceptable. The control system microprocessor board shall be specifically designed to protect against building electrical system noise contamination, EMI, and RFI interference. The control system shall interface with a heat pump type thermostat. The control system shall have the following features:

   a. Anti-short cycle time delay on compressor operation.
   b. Random start on power up mode.
   c. Low voltage protection.
   d. High voltage protection.
   e. Unit shutdown on high or low refrigerant pressures.
   f. Unit shutdown on low water temperature.
   g. Condensate overflow electronic protection.
   h. Option to reset unit at thermostat or disconnect.
   i. Automatic intelligent reset. Unit shall automatically reset the unit 5 minutes after trip if the fault has cleared. If a fault occurs 3 times sequentially without thermostat meeting temperature, then lockout requiring manual reset will occur.
   j. Ability to defeat time delays for servicing.
   k. Light emitting diode (LED) on circuit board to indicate high pressure, low pressure, low voltage, high voltage, low water/air temperature cut-out, condensate overflow, and control voltage status.
   l. The low-pressure switch shall not be monitored for the first 120 seconds after a compressor start command to prevent nuisance safety trips.
   m. 24V output to cycle a motorized water valve or other device with compressor contactor.
   n. Unit Performance Sentinel (UPS). The UPS warns when the heat pump is running inefficiently.
   o. Water coil low temperature sensing (selectable for water or anti-freeze).
   p. Air coil low temperature sensing.

I. MPC (Multiple Protocol Control) interface system

1. Units shall have all the features listed above (either CXM or DXM) and the control board will be supplied with a Multiple Protocol interface board. Available protocols are BACnet MS/TP, Modbus, or Johnson Controls N2. The choice of protocol shall be field selectable/changeable via the use of a simple selector switch. Protocol selection shall not require any additional programming or special external hardware or software tools. This will permit all units to be daisy chain connected by a 2-wire twisted pair shielded cable. The following points must be available at a central or remote computer location:

    a. Space temperature
    b. Leaving water temperature
    c. Discharge air temperature
    d. Command of space temperature setpoint
    e. Cooling status
    f. Heating status
    g. Low temperature sensor alarm
    h. Low pressure sensor alarm
    i. High pressure switch alarm
    j. Condensate overflow alarm
    k. Hi/low voltage alarm
    l. Fan “ON/AUTO” position of space thermostat as specified above
    m. Unoccupied/occupied command
    n. Cooling command
    o. Heating command
    p. Fan “ON/AUTO” command
    q. Fault reset command
    r. Itemized fault code revealing reason for specific shutdown fault (any one of 7)

2. Provides a 75VA control transformer with load side short circuit and overload protection via a built in circuit breaker.

J. Warranty:

1. Manufacturer shall warranty equipment for a period of 12 months from start up or 18 months from shipping (which ever occurs first).

2. Extended 4-year compressor warranty covers compressor for a total of 5 years.

3. Extended 4-year refrigeration circuit warranty covers coils, reversing valve, expansion valve and compressor for a total of 5 years.

4. Extended 4-year control board warranty covers the CXM/DXM2 control board for a total of 5 years.

2.4 DUCTED VERTICAL STACK HEAT PUMPS (CLIMATEMASTER MODEL TSL – GUEST & SUITE ROOM UNITS)

A. General:

1. Units shall be supplied completely factory built capable of operating over an entering water temperature range from 20° to 120°F (-6.7° to 48.9°C) as standard. Equivalent units from other manufacturers may be proposed provided approval to bid is given 10 days prior to bid closing. All equipment listed in this section must be rated and certified in accordance with Air-Conditioning, Heating and Refrigeration Institute/International Standards Organization (AHRI / ISO 13256-1). All equipment must be tested, investigated, and determined to comply with the requirements of the standards for Heating and Cooling Equipment UL-1995 for the United States and CAN/CSA-C22.2 NO.236 for Canada, by Intertek Testing Laboratories (ETL). The units shall have AHRI / ISO and ETL-US-C labels.

2. Where required to allow low leaving water temperatures, the jumper wire shall be clipped in accordance with manufacturer's recommendations.

3. All units shall pass a factory acceptance test. The quality control system shall automatically perform factory acceptance test via computer. A detailed report card from the factory acceptance test shall ship with each unit.

B. Cabinet Construction:

1. The cabinet construction is for ducted top discharge. The cabinet panels shall be fabricated from heavy gauge galvanized steel. The rigid one-piece cabinet assembly shall be constructed so that it is self-supporting, and can be installed prior to the chassis arrival, and to be able to avoid damage during construction. Top, base, fan deck, and other metal structural parts are to be 16 gauge construction, while exterior panels to be 20 gauge; unit further strengthened by structural breaks at corners. Cabinet shall have a full panel over the chassis opening for structural rigidity of the cabinet; no "open" top or "open" bottom designs allowed.

2. The cabinet shall contain a secondary drain pan fully insulated with a pressure differential drain trap for field connection to the condensate riser pipe, and guide rails for the slide in refrigeration chassis. Drain pan to be rubber grommet mounted to provide isolation of chassis from the cabinet. Drain pan(s) shall be easily accessible for cleaning. All interior surfaces shall be lined with 1/2 inch (12.7mm) thick, 1-1/2 lb/ft3 (24 kg/m3) acoustic type fiberglass insulation. All insulation shall be foil faced and have exposed edges butted up to flanges to prevent the introduction of glass fibers into the air stream.

3. Standard insulation must meet NFPA Fire Hazard Classification requirements 25/50 per ASTM E84, UL 723, CAN/ULC S102-M88 and NFPA 90A requirements; air erosion and mold growth limits of UL-181; stringent fungal resistance test per ASTM-C1071 and ASTM G21; and shall meet zero level bacteria growth per ASTM G22.

4. Isolation pad attached to bottom of cabinet for best sound attenuation.

5. 2 inch (50mm) filter holder with 2" (50mm) thick fiberglass throwaway filter.

6. Cabinet arrangements shall allow riser piping on any one of the three sides of the cabinet not used for the chassis access. Cabinet to be top ducted. Ductwork to be field fabricated. Return K.O. to be removed from panel behind the filter. Field shall configure cabinets by removing factory Riser knockouts per model configuration shown on plans. Cabinet design shall allow a full height base board (4.50 inches/114mm) beneath the return air panel. The cabinet shall contain an easily removable motor/blower assembly.

7. Factory to provide dust protection, includes capping top opening and leaving K.O. in panel behind filter (installer to remove both).

8. Electrical connections are direct into the control compartment through top of cabinet.

9. Low voltage 15, 25, or 35 foot (572, 762, or 1,067 cm) wire harness (whip) with molex-type connector for connection to remote mounted thermostat.

10. Premium automotive grade rubber seal between cabinet inner panel and chassis.

11. Risers supply, return, and insulated condensate water risers will ship separate. Risers shall be type M copper. Riser length up to 120" (305cm) is standard. Supply and return risers have integral internal piping including ball valves (for shut off purposes at unit). Risers and piping shall be factory pressure tested to check for leaks. Field installed hose kits are required to connect the chassis piping to the cabinet ball valve. The condensate riser shall be insulated with 3/8" (9.5mm) Armaflex type insulation. The top of each riser shall be deeply swaged (3 in./76.2mm) to accept connection to the riser above/below, allowing for a floor to floor dimensional variance of ± one inch (25.4mm). Risers are shipped loose so complete riser stack can be constructed, pressure tested, and filled prior to cabinet placement. Units not having swaged riser-piping connections shall not be acceptable. Couplings and trim pieces shall not be allowed.

C. Blower and Motor Assembly:

1. The cabinet shall contain a removable motor/blower assembly. Units shall have a direct drive centrifugal fblower. Constant Volume (CV) variable speed ball bearing type motor. The fan motor shall provide soft starting, maintain constant CFM over its static operating range and provide airflow adjustment in 25 CFM increments via its control board. The fan motor shall be isolated from housing by rubber grommets. The motor shall be permanently lubricated and have thermal overload protection. A special dehumidification mode shall be provided to allow lower airflows in cooling for better dehumidification. The dehumidification mode may be constant or automatic (humidistat controlled).

D. Chassis:

1. The chassis, which incorporates the air coil, water coil, drain pan with solid-state electronic condensate overflow protection, compressor, and electrical components shall be easily installed for quick jobsite installation and future servicing purposes. The slide in chassis shall have insulated panels surrounding the compressor. Compressors are not in the air stream. The chassis base shall be fabricated from heavy gauge galvanized steel formed to match the slide in rails of the cabinet. Units shall have a factory installed 1 inch (25.4mm) thick filter bracket and throwaway type glass fiber filter. Furnish one spare set of filters.

2. UltraQuiet package shall consist of the standard double isolation of the compressor plus sound attenuating compressor blanket applied to the compressor. All sheet metal surrounding the compressor shall have high density sound attenuating material with STC rating of 26 per ASTM E-90 and then covered with fiberglass insulation.

3. Rib relay replaces contactor for models 09 through 18. Eliminates contactor "click" when first energized.

4. VFLow®The unit will be supplied with internally factory mounted modulating water valve with delta T control. The factory built-in valve shall modulate water flow through unit based on a field adjustable water temperature difference between the entering and leaving water. The valve shall automatically adjust for operating mode, source water temperature and variations in external head pressure. The valve will also act as a shut-off valve to prevent water flow through the unit when the unit is not activated and will have a minimum position capability.

5. Water connections between chassis and the cabinet shall be accomplished via a hose kit consisting of Kevlar-reinforced EPDM core hose surrounded by a stainless-steel braid. Hose kit shall have brass fittings with stainless-steel ferrules. AHH hose ends shall be solid External MPT which connects to mating fitting on cabinet shut off ball valve(s), and Internal NPSM (National Pipe Straight Mechanical) swivel end with fiber or EPDM washer which connects to mating threaded end connection on chassis. AHU hose ends shall be Internal NPSM (National Pipe Straight Mechanical) swivel end with fiber or EPDM washer which connects to mating threaded end connection on chassis. The hose kit shall be rated for 400 psi (2756 kPa) design working pressure.

E. Refrigerant Circuit:

1. All units shall contain a HFC-410A sealed refrigerant circuit including a high efficiency scroll or rotary compressor designed for heat pump operation, a thermostatic expansion valve for refrigerant metering, an enhanced corrugated aluminum lanced fin and rifled copper tube refrigerant to air heat exchanger, reversing valve, coaxial (tube in tube) refrigerant to water heat exchanger, and safety controls including a high pressure switch, low pressure switch (loss of charge), water coil low temperature sensor, and air coil low temperature sensor. Access fittings shall be factory installed on high and low pressure refrigerant lines to facilitate field service. Activation of any safety device shall prevent compressor operation via a microprocessor lockout circuit. The lockout circuit shall be reset at the thermostat or at the contractor supplied disconnect switch. Units that cannot be reset at the thermostat shall not be acceptable.

2. Hermetic compressors shall be internally sprung and externally isolated. The compressor shall have a dual level vibration isolation system. The compressor will be mounted on specially engineered sound-tested EPDM vibration isolation grommets to a large heavy gauge compressor base pan, which is then isolated from the cabinet by resting on condensate drain pan which is isolated by grommets for maximized vibration attenuation. All units (except units with rotary compressors) shall include a discharge muffler to further enhance sound attenuation. Compressor shall have thermal overload protection.

3. Refrigerant to air heat exchangers shall utilize enhanced corrugated lanced aluminum fins and rifled copper tube construction rated to withstand 625 PSIG (4309 kPa) refrigerant working pressure. Copper hairpins are tin electroplated for added protection from formicary corrosion.

4. Refrigerant to water heat exchangers shall be of copper inner water tube and steel refrigerant outer tube design, rated to withstand 625 PSIG (4309 kPa) working refrigerant pressure and 500 PSIG (3445 kPa) working water pressure. The refrigerant to water heat exchanger shall be “electro-coated” with a low cure cathodic epoxy material a minimum of 0.4 mils thick (0.4 – 1.5 mils range) on all surfaces. The black colored coating shall provide a minimum of 1000 hours salt spray protection per ASTM B117-97 on all external steel and copper tubing. The material shall be formulated without the inclusion of any heavy metals and shall exhibit a pencil hardness of 2H (ASTM D3363-92A), crosshatch adhesion of 4B-5B (ASTM D3359-95), and impact resistance of 160 in-lbs (184 kg-cm) direct (ASTM D2794-93).

5. Refrigerant metering shall be accomplished by thermostatic expansion valve only. Expansion valves shall be dual port balanced types with external equalizer for optimum refrigerant metering. Units shall be designed and tested for operating ranges of entering water temperatures from 20° to 120°F (-6.7° to 48.9°C). Reversing valve shall be four-way solenoid activated refrigerant valve, which shall default to heating mode should the solenoid fail to function. If the reversing valve solenoid defaults to cooling mode, an additional low temperature thermostat must be provided to prevent over-cooling an already cold room.

6. The unit will be supplied with internally factory mounted two-way water valve for variable speed loop pumping requirements. Valve to be normally closed type. Water circuit will have factory installed high pressure switch located between MWV and Heat Exchanger.

7. The unit will be supplied with internally factory mounted automatic water flow regulators.

F. Cabinet Drain Pan:

1. The drain pan shall be constructed of stainless steel and have a powder coat paint application to further inhibit corrosion. This corrosion protection system shall meet the stringent 1000 hour salt spray test per ASTM B117. Drain pan to be isolated from cabinet with four EPDM vibration isolation grommets. Drain pan shall be fully insulated. Drain pan shall have side rails that chassis slides in and out on for ease of installation. Drain pan shall have at a minimum a doubled sloped surface to allow positive drainage to the outlet opening, which shall be at the lowest level of the entire pan surface. Drain outlet shall have factory installed rubber hose that forms trap inside of cabinet. The cabinet drain pan as standard will be supplied with solid-state electronic condensate overflow protection.

G. Hose Kit

1. Water connections between chassis and the cabinet shall be accomplished via a hose kit consisting of Kevlar-reinforced EPDM core hose surrounded by a stainless-steel braid. The hose kit shall be rated for 400 psi (2756 kPa) design working pressure. This hose kit accessory is required for each cabinet, AHH for union cap valve and AHU for sweat valve:

H. Cabinet Stand

1. Cabinet stands shall be 16 gauge galvanized steel construction. Stand shall bolt to the bottom of the cabinet.

2. A neoprene isolation pad shall be attached to the bottom of the cabinet stand.

3. Stand height shall be coordinated with mounting height of the return air panel to ensure cabinet and chassis are fully accessible through return air panel face.

I. Electrical:

1. A control compartment shall be located within the chassis and shall contain a 50VA transformer with load side circuit breaker, 24 volt activated, 2 pole compressor contactor, relay and solid-state controller for complete unit operation. Reversing valve and fan motor wiring shall be routed through this electronic controller. Units shall be name-plated for use with time delay fuses or HACR circuit breakers. Unit controls shall be 24 Volt and provide heating or cooling as required by the remote thermostat/sensor. A control compartment shall be located within the cabinet and shall contain a terminal block for high voltage connections. All electrical connections between the chassis and cabinet shall be made via locking quick-connects.

2. Disconnect Switch, Non-Fused, classified as motor disconnect.

J. Solid State Control System (CXM):

1. Units shall have a solid-state control system. Units utilizing electro-mechanical control shall not be acceptable. The control system microprocessor board shall be specifically designed to protect against building electrical system noise contamination, EMI, and RFI interference. The control system shall interface with a heat pump type thermostat. The control system shall have the following features:

a. Anti-short cycle time delay on compressor operation.
b. Random start on power up mode.

c. Low voltage protection.
d. High voltage protection.
e. Unit shutdown on high or low refrigerant pressures.
f. Unit shutdown on low water temperature.
g. Condensate overflow electronic protection.
h. Option to reset unit at thermostat or disconnect.
i. Automatic intelligent reset. Unit shall automatically reset the unit 5 minutes after trip if the fault has cleared. If a fault occurs 3 times sequentially without thermostat meeting temperature, then lockout requiring manual reset will occur.
j. Ability to defeat time delays for servicing.
k. Light emitting diode (LED) on circuit board to indicate high pressure, low pressure, low voltage, high voltage, low water/air temperature cut-out, condensate overflow, and control voltage status.
l. The low-pressure switch shall not be monitored for the first 120 seconds after a compressor start command to prevent nuisance safety trips.
m. 24V output to cycle a motorized water valve or other device when compressor relay is active.
n. Unit Performance Sentinel (UPS). The UPS warns when the heat pump is running inefficiently.
o. Water coil low temperature sensing (selectable for water or antifreeze).
p. Air coil low temperature sensing.

K. MPC (Multiple Protocol Control) interface system

1. Units shall have all the features listed above (either CXM or DXM2) and the control board will be supplied with a Multiple Protocol interface board. Available protocols are BACnet MS/TP, Modbus, or Johnson Controls N2. The choice of protocol shall be field selectable/changeable via the use of a simple selector switch. Protocol selection shall not require any additional programming or special external hardware or software tools. This will permit all units to be daisy chain connected by a 2-wire twisted pair shielded cable. The following points must be available at a central or remote computer location:

a. Space temperature
b. Leaving water temperature
c. Discharge air temperature
d. Command of space temperature setpoint
e. Cooling status
f. Heating status
g. Low temperature sensor alarm
h. Low pressure sensor alarm
i. High pressure switch alarm
j. Condensate overflow alarm
k. Hi/low voltage alarm
l. Fan “ON/AUTO” position of space thermostat as specified above
m. Unoccupied/occupied command
n. Cooling command
o. Heating command
p. Fan “ON/AUTO” command
q. Fault reset command
r. Itemized fault code revealing reason for specific shutdown fault (any one of 7). This option also provides the upgraded 75VA control transformer with load side short circuit and overload protection via a built in circuit breaker.

L. Return Panel:

1. The return air panel shall be architecturally designed, acoustic type, flush mounted with hinged door for easy

and quick access to filter and unit interior. Chassis shall be easily removed. The hinged return panel shall be made of heavy gauge die formed galvanized steel with a powder coat finish. Return air panels that protrude from wall more than 7/8 inch (22mm) are not acceptable.

2. Panel shall be provided with a custom finish. Coordinate with architect for color match.

3. Provide style “G” return air panel with frame for recessing cabinet 5 inches(127mm) or more behind finished wall.

4. Panel shall have keyed locks to prevent users from tampering with units.

M. Warranty:

1. Manufacturer shall warranty equipment for a period of 12 months from start up or 18 months from shipping (which ever occurs first).

2. Extended 4-year compressor warranty covers compressor for a total of 5 years.

3. Extended 4-year refrigeration circuit warranty covers coils, reversing valve, expansion valve and compressor for a total of 5 years.

4. Extended 4-year control board warranty covers the CXM/DXM2 control board for a total of 5 years.

2.5 CONSOLE HEAT PUMPS (CLIMATEMASTER MODEL TRC)

A. General:

1. Units shall be supplied completely factory built capable of operating over an entering water temperature range from 20° to 120°F (-6.7° to 48.9°C) as standard.

2. Where required to allow low leaving water temperatures, the jumper wire shall be clipped in accordance with manufacturer’s recommendations.

3. All equipment listed in this section must be rated and certified in accordance with Air-Conditioning, Heating and Refrigeration Institute/International Standards Organization (AHRI/ISO 13256-1).

4. All equipment must be tested, investigated, and determined to comply with the requirements of the standards for Heating and Cooling Equipment UL-1995 for the United States and CAN/CSA-C22.2 NO.236 for Canada, by Intertek Testing Laboratories (ETL). The units shall have AHRI/ISO and ETL-US-C labels.

5. All units shall pass a factory acceptance test. The quality control system shall automatically perform factory acceptance test via computer. A detailed report card from the factory acceptance test shall ship with each unit. Failed units shall not be shipped to the site.

B. Basic Construction:

1. Console units shall have one of the following air flow and piping arrangements: Front Inlet/Right-hand Piping; Front Inlet/Left-hand piping; Bottom Inlet/Right-hand piping; or Bottom Inlet/Left-hand piping as shown on the plans. If units with these arrangements are NOT used, the contractor is responsible for any extra costs

incurred by other trades. If other arrangements make servicing difficult, the contractor must provide access panels and clear routes to ease service. Architect/Engineer must approve any changes in layout.

2. The cabinet, wall mounted back wrapper and subbase shall be constructed of heavy gauge galvanized steel with a baked polyester powder coat paint finish. Corrosion protection system shall meet the stringent 1000 hour salt spray test per ASTM B117. Color will be Polar Ice. Both sides of the steel shall be painted for added protection. Additionally, the wall mounted back wrapper shall have welded corner bracing. The easily removable cabinet enclosure allows for easy service to the chassis, piping- and control compartments.

3. All interior surfaces shall be lined with 1/4 inch (6.4mm) thick, 2 lb/ft3 (32 kg/m3) acoustic flexible blanket type glass fiber insulation with a non-woven, anti-microbial treated mat face. Insulation placement shall be designed in a manner that will eliminate any exposed edges to prevent the introduction of glass fibers into the air stream. Standard insulation must meet NFPA Fire Hazard Classification requirements 25/50 per ASTM E84, UL 723, CAN/ULC S102-M88 and NFPA 90A requirements; air erosion and mold growth limits of UL-181; stringent fungal resistance test per ASTM-C1071 and ASTM G21; and shall meet zero level bacteria growth per ASTM G22.

4. The cabinet shall have a 30º sloped top with aluminum rigid bar type discharge grille. Aluminum discharge grille shall be anodized charcoal grey in color including hinged control door. Cabinet shall have rounded edges (0.325 inch / 8.255 mm minimum radius) on all exposed corners for safety and aesthetic purposes.

5. Return Air Filter shall be 1" (25.4mm) fiberglass disposable type media for bottom return units (units with sub-base) or 1/8" (3.2mm) permanent cleanable type media for front return type units.

6. The unit shall be provided with a keyed lock on the control access door.

7. The unit shall include a front return air grille integrally stamped into Cabinet (subbase not required).

8. UltraQuiet package shall consist of high technology sound attenuating material that is strategically applied to the compressor and compressor compartment in addition to the standard ClimaQuiet system design, to further dampen and attenuate sound transmissions. Compressor is mounted on specially engineered sound-tested EPDM isolators.

C. Fan and Motor Assembly:

1. Fan and motor assembly shall be assembled on a slide out fan deck with quick electrical disconnecting means to provide and facilitate easy field servicing. The fan motor shall be multi-speed, permanently lubricated, PSC type, with internal thermal overload protection. Units supplied without permanently lubricated motors must provide external oilers for easy service. The fan motor shall include a torsionally flexible motor mounting system or saddle mount system with resilient rings to inhibit vibration induced high noise levels associated with "hard wire belly band" motor mounting. The airflow rating of the unit shall be based on a wet coil and a clean filter in place.

D. Refrigerant Circuit:

1. All units shall contain HFC-410A sealed refrigerant circuit including a high efficiency rotary compressor designed for heat pump operation, a thermostatic expansion valve for refrigerant metering, an enhanced

corrugated aluminum lanced fin and rifled copper tube refrigerant to air heat exchanger, reversing valve, coaxial (tube in tube) refrigerant to water heat exchanger, and safety controls including a high pressure switch, low pressure switch (loss of charge), water coil low temperature sensor, and air coil low temperature sensor. Access fittings shall be factory installed on high and low pressure refrigerant lines to facilitate field service. Activation of any safety device shall prevent compressor operation via a microprocessor lockout circuit. The lockout circuit shall be reset at the thermostat or at the optional disconnect switch.

2. Hermetic compressors shall be internally sprung. The compressor will be mounted on specially engineered sound-tested EPDM vibration isolation grommets for maximized vibration attenuation. Compressor shall have thermal overload protection. Compressor shall be located in an insulated compartment away from air stream to minimize sound transmission.

3. Refrigerant to air heat exchangers shall utilize enhanced corrugated lanced aluminum fins and rifled copper tube construction rated to withstand 625 PSIG (4309 kPa) refrigerant working pressure. Refrigerant to water heat exchangers shall be of copper inner water tube and steel refrigerant outer tube design, rated to withstand 625 PSIG (4309 kPa) working refrigerant pressure and 500 PSIG (3445 kPa) working water pressure. The refrigerant to water heat exchanger shall be “electro-coated” with a low cure cathodic epoxy material a minimum of 0.4 mils thick (0.4 – 1.5 mils range) on all surfaces. The black colored coating shall provide a minimum of 1000 hours salt spray protection per ASTM B117-97 on all external steel and copper tubing. The material shall be formulated without the inclusion of any heavy metals and shall exhibit a pencil hardness of 2H (ASTM D3363-92A), crosshatch adhesion of 4B-5B (ASTM D3359-95), and impact resistance of 160 in-lbs (184 kg-cm) direct (ASTM D2794-93).

4. Refrigerant metering shall be accomplished by thermostatic expansion valve only. Expansion valves shall be dual port balanced type with external equalizer for optimum refrigerant metering. Units shall be designed and tested for operating ranges of entering water temperatures from 20° to 120°F (-6.7° to 48.9°C). Reversing valve shall be four-way solenoid activated refrigerant valve, which shall default to heating mode should the solenoid fail to function. If the reversing valve solenoid defaults to cooling mode, an additional low temperature thermostat must be provided to prevent over-cooling an already cold room.

5. The unit will be supplied with internally factory mounted two-way water valve for variable speed pumping requirements. A factory-mounted or field-installed high pressure switch shall be installed in the water piping to disable compressor operation in the event water pressures build due to water freezing in the piping system.

6. The unit will be supplied with internally factory mounted automatic water flow regulators.

E. Piping:

1. Water piping shall terminate in the same location regardless of the connection and valve options. Threaded MPT copper fittings.

F. Valve & Hose Kit Assembly

1. Provide 1 ft long, braided stainless steel, fire-rated hoses complete with adapters. Hose kit shall include the following components already assembled to the hose:

a. Supply hose
   1) "Y" strainer with blowdown valve
   2) Ball valve with PT port
b. Return hose
   1) Automatic flow regulator with PT port
   2) Ball valve

2. All required components as shown on the contract drawings not listed above shall be provided by the contractor and field installed

G. Drain Pan:

1. The drain pan shall be constructed of stainless steel and have a powder coat paint application to further inhibit corrosion. This corrosion protection system shall meet the stringent 1000 hour salt spray test per ASTM B117Drain pan shall be insulated. Drain outlet shall be located at pan as to allow complete and unobstructed drainage of condensate. The unit as standard will be supplied with solid-state electronic condensate overflow protection.

H. Electrical:

1. Unit control shall be located under the hinged control door in the sloped top grille. Operating control shall consist of push buttons to select mode of operation "OFF", "HEAT," "COOL," "AUTO", Fan "AUTO" (fan cycles with compressor), Fan "ON" (continuous fan), Fan "LO" (low speed fan), and Fan "HI" (high speed fan). Temperature adjustment shall be accomplished via two push buttons, one labeled with an arrow up, and the other labeled with an arrow down. Control shall include an LCD display for display of temperature and setpoint.

2. A control box shall be located above the unit compressor compartment and shall contain operating controls as outlined in the paragraph above, 24VAC transformer, double-pole compressor relay, and solid-state controller for complete unit operation. Reversing valve and fan motor wiring shall be routed through this electronic controller. Units shall be name-plated for use with time delay fuses or HACR circuit breakers. A unit-mounted digital thermostat with a remote sensor measuring return air temperature shall control the compressor operation for heating and cooling. Field can configure digital ACO unit mounted thermostat for MCO operation, F or C temperature reading, and offset.

3. Provisions for remote thermostat (single fan speed).

4. Disconnect Switch, Non-Fused.

I. Solid State Control System (CXM):

1. Units shall have a solid-state control system. Units utilizing electro-mechanical control shall not be acceptable. The control system microprocessor board shall be specifically designed to protect against building electrical system noise contamination, EMI, and RFI interference. The control system shall interface with a heat pump type thermostat. The control system shall have the following features:

   a. Anti-short cycle time delay on compressor operation.
   b. Random start on power up mode.

c. Low voltage protection.
d. High voltage protection.
e. Unit shutdown on high or low refrigerant pressures.
f. Unit shutdown on low water temperature.
g. Condensate overflow electronic protection.
h. Option to reset unit at thermostat or disconnect.
i. Automatic intelligent reset. Unit shall automatically reset the unit 5 minutes after trip if the fault has cleared. If a fault occurs 3 times sequentially without thermostat meeting temperature, then lockout requiring manual reset will occur.
j. Ability to defeat time delays for servicing.
k. Light emitting diode (LED) on circuit board to indicate high pressure, low pressure, low voltage, high voltage, low water/air temperature cut-out, condensate overflow, and control voltage status.
l. The low-pressure switch shall not be monitored for the first 120 seconds after a compressor start command to prevent nuisance safety trips.
m. 24V output to cycle a motorized water valve or other device with compressor contactor.
n. Unit Performance Sentinel (UPS). The UPS warns when the heat pump is running inefficiently.
o. Water coil low temperature sensing (selectable for water or anti-freeze).
p. Air coil low temperature sensing.

J. MPC (Multiple Protocol Control) interface system:

1. Units shall have all the features listed above (either CXM or DXM) and the control board will be supplied with a Multiple Protocol interface board. Available protocols are BACnet MS/TP, Modbus, or Johnson Controls N2. The choice of protocol shall be field selectable/changeable via the use of a simple selector switch. This will permit all units to be daisy chain connected by a 2-wire twisted pair shielded cable. The following points must be available at a central or remote computer location:

a. space temperature
b. leaving water temperature
c. discharge air temperature
d. command of space temperature setpoint
e. cooling status
f. heating status
g. low temperature sensor alarm
h. low pressure sensor alarm
i. high pressure switch alarm
j. condensate overflow alarm
k. hi/low voltage alarm
l. fan “ON/AUTO” position of space thermostat as specified above
m. unoccupied/occupied command
n. cooling command
o. heating command
p. fan “ON/AUTO” command
q. fault reset command
r. itemized fault code revealing reason for specific shutdown fault (any one of 7)

2. This option also provides the upgraded 75VA control transformer with load side short circuit and overload protection via a built in circuit breaker.

K. Warranty:

1. Climate Master shall warranty equipment for a period of 12 months from start up or 18 months from shipping (which ever occurs first).

2. Extended 4-year compressor warranty covers compressor for a total of 5 years.

3. Extended 4-year refrigeration circuit warranty covers coils, reversing valve, expansion valve and compressor for a total of 5 years.

4. Extended 4-year control board warranty covers the CXM/DXM control board for a total of 5 years.

PART 3 - EXECUTION

3.1 GENERAL

A. Assemble and install in accordance with manufacturers written installation instructions and details on drawings.

B. Coordinate duct, piping and electrical work so as to provide access to unit for maintenance and filter replacement and coil removal with minimum disturbance of piping.

C. Prior to unit start-up all controls shall be installed and tested.

D. Prior to initial start-up and for system testing install air filters to protect the unit and ductwork from dirt and debris. After the system has been tested and prior to turning the system over to the Owner, replace the pre-filters with new, clean filters as specified.

E. Prior to turning the system over to the Owner, all damages incurred during shipping, storing and installing shall be repaired. These repairs shall be sufficient to bring the equipment back to the quality standards equal to the original manufacturing standards. These repairs shall include but are not limited to repairing painted surfaces, dent removal, combing coil fins, repairing or replacing wet, sagging or torn insulation, etc.

F. Install units with adequate clearances to access valves, open access doors fully, for coil pull and NEC clearances in front of disconnect switches.

END OF SECTION

SECTION 23 81 20

SELF CONTAINED WATER COOLED ROOFTOP HEAT PUMPS

PART 1 - GENERAL

1.1 WORK INCLUDED

A. Packaged Rooftop Heat Pumps

1. DOAS-2
2. MUA-1

1.2 RELATED WORK

A. Section 23 05 13 – Motors and Starters

B. Section 23 05 30 – Electronic Speed Controllers

C. Section 23 09 00 – Building Automation and Automatic Temperature Control Systems

1.3 REFERENCES

A. ARI 430 – Standard for Central Station Air Handling Units.

B. NFPA 90A – Installation of Air Conditioning and Ventilation Systems.

C. ANSI/AFBMA 9 – Load Ratings and Fatigue Life for Ball Bearings.

D. SMACNA – HVAC Duct Construction Standards.

E. ARI 410 – Standard for Forced Circulation Air-Cooling and Air-Heating Coils.

F. ANSI/UL 900 – Test Performance of Air Filter Units.

G. AMCA 301 – Method for Publishing Sound Ratings for Air Moving Devices.

H. ARI 320.

I. ASHRAE 90.1 – Energy Efficiency

1.4 QUALITY ASSURANCE

A. All Self Contained Air Conditioners and Heating Pump Units: Product of manufacturer regularly engaged in production of components who issues complete catalog data on total product offering.

B. Certify capacity, static pressure, fan speed, brake horsepower and selection procedures in accordance with ARI.

C. Air Coils: Certify capacities, pressure drops and selection procedures in accordance with ARI 410-87.

D. Unit shall be certified in accordance with UL Standard 1995/CSA C22.2 No. 236, Safety Standard for Heating and

Cooling Equipment.

E. Unit and refrigeration system shall comply with ASHRAE 15, Safety Standard for Mechanical Refrigeration.

F. Unit Energy Efficiency Ratio (EER) shall be equal to or greater that prescribed by ASHRAE 90.1, Energy Efficient Design of New Buildings except Low-Rise Residential Buildings.

G. Unit shall be safety certified by ETL and ETL US listed. Unit nameplate shall include the ETL/ETL Canada label.

1.5 SUBMITTALS

A. Submit as-built drawings and product data.

B. As-built drawings shall show unit configuration in direction of airflow, and shall indicate assembly and unit dimensions.

C. Product data shall indicate dimensions, weights, capacities, fan performance, motor electrical characteristics, and finishes of materials.

D. Submit product data of filter sizes and quantities, filter performance, and filter frames.

E. Provide fan curves with specified operating point clearly plotted.

F. Submit sound power levels for air handling unit(s) at scheduled conditions. If unit exceeds sound power levels at scheduled conditions, manufacturer must provide additional sound attenuators.

G. Shop Drawings: Unit drawings shall be provided that indicate assembly, unit dimensions, construction details, clearances and connection details. Computer generated fan curves for each fan shall be submitted with specific design operation point noted. Wiring diagram shall be provided with details for both power and control systems and differentiate between factory installed and field installed wiring.

1.6 OPERATION AND MAINTENANCE DATA

A. Submit operation and maintenance data.

B. Include instructions for lubrication, filter replacement, motor and drive replacement, spare parts lists, and wiring diagrams.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Store and protect products under provisions of Section 23 05 03.

B. Unit shall be shipped with doors screwed shut and outside air hood closed to prevent damage during transport and thereafter while in storage awaiting installation.

C. Follow Installation, Operation, and Maintenance manual instructions for rigging, moving, and unloading the unit at its final location.

D. Store in clean dry place and protect from weather and construction traffic. Handle carefully to avoid damage to components, enclosures, and finish.

1.8 ENVIRONMENTAL REQUIREMENTS

A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.9 WARRANTY

A. Manufacturer shall provide a limited “parts only” warranty for a period of 12 months from the date of equipment startup or 18 months from the date of original equipment shipment from the factory, whichever is less. Warranty shall cover material and workmanship that prove defective, within the specified warranty period, provided manufacturer’s written instructions for Installation, Operation, and maintenance have been followed. Warranty excludes parts associated with routine maintenance, such as belts and filters.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Basis of Design: AAON

B. Other Acceptable Manufacturers:

1. FTP
2. York
3. Trane
4. Daikin McQuay

C. Substitute equipment may be considered for approval that includes at a minimum:

1. R-410A refrigerant

2. Variable capacity compressor with 10-100% capacity control

3. Direct drive supply fans

4. Double wall cabinet construction

5. Insulation with a minimum R-value of 13

6. Stainless steel drain pans

2.2 GENERAL

A. Packaged rooftop unit shall include compressors, evaporator coils, filters, supply fans, dampers, water-cooled condenser, exhaust fans, energy recovery wheels, and unit controls.

B. Unit shall be factory assembled and tested including leak testing of the DX coils, pressure testing of the refrigeration circuit, and run testing of the completed unit. Run test report shall be supplied with the unit in the service compartment’s literature pocket.

C. Unit shall have decals and tags to indicate lifting and rigging, service areas and caution areas for safety and to assist service personnel.

D. Unit components shall be labeled, including refrigeration system components and electrical and controls components.

E. Estimated sound power levels (dB) shall be shown on the unit ratings sheet.

F. Installation, Operation, and Maintenance manual shall be supplied within the unit.

G. Laminated color-coded wiring diagram shall match factory installed wiring and shall be affixed to the interior of the control compartment's hinged access door.

H. Unit nameplate shall be provided in two locations on the unit, affixed to the exterior of the unit and affixed to the interior of the control compartment's hinged access door.

2.3 CONSTRUCTION

A. All cabinet walls, access doors, and roof shall be fabricated of double wall, impact resistant, rigid polyurethane foam panels.

B. Unit insulation shall have a minimum thermal resistance R-value of 13. Foam insulation shall have a minimum density of 2 pounds/cubic foot and shall be tested in accordance with ASTM D1929-11 for a minimum flash ignition temperature of 610°F.

C. Unit construction shall be double wall with G90 galvanized steel on both sides and a thermal break. Double wall construction with a thermal break prevents moisture accumulation on the insulation, provides a cleanable interior, prevents heat transfer through the panel, and prevents exterior condensation on the panel.

D. Unit shall be designed to reduce air leakage and infiltration through the cabinet. Cabinet leakage shall not exceed 1% of total airflow when tested at 3 times the minimum external static pressure provided in AHRIStandard 340/360. Panel deflection shall not exceed L/240 ratio at 125% of design static pressure, at a maximum 8 inches of positive or negative static pressure, to reduce air leakage. Deflection shall be measured at the midpoint of the panel height and width. Continuous sealing shall be included between panels and between access doors and openings to reduce air leakage. Piping and electrical conduit through cabinet panels shall include sealing to reduce air leakage.

E. Roof of the air tunnel shall be sloped to provide complete drainage. Cabinet shall have rain break overhangs above access doors.

F. Access to filters, dampers, cooling coils, reheat coil, heaters, compressors, water-cooled condensers, and electrical and controls components shall be through hinged access doors with quarter turn, zinc cast, lockable handles. Full length stainless steel piano hinges shall be included on the doors.

G. Exterior paint finish shall be capable of withstanding at least 2,500 hours, with no visible corrosive effects, when tested in a salt spray and fog atmosphere in accordance with ASTM B 117-95 test procedure.

H. Units with cooling coils shall include double sloped 304 stainless steel drain pans.

I. Unit shall be provided with base discharge and return air openings. All openings through the base pan of the unit shall have upturned flanges of at least 1/2 inch in height around the opening.

J. Unit shall include lifting lugs on the top of the unit.

K. Unit base pan shall be provided with 1/2 inch thick foam insulation.

L. Unit base shall be fabricated of 1 inch thick double wall, impact resistant, rigid polyurethane foam panels.

2.4 ELECTRICAL

A. Unit shall have a 5kAIC SCCR.

B. Unit shall be provided with factory installed and factory wired, non-fused disconnect switch.

C. Unit shall be provided with a factory installed and factory wired 115V, 12 amp GFI outlet disconnect switch in the unit control panel.

D. Unit shall be provided with phase and brown out protection which shuts down all motors in the unit if the electrical phases are more than 10% out of balance on voltage, the voltage is more than 10% under design voltage or on phase reversal.

E. Unit shall be provided with remote stop/start terminals which require contact closure for unit operation. When these contacts are open the low voltage circuit is broken and the unit will not operate.

2.5 SUPPLY FAN(S)

A. Unit shall include direct drive, unhoused, backward curved, plenum supply fans.

B. Blowers and motors shall be dynamically balance and mounted on rubber isolators.

C. Motors shall be premium efficiency ODP with ball bearings rated for 200,000 hours service with external lubrication points.

D. Variable frequency drives shall be factory wired and mounted in the unit. Fan motors shall be premium efficiency.

2.6 EXHAUST FAN(S)

A. Exhaust dampers shall be sized for 100% relief.

B. Fans and motors shall be dynamically balanced.

C. Motors shall be premium efficiency ODP with ball bearings rated for 200,000 hours service with external lubrication points.

D. Access to exhaust fans shall be through double wall, hinged access doors with quarter turn lockable handles.

E. Unit shall include belt driven, unhoused, backward curved, plenum exhaust fans.

F. Unit shall include direct drive, axial flow exhaust fans. Blades shall be adjustable pitch.

G. Variable frequency drives shall be factory wired and mounted in the unit. Fan motors shall be premium efficiency.

2.7 COOLING COILS

A. Evaporator Coils

1. Coils shall be designed for use with R-410A refrigerant and constructed of copper tubes with aluminum fins mechanically bonded to the tubes and galvanized steel end casings. Fin design shall be sine wave rippled.

2. Coils shall have interlaced circuitry and shall be standard capacity.

3. Coils shall be hydrogen or helium leak tested.

4. Coils shall be furnished with factory installed expansion valves.

2.8 REFRIGERATION SYSTEM

A. Unit shall be factory charged with R-410A refrigerant.

B. Compressors shall be scroll type with thermal overload protection and carry a 5 year non-prorated warranty, from the date of original equipment shipment from the factory.

C. Compressors shall be mounted in an isolated service compartment which can be accessed without affecting unit operation. Lockable hinged compressor access doors shall be fabricated of double wall, rigid polyurethane foam injected panels to prevent the transmission of noise outside the cabinet.

D. Compressors shall be isolated from the base pan with the compressor manufacturer's recommended rubber vibration isolators, to reduce any transmission of noise from the compressors into the building area.

E. Each refrigeration circuit shall be equipped with expansion valve type refrigerant flow control.

F. Each refrigeration circuit shall be equipped with automatic reset low pressure and manual reset high pressure refrigerant safety controls, Schrader type service fittings on both the high pressure and low pressure sides and a factory installed replaceable core liquid line filter driers.

G. Unit shall include a variable capacity scroll compressor on the lead refrigeration circuit which shall be capable of modulation from 10-100% of its capacity.

H. Unit shall include a variable capacity scroll compressor on all refrigeration circuits which shall be capable of modulation from 10-100% of its capacity.

I. Lead refrigeration circuit shall be provided with hot gas reheat coil, modulating valves, electronic controller, supply air temperature sensor and a control signal terminal whichallow the unit to have a dehumidification mode of operation, which includes supply air temperature control to prevent supply air temperature swings and overcooling of the space.

J. Unit shall be configured as a water-source heat pump. Each refrigeration circuit shall be equipped with a factory installed liquid line filter drier with check valve, reversing valve, and expansion valves on both the indoor coil and refrigerant-to-water heat exchanger. Reversing valve shall energize during the heat pump cooling mode of operation.

K. Each refrigeration circuit shall be equipped with a liquid line sight glass.

2.9 CONDENSERS

A. Water-Cooled Condenser

1. Water-cooled condensing section shall contain plate type, heat exchangers located in an insulated vestibule. Heat exchangers shall be circuited in a counter flow arrangement to the refrigerant system. Plates shall be stainless steel. Each heat exchanger shall be provided with a removable and cleanable type, basket filter on the waterside circuit. Field piping connections shall be made at each plate heat exchanger within the condensing section of the rooftop unit. Maximum operating pressure on the water side of the condenser shall be 125 psi.

2. All field installed piping shall be hydrostatically tested before being put into service. Test pressure shall be 125 psi for a 2 hour duration. Leaks and loss in test pressure constitute defects. If test fails, corrections shall be made to the system and the test shall then be repeated to make certain all defects were corrected. All testing shall be performed to ASTM Standards.

3. Each heat exchanger circuit shall have a flow switch that shuts down the compressors if water flow to the condenser is interrupted

4. Unit shall include factory installed head pressure control module and each heat exchanger shall include factory installed head pressure control valve which modulates the condenser water flow based on head pressure and allows cooling operation below 65°F condenser water temperature.

2.10 ELECTRIC HEATING

A. Unit shall include an electric heater consisting of electric heating coils, fuses and a high temperature limit switch, with capacities as shown on the plans.

B. Electric heating coils shall be located in the preheat position upstream of the cooling coil.

C. Electric heater shall have full modulation capacity controlled by an SCR (Silicon Controlled Rectifier). A 0-10 VDC heating control signal shall be field provided to control the amount of heating.

D. Emergency electric heating capacity shall be sized by determining the maximum electric heating capacity not to exceed the amp draw of all compressors and adding that electric heating capacity to the auxiliary electric heating capacity. Auxiliary electric heating capacity shall be sized to meet heating leaving air temperature setpoint when heat pump heating is in operation. Unit shall include 1 stage of auxiliary electric heating capacity.

2.11 FILTERS

A. Unit shall include 4 inch thick, pleated panel filters with an ASHRAEMERV rating of 13, upstream of the cooling coil. Unit shall also include 2 inch thick, pleated panel pre filters with an ASHRAE MERV rating of 8, upstream of the 4 inch standard filters.

B. Unit shall include a clogged filter switch.

C. Unit shall include a Magnehelic gauge mounted in the controls compartment.

2.12 OUTSIDE AIR/ECONOMIZER

A. Unit shall include 0-100% economizer consisting of a motor operated outside air damper and return air damper assembly constructed of extruded aluminum, hollow core, airfoil blades with rubber edge seals and aluminum end seals. Damper blades shall be gear driven and designed to have no more than 20 cfm of leakage per sq ft. at 4 in. w.g. air pressure differential across the damper. Low leakage dampers shall be Class 2 AMCA certified, in accordance with AMCA Standard 511. Damper assembly shall be controlled by spring return sensible temperature activated fully modulating enthalpy activated fully modulating actuator. Unit shall include outside air opening bird screen, outside air hood, and barometric relief dampers.

2.13 CONTROLS

A. Unit controller shall be capable of controlling all features and options of the unit. Controller shall be factory installed in the unit controls compartment and factory tested. Controller shall be capable of stand alone operation with unit configuration, setpoint adjustment, sensor status viewing, unit alarm viewing, and occupancy scheduling available without dependence on a building management system.

B. Controller shall have an onboard clock and calendar functions that allow for occupancy scheduling.

C. Controller shall include non-volatile memory to retain all programmed values without the use of a battery, in the event of a power failure.

D. Makeup Air Controller

1. Unit shall modulate cooling with constant airflow to meet ventilation outside air loads. Cooling capacity shall modulate based on supply air temperature.

2. With modulating hot gas reheat, unit shall modulate cooling and hot gas reheat as efficiently as possible, to meet outside air humidity loads and prevent supply air temperature swings and overcooling of the space.

3. Unit shall modulate heating with constant airflow to meet ventilation outside air loads. Heating capacity shall modulate based on supply air temperature.

E. Unit configuration, setpoint adjustment, sensor status viewing, unit alarm viewing, and occupancy scheduling shall be accomplished with connection to interface module with LCD screen and input keypad, interface module with touch screen, or with connection to PC with free configuration software. Controller shall be capable of connection with other factory installed and factory provided unit controllers with individual unit configuration, setpoint adjustment, sensor status viewing, and occupancy scheduling available from a single unit. Connection between unit controllers shall be with a modular cable. Controller shall be capable of communicating and integrating with a LonWorks or BACnet network.

2.14 ACCESSORIES

A. Unit shall be provided with a smoke detector sensing the supply air of the unit, wired to shut off the unit's control circuit.

B. Unit shall be provided with a safety shutdown terminal block for field installation of a smoke detector which shuts off the unit's control circuit.

2.15 CURBS

A. Curbs shall to be fully gasketed between the curb top and unit bottom with the curb providing full perimeter support, cross structure support and air seal for the unit. Curb gasket shall be furnished within the control compartment of the rooftop unit to be mounted on the curb immediately before mounting of the rooftop unit.

B. Knockdown curb (with duct support rails) shall be factory furnished for field assembly.

C. Solid bottom curb shall be factory assembled and fully lined with curb rated 1 inch fiberglass insulation and include a wood nailer strip. (Curb shall be adjustable up to 3/4 inch per foot to allow for sloped roof applications.)

PART 3 - EXECUTION

3.1 GENERAL

A. Assemble and install in accordance with manufacturers written installation instructions and details on drawings.

B. Coordinate duct, piping and electrical work so as to provide access to unit for maintenance and filter replacement and coil removal with minimum disturbance of piping.

C. Prior to unit start-up all controls shall be installed and tested.

D. Prior to initial start-up and for system testing install air filters to protect the unit and ductwork from dirt and debris. After the system has been tested and prior to turning the system over to the Owner, replace the pre-filters with new, clean filters as specified.

E. Prior to turning the system over to the Owner, all damages incurred during shipping, storing and installing shall be repaired. These repairs shall be sufficient to bring the equipment back to the quality standards equal to the original manufacturing standards. These repairs shall include but are not limited to repairing painted surfaces, dent removal, combing coil fins, repairing or replacing wet, sagging or torn insulation, etc.

F. Install units with adequate clearances to access valves, open access doors fully, for coil pull and NEC clearances in front of disconnect switches.

G. Installing contractor shall install unit, including field installed components, in accordance with Installation, Operation, and Maintenance manual instructions.

H. Start up and maintenance requirements shall be complied with to ensure safe and correct operation of the unit.

END OF SECTION

SECTION 23 81 21

SELF CONTAINED WATER COOLED INTERIOR HEAT PUMPS

PART 1 - GENERAL

1.1 WORK INCLUDED

A. Self Contained Indoor Heat Pumps

1. DOAS-1
2. GSHP-L-1

1.2

1.3 RELATED WORK

A. Section 23 05 13 – Motors and Starters

B. Section 23 05 30 – Electronic Speed Controllers

C. Section 23 09 00 – Building Automation and Automatic Temperature Control Systems

1.4 REFERENCES

A. ARI 430 – Standard for Central Station Air Handling Units.

B. NFPA 90A – Installation of Air Conditioning and Ventilation Systems.

C. ANSI/AFBMA 9 – Load Ratings and Fatigue Life for Ball Bearings.

D. SMACNA – HVAC Duct Construction Standards.

E. ARI 410 – Standard for Forced Circulation Air-Cooling and Air-Heating Coils.

F. ANSI/UL 900 – Test Performance of Air Filter Units.

G. AMCA 301 – Method for Publishing Sound Ratings for Air Moving Devices.

H. ARI 320.

I. ASHRAE 90.1 – Energy Efficiency

1.5 QUALITY ASSURANCE

A. All Self Contained Air Conditioners and Heating Pump Units: Product of manufacturer regularly engaged in production of components who issues complete catalog data on total product offering.

B. Certify capacity, static pressure, fan speed, brake horsepower and selection procedures in accordance with ARI.

C. Air Coils: Certify capacities, pressure drops and selection procedures in accordance with ARI 410-87.

D. Unit shall be certified in accordance with UL Standard 1995/CSA C22.2 No. 236, Safety Standard for Heating and Cooling Equipment.

E. Unit and refrigeration system shall comply with ASHRAE 15, Safety Standard for Mechanical Refrigeration.

F. Unit Energy Efficiency Ratio (EER) shall be equal to or greater that prescribed by ASHRAE 90.1, Energy Efficient Design of New Buildings except Low-Rise Residential Buildings.

G. Unit shall be safety certified by ETL and ETL US listed. Unit nameplate shall include the ETL/ETL Canada label.

1.6 SUBMITTALS

A. Submit as-built drawings and product data.

B. As-built drawings shall show unit configuration in direction of airflow, and shall indicate assembly and unit dimensions.

C. Product data shall indicate dimensions, weights, capacities, fan performance, motor electrical characteristics, and finishes of materials.

D. Submit product data of filter sizes and quantities, filter performance, and filter frames.

E. Provide fan curves with specified operating point clearly plotted.

F. Submit sound power levels for air handling unit(s) at scheduled conditions. If unit exceeds sound power levels at scheduled conditions, manufacturer must provide additional sound attenuators.

G. Shop Drawings: Unit drawings shall be provided that indicate assembly, unit dimensions, construction details, clearances and connection details. Computer generated fan curves for each fan shall be submitted with specific design operation point noted. Wiring diagram shall be provided with details for both power and control systems and differentiate between factory installed and field installed wiring.

1.7 OPERATION AND MAINTENANCE DATA

A. Submit operation and maintenance data.

B. Include instructions for lubrication, filter replacement, motor and drive replacement, spare parts lists, and wiring diagrams.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Store and protect products under provisions of Section 23 05 03.

B. Unit shall be shipped with doors screwed shut and outside air hood closed to prevent damage during transport and thereafter while in storage awaiting installation.

C. Follow Installation, Operation, and Maintenance manual instructions for rigging, moving, and unloading the unit at its final location.

D. Unit shall be handled carefully to avoid damage to components, enclosures and finish.

E. Store in clean dry place and protect from weather and construction traffic. Handle carefully to avoid damage to components, enclosures, and finish.

1.9 ENVIRONMENTAL REQUIREMENTS

A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.10 WARRANTY

A. Manufacturer shall provide a limited “parts only” warranty for a period of 12 months from the date of equipment startup or 18 months from the date of original equipment shipment from the factory, whichever is less. Warranty shall cover material and workmanship that prove defective, within the specified warranty period, provided manufacturer’s written instructions for Installation, Operation, and maintenance have been followed. Warranty excludes parts associated with routine maintenance, such as belts and filters.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Basis of Design: AAON

B. Other Acceptable Manufacturers:

1. FTP
2. York
3. Trane
4. Daikin McQuay

C. Substitute equipment may be considered for approval that includes at a minimum:

1. R-410A refrigerant
2. ECM driven direct drive backward curved plenum supply fans
3. Double wall cabinet construction
4. Insulation with a minimum R-value of 6.25
5. Double sloped stainless steel drain pans
6. Hinged access doors with lockable handles
7. Variable capacity compressor with 10-100% capacity
8. Factory installed acoustic insulation in the compressorized section
9. Designed, engineered, and manufactured in the United States of America
10. All other provisions of the specifications must be satisfactorily addressed

2.2 GENERAL

A. Self contained unit shall include compressors, evaporator coils, filters, supply fans, energy recovery wheel, and unit controls.

B. Unit shall be factory assembled and tested including and run testing of the supply fans and factory wired electrical system. Run test report shall be supplied with the unit.

C. Unit shall have decals and tags to indicate lifting and rigging, service areas and caution areas for safety and to assist service personnel.

D. Unit components shall be labeled, including pipe stub outs, refrigeration system components and electrical and controls components.

E. Installation, Operation and Maintenance manual shall be supplied within the unit.

F. Laminated color-coded wiring diagram shall match factory installed wiring and shall be affixed to the interior of the control compartment's access door.

G. Unit nameplate shall be provided in two locations on the unit, affixed to the exterior of the unit and affixed to the interior of the control compartment's access door.

2.3 CONSTRUCTION

A. Unit shall be provided with a horizontal intake, have a draw-through supply fan configuration and discharge air vertically.

B. All cabinet walls, access doors, and roof shall be fabricated of double wall, impact resistant, rigid polyurethane foam panels.

C. Unit insulation shall have a minimum thermal resistance R-value of 6.25. Foam insulation shall have a minimum density of 2 pounds/cubic foot and shall be tested in accordance with ASTM D1929-11 for a minimum flash ignition temperature of 610°F.

D. Unit construction shall be double wall with G90 galvanized steel on both sides and a thermal break. Double wall construction with a thermal break prevents moisture accumulation on the insulation, provides a cleanable interior, prevents heat transfer through the panel and prevents exterior condensation on the panel.

E. Unit shall be designed to reduce air leakage and infiltration through the cabinet. Sealing shall be included between panels and between access doors and openings to reduce air leakage. Refrigerant piping and electrical wiring through cabinet panels shall include sealing to reduce air leakage.

F. Access to filters, compressors, cooling coil, condensers, supply fans and electrical, energy recovery wheeland controls components shall be through hinged access doors.

G. Access doors shall be flush mounted to cabinetry, with stainless steel removable pin hinges and zinc cast lockable handles. Unit shall include a 304 stainless steel sloped drain pan. Drain pan connection shall be available on the right (left) side of the air handling section of the unit.

H. Cooling coils shall be mechanically supported above the drain pan by multiple supports that allow drain pan cleaning and coil removal.

I. Unit shall include a 5-inch forklift base.

2.4 ELECTRICAL

A. Unit shall be provided with an integrated control panel.

B. Unit shall be provided with standard power block for connecting power to the unit.

C. Control circuit transformer and wiring shall provide 24 VAC control voltage from the line voltage to the unit.

D. Unit shall have a 5kAIC SCCR.

E. Unit shall be provided with phase and brown out protection which shuts down all motors in the unit if the electrical phases are more than 10% out of balance on voltage, the voltage is more than 10% under design voltage or on phase reversal.

F. Unit shall be provided with blower auxiliary contacts on the low voltage terminal block which close when the supply fans are energized.

G. Unit shall be provided with remote stop/start terminals which require contact closure for unit operation. When these contacts are open the low voltage circuit is broken and the unit will not operate.

H. Unit shall be provided with manual reset low temperature limit controls which shut off the unit when the discharge temperature reaches a field adjustable setpoint

2.5 SUPPLY/EXHAUST FAN(S)

A. Unit shall include direct drive, unhoused, backward curved, plenum supply fans.

B. Fan and motor assembly shall be dynamically balanced.

C. Motors shall be a high efficiency electronically commutated motor (ECM).

D. Supply air shall discharge vertically from the unit.

E. Blower and motor assembly shall be mounted on rubber isolators.

2.6 COOLING COILS

A. Evaporator Coils

1. Coil shall be designed for use with R-410A refrigerant and constructed of copper tubes with aluminum fins mechanically bonded to the tubes and aluminum end casings. Fin design shall be sine wave rippled.

2. Coil shall two circuits and interlaced circuitry.

3. Coil shall be hydrogen or helium leak tested.

4. Coil shall be furnished with factory installed thermostatic expansion valves. The sensing bulbs shall be field installed on the suction line immediately outside the cabinet.

5. Drain pan shall be provided with overflow switch which shuts down the cooling circuits.

2.7 REFRIGERATION SYSTEM

A. Unit shall be factory charged with R-410A refrigerant.

B. Compressors shall be R-410A scroll type with thermal overload protection and independently circuited.

C. Unit shall include a variable capacity scroll compressor which shall be capable of modulation from 10-100% of its rated capacity.

D. Compressor shall carry a 5 year non-prorated warranty, from the date of original equipment shipment from the factory.

E. Compressors shall be mounted in an isolated service compartment which can be accessed without affecting unit operation. Lockable hinged compressor access doors shall be fabricated of double wall, rigid polyurethane foam insulated panels to prevent the transmission of noise outside the cabinet.

F. Compressors shall be isolated from unit with the compressor manufacturer's recommended rubber vibration isolators, to reduce any transmission of noise from the compressor into the building area.

G. Unit shall be equipped with thermostatic expansion valve type refrigerant flow control.

H. Unit shall be configured as a water-source condensing unit.

I. Unit shall be configured as a water-source heat pumpUnit shall be equipped with an automatic reset low pressure and manual reset high pressure refrigerant safety controls, Schrader type service fittings on both the high pressure and low pressure sides, factory installed liquid line heat pump filter drier, reversing valve and thermostatic expansion valves on the indoor coil. Reversing valve shall energize during the cooling mode of operation.

J. Each refrigeration circuit shall be equipped with a liquid line sight glass.

2.8 CONDENSERS

A. Water-Cooled Condenser

1. Water-cooled condensing section shall contain plate type, heat exchangers located in an insulated vestibule. Heat exchangers shall be circuited in a counter flow arrangement to the refrigerant system. Plates shall be stainless steel. Each heat exchanger shall be provided with a removable and cleanable type, basket filter on the waterside circuit. Field piping connections shall be made at each plate heat exchanger within the condensing section of the rooftop unit. Maximum operating pressure on the water side of the condenser shall be 125 psi.

2. All field installed piping shall be hydrostatically tested before being put into service. Test pressure shall be 125 psi for a 2 hour duration. Leaks and loss in test pressure constitute defects. If test fails, corrections shall be made to the system and the test shall then be repeated to make certain all defects were corrected. All testing shall be performed to ASTM Standards.

3. Each heat exchanger circuit shall have a flow switch that shuts down the compressors if water flow to the condenser is interrupted

4. Unit shall include factory installed head pressure control module and each heat exchanger shall include factory installed head pressure control valve which modulates the condenser water flow based on head pressure and allows cooling operation below 65°F condenser water temperature.

2.9 FILTERS

A. Unit shall include 4 inch thick, pleated panel filters with an ASHRAE MERV rating of 13, in a prefilter box upstream of the cooling coil.

B. 2 inch thick, pleated panel pre filters with an ASHRAE MERV rating of 8, upstream of the 4 inch standard filters.

C. Unit shall include a clogged filter switch.

2.10 ENERGY RECOVERY

A. Where scheduled, unit shall contain a factory mounted and tested energy recovery wheel. The energy recovery wheel shall be mounted in a rigid frame containing the wheel drive motor, drive belt, wheel seals and bearings.

B. Wheel frame shall slide out for service and removal from the cabinet.

C. The energy recovery component shall incorporate a rotary wheel in an insulated cassette frame complete with seals, drive motor and drive belt.

D. Wheels shall be wound continuously with one flat and one structured layer in an ideal parallel plate geometry providing laminar flow. The layers shall be effectively captured in stainless steel wheel frames or aluminum and stainless steel segment frames that provide a rigid and self-supporting matrix.

E. Wheels shall be provided with removable energy transfer matrix. Wheel frame construction shall be a welded hub, spoke and rim assembly of stainless, plated and/or coated steel and shall be self-supporting without matrix segments in place. Segments shall be removable without the use of tools to facilitate maintenance and cleaning. Wheel bearings shall be selected to provide an L-10 life in excess of 400,000 hours. Rim shall be continuous rolled stainless steel and the wheel shall be connected to the shaft by means of taper locks.

F. All diameter and perimeter seals shall be provided as part of the cassette assembly and shall be factory set. Drive belts of stretch urethane shall be provided for wheel rim drive without the need for external tensioners or adjustment.

G. The energy recovery cassette shall be an Underwriters Laboratories Recognized Component for electrical and fire safety. The wheel drive motor shall be an Underwriters Laboratory Recognized Component and shall be mounted in the cassette frame and supplied with a service connector or junction box. Thermal performance shall be certified by the manufacturer in accordance with ASHRAE Standard 84, Method of Testing Air-to-Air Heat Exchangers and AHRI Standard 1060, Rating Air-to-Air Energy Recovery Ventilation Equipment. Cassettes shall be listed in the AHRI Certified Products.

H. Energy recovery wheel cassette shall carry a 5 year non-prorated warranty, from the date of original equipment shipment from the factory. The first 12 months from the date of equipment startup, or 18 months from the date of original equipment shipment from the factory, whichever is less, shall be covered under the standard AAON limited parts warranty. The remaining period of the warranty shall be covered by Air exchange. The 5 year warranty applies to all parts and components of the cassette, with the exception of the motor, which shall carry an 18 month warranty. Warranty shall cover material and workmanship that prove defective, within the specified warranty period, provided the Air exchange written instructions for installation, operation and maintenance have been followed. Warranty excludes parts associated with routine maintenance, such as belts. Refer to the Airxchange Energy Recovery Cassette Limited Warranty Certificate.

I. Unit shall include 2 inch thick, pleated panel outside air filters with an ASHRAE MERV rating of 8, upstream of the wheels.

J. Hinged service access door shall allow access to the wheel.

K. Total energy recovery wheels shall be coated with silica gel desiccant permanently bonded by a process without the use of binders or adhesives, which may degrade desiccant performance. The substrate shall be lightweight polymer and shall not degrade nor require additional coatings for application in marine or coastal environments. Coated segments shall be washable with detergent or alkaline coil cleaner and water. Desiccant shall not dissolve nor deliquesce in the presence of water or high humidity.

L. Unit shall include energy recovery wheel rotation detection sensors and a set of normally open and normally closed contracts for field indication of wheel rotation.

2.11 OUTSIDE AIR/ECONOMIZER

A. Unit shall include 0-100% economizer consisting of a motor operated outside air damper and return air damper assembly constructed of extruded aluminum, hollow core, airfoil blades with rubber edge seals and aluminum end seals. Damper blades shall be gear driven and designed to have no more than 20 cfm of leakage per sq ft. at 4 in.

w.g. air pressure differential across the damper. Low leakage dampers shall be Class 2 AMCA certified, in accordance with AMCA Standard 511. Damper assembly shall be controlled by spring return sensible temperature activated fully modulating enthalpy activated fully modulating actuator. Unit shall include outside air opening bird screen, outside air hood, and barometric relief dampers.

2.12 CONTROLS

A. Factory Installed and Factory Provided Controller

1. Unit controller shall be capable of controlling all features and options of the unit. Controller shall be factory installed in the unit controls compartment and factory tested.

2. Controller shall be capable of stand-alone operation with unit configuration, setpoint adjustment, sensor status viewing, unit alarm viewing, and occupancy scheduling available without dependence on a building management system.

3. Controller shall have an onboard clock and calendar functions that allow for occupancy scheduling.

4. Controller shall include non-volatile memory to retain all programmed values without the use of a battery, in the event of a power failure.

5. Variable Air Volume Controller

a. Unit shall utilize a variable capacity compressor system and a variable speed supply fan system to modulate cooling and airflow as required to meet space temperature cooling loadsand to save operating energy. Supply fan speed shall modulate based on supply air duct static pressure. Cooling capacity shall modulate based on supply air temperature.

b. With modulating hot gas reheat, unit shall modulate cooling and hot gas reheat as efficiently as possible, to meet space humidity loads and prevent supply air temperature swings and overcooling of the space.

c. Unit shall modulate heating with constant airflow to meet space temperature heating loads. Staged heating capacity shall modulate based on space temperature.

d. Unit shall modulate heating with constant airflow to meet space temperature heating loads. Modulating heating capacity shall modulate based on supply air temperature.

e. Return air temperature sensor, supply air temperature sensor, and supply air duct static pressure sensor shall be furnished with the unit for field installation.

f. Control of supply airflow, for duct static pressure control, shall be with unit controller, factory installed electronically commutated motor, and supply air duct static pressure sensor.

g. With the modulating hot gas reheat option a space humidity sensor and supply air temperature sensor shall be furnished with the unit for field installation. Suction pressure sensor shall be factory installed. Supply air temperature and space humidity setpoints, for the dehumidification mode of operation, shall be adjustable.

6. Make Up Air Controller

a. Unit shall modulate cooling with constant airflow to meet ventilation outside air loads. Cooling capacity shall modulate based on supply air temperature.

b. Hot gas bypass shall be required on the lead refrigeration circuits of systems without variable capacity compressors.

c. With modulating hot gas reheat, unit shall modulate cooling and hot gas reheat as efficiently as possible, to meet outside air humidity loads and prevent supply air temperature swings and overcooling of the space.

d. Unit shall modulate heating with constant airflow to meet ventilation outside air loads. Heating capacity shall modulate based on supply air temperature.

e. Supply air temperature sensor and outside air temperature sensor shall be furnished with the unit for field installation.

f. With the modulating hot gas reheat option an outside air humidity sensor shall be furnished with the unit for field installation. Suction pressure sensor shall be factory installed. Supply air temperature and space humidity setpoints, for the dehumidification mode of operation, shall be adjustable.

B. Unit configuration, setpoint adjustment, sensor status viewing, unit alarm viewing, and occupancy scheduling shall be accomplished with connection to interface module with LCD screen and input keypad, interface module with touch screen, or with connection to PC with free configuration software. Controller shall be capable of connection with other factory installed and factory provided unit controllers with individual unit configuration, setpoint adjustment, sensor status viewing, and occupancy scheduling available from a single unit. Connection between unit controllers shall be with a modular cable. Controller shall be capable of communicating and integrating with a LonWorks or BACnet network.

2.13 ACCESSORIES

A. Unit shall be provided with a smoke detector shipped loose for sensing the supply air of the unit, to be wired to shut off the unit's control circuit.

B. Unit shall be provided with a low voltage safety shutdown terminal block for field installation of a smoke detector which shuts off the unit's control circuit.

PART 3 - EXECUTION

3.1 GENERAL

A. Assemble and install in accordance with manufacturers written installation instructions and details on drawings.

B. Coordinate duct, piping and electrical work so as to provide access to unit for maintenance and filter replacement and coil removal with minimum disturbance of piping.

C. Prior to unit start-up all controls shall be installed and tested.

D. Prior to initial start-up and for system testing install air filters to protect the unit and ductwork from dirt and debris. After the system has been tested and prior to turning the system over to the Owner, replace the pre-filters with new, clean filters as specified.

E. Prior to turning the system over to the Owner, all damages incurred during shipping, storing and installing shall be repaired. These repairs shall be sufficient to bring the equipment back to the quality standards equal to the original manufacturing standards. These repairs shall include but are not limited to repairing painted surfaces, dent removal,

combing coil fins, repairing or replacing wet, sagging or torn insulation, etc.

F. Installation, Operation and Maintenance manual shall be supplied with the unit.

G. Install units with adequate clearances to access valves, open access doors fully, for coil pull and NEC clearances in front of disconnect switches.

H. Installing contractor shall install unit, including field installed components, in accordance with Installation, Operation, and Maintenance manual instructions.

I. Start up and maintenance requirements shall be complied with to ensure safe and correct operation of the unit.

END OF SECTION

SECTION 23 81 26

SPLIT SYSTEM DX AIR CONDITIONING SYSTEM

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Packaged Split System DX air handling units.

B. Refrigeration components.

1.2 RELATED SECTIONS

A. Section 23 05 13 – Motors and Starters

B. Section 23 40 00 – Air Cleaning

1.3 REFERENCES

A. ANSI/ASHRAE 15 – Safety Code for Mechanical Refrigeration.

B. ANSI/ASHRAE/IES 90.1A – 2001 - Energy Conservation in New Building Design Standard.

C. ARI 210/240 – Unitary Air-Conditioning Equipment and Air-Source Heat Pump Equipment, (less than 135,000 Btuh).

D. ARI 360 – Commercial and Industrial Unitary Air Conditioning Equipment testing and rating standard, (equipment greater than 135,000 Btuh).

E. ARI 340 – Commercial and Industrial Unitary Heat Pump Equipment, (heat pumps above 135,000 Btuh).

F. ANSI Z21.47/UL1995 – Unitary Air Conditioning Standard for safety requirements.

1.4 QUALITY ASSURANCE

A. Air Handling Units: Product of manufacturer regularly engaged in production of components who issues complete catalog data on total product.

1.5 SUBMITTALS

A. Submit unit performance data including capacity, nominal and operating performance.

B. Submit Mechanical Specifications for unit and accessories describing construction, components and options.

C. Submit shop drawings indicating overall dimensions as well as installation, operation and service clearances. Indicate lift points and recommendations and center of gravity. Indicate unit shipping, installation and operating weights including dimensions.

D. Submit data on electrical requirements and connection points. Include recommended wire and fuse sizes or MCA, sequence of operation, safety and start-up instructions.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Comply with manufacturer's installation instructions for rigging, unloading, and transporting units.

B. Store in clean dry place and protect from weather and construction traffic. Handle carefully to avoid damage to components, enclosures, and finish.

1.7 ENVIRONMENTAL REQUIREMENTS

A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.8 WARRANTY

A. Provide one year parts warranty.

PART 2 - PRODUCTS

2.1 DUCTLESS SPLIT SYSTEM AIR CONDITIONERS

A. Acceptable Manufacturers: LG Electronics.

B. Indoor Unit

1. Furnish and install a ductless-split air conditioning system as shown on the plans and as listed below. The indoor unit shall be factory assembled, wired, and run tested.
2. The unit cabinet shall be supplied with a separate back plate and multi-directional drain and refrigerant piping. The casing shall have a white finish. Cabinet shall be rigidly mounted to the wall without vibration.
3. The evaporator fan shall be an assembly with a line-flow fan direct driven by a single motor. The fan shall be statically and dynamically balanced and run on a motor with permanently lubricated bearings. The fan shall consist of three (3) speeds: High, Medium, and Low.
4. A manual adjustable guide vane shall be provided.
5. Return air shall be filtered by means of easily removed, washable, Catechin, Antioxidant Pre-filter, and an Anit-allergy enzyme filter – blue bellows type.
6. The evaporator coil shall be of nonferrous construction with smooth plate fins on copper tubing. The tubing shall have inner groves for high efficiency heat exchange. All tube joints shall be brazed with phoscopper or silver alloy. Coils shall be pressure tested at the factory.
7. A condensate pan and drain shall be provided under the evaporator coil.
8. The unit shall have a wireless controller to perform input functions necessary to operate the system and have a field installed hard-wired remote controller. The controller shall consist of a power on/off switch, mode selector, temperature setting, timer control, fan speed selector and auto vane selector. The unit shall perform self-diagnostic function, test run switching, and check mode switching. Temperature changes shall be by 1 F increments with a range of 65-87 F. The microprocessor shall have the capability of sensing return air temperatures and indoor coil temperature, receiving and processing commands from the wireless and wired controller, provide emergency operation and controlling the outdoor unit.
9. The unit shall be equipped with pulse amplitude modulation (PAM) control for efficiency. Indoor unit shall be powered directly from the outdoor unit.

C. Outdoor Unit

1. Furnish and install split air conditioning system as shown on the plans and as listed below.
2. The outdoor unit shall be completely factory assembled, piped, wired, and run tested.
3. The casing shall be fabricated of galvanized steel, bonderized, finished with electrostatically applied, thermally fused acrylic powder coating for corrosion protection.
4. The condenser unit shall be furnished with a direct drive propeller type fan with permanently lubricated bearings. The fan shall be provided with a raised guard to prevent contact with moving parts. The unit shall have a horizontal discharge airflow.
5. The condenser coil shall be of nonferrous construction with lanced or corrugated plate fins on copper tubing and shall be protected with an integral metal guard. The refrigerant flow from the condenser shall be controlled by means of a metering orifice.
6. The compressor motor shall be of a high performance hermetic, inverter driven, variable speed, rotary type. The unit shall have an accumulator. The compressor shall be equipped with an internal thermal overload. The unit must have the ability to operate with a maximum height difference of 35 feet and have a refrigerant tubing length of 65 feet between the indoor and outdoor units without the need for line size changes, traps, or additional oil. The compressor shall be mounted to avoid the transmission of vibration.
7. Low ambient operation shall be provided and shall be accomplished by means of an opposed blade damper assembly as furnished by the manufacturer and field installed at the condenser air inlet and connected to the factory mounted schreader fitting on the liquid line. This is to be accomplished without loss of refrigerant. Unit is to operate effectively to 0 degree Fahrenhiet.
8. The unit shall be capable of satisfactory operation with voltage limits of 198V to 253V. The outdoor unit shall be controlled by a microprocessor located in the indoor unit and outdoor unit.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Install unit on vibration isolators. Reference Section 23 05 48.

C. Locate condensing unit in general position indicated in relation to other work.

1. Position for sufficient clearance for normal service and maintenance, including clearance for cleaning and replacement of tubes, filters, motor, etc.

D. Charge with refrigerant in the quantity recommended by the manufacturer.

1. Bleedout non-condensable gases.
2. Test refrigerant system for leakage in manner recommended by manufacturer.

E. Install pressure relief system in compliance with governing regulations, to vent refrigerant in manner indicated.

F. Install refrigerant piping (Type ACR copper tube) in accordance with manufacturers recommendations, and per the drawings.

1. Comply with the Clean Air Act.
2. Provide filter/dryer, site glass and service/isolation valves for each circuit.
3. Run piping plumb. Slope as required for proper oil return and to protect compressor.
   a. Provide oil trap at bottom of suction risers.

G. Provide for vibration and expansion of piping.

3.2 START-UP

A. Sustained Operation: Do not place unit in sustained operation prior to initial balancing of mechanical systems affected by unit operation.

B. Cooperate with other trades and installers of other work during testing, adjusting, balancing and start-up of mechanical systems.

C. Start up and first year parts and labor to be provided by equipment manufacturer.

END OF SECTION

SECTION 23 81 27

VARIABLE REFRIGERANT FLOW (VRF) DX AIR CONDITIONING SYSTEM

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Packaged VRF DX air handling units.

B. Refrigeration components.

H. ISO 14001 Environmental Management System

I. Underwriters Laboratories (UL) 1995 Heating and Cooling Equipment Standard for Safety and bear the Electrical Testing Laboratories (ETL) label.

J. National Electrical Code (NEC) and all applicable state and local building codes.

K. Performance ratings certified by AHRI (Air-Conditioning, Heating, and Refrigeration Institute) and listed in the AHRI Standard 1230 certified product directory.

1.4 QUALITY ASSURANCE

A. Air Handling Units: Product of manufacturer regularly engaged in production of components who issues complete catalog data on total product.

B. The units shall be listed by Electrical Testing Laboratories (ETL) and bear the ETL label.

C. All wiring shall be in accordance with the National Electrical Code (N.E.C.).

D. The units shall be manufactured in a facility registered to ISO 9001 and ISO14001 which is a set of standards applying to environmental protection set by the International Standard Organization (ISO).

E. All units must meet or exceed the 2010 Federal minimum efficiency requirements and the ASHRAE 90.1 efficiency requirements for VRF systems. Efficiency shall be published in accordance with the Air-Conditioning, Heating, and Refrigeration Institute (AHRI) Standard 1230.

F. A full charge of R-410A for the condensing unit only shall be provided in the condensing unit.

1.5 SYSTEM PERFORMANCE DOCUMENTATION

A. The VRF manufacturer shall provide published outdoor unit performance data in table format which states the products heating and cooling capacity expressed in British thermal units per hour (BTUH) and power consumption expressed in kilowatts (kW). Performance data published at any and all operating conditions, including ambient outdoor air temperature, entering indoor unit air temperature, and proposed combination ratio (CR = sum of nominal cooling capacity of proposed indoor units/nominal cooling capacity of the outdoor unit) in these tables must guarantee continuous compressor operation. Tabular data that communicates performance at conditions where compressor may or may not be operating (commonly referred to as 'Reference data') is not acceptable documentation for VRF system performance. Any product whose system design and engineering manuals or guides where published data tables are expressed in units other than these specified will not be accepted.

B. Any product whose published documentation requires the design engineer to manually apply a correction factor derived from a published curve against nominal capacity to obtain corrected capacity shall not be accepted. Correction factor curves including but not limited to: a) Outdoor air temperature capacity and power input; b) Entering indoor unit air temperature capacity and power input; c) combination ratio capacity and power input; d) Heating mode pipe length capacity correction.

1.6 SUBMITTALS

A. Submit unit performance data including capacity, nominal and operating performance.

B. Submit Mechanical Specifications for unit and accessories describing construction, components and options.

C. Submit shop drawings indicating overall dimensions as well as installation, operation and service clearances. Indicate lift points and recommendations and center of gravity. Indicate unit shipping, installation and operating weights including dimensions.

D. Submit data on electrical requirements and connection points. Include recommended wire and fuse sizes or MCA, sequence of operation, safety and start-up instructions.

E. VRF outdoor unit submittal data must include salt spray test results. Salt spray test shall be conducted per ASTM B-117 standard. The test shall be performed for a minimum of 1000 hours.

1.7 OPERATION AND MAINTENANCE DATA

A. Submit operation and maintenance data, troubleshooting guides, service manuals, and engineering manuals.

B. Provide the owner with the manufacturer’s VRF system service diagnostics software

1.8 DELIVERY, STORAGE, AND HANDLING

A. Comply with manufacturer's installation instructions for rigging, unloading, and transporting units.

B. Store in clean dry place and protect from weather and construction traffic. Handle carefully to avoid damage to components, enclosures, and finish.

1.9 ENVIRONMENTAL REQUIREMENTS

A. Do not operate units for any purpose, temporary or permanent, until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

1.10 WARRANTY

A. Provide one year parts warranty and seven (7) year compressor to the owner from date of installation.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Basis of Design: LG

B. Acceptable standards shall be supplied based upon the performance characteristics and features of the LG model number(s) specified, LG model families specified and as otherwise specified herein. Alternate suppliers shall request permission to bid, in writing, to the engineer at least 10 days prior to the bid date. This request by the contractor to bid an alternate supplier to the basis of design, listed or not listed, shall not relieve the contractor of supplying all materials, options, controls, sequences, efficiencies and intents of the original specifications written or implied by LG model number or model family or as otherwise specified. The contractor will be responsible for any additional cost resulting from the alternate supplier.

2.2 GENERAL

A. Variable Refrigerant Flow (VRF) HVAC system shall be a variable capacity, direct expansion (DX) heat recovery or heat pump engineered system.

B. Water source systems:

1. The water source unit shall consist of one or more cabinet(s) connected through common refrigerant piping, with built-in refrigerant to water heat exchanger for integration with field provided boiler/geothermal heat sink systems. Each water source system shall have (1) inverter compressor. Each system shall be connected to multiple indoor evaporator units refrigerant piping and integrated system controls. Each indoor unit shall be capable of providing individual zone control.

C. Air source systems:

1. The outdoor unit shall consist of one or more frames connected through a common 2-pipe Heat Pump or 3-pipe Heat Recovery refrigerant piping network and control communication wiring. Each system shall have single or multiple, inverter compressor(s). Each system shall be connected to multiple indoor units (ducted, non-ducted or mixed combinations) through a common refrigerant piping network and integrated system controls and communication network. Each indoor unit shall be controlled individually or as a group.

D. Heat recovery systems shall be capable of simultaneous heating and cooling individual zone(s).

2.3 LG MULTI V WATER IV VRF HEAT RECOVERY SYSTEM (6 TO 48 TONS)

A. Water source Unit shall be capable of the following operating ambient range.

1. Heat Recovery System
   a. Cooling and simultaneous mode
      1) Entering water range temperature: 23°F to 113°F

   b. Heating mode
      1) Entering water range temperature: 23°F to 113°F

2. Geothermal operating range: 23°F (Heating only)

B. General

1. The air-conditioning system shall use R410A refrigerant.

2. Each system shall have one, two or three water source units.

3. Dual and triple frame configurations shall be field piped together using manufacturer's designed and supplied Y-branch kit and field provided interconnecting pipe to form a common refrigerant circuit.

4. Refrigerant circuit configuration for Heat Recovery System

   a. The refrigerant circuit shall be constructed using field provided copper pipe together with manufacturer supplied Heat Recovery unit(s) connected to Y- branches or Headers fittings connected to multiple (ducted, non-ducted or combination thereof) indoor units to effectively and efficiently distribute refrigerant between system components.
   b. Each refrigerant pipe, y-branch, header kit and refrigerant specialties shall be individually insulated with no air gaps. All joints shall be glued and sealed.

5. Water circuit for heat recovery system

   a. All water piping between the water source unit(s) and the boiler/cooling tower or geothermal field shall be supplied and installed by the installing contractor with all accessories and water piping specialties required to complete the circuit.
   b. Flow of water shall be monitored by a field supplied flow switch connected to water source unit safety controls to prevent operation of the water source unit when there is insufficient water flow through heat exchanger.

6. Factory installed microprocessor controls in the water source unit, HR unit(s), and indoor unit(s) shall perform functions to efficiently operate the VRF system and communicate in a daisy chain configuration between the water source unit, the HR unit(s) and indoor unit(s) via RS485.

7. The system shall have the ability to accept connection up to 64 indoor units.

8. The maximum allowable system combination ratio shall be 130%. Systems designed with combination ratio above 130% are not acceptable.

9. The total nominal capacity of all indoor units shall be no less than 50% and no more than 130% of outdoor unit's nominal capacity to ensure the VRF system will have sufficient capacity to meet the building's cooling and heating load at design day weather conditions.

10. The unit shall be shipped from the factory fully assembled including internal refrigerant piping, compressor, contacts, relay(s), power and communications wiring necessary.

11. Each water source unit refrigeration circuit shall have the following components:

    a. Refrigerant strainer
    b. Check valves
    c. Oil separator
    d. Accumulator
    e. Hot gas bypass valve
    f. 4-way reversing valve
    g. Electronic expansion valve(s)
    h. Sub-cooler
    i. High and low side Schrader valves
    j. Service valves

12. Variable Water Flow Control Kit accessory shall be installed. Variable Water Flow Control Kit allows connection to a field supplied modulating water valve that will vary the flow to the water source used based on compressor speed, saving pumping energy.

C. Piping Capabilities

1. The system shall be capable of operating at an elevation difference of up to 164 feet above or below the lowest or highest indoor unit respectively.

2. The system shall be capable of operating with up to 1640 equivalent length feet of interconnecting liquid line refrigerant pipe in the network.

3. The system shall be capable of operating with up to 656 actual feet or 738 equivalent length feet of liquid line refrigerant pipe spanning between the outdoor unit and farthest indoor unit.

4. The elevation difference between two indoor units shall not exceed 131 feet for heat pump.

D. Oil Management

1. The system shall have Hi-POR (High Pressure Oil Return) to ensure a consistent film of oil on all moving compressor parts at low speed. Oil is returned to compressor through a separate oil injection pipe.

2. The system shall be provided with a centrifugal oil separator designed to extract oil from the oil/refrigerant gas stream leaving the compressor and return the extracted oil to the compressor oil sump.

3. The system shall have an oil level sensor in the compressor to provide direct oil level sensing.

4. The system shall only initiate an oil return cycle if the oil level is too low.

E. Cabinet

1. Water source unit cabinet shall be made of 20 gauge galvanized steel with a powder coated baked enamel finish.

2. Water source unit cabinet shall be tested in accordance with ASTM B-117 salt spray test procedure for a minimum of 1000 hours.

3. All pipe connections, maintenance, and service access shall be from front side of the unit only. Unit designs that require service access or pipe connections through either side, top or back panels will not be acceptable.

4. Optionally, the cabinet shall be designed to also accept field provided refrigerant piping through the bottom of the unit.

5. A smaller service access panel, not larger than 4”x 8” shall be provided in the front panel to access the following with removing the front service panel:

   a. Service tool connection
   b. DIP switches
   c. Error code

6. Water connections shall be from the front of the water source unit.

F. Condenser

1. The water source unit shall be provided with a stainless steel plate type heat exchanger.

2. The heat exchanger shall remove/add heat between refrigerant and water.

3. The heat exchanger shall be protected with a field supplied (50Mesh or finer) strainer.

4. The system shall be provided with a field provided flow switch.

5. The unit shall have a factory installed water temperature safety switch to monitor excessive increase or decrease of inlet water temperature.

G. Compressor(s)

1. 460V Water Source Unit
   a. Each 6, 8, 10, 12, 14, 16 ton cabinet(s) shall be equipped with one hermetically sealed, High Side Shell (HSS), inverter driven, scroll compressor.
   b. Low Side Shell compressor(s) are not acceptable.

2. Each inverter driven, digitally scroll compressor shall be capable of operating in a frequency range from 20 Hz to 140 Hz with control in 1 Hz increments.

3. The compressor shall be provided with a full charge of Polyvinyl Ether (PVE) oil from the factory.

4. The compressor bearing(s) shall be Teflon™ coated.

5. The compressor(s) shall be mounted on rubber isolation grommets.

6. The compressor(s) shall be wrapped with heat resistant, sound attenuating blanket.

7. Inverter compressor(s) safeties shall include a minimum of:
    a. High Pressure switch
    b. Over-current /under current protection
    c. Phase failure
    d. Phase reversal

H. Sound Levels

1. Each cabinet shall be rated with a sound level not to exceed 62 dB(A) when tested in an anechoic chamber under ISO3745 standard.

I. Sensors

1. Each unit cabinet shall be equipped with
    a. Suction temperature thermistor
    b. Discharge temperature thermistor
    c. High Pressure switch
    d. High Pressure sensor
    e. Low Pressure sensor
    f. Water source temperature sensor
    g. Heat exchanger temperature sensor

2.4 HEAT RECOVERY UNIT (HRU)

A. General

1. HR unit shall be designed and manufactured by the same manufacturer of VRF indoor units and water source units.

2. HR unit casing shall be made with galvanized steel.

3. HR unit shall require 208-230V/1-phase/60Hz power supply.

4. HR Unit shall be an intermediate refrigerant control device between the water source unit and the indoor units to control the systems simultaneous cooling and heating operation.

5. HR unit shall be engineered to work with a have a three pipe VRF system comprising of

    a. High Pressure Vapor Pipe
    b. Low Pressure Vapor Pipe
    c. Liquid Pipe

6. HR unit shall be designed to be piped in series with the use of Y-branch or header fittings.

7. HR unit shall have 2, 3, 4, or 6 ports.

8. Each port shall be capable of operating in cooling or heating independently regardless of the operating mode of any other port on the HR unit or in the system.

9. Each port shall be capable of connecting from 2, 3, 4, or 6 indoor units to a maximum nominal capacity of 54MBh.

10. Maximum nominal capacity per HR unit shall not exceed 191MBh.

11. HR unit shall be internally piped, wired, assembled and run tested at the factory.

12. HR unit shall be designed for installation in a conditioned environment.

13. HR unit shall have a liquid bypass valve.

14. HR unit shall have (2) two-position solenoid valves per port.

15. HR unit shall have a balancing valve to control the pressure between the high pressure and low pressure pipe during mode switching.

16. HR unit shall have an electronic expansion valve for subcooling.

17. HR unit shall not require a condensate drain.

18. HR unit shall be internally insulated.

19. All field refrigerant lines between water source unit and HR unit and from HR unit to indoor unit shall be field insulated.

20. The HR unit shall not exceed a net weight of 53 lbs.

21. The system shall be designed to accommodate 16 HR units connected to Heat Recovery units piped in single series string.

22. A single series pipe string of 1 to 16 HR units shall be capable of serving indoor units with a total nominal capacity of 192 MBH

B. Piping Capabilities

1. The acceptable piping length between HR unit(s) and indoor unit(s) shall be 131 equivalent length feet.

2. The acceptable elevation difference between each HR unit and each indoor unit and between (2) HR units shall not exceed 131 feet.

C. Controls

1. HR unit(s) shall have factory installed unit mounted control boards and integral microprocessor to communicate with other devices in the VRF system.

2. HR unit shall be connected to the water source unit and indoor unit in a control circuit with 24VDC using a 2-conductor shielded cable for RS485 daisy chain communication.

3. The VRF manufacturer shall provide published documentation that specifically allows the installation of field provided isolation valves on all pipes connected to the Heat Recovery unit to allow the servicing of HR units refrigerant circuit or the replacement of HR unit without evacuating the balance of the piping system

2.5 LG MULTI V S HEAT PUMP (2 TO 5 TONS)

A. General

1. Variable Refrigerant Flow (VRF) HVAC outdoor unit shall be a variable capacity, direct expansion (DX), Heat Pump engineered system. The VRF system shall consist of a single frame outdoor unit, interconnecting piping, multiple indoor units (ducted, non-ducted or mixed combinations), onboard, self-contained, stand-alone communication and controls.

2. LG Multi V S outdoor unit shall be manufactured as a Heat Pump model capable of heating or cooling. Heat pump models shall be able to heat OR cool separate thermal zones.

3. Heat pump systems shall require two pipes, simultaneous heating and cooling shall not be supported. One pipe shall support bidirectional flow single state liquid refrigerant. The other pipe shall support bidirectional flow of single state refrigerant gas. In heating mode, the gas shall be superheated high pressure. In cooling mode the gas shall be low pressure, low temperature.

4. Heat pump outdoor units shall be designed to communicate directly with all VRF indoor units manufactured by the same supplier over a field supplied stranded, twisted and shielded pair wire. Systems requiring intermediary protocol translators, signal boosters, integration with a third party building management systems (BMS) or any other device required for communication possible shall not be accepted.

5. Indoor unit connectivity: The system shall be designed to accept connection up to 12 indoor units of various configurations and capacity.

6. Combination Ratio (CR) is defined as sum of nominal cooling capacity of proposed indoor units/nominal cooling capacity of the outdoor unit. The maximum allowable system combination ratio shall be 130%. Systems designed with combination ratio above 130% are not acceptable. The total nominal capacity of all indoor units shall be no less than 50% and no more than 130% of outdoor unit's nominal capacity.

B. Outdoor Unit

1. The unit shall be shipped from the factory fully assembled including internal refrigerant piping, inverter driven compressor, controls, contacts, relay(s), fan(s), power and communication wiring.

2. The refrigerant shall be R410A.

3. Voltage specifications: 208-230V/60Hz/1-phase (Phase to ground tolerance ±10%)

4. All outdoor units, regardless of the Heat Pump or Heat Recovery models, shall be the same generation and provide with most up to date firmware version at the time of delivery. Manufacturers commissioning agents shall assure the owner in the commissioning report that the latest software version.

5. If the specifications include both heat pump and heat recovery outdoor models, the manufacturer shall provide the most recent generation equipment only. Old stock or obsolete models will not be accepted. Products purchased over the internet and not from the manufacturer's authorized local mechanical representative or authorized distributer will not be accepted.

6. The VRF systems shall be capable of providing continuous compressor operation over the required ambient operating range. Submittal or technical performance data that indicates the required operating ambient range includes data points that do not guarantee continuous compressor operation, noted as reference data, or footnoted as such shall not be accepted. The required ambient operating range is defined as follows:

    a. Cooling
        1) Heat Pump System w/ Low Ambient Kit: -9.9°F DB to 122°F DB

b. Heating
   1) Heat Pump: - 4°F WB to 61°F WB

7. Operational Sound Level.

   a. Manufacturers' published data shall include sound pressure and sound power levels.

      1) Sound pressure level shall not exceed 52 dB (A) during cooling operation for Heat Pump outdoor units when tested in an anechoic chamber under ISO3745 standard. Other testing conditions shall not be allowed.
      2) Sound power level shall not exceed 69 dB (A) when tested in an anechoic chamber under ISO3745 standard. Other testing conditions shall not be allowed.

8. Cabinet

   a. Outdoor unit cabinet shall be made of 22 gauge, galvanized steel with a weather and corrosion resistant enamel finish. Outdoor unit cabinet finish shall be tested in accordance with ASTM B-117 salt spray surface scratch test (SST) procedure for a minimum of 1000 hours.

   b. The cabinet shall have piping knockouts to allow refrigerant piping to be connected at the front, right side, or through the bottom of the unit.

   c. A removable service panel shall be provided to access the following internal components:

      1) Service tool connection
      2) DIP switches
      3) Main microprocessor
      4) Inverter PCB

9. Compressor

   a. The compressor shall be a high efficiency high-side shell rotary hermetic design. Bearing shall be manufactured using high lubricity material. Compressor shall be factory charged with Polyvinyl Ether (PVE) oil. Single or dual speed compressors charged with Polyolester oil (POE) shall not be acceptable. Compressor inverter drive shall allow modulation from 20Hz to 90Hz with control in 1.0 Hz increments depending on the nominal capacity.

10. Outdoor Unit Coil

   a. Outdoor unit coil shall be comprised of aluminum fins mechanically bonded to copper tubing with inner surfaces having a riffling treatment to expand the total surface of the tube interior

   b. The aluminum fin heat transfer surfaces shall have factory applied corrosion resistant GoldFin™ coating. The coils coating shall be tested per ASTM B-117 standard. The test shall be performed for a minimum of 1000 hours. The outdoor unit coil shall have a minimum of 2 rows.

   c. The outdoor unit coil shall have a minimum of 14 Fins per Inch (FPI).

   d. The outdoor unit coil shall be protected with a heavy gauge steel wire guard.

   e. The coil guard shall have a baked enamel finish.

   f. The outdoor unit coil, all indoor units and pipe network shall be field tested to a minimum pressure of 550 psig. Manufacturers that do not specify and/or allow field testing at 550 psig shall not be allowed.

g. The cabinet shall have a factory installed coil guard.

11. Fan Assembly

a. All units shall be equipped with direct drive, variable speed, axial flow fan(s) with Brushless Digitally Controlled (BLDC) motor(s) with a horizontal air discharge.

b. The fan(s) blades shall be made of Acrylonitrile Butadiene Styrene (ABS) material.

c. The fan motor(s) shall be equipped with permanently lubricated bearings.

d. The fan motor(s) shall be variable speed with an operating speed range of 0 to 850 RPM in cooling mode and heating mode. The fan(s) shall have a guard(s) to help prevent contact with moving parts.

e. The fan control shall have a function setting to remove excess snow.

12. Outdoor unit Refrigerant Circuit

a. The outdoor unit refrigeration circuit at a minimum shall include the following components:

1) Refrigerant strainer(s)
2) Check valve(s)
3) Inverter driven, high pressure shell compressor
4) Oil separator
5) Accumulator
6) 4-way reversing valve
7) Electronic expansion valve(s)
8) Double spiral tube sub-cooler and EEV
9) High/low Schrader valve service ports with caps
10) High/low service valves
11) Threaded fusible plug
12) High pressure switch

b. The VRF outdoor unit shall use the sub-cooler while operating in cooling mode to sub-cool liquid refrigerant coming from the condenser coil well below saturation temperature to ensure that refrigerant remains in 100% liquid state when it reaches the farthest indoor unit's EEV valve. Sub-cooler operation algorithm must be able to vary the amount of sub-cooling from 4˚F to 30˚F. The amount of sub-cooling shall be minimized at all times to maximize efficiency by not overcooling the liquid.

13. Defrost Operations

a. The outdoor unit(s) shall be capable of auto defrost operation to melt accumulated frost off the outdoor unit heat exchanger. The defrost cycle control shall monitor the outdoor ambient temperature and outdoor unit heat exchanger surface temperature.

b. The frequency of operating the defrost cycle shall be determined by the system's ability to maintain sufficient system head pressure to deliver comfortable warm air to the building.

14. Microprocessor Control

a. Factory installed microprocessor control in the outdoor unit, heat recovery unit(s), and indoor unit(s) shall communicate using the same protocol. Translators of any kind are not allowed. Communication between VRF system components shall be via field supplied stranded, shielded and twisted wire pair

in a RS 485 network configuration. Integrated control system shall perform functions to optimize the operation of the VRF system.

b. Power and communication interruption: The system shall be capable of performing continuous operation when an individual or several indoor units are being serviced; communication wire cut or power to indoor unit is disconnected. Systems that alarm and/or shut down because of a lack of power to any number of indoor units shall not be acceptable or allowed.

c. Main microprocessor shall include human interface capability that provides a visual code that reports systems operation status. If any malfunction occurs, or system is operating with an unstable refrigerant cycle sensors shall report the malfunction to the visual display.

d. Main processor shall provide the commissioning agent the ability to customize the VRF systems operation based on the environment in which it is installed. Customization function to include defrost operation, modifying target superheat, sub-cooling, low pressure and high pressure values , and invoke other algorithms such as smart load control to optimize system operating efficiency. The main processor board shall include the following features:

1) Service tool connection
2) DIP switches
3) Auto addressing
4) Error codes
5) Main microprocessor
6) Inverter PCB

15. Outdoor unit microprocessor shall have the capability of reporting malfunction and diagnostic codes to remote control devices such as the VRF manufacturer's central controller, Zone controllers, and Building Management System (BMS).

16. Sensors

a. Each outdoor unit module shall have

1) Suction temperature sensor
2) Discharge temperature sensor
3) High Pressure sensor
4) Low Pressure sensor
5) Outdoor temperature sensor
6) Outdoor unit heat exchanger temperature sensors

17. Wi-Fi communication: The outdoor unit shall be Wi-Fi capable. Wi-Fi shall allow service or maintenance personal access to the operating system diagnostics and monitoring functions, via the manufacturer's provided maintenance and diagnostic software over a mobile device or personal computer. Communication between devices shall include: 1) Real-time system operation monitoring with the ability to capture all system operating data for a field determined period of time into a downloadable csv file format to a wireless connected device; 2) Collection of point in time (snapshot) information including all current outdoor unit operating conditions and each indoor unit, system EEV and solenoid valves, sensors, compressor speed, and refrigerant operating pressures. Systems that require computers with a hard wire only connection or other devices to collect, review or record operating conditions shall not be allowed.

18. Third Party Controls platform Integration

a. The VRF system manufacturer's central controls platform shall be able to communicate with third party building management systems (BMS) via BACnet™ IP, Modbus TCP, or LonWorks™ protocol allowing third party BMS system control and/or monitoring of the LG air conditioning and heating

system. See controls specification for more detailed description of integration and points to be controlled and monitored.

b. The VRF system manufacturer shall have available off-the shelf devices that allows on/off binary interfaces between third party ancillary devices such as fans, door locks, photo eyes, key card switches, motion sensors, exhaust fans, dampers, and a single (or group of) VRF indoor units. Indoor units shall have the ability to start/stop the third party device, receive a contact closure signal from the third party device, or have the third party device change the operating conditions of the VRF indoor unit. Operating conditions shall include one or more of the following indoor unit functions: fan speed, fan on/off, thermal on/off cooling or heating, or indoor unit start/stop.

19. Refrigerant System Cycle and Control

a. The refrigerant cycle operation core logic shall establish and maintain target evaporating temperature (Te) to be constant in cooling mode and condensing temperature (Tc) constant in heating mode and maintain system stable operation while operating compressors across the range of environmental conditions guaranteeing continuous compressor operation. VRF system core logic shall be able to dynamically modify the target evaporator and condenser temperatures to maximize energy savings when system is operating at part load conditions.

b. Flexible Capacity Control (Demand limiting): The flexible capacity control (FCC) optional controller provides third party control of the power consumption of the VRF system. The FCC controller shall be able to accept up to five (5) separate inputs from a third party device. Demand limiting shall provide up to eight (8) steps of capacity control in response to a binary signal from a third party BMS system or multistep signal from the local power company.

c. Smart load control: Smart load control operation shall enhance energy savings and increase indoor comfort by monitoring the real time ambient temperature, real time weighted mean average building load, and the outdoor relativity humidity (if enabled).

1) Smart load control shall be a field selectable, consisting of three operating algorithm, selectable at the time of commissioning or at any other time:

a) At initial start up
i. The system shall be influenced by any one of the chosen algorithm
ii. Off mode: Smart load control algorithm shall be in off mode
iii. Smooth mode: Smart Load control shall maximize energy savings. The rate of temperature change shall be insignificant.
iv. Normal Mode: Smart Load Control shall balance the rate of temperature change with energy consumed.
v. Peak Mode: Smart Load shall quickly cool/heat the building. The energy consumption shall not be the priority in this mode.

b) For the first 20 minutes after the initial startup, the Smart Load Control will influence the outdoor unit operation for the chosen algorithm. This operation will be available at every start up.

2) After 20 minutes of compressor operation

a) Smart Load control will maintain the chosen logic and system will operate with the same core logic.

3) Smart Load Control monitors two or three inputs:

a) Weighted mean average building load

b) Outdoor ambient dry bulb temperature
c) Outdoor ambient relative humidity (when enabled)

4) Enhance energy savings

a) Cooling Mode:
i. Smart Load Control raises the system target low pressure during off-peak operation.
ii. Raising the operating low pressure shall reduce the compressor lift; reduce compressor's speed and power consumption.

b) Heating Mode

i. Smart Load control shall lower the system target high pressure during off-peak heating operation.
ii. Lowering the operating high pressure target shall reduce compressor lift, reduce compressor speed and power consumption.
iii. Energy saved is in addition to the energy savings basic VRF load control provides.

5) Increased indoor comfort

a) Smart Load control shall use one (or two) sensors to measure changing outdoor weather conditions and shall prepare the VRF system to operate under the revised weather conditions. This operation shall be activated before the changed ambient conditions have an impact on indoor units.

C. Field Supplied Refrigerant Piping Design Parameters

1. General

a. Refrigerant circuit configuration for heat pump and heat recovery system:

1) The refrigerant circuit shall be constructed using field provided ACR copper, de-hydrated, refrigerant rated copper pipe, piped together with manufacturer supplied heat recovery unit(s) and Y- branches, as may be required, connected to multiple (ducted, non-ducted or mixed combination) indoor units to effectively and efficiently control the heat pump or heat recovery mode operations or simultaneous heating and cooling operation of the VRF system. Other pipe materials, if used, shall perform, at a minimum, as well as that specified above, shall not have any adverse reactions to any other componets or materials also in use in the system and shall be installed per manufactures instructions. LG does not endorse, approve or recommend any mechancial fitting or pipe manufacture.

2) All refrigerant pipe, y-branches, elbows and valves shall be individually insulated with no air gaps. Insulation R-value (thickness) shall not be less than the minimum called for by the local building code, local energy code or as a minimum per manufacture installation requirements. In no case shall the insulation be allowed to be compressed at any point in the system.

3) All joints shall be glued and sealed per insulation manufactures instructions to make an air tight assembly.

b. The outdoor unit shall be capable of operating at an elevation difference of up to of 164 feet above or 131 feet below the lowest or highest indoor unit respectively without the requirement of field installed sub-cooler or other forms of performance enhancing booster devices.

c. The outdoor unit shall be capable of operating with up to 984 equivalent length feet of interconnecting liquid line refrigerant pipe in the network.

d. The outdoor unit shall be capable of operating with up to 492 actual feet or 574 equivalent length feet of liquid line refrigerant pipe spanning between outdoor unit and farthest indoor unit.

e. The elevation difference between the highest and lowest indoor units shall not exceed 49 feet.

f. The piping system shall be designed with pipe expansion and contraction possibilities in mind. Required expansion devices shall be field designed, supplied and installed based on proper evaluation of the proposed piping design. In addition to these requirements, the piping system installation must conform to the VRF equipment manufacturer's published guidelines.

g. The installation of pipe hangers, supports, insulation, and in general the methods chosen to attach the pipe system to the structure must allow for expansion and contraction of the piping system and shall not interfere with that movement.

2.6 LG MULTI V 5 HEAT PUMP (6 TO 42 TONS)

A. General

1. Variable Refrigerant Flow (VRF) HVAC system shall be a variable capacity, direct expansion (DX) field selectable Heat Pump engineered system within a single cabinet. The outdoor unit shall consist of one or more frames connected through a common 2-pipe Heat Pump refrigerant piping network and control communication wiring. Each system shall have single or multiple, inverter compressor(s). Each system shall be connected to multiple indoor units (ducted, non-ducted or mixed combinations) through a common refrigerant piping network and integrated system controls and communication network. Each indoor unit shall be controlled individually or as a group.

2. All three-phase outdoor units shall be from the same product design. Mixing of different product designs, families, or product lines are not acceptable.

3. All three-phase VRF heat pump outdoor units shall be from the same product development generation. Mixing of outdoor units from different development generations is not acceptable

4. The VRF systems shall be capable of providing continuous compressor operation over the required ambient operating range. VRF systems that provide possible, but don't guarantee continuous compressor operation over the required ambient operating range, will not be accepted. Submittal that states performance data is reference data, data that is for reference only, or that is footnoted as such shall not be accepted.

5. Outdoor Unit shall be capable of continuous compressor operation between the following operating ambient air conditions, operation outside of these conditions are possible and may involve non-continuous operations.

6. Operating Ambient Air Conditions:

   a. Heat Pump System w/ Low Ambient Kit

      1) Cooling: -9.9°F DB to 122°F DB
      2) Heating: -13°F WB to 61°F WB

7. The air-conditioning system shall use R410A refrigerant.

8. The system shall be capable of an automatic variable refrigerant charge function for use in both the heat mode and cool mode to ensure the proper amount of circulating refrigerant is in the system. Manufactures that cannot control, in real time, the amount of circulating refrigerant to ensure optimal system operation

year-round shall not be allowed.

9. Each system shall consist of one, two or three air source outdoor unit modules conjoined together in the field to result in the capacity specified elsewhere in these documents.

10. System shall employ self-diagnostics function to identify any malfunctions and provide type and location of malfunctions via fault alarms.

11. Refrigerant Circuit Configuration for Heat Pump Systems: The refrigerant circuit shall be constructed using field provided ACR copper, de-hydrated, refrigerant rated copper pipe, piped together with manufacturer supplied Heat recovery unit(s) and Y- branches, as may be required, connected to multiple (ducted, non-ducted or mixed combination) indoor units to effectively and efficiently control the heat pump or Heat Recovery mode operations or simultaneous heating and cooling operation of the VRF system. Other pipe materials, if used, shall perform, at a minimum, as well as that specified above, shall not have any adverse reactions to any other components or materials also in use in the system and shall be installed per manufacturer's instructions. LG does not endorse, approve or recommend any mechanical fitting or pipe manufacturer.

12. All refrigerant pipe, y-branches, elbows and valves shall be individually insulated with no air gaps. Insulation R-value (thickness) shall not be less than the minimum called for by the local building code, local energy code or as a minimum per manufacture installation requirements. In no case shall the insulation be allowed to be compressed at any point in the system.

    a. All joints shall be glued and sealed per insulation manufactures instructions to make an air tight assembly.

13. Factory installed microprocessor controls in the outdoor unit(s), heat recovery unit(s), and indoor unit(s) shall perform functions to optimize the operation of the VRF system and communicate in a daisy chain configuration between outdoor unit and heat recovery unit(s) and indoor unit(s) via RS485 network. Controls shall also be available to control other building systems as required from the VRF control system. DIO/AIO capabilities shall be available as well as a central controller to perform operation changes, schedules and other duties as required by this specification. Addition of separate building control system shall not be required. Other control devices and sequences shall be as specified in other sections of this project specification.

14. Inverter PCB Cooling: Cooling of the inverter PCB shall be conducted by way of high pressure, sub-cooled liquid refrigerant via heat exchanger attached to rear side of inverter PCB. The full capacity flow of refrigerant shall pass though the heat exchangers to maximize the cooling effect of the PCBs and to aid in the evaporation process and capacity of the outdoor coil during the heating mode. The recovered heat of the PCBs must be used to enhance the overall heating process, other uses or dissipation of heat to ambient shall not be permitted.

15. Compressor Control: Fuzzy control logic shall establish and maintain target evaporating temperature (Te) to be constant on cooling mode and condensing temperature (Tc) constant on heating mode by Fuzzy control logic to ensure the stable system performance. Other compressor control capabilities shall be available via special function controls as noted elsewhere in this specification.

16. Initial Test Run (ITR) (Heating or Cooling) / Fault Detection Diagnosis (FDD) Code: This control mode shall monitor and display positive or negative results of system initial startup and commissioning. Heating or Cooling ITR mode will be automatically selected. It shall monitor the following, but not be limited to, refrigerant quantity charge, auto-charge, stable operations, connection ratios, indoor unit status, error status, and number of indoor units connected. This control mode shall not replace the system error monitoring control system.

17. Integration: Each system shall be able to integrate via BACnet™ IP gateway. This gateway converts between BACnet™ IP or Modbus TCP protocol, and RS-485 LGAP (LG Aircon protocol) allowing third party control and monitoring of the LG A/C system, or LonWorks™ gateways. See controls specification for more detailed description of integration and points to be controlled and monitored.

18. Advanced Smart Load Control: Smart load control operation shall be available at any time during or after system commissioning. Smart Load Control shall be initiated by outdoor air temperature and or relativity humidity as sensed at the outdoor unit and shall automatically adjust the evaporator target (condenser target for heat) pressure/temperature that the system will operate to in order to precisely load match the system to the building load as the outdoor and/or the indoor ambient temperature increases or decreases. By varying the compression ratios of the system and increasing the operating efficiencies, comfort and reducing energy consumption by adjusting the compressor lifts, the system shall poll all indoor units' data and dry bulb temperature in real time and apply its algorithm to determine the optimal evaporating temperature to satisfy varying loads. Systems that rely on the worst performing zone to reset the system conditions shall not be sufficient and shall not be allowed.

19. Wi-Fi Communication: The outdoor unit shall be Wi-Fi enabled and capable. Wi-Fi shall allow service or maintenance personal access to the complete operating system, via LGMV mobile, without need of tools other than smart phone or tablet. Active live system review, collection of all system data for a field determined duration presented in a .csv file format or collection of all operating conditions, including all indoor units, valves, sensors, compressor speeds, refrigerant pressures, etc., by snapshot of conditions and placing that snapshot into a power point slide to be reviewed at another time. Systems that require computers, hard wire only connection or other devices to collect, review or record operating conditions shall not be allowed.

20. Indoor Unit Connectivity: The system shall be designed to accept connection up to 64 indoor units of various configuration and capacity, depending on the capacity of the system.

21. Power and Communication Interruption: The system shall be capable of performing continuous operation when an individual or several indoor units are being serviced; communication wire cut or power to indoor unit is disconnected. Systems that alarm and/or shut down because of a lack of power to any number of indoor units shall not be acceptable or allowed.

22. Connection Ratios: The maximum allowable system combination ratio shall be 130%. Systems designed with combination ratio above 130% are not acceptable. The total nominal capacity of all indoor units shall be no less than 50% and no more than 130% of outdoor unit's nominal capacity.

23. Intelligent Heat Mode: Intelligent heating shall be initiated via a field setting at the outdoor unit. Intelligent heating shall extend the heating operation by calculating the dew point of the outdoor coil surface using the outdoor units' temperature and humidity sensors to maintain the coil surface temperature above the ambient dew point minimizing frost build-up and delaying a defrost operation while maintaining indoor space temperature. This feature shall be capable of eliminating several defrost actions per day based on outdoor air temperature and humidity conditions.

24. Comfort Cooling Mode: Comfort cooling shall be initiated via a field setting at the outdoor unit during commissioning or anytime thereafter. Comfort cooling shall allow user to select all or some of the zones on a system to adjust automatically their evaporator temperatures, independent of other zones, based on the impending total loads of that zone determined by using the zone controller temperature sensor.

25. The outdoor unit refrigerant circuit shall employ for safety a threaded fusible plug.

26. The unit shall be shipped from the factory fully assembled including internal refrigerant piping, inverter driven compressor(s), controls, temperature sensor, humidity sensor, contacts, relay(s), fans, power and communications wiring as necessary to perform both Heat Pump and Heat recovery operations.

27. Each outdoor unit refrigeration circuit shall include, but not limited to, the following components:

    a. Refrigerant strainer(s)
    b. Check valve(s)
    c. Inverter driven, medium pressure vapor injection, high pressure shell compressors
    d. Liquid refrigerant cooled inverter PCB
    e. Oil separator(s)
    f. Accumulator /controlled volume receiver(s)
    g. 4-way reversing valve(s)
    h. Vapor injection valve(s)
    i. Variable path heat exchanger control valve(s)
    j. Oil balancing control
    k. Oil Level sensor(s)
    l. Electronic expansion valve(s)
    m. Sub-cooler (s)
    n. Vapor Injection Valve(s)
    o. High and low side Schrader valve service ports with caps
    p. Service valves
    q. Factory supplied refrigerant charge, pounds.

B. Refrigerant Flow Control

1. Variable Path Heat Exchanger: System shall have a variable flow and path outdoor heat exchanger function to vary the refrigerant flow and volume and path. Control of the variable path circuits shall be based on system operating mode and operating conditions as targeted to manage the efficiency and minimize or maximize the circulating volume of the operating fluids of the system.

2. Vapor Injection: System shall have a medium pressure gas vapor injection function employed in the heating and cooling modes to increase system capacity when the outdoor ambient temperatures are low and lower compressor lift when temperatures are high. The compressor vapor injection flow amount shall be controlled by the vapor injection sub-cooling algorithm reset by discharge gas temperatures of the compressor.

3. Active Refrigerant Control: System shall have an active refrigerant control and multi section accumulator-receiver that dynamically changes the volume of refrigerant circulating in the system based on operating mode and operating conditions to ensure maximum system performance and efficiency.

4. Compressor Design: The compressor design shall be of the high pressure shell scroll type where the internal pressure below the suction valves of the compressor shall be at the same high pressure and high temperature. The motor shall be cooled by high pressure gas at temperatures above saturation conditions and minimize the mixing of refrigerant liquid with oil in the sump. The system shall employ a high pressure oil return method returning recovered oil from the oil separator directly into the oil sump of the compressor; oil shall not be allowed to return via the suction line. Bearing surfaces are continually coated with oil. The compressor shall employ an Aero-bearing constructed with high lubricity materials increasing operation time in case of low sump oil level. Compressor shall have a nominal operating range from 15Hz to 150 Hz.

5. The VRF outdoor unit shall include a factory provided and mounted sub-cooler assembly consisting of a shell and tube-type sub-cooling heat exchanger and EEV providing refrigerant sub-cooling modulation control by fuzzy logic of EEV and by mode of operation to provide capacity and efficiency as required. Brazed plate heat exchangers shall not be allowed for this function.

6. VRF Systems with Onboard Alternate Operating Mode Selection Capability

    a. All VRF systems which provide field selectable Alternate Operating Modes, for example, High Heat or High Ambient Cooling, published data tables must be available to the public for all modes offered.

b. Acceptable Alternate Operating Modes must ship with all models of the VRF product offering and must be factory embedded. Custom factory or field modifications to factory provided algorithms created to meet scheduled requirements are not acceptable.

c. Provide a copy of instructions required to set the Alternate Operation Mode with the initial submittal.

d. For systems that provide field selectable Alternate Operating Modes, ALL technical data provided in the submittal data sheets showing product rated condition performance data, must also provide separate data sheets that show product performance data at each of the field selectable Alternate Operating Modes available. Capacity, power input, and acoustic performance data for each mode offered shall be reported separately. Mixing of ODU, IDU, or VRF system performance capability operating in one mode with for example the power consumption, sound power rating, or electrical requirements of the same system operating in another mode is not acceptable.

C. Field Supplied Refrigerant Piping Design Parameters

1. The outdoor unit shall be capable of operating at an elevation difference of up to 360 feet above or below the lowest or highest indoor unit respectively without the requirement of field installed subcooler or other forms of performance enhancing booster devices.

2. The outdoor unit shall be capable of operating with up to 3280 equivalent length feet of interconnecting liquid line refrigerant pipe in the network.

3. The outdoor unit shall be capable of operating with up to 656 actual feet or 738 equivalent length feet of liquid line refrigerant pipe spanning between outdoor unit and farthest indoor unit.

4. The piping system shall be designed with pipe expansion and contraction possibilities in mind. Required expansion devices shall be field designed, supplied and installed based on proper evaluation of the proposed piping design. In addition to these requirements, the piping system installation must conform to the VRF equipment manufacturer's published guidelines.

5. The installation of pipe hangers, supports, insulation, and in general the methods chosen to attach the pipe system to the structure must allow for expansion and contraction of the piping system and shall not interfere with that movement.

D. Defrost Operations

1. The outdoor unit(s) shall be capable of Intelligent defrost operation to melt accumulated frost, snow and ice that may have accumulated on the outdoor unit heat exchanger. The defrost cycle length and sequence shall be based on outdoor ambient temperatures, outdoor unit heat exchanger temperature, and various differential pressure variables. Intelligent Heating Mode, when outdoor unit humidistat is engaged, shall extend the normal heating sequences by adjusting the outdoor unit coil target temperature to be above the ambient dew point temperature delaying the need for defrost operations, so long as heating demand is being met.

2. Defrost Mode Selection: The outdoor unit shall be provided with a minimum of three field selectable defrost operation modes: Normal, Fast, or Forced.

a. Fast Defrost: Operation intended for use in areas of the country with mild winter temperatures and light to moderate humidity levels. The strategy minimizes defrost cycle frequency allowing frozen precipitation to build longer in between cycles. Minimum time between defrost cycles shall be 20 minutes. Intelligent Defrost shall choose between split coil/frame and full system methods based on current weather conditions to minimize energy consumption and maximize heating cycle time.

b. Normal Defrost: Operation intended for use in areas of the country that experience adverse winter

weather with periods of heavy winter precipitation and extremely low temperatures. This strategy shall maximize the systems heating performance and maintain operational efficiency. When the ambient temperature is either: a) above 32°F or b) below 32°F with the humidity level below 60% RH, Intelligent Defrost shall continue heating regardless of ice build-up on the coil until the quality of the heated air (i.e. discharge air temperature) decreases. At temperatures below 4°F, a defrost cycle shall occur every two hours to optimize system heating efficiency.

c. Forced Defrost: Operation shall be available for the service provider to test defrost operations at any weather condition and to manually clear frozen water from the outdoor coil surfaces.

3. Defrost Method Selection: The outdoor unit shall be provided with two field selectable defrost operation methods: Split Coil/Frame and Full System. Split Coil/Frame option provides continuous heating of the occupied space during defrost operation.

a. Split Coil/Frame method shall be available when Normal Defrost mode is selected. Split Coil method shall be available on all Heat Pump and Heat recovery single-frame VRF systems. Split Frame defrost shall be available on all Heat Pump and Heat recovery multi-frame outdoor units.

b. Split Coil method shall remove ice from the bottom half of the outdoor unit coil first for a maximum time of six minutes, then the top half for a maximum of six minutes. Next the bottom coil shall be heated again for an additional three minutes to remove any frozen water that may have dripped onto the lower coil during the top coil defrost operation.

c. When Split Coil/Frame method is selected, a Full System defrost shall occur every 1-9 (field selectable) defrost cycles to assure 100% of the frozen precipitation has been removed to maintain efficient performance.

d. Full System method shall be available as a field selectable option. All outdoor units located in areas of the country where large volumes of frozen precipitation are common, the commissioning agent shall be able to select the Full System only defrost method.

4. Indoor Unit Fan Operation During Defrost

a. During partial defrost operation indoor units operating in cooling or dry mode shall continue normal operation.

b. During partial defrost operation, indoor units that are commissioned with fans set for continuous operation shall maintain normal fan speed unless the leaving air temperature drops, then the fan speed will be reduced to low speed for the remainder of the defrost cycle.

c. During full system defrost operation indoor unit fans will cycle off and remain off during the remainder of the defrost cycle.

E. Oil Management

1. The system shall utilize a high pressure oil return system to ensure a consistent film of oil on all moving compressor parts at all points of operation. Oil is returned to compressor through a separate high pressure oil injection pipe directly into the oil sump. Oil returned to the compressor via the suction port of the compressor shall not be allowed.

2. Each compressor shall be provided with a high efficiency independent centrifugal cyclone type oil separator, designed to extract oil from the oil/refrigerant gas stream leaving the compressor.

3. The system shall have an oil level sensor in the compressor to provide direct oil level sensing data to the main controller. The sensor shall provide data to main outdoor unit PCB to start oil return mode and balance

oil levels between multiple compressors.

4. The system shall only initiate an oil return cycle if the sensed oil level is below oil level target values as determined by the microprocessor. The system shall display an error if the oil sensor signals low oil level for a period of 130 minutes or longer.

5. A default oil return algorithm shall automatically initiate the oil return mode if the system detects a failure of the oil sump sensor. A fault code shall be reported by the system.

6. Timed oil return operations or systems that do not directly monitor compressor oil level shall not be permitted.

7. Indoor Unit Fan Operation During Oil Return Cycle

   a. During oil return cycle indoor units operating in cooling or dry mode shall continue normal operation.

   b. During oil return, indoor units that are commissioned with fans set for continuous operation shall maintain normal fan speed unless the leaving air temperature drops, then the fan speed will be reduced to low speed for the remainder of the oil return cycle.

   c. During oil return cycle indoor unit fans will cycle off and remain off during oil return cycle while operating in all modes except 4.9.G.1 and 2.

F. Cabinet

1. Outdoor unit cabinet shall be made of 20 gauge galvanized steel with a weather and corrosion resistant enamel finish. Outdoor unit cabinet finish shall be tested in accordance with ASTM B-117 salt spray surface scratch test (SST) procedure for a minimum of 1000 hours.

2. The front panels of the outdoor units shall be removable type for access to internal components.

3. A smaller service access panel, not larger than 7” x 7” and secured by a maximum of (2) screws, shall be provided to access the following:

   a. Service tool connection
   b. DIP switches
   c. Auto addressing
   d. Error codes
   e. Main microprocessor
   f. Inverter PCB

4. The cabinet shall have piping knockouts to allow refrigerant piping to be connected at the front, right side, or through the bottom of the unit.

G. Fan Assembly

1. 6 ton frames shall be equipped with one direct drive variable speed propeller fan with Brushless Digitally Controlled (BLDC) motor with a vertical air discharge.

2. 8 to 20 ton frames shall be equipped with two direct drive variable speed propeller fan(s) with BLDC motor(s) with a vertical air discharge.

3. The fan(s) blades shall be made of Acrylonitrile Butadiene Styrene (ABS) material and incorporate biomimetic technology to enhance fan performance and reduce fan generated noise.

4. The fan(s) motor shall be equipped with permanently lubricated bearings.

5. The fan motor shall be variable speed with an operating speed range of 0-1150 RPM cooling mode and 0-1150 RPM heating mode.

6. The fan shall have a guard to help prevent contact with moving parts.

7. The cabinet shall have option to redirect the discharge air direction from vertical to horizontal with the addition of optional factory provided air guides.

8. The fan controller shall have a DIP switch setting to raise external static pressure of the fan up to 0.32 inch of W.C. to accommodate ducted installations.

9. The fan control shall have a function setting to remove excess snow automatically.

10. The fan control shall have a function setting to remove access dust and light debris from the outdoor unit and coil.

H. Outdoor Unit Coil

1. Shall be comprised of aluminum fins mechanically bonded to copper tubing and shall be four sided and 2 or 3 rows deep and 17 fins per inch.

2. The copper tubes shall have inner riffling to expand the total surface of the tube interior.

3. The aluminum fins shall have a factory applied Black Fin heat exchanger coating that is comprised of a highly corrosion resistant epoxy resin coating, 1.6-2.0 um thick, designed to perform in corrosive environments such as contaminated and humid conditions. The Black Fin heat exchanger protection shall include a Hydrophilic coating which minimizes moisture buildup on the fin heat exchanger. The “Black Fin” heat exchanger shall have been tested to the following conditions:

   a. ASTM B-117 Salt spray test – 1500 hours with no corrosion
   b. Acid salt test – 900 hours .02% corrosion
   c. ASM corrosion test – 3,000 hours. The Black Fin coating shall be certified by underwriters Laboratories and per ISO 21207. The above conditions shall establish the minimum allowable performance which all alternates must comply.

4. Shall be designed, built and provided by the VRF outdoor unit manufacturer.

5. The outdoor unit coil, all indoor units and pipe network shall be field tested to a minimum pressure of 550 psig. Manufacturers that do not specify and/or allow field testing at 550 psig shall not be allowed.

6. The outdoor unit coil for each cabinet shall have lanced aluminum fins with a maximum fin spacing of no more than 17 Fins per Inch (FPI). All the outdoor unit coils shall be a 2 or 3 rows consisting of staggered tubes for efficient air flow across the heat exchanger.

7. The cabinet shall have a factory installed coil guard.

I. Compressor(s)

1. Each 6, 8, 10 ton frames shall be equipped with a single hermetically sealed, inverter driven, High Side Shell (HSS) scroll compressor.

2. 12, 14, 16, 18 and 20 ton frames shall be equipped with dual hermetically sealed, inverter driven, High Side Shell (HSS) scroll compressors.

3. Each inverter driven, HSS scroll compressor shall be capable of operating from 12 Hz up to 150 Hz with control in 0.5 Hz increments in any and all modes (cooling, heating or simultaneous modes).

4. The compressor(s) shall be equipped with a 60 Watt crankcase heater controlled by oil temperature.

5. The compressor shall employ a factory metered charge of Polyvinyl Ether (PVE) oil.

6. The compressor shall be designed for a separate port for oil to be directly returned to the compressor oil sump.

7. The compressor bearing(s) shall have Teflon™ coating and shall be an aero type design using High lubricity materials.

8. The compressor(s) shall be protected with:

   a. High Pressure switch
   b. Over-current /under current protection
   c. Oil sump sensor
   d. Phase failure
   e. Phase reversal
   f. Compressor shall be capable of receiving injection of medium pressure gas at a point in the compression cycle where such injection shall allow a greater mass flow of refrigerant at lower outdoor ambient and achieving a higher heating capability. The VRF outdoor unit shall have published performance data for heating mode operation down to -13°F on both heat pump and heat recovery systems.

9. Standard, non-inverter driven compressors shall not be permitted nor shall a compressor without vapor injection or direct sump oil return capabilities.

J. Inverter Compressor Controller(s)

1. The VRF outdoor unit shall be provided with a separate inverter compressor controller PCB for each compressor. Inverter compressor controllers that host more than one compressor shall not be accepted.

2. The inverter compressor controller shall be designed and programmed to utilize the entire range of operation of the connected compressor during cooling cycle operation and/or heating cycle operation.

K. Operational Sound Levels

1. Each single frame outdoor unit shall be rated with an operational sound pressure level not to exceed as listed on below chart when tested in an anechoic chamber under ISO 3745 standard at the highest field selectable heating operating modes available. Such documentation shall be presented in all submittals, manufactures who elect to rate their equipment at other than tested in an anechoic chamber under ISO 3745 standard at the highest field selectable heating operating modes available and the highest field selectable conditions shall not be allowed. Rated sound pressure values shall not exceed 59 dBA.

2. A field setting shall be available to program the outdoor unit to reduce sound levels at night, when desired, to a selectable level while still able to meet building load requirement. This mode is available in both cooling and heating modes.

L. Sensors

1. Each outdoor unit module shall have:

a. Suction temperature sensor
b. Discharge temperature sensor
c. Oil level sensor
d. High Pressure sensor
e. Low Pressure sensor
f. Outdoor temperature sensor
g. Outdoor humidity sensor
h. Outdoor unit heat exchanger temperature sensors

2.7 LG DUCTED – HIGH STATIC EVAPORATORS

A. General

1. Unit shall be manufactured by LG.

2. Unit shall be designed to be installed for indoor application.

3. Unit shall be designed to mount fully concealed above the finished ceiling.

4. Unit shall have opening to supply air from front horizontal and a dedicated rear horizontal return.

5. The supply air shall be flanged for field installed ductwork that shall not exceed the external static pressure limitation of the unit.

B. Casing/Panel

1. Unit case shall be manufactured using galvanized steel plate.

2. The cold surfaces of the unit shall be covered internally with a coated polystyrene insulating material.

3. The cold surfaces of the unit shall be covered externally with sheet insulation made of Ethylene Propylene Diene Monomer (M-Class) (EPDM)

4. The external insulation shall be plenum rated and conform to ASTM Standard D-1418.

5. Unit shall be provided with hanger brackets designed to support the unit weight on four corners.

6. Hanger brackets shall have pre-punched holes designed to accept field supplied, all thread rod hangers.

C. Cabinet Assembly

1. Unit shall have horizontal supply air discharge outlets and a return air inlet

2. Unit shall be equipped with factory installed temperature thermistors for:

a. Return air
b. Refrigerant entering coil
c. Refrigerant leaving coil

3. Unit shall have a factory assembled, piped and wired electronic expansion valve (EEV) for refrigerant control.

4. Unit shall have a built-in control panel to communicate with other indoor units and to the outdoor unit.

5. Unit shall have the following functions as standard:

a. Self-diagnostic function
b. Auto addressing
c. Auto restart function
d. Auto changeover function (Heat Recovery system only)
e. Auto operation function
f. Child lock function
g. Forced operation
h. Dual thermistor control
i. Sleep mode
j. External static pressure (ESP) control
k. Dual set point control
l. Multiple aux heater applications
m. Filter life timer
n. External on/off input
o. Wi-Fi compatible
p. Auto fan operation
q. Leak detection logic

D. Fan Assembly

1. The unit shall have two direct drive Sirocco fans made of high strength ABS GP-2200 polymeric resin.
2. The fan impeller shall be statically and dynamically balanced.
3. The fans shall be mounted on a common shaft.
4. The fan motor is Brushless Digitally commutated (BLDC) with permanently lubricated and sealed ball bearings.
5. The fan motor shall include thermal, overcurrent and low RPM protection.
6. The fan/motor assembly shall be mounted on vibration attenuating rubber grommets.
7. The fan speed shall be controlled using microprocessor based direct digitally controlled algorithm that provides a minimum of three pre-programed fan speeds, each setting is also adjustable by field setting to compensate for a limited amount of additional resistance to airflow by adjusting the RPM of the fan motor.
8. In cooling mode, the indoor fan shall have the following settings; Low, Med, High, and Auto.
9. In heating mode, the indoor fan shall have the following settings: Low, Med, High, and Auto.
10. Each of the settings can be field adjusted from the factory setting (RPM/ESP).
11. Unit shall be designed for high speed air volume against an external static pressure of up to 0.98” water gauge, model dependent.

E. Filter Assembly

a. The return air inlet shall have a factory supplied removable, washable filter.

b. The filter access shall be from the rear of the unit.

F. Coil Assembly

1. Unit shall have a factory built coil comprised of aluminum fins mechanically bonded on copper tubing.
2. The copper tubing shall have inner grooves to expand the refrigerant contact surface for high efficiency heat exchanger operation.
3. Unit shall have a minimum two to three row coil, 19-21 fins per inch.
4. Unit shall have a factory supplied condensate drain pan below the coil constructed of HIPS (high impact polystyrene resin).
5. Unit shall include an installed and wired condensate drain lift pump capable of providing minimum 27.5 inch lift from bottom surface of the unit. The unit drain pan is supplied with a secondary drain port/plug allowing the pan to be gravity drained and serviced.
6. The drain pump shall have a safety switch to shut off the unit if condensate rises too high in the drain pan, model dependent.

7. Unit shall have provision of 45° flare refrigerant pipe connections.
8. The coil shall be factory pressure tested at a minimum of 550 psig.
9. All refrigerant piping from outdoor unit to indoor unit shall be field insulated. Each pipe should be insulated separately. Thickness and heat transfer characteristics shall be as per Section 23 07 00.

G. Microprocessor Control

1. The unit shall have a factory installed microprocessor controller capable of performing functions necessary to operate the system with or without the use of a wall mounted controller. The unit shall have a factory mounted return air thermistor for use as a space temperature control device. All operating parameters except scheduling shall be stored in non-volatile memory resident on the microprocessor. The microprocessor shall provide the following functions, self-diagnostics, auto re-start after a power failure and a test run mode.
2. The unit shall be able to communicate with other indoor units and the outdoor unit using a field supplied minimum of 18 AWG, two core, stranded, twisted, and shielded communication cable.
3. The unit controls shall operate the indoor unit using one of the five operating modes:
   a. Auto changeover (Heat Recovery System only)
   b. Heating
   c. Cooling
   d. Dry
   e. Fan only
4. The unit shall be able to operate in either cooling or heating mode for testing and/or commissioning.
5. The unit shall be able to operate with the fan turned off during system cooling thermal off.
6. The unit shall be able to operate with a continuous fan setting.
7. The unit shall have adjustable, multi-step cooling and heating mode thermal on/off temperature range settings.
8. The system shall include a product check function to access and display indoor unit type and capacity from a wired programmable thermostat controller.

H. Electrical
1. The unit electrical power shall be 208-230/1/60 (V/Ph/Hz).
2. The unit shall be capable of operating within voltage limits of +/- 10% of the rated voltage.

I. Controls

1. Unit shall use controls provided by the manufacturer to perform all functions necessary to operate the system effectively and efficiently and communicate with the outdoor unit over an RS-485 daisy chain.

2.8 LG WALL MOUNTED - STANDARD

A. General

1. Unit shall be manufactured by LG.
2. Unit shall be designed to be installed for indoor application.
3. Unit shall be attached to an installation plate/bracket that secures unit to the wall.
4. The depth of the unit shall not exceed 8.25 inches.

B. Casing/Panel

1. Unit case shall be manufactured using Acrylonitrile Butadiene Styrene (ABS) polymeric resin and has a pearl white finish designed for mounting on a vertical surface and includes an installation mounting template and hanging bracket.

C. Cabinet Assembly

1. Unit shall have one supply air outlet and one return air inlet with a manual or motorized sweeping guide vane that automatically changes the direction of airflow from side-to-side and up-and-down.
2. Unit shall be equipped with factory installed temperature thermistors for:

    a. Return air
    b. Refrigerant entering coil
    c. Refrigerant leaving coil

3. Unit shall have a factory assembled, piped and wired electronic expansion valve (EEV) for refrigerant control.
4. Unit shall have a built-in control panel to communicate with other indoor units and to the outdoor unit.
5. Unit shall have the following functions as standard:

    a. Self-diagnostic function
    b. Auto addressing
    c. Auto restart function
    d. Auto changeover function (Heat Recovery system only)
    e. Auto operation function
    f. Auto clean function
    g. Child lock function
    h. Forced operation
    i. Dual thermistor control
    j. Sleep mode
    k. Dual set point control
    l. Filter life timer
    m. External on/off control input
    n. Wi-Fi compatible
    o. Auto fan operation
    p. Refrigerant Refrigerant Leak detection logic

6. Unit shall be capable of refrigerant piping in four different directions.
7. Unit shall be capable of drain piping in two different directions.

D. Fan Assembly

1. The unit shall have a single, direct driven crossflow tangential Sirocco fan made of high strength ABS BSN-7530 polymeric resin.
2. The fan impeller shall be statically and dynamically balanced.
3. The fan motor is Brushless Digitally commutated (BLDC) with permanently lubricated and sealed ball bearings.
4. The fan motor shall include thermal, overcurrent and low RPM protection.
5. The fan/motor assembly shall be mounted on vibration attenuating rubber grommets.
6. The fan speed shall be controlled using microprocessor based direct digitally controlled algorithm that provides a minimum of three pre-programed fan speeds in the heating mode and fan only mode and four speeds in the cooling mode. The fan speed algorithm provides a field selectable fixed speed.
7. In cooling mode, the indoor fan shall have the following settings: Low, Med, High, Power Cool, and Auto.
8. In heating mode, the indoor fan shall have the following settings: Low, Med, High, and Auto.
9. Unit shall have factory installed motorized louver to provide flow of air in up and down direction for uniform airflow.
10. Unit shall have factory installed motorized guide vane to control the direction of flow of air from side to side.

E. Filter Assembly

1. The return air inlet shall have a factory supplied removable, washable filter
2. The filter access shall be from the front of the unit without the need of tools.

F. Coil Assembly

1. Unit shall have a factory built coil comprised of aluminum fins mechanically bonded on copper tubing.
2. The copper tubing shall have inner grooves to expand the refrigerant contact surface for high efficiency heat exchanger operation.
3. Unit shall have a minimum two row coil, 18 fins per inch.
4. Unit shall have a factory supplied condensate drain pan below the coil constructed of EPS (expandable polystyrene resin).
5. Unit shall be designed for gravity drain.
6. Unit shall have a 5/8" inside diameter factory insulated drain hose to handle condensate.
7. Unit shall have provision of 45° flare refrigerant pipe connections.
8. The coil shall be factory pressure tested at a minimum of 550 psig.
9. All refrigerant piping from outdoor unit to indoor unit shall be field insulated. Each pipe should be insulated separately.
10. Thickness and heat transfer characteristics shall be determined by the design engineer and shall meet all code requirements.

G. Microprocessor Control

1. The unit shall have a factory installed microprocessor controller capable of performing functions necessary to operate the system with or without the use of a wall mounted zone controller. The unit shall have a factory mounted return air thermistor for use as a space temperature control device. All operating parameters except scheduling shall be stored in non-volatile memory resident on the microprocessor. The microprocessor shall provide the following functions, self-diagnostics, auto re-start after a power failure and a test run mode.
2. The unit shall be able to communicate with other indoor units and the outdoor unit using a field supplied minimum of 18 AWG, two core stranded, twisted, and shielded communication cable (RS-485).
3. The unit controls shall operate the indoor unit using one of the five operating modes:

    a. Auto changeover (Heat Recovery System only)
    b. Heating
    c. Cooling
    d. Dry
    e. Fan only

4. The unit shall be able to operate in either cooling or heating mode for testing and/or commissioning.
5. The unit shall be able to operate with the fan turned off during system cooling thermal off.
6. The unit shall have adjustable, multi-step cooling and heating mode thermal on/off temperature range settings.
7. The system shall include a product check function to access and display indoor unit type and capacity from a wired programmable thermostat controller.
8. Unit shall have a field settable method to choose auto fan speed change operation based on mode of operation, on/off fan operation based on mode of operation, or continuous minimum set fan speed operation.

H. Electrical

1. The unit electrical power shall be 208-230/1/60 (V/Ph./Hz).
2. The unit shall be capable of operating within voltage limits of +/- 10% of the rated voltage.

I. Controls

1. Unit shall use controls provided by the manufacturer to perform all functions necessary to operate the system effectively and efficiently and communicate with the outdoor unit over an RS485 daisy chain.

2.9 LG CEILING CASSETTE – 1 WAY

A. General

1. Unit shall be manufactured by LG.
2. Unit shall be designed for indoor application.
3. Unit shall be designed to mount recessed in the ceiling and has a surface mounted grille with air inlet and outlet.

B. Casing/Panel

1. Unit case shall be manufactured using galvanized steel plate.
2. The unit shall be provided with an off-white Acrylonitrile Butadiene Styrene (ABS) polymeric resin grille.
3. The grille shall have a tapered trim edge, and a hinged, spring clip (screw-less) return air filter-grille door.
4. Unit shall be provided with metal ears designed to support the unit weight on four corners.
5. Ears shall have pre-punched holes designed to accept field supplied all thread rod hangers.

C. Cabinet Assembly

1. Unit shall have one supply air outlet and one return air inlet.
2. The supply air outlet shall be through a single directional slot diffuser with oscillating motorized guide vane designed to change the airflow direction.
3. The grille shall have a discharge range of motion of 40° in an up/down direction with capabilities of locking the vanes.
4. Unit shall have factory installed motorized louver to provide flow of air in up and down direction for uniform airflow.
5. Unit shall be equipped with factory installed temperature thermistors for:

    a. Return air
    b. Refrigerant entering coil
    c. Refrigerant leaving coil

6. Unit shall have a factory assembled, piped and wired electronic expansion valve (EEV) for refrigerant control.
7. Unit shall have a built-in control panel to communicate with other indoor units and to the outdoor unit main processor.
8. The unit shall have provision of fresh air ventilation through a knock-out on the cabinet.
9. Unit shall have the following functions as standard:

    a. Self-diagnostic function
    b. Auto addressing
    c. Auto restart function
    d. Auto changeover function (Heat Recovery system only)
    e. Auto operation function
    f. Child lock function
    g. Forced operation
    h. Dual thermistor control
    i. Sleep mode
    j. Dual set point control
    k. Filter life timer
    l. External on/off input
    m. Wi-Fi compatible
    n. Auto fan operation
    o. Refrigerant Leak detection logic

D. Fan Assembly

1. The unit shall have a single, direct driven, crossflow tangential Sirocco fan made of high strength ABS GP-2305 polymeric resin.
2. The fan impeller shall be statically and dynamically balanced.
3. The fan motor is Brushless Digitally commutated (BLDC) with permanently lubricated and sealed ball bearings.
4. Fan speed shall be controlled using microprocessor based digitally controlled algorithm that provides a minimum of four pre-programed fan speeds in the heating mode and fan only mode and five speeds in the cooling mode. The fan speed algorithm provides a field selectable fixed speed.
5. The fan motor shall include thermal overload and low RPM protection.
6. In cooling mode, the indoor fan shall have the following settings: Low, Med, High, super high, Power Cool, and Auto. The fan motor shall include thermal overload and low RPM protection.
7. In cooling mode, the indoor fan shall have the following settings: Low, Med, High, super high, Power Cool, and Auto.
8. In heating mode, the indoor fan shall have the following settings: Low, Med, High, super high and Auto.

E. Filter Assembly

1. The return air inlet shall have a factory supplied removable, washable filter
2. The filter access shall be from the bottom of the unit without the need for tools.

F. Coil Assembly

1. Unit shall have a factory built coil comprised of aluminum fins mechanically bonded on copper tubing.
2. The copper tubing shall have inner grooves to expand the refrigerant contact surface for high efficiency heat exchanger operation.
3. Unit shall have a minimum two row coil, 21 fins per inch.
4. Unit shall have a factory supplied condensate drain pan below the coil constructed of EPS (expandable polystyrene resin).
5. Unit shall include an installed and wired condensate drain lift pump capable of providing minimum 27.5 inch lift from bottom surface of the unit.
6. Unit shall have a 1.0” ID factory insulated drain hose to handle condensate.
7. The drain pump shall have a safety switch to shut off the unit if condensate rises too high in the drain pan.
8. Unit shall have provision of 45° flare refrigerant pipe connections.
9. The coil shall be factory pressure tested at a minimum of 550 psig.
10. All refrigerant piping from outdoor unit to indoor unit shall be field insulated. Each pipe should be insulated separately. Thickness and heat transfer characteristics shall be determined by the design engineer and shall meet all code requirements.

G. Microprocessor Control

1. The unit shall have a factory installed microprocessor controller capable of performing functions necessary to operate the system with or without the use of a wall mounted controller. The unit shall have a factory mounted return air thermistor for use as a space temperature control device. All operating parameters except scheduling shall be stored in non-volatile memory resident on the microprocessor. The microprocessor shall provide the following functions, self-diagnostics, auto re-start after a power failure and a test run mode
2. The unit shall be able to communicate with other indoor units and the outdoor unit using a field supplied minimum of 18 AWG, two core, stranded, twisted, and shielded communication cable (RS485).
3. The unit controls shall operate the indoor unit using one of the five operating modes:
4. Auto changeover (Heat Recovery System only)
    a. Heating
    b. Cooling
    c. Dry
    d. Fan only

5. The unit shall be able to operate in either cooling or heating mode for testing and/or commissioning.
6. The unit shall be able to operate with the fan turned off during system cooling thermal off.
7. The unit shall have adjustable, multi-step cooling and heating mode thermal on/off temperature range settings.
8. The system shall include a product check function to access and display indoor unit type and capacity from a wired programmable thermostat controller.
9. Unit shall have a field settable method to choose auto fan speed change operation based on mode of operation, on/off fan operation based on mode of operation, or continuous minimum set fan speed operation

H. Electrical

1. The unit electrical power shall be 208-230/1/60 (V/Ph/Hz).
2. The unit shall be capable of operating within voltage limits of +/- 10% of the rated voltage.

I. Controls

1. Unit shall use controls provided by the manufacturer to perform all functions necessary to operate the system effectively and efficiently and communicate with the outdoor unit over an RS-485 daisy chain.

2.10 LG CEILING CASSETTE – 4 WAY

A. General

1. Unit shall be manufactured by LG.
2. Unit shall be designed to be installed for indoor application.
3. Unit shall be designed to mount recessed in the ceiling and has a surface mounted grille on the bottom of the unit.
4. The unit shall be available in both nominal 2’ x 2’ and 3’ x 3’ chassis.

B. Casing/Panel

1. Unit case shall be manufactured using galvanized steel plate.
2. The unit panel shall be provided with an off-white or black Acrylonitrile Butadiene Styrene (ABS) polymeric resin grille.
3. The grille shall have a tapered trim edge, and a hinged, spring clip (screw-less) return air filter-grille door.
4. Unit shall be provided with metal ears designed to support the unit weight on four corners.
5. Ears shall have pre-punched holes designed to accept field supplied all thread rod hangers.
6. Unit shall be supplied with snap off access panels to facilitate leveling of unit without removing the grille.

C. Cabinet Assembly

1. Unit shall have four supply air outlets and one return air inlet.
2. The supply air outlet shall be through four directional slot diffusers each equipped with independent oscillating motorized guide vanes designed to change the airflow direction.
3. The grille shall have a discharge range of motion of 40° in an up/down direction with capabilities of locking the vanes.
4. The unit shall have a guide vane algorithm designed to sequentially change the predominant discharge airflow direction in counterclockwise pattern.
5. Guide vanes shall provide airflow in all directions.
6. Unit shall be equipped with factory installed temperature thermistors for:

    a. Return air
    b. Refrigerant entering coil
    c. Refrigerant leaving coil

7. Unit shall have a factory assembled, piped and wired electronic expansion valve (EEV) for refrigerant control.
8. Unit shall have a built-in control panel to communicate with other indoor units and to the outdoor unit.
9. The unit shall have factory designated branch duct knockouts on the unit case.
10. The unit shall have provision of fresh air ventilation through a knock-out on the cabinet.
11. The branch duct knockouts shall have the ability to duct up to 1/2 the unit airflow capacity.
12. The branch duct cannot be ducted to another room.
13. Unit shall have the following functions as standard:
    a. Self-diagnostic function
    b. Auto addressing
    c. Auto restart function
    d. Auto changeover function (Heat Recovery system only)
    e. Auto operation function
    f. Child lock function
    g. Forced operation
    h. Dual thermistor control
    i. Sleep mode
    j. Dual set point control
    k. Multiple aux heater applications
    l. Filter life timer
    m. External on/off input
    n. Wi-Fi compatible
    o. Auto fan operation
    p. Leak detection logic

D. Fan Assembly

1. The unit shall have a single, direct-drive turbo fan made of high strength ABS HT-700 polymeric resin.
2. The fan impeller shall be statically and dynamically balanced.
3. The fan motor is Brushless Digitally commutated (BLDC) with permanently lubricated and sealed ball bearings.
4. The fan motor shall include thermal, overcurrent and low RPM protection.
5. The fan/motor assembly shall be mounted on vibration attenuating rubber grommets.
6. The fan speed shall be controlled using microprocessor based direct digitally controlled algorithm that provides a minimum of four pre-programed fan speeds in the heating mode and fan only mode and five speeds in the cooling mode. The fan speed algorithm provides a field selectable fixed speed.
7. A field setting shall be provided to vary air throw pattern to compensate for high ceiling installations.
8. In cooling mode, the indoor fan shall have the following settings: Low, Med, High, Super high, Power Cool, and Auto.
9. In heating mode, the indoor fan shall have the following settings: Low, Med, High, Super high and Auto.
10. Unit shall have factory installed motorized louver to provide flow of air in up and down direction for uniform airflow.

E. Filter Assembly

1. The return air inlet shall have a factory supplied removable, washable filter.
2. The filter access shall be from the bottom of the unit without the need for tools.
3. The nominal 3'x3' cabinet unit shall have provision for an optional auto-elevating grille kit designed to provide motorized ascent/descent of the return air grille/pre filter assembly.

    a. The ascent/descent of the return air grille shall be up to a distance of 14-3/4 feet allowing access to remove and clean the filter.
    b. The auto-elevating grille shall have a control algorithm to accept up, down and stop control commands from the controller.
    c. The auto-elevating grille shall have a control to stop the descent automatically if a contact is made with any obstacle.

F. Coil Assembly

1. Unit shall have a factory built coil comprised of aluminum fins mechanically bonded on copper tubing.
2. The copper tubing shall have inner grooves to expand the refrigerant contact surface for high efficiency heat exchanger operation.
3. Unit shall have a minimum one or two row coil, 18-19 fins per inch.
4. Unit shall have a factory supplied condensate drain pan below the coil constructed of EPS (expandable polystyrene resin).
5. Unit shall include an installed and wired condensate drain lift pump capable of providing minimum 27.5 inch lift from bottom surface of the unit.
6. The drain pump shall have a safety switch to shut off the unit if condensate rises too high in the drain pan.
7. Unit shall have provision of 45° flare refrigerant pipe connections.
8. The coil shall be factory pressure tested at a minimum of 550 psig.
9. All refrigerant piping from outdoor unit to indoor unit shall be field insulated. Each pipe should be insulated separately. Thickness and heat transfer characteristics shall be determined by the design engineer and shall meet all code requirements.

G. Microprocessor Control

1. The unit shall have a factory installed microprocessor controller capable of performing functions necessary to operate the system.
2. The unit shall be able to communicate with other indoor units and the outdoor unit using a field supplied minimum of 18 AWG, two core, stranded, twisted and shielded communication cable.
3. The unit controls shall operate the indoor unit using one of the five operating modes:

    a. Auto changeover (Heat Recovery System only)
    b. Heating
    c. Cooling
    d. Dry
    e. Fan only

4. The unit shall be able to operate in either cooling or heating mode for testing and/or commissioning.
5. The unit shall be able to operate with the fan turned off during system cooling thermal off.
6. The unit shall have adjustable, multi-step cooling and heating mode thermal on/off temperature range settings.
7. The system shall include a product check function to access and display indoor unit type and capacity from a wired programmable thermostat controller.
8. Unit shall have a field settable method to choose auto fan speed change operation based on mode of operation, on/off fan operation based on mode of operation, or continuous minimum set fan speed operation.

H. Electrical

1. The unit electrical power shall be 208-230/1/60 (V/Ph/Hz).
2. The unit shall be capable of operating within voltage limits of +/- 10% of the rated voltage.

I. Controls

1. Unit shall use controls provided by the manufacturer to perform all functions necessary to operate the system effectively and efficiently and communicate with the outdoor unit over an RS-485 daisy chain.

2.11 LG FLOOR STANDING – CASED AND UNCASED

A. General

1. Unit shall be manufactured by LG.
2. Unit shall be factory assembled, wired, piped and run tested.
3. Unit shall be designed to be installed for indoor application.
4. The unit shall be designed to be free standing on the floor against a wall with factory supplied enclosure or may be located within a field provided architectural enclosure
5. The back plate of the unit shall have two side mounting flanges with bolt holes to allow a secure attachment of the unit to a vertical surface at or above the floor
6. The discharge shall be vertical from the top of the unit.
7. The return air shall be from the bottom front through a toe slot at floor level.
8. The discharge air opening shall be covered with an architectural grille for units supplied with factory enclosure
9. Floor standing indoor units without enclosure shall be installed under a field supplied and installed enclosure that does not introduce any significant external static pressure.

B. Casing/Panel

1. The units supplied with factory enclosure shall be manufactured using coated metal frame covered with an off white ABS architectural polymeric resin exterior case.
2. The cold surface shall be covered with a coated polystyrene insulating material.
3. The unit shall have a flip open controller access door that shall cover the control mounting bays located on both ends of the top panel.
4. The unit shall have a polymeric resin coated metal safety grille provided behind the removable filters.

C. Cabinet Assembly

1. Unit shall have one supply air outlet and one return air inlet at the toe slot at the floor level.
2. Unit shall be equipped with factory installed temperature thermistors for:
    a. Return air
    b. Refrigerant entering coil
    c. Refrigerant leaving coil
3. Unit shall have a factory assembled, piped and wired electronic expansion valve (EEV) for refrigerant control.
4. Unit shall have a built-in control panel to communicate with other indoor units and to the outdoor unit main processor.
5. Unit shall have the following functions as standard:
    a. Self-diagnostic function
    b. Auto addressing
    c. Auto restart function
    d. Auto changeover function (Heat Recovery system only)
    e. Auto operation function
    f. Child lock function
    g. Forced operation
    h. Dual thermistor control
    i. Sleep mode
    j. Dual set point control
    k. Multiple aux heater applications
    l. Filter life timer
    m. Power consumption data
    n. External on/off control input
    o. Wi-Fi compatible
    p. Auto fan operation
    q. Refrigerant Leak detection logic

D. Fan Assembly (7-15 MBH):

1. The unit shall have three direct driven Sirocco fans made of high strength ABS HT-700 polymeric resin.
2. The fans shall be mounted on common shaft.
3. The fan impeller shall be statically and dynamically balanced.
4. The fan motor is Brushless Digitally commutated (BLDC) with permanently lubricated and sealed ball bearings.
5. The fan motor shall include thermal, overcurrent and low RPM protection.
6. The fan/motor assembly shall be mounted on vibration attenuating rubber grommets.
7. The fan speed shall be controlled using microprocessor based direct digitally controlled algorithm that provides a minimum of three pre-programed fan speeds in the heating mode and fan only mode and four speeds in the cooling mode. The fan speed algorithm provides a field selectable fixed speed.
8. In cooling mode, the indoor fan shall have the following settings: Low, Med, High, and Auto.
9. In heating mode, the indoor fan shall have the following settings: Low, Med, High, and Auto.
10. Unit shall be designed for high speed air volume against an external static pressure of up to 0.08” water gauge (uncased).

E. Fan Assembly (18-24 MBH):

1. The unit shall have two independent fan assemblies consisting of two motors and four direct driven Sirocco fans made of high strength ABS HT-700 polymeric resin.
2. The fans shall be mounted on common shaft.
3. The fan impeller shall be statically and dynamically balanced.
4. The fan motor is Brushless Digitally commutated (BLDC) with permanently lubricated and sealed ball bearings.
5. The fan motor shall include thermal, overcurrent and low RPM protection.
6. The fan/motor assembly shall be mounted on vibration attenuating rubber grommets.
7. The fan speed shall be controlled using microprocessor based direct digitally controlled algorithm. That provides a minimum of three pre-programed fan speeds in the heating mode and fan only mode and four speeds in the cooling mode. The fan speed algorithm provides a field selectable fixed speed.
8. In cooling mode, the indoor fan shall have the following settings: Low, Med, High, Power Cool, and Auto.
9. In heating mode, the indoor fan shall have the following settings: Low, Med, High, and Auto.
10. Unit shall be designed for high speed air volume against an external static pressure of up to 0.24” water gauge (uncased).

F. Filter Assembly

1. The return air inlet shall have two factory supplied primary removable, washable filters on the 7-15MBh models.
2. The return air inlet shall have three factory supplied primary removable, washable filters on the 18-24MBh models.
3. The unit shall have an access to the filter media through toe slot located on the front of unit without the need to remove any panels.
4. The filters shall be accessible without removing the unit panel.

G. Coil Assembly

1. Unit shall have a factory built coil comprised of aluminum fins mechanically bonded on copper tubing.
2. The copper tubing shall have inner grooves to expand the refrigerant contact surface for high efficiency heat exchanger operation.
3. Unit shall have minimum of a two row coil, 19 fins per inch.
4. Unit shall be designed for gravity drain.
5. Unit shall have a factory supplied condensate drain pan below the coil constructed of EPS (expandable polystyrene resin).

6. Unit shall have a factory insulated drain hose to handle condensate.
7. Unit shall have provision of 45° flare refrigerant pipe connections.
8. The coil shall be factory pressure tested at a minimum of 550 psig.
9. All refrigerant piping from outdoor unit to indoor unit shall be field insulated. Each pipe should be insulated separately. Thickness and heat transfer characteristics shall be determined by the design engineer and shall meet all code requirements.

H. Microprocessor Control

1. The unit shall have a factory installed microprocessor controller capable of performing functions necessary to operate the system with or without the use of a wall mounted controller. The unit shall have a factory mounted return air thermistor for use as a space temperature control device. All operating parameters except scheduling shall be stored in non-volatile memory resident on the microprocessor. The microprocessor shall provide the following functions, self-diagnostics, auto re-start after a power failure and a test run mode
2. The unit shall be able to communicate with other indoor units and the outdoor unit using a field supplied minimum of 18 AWG, two core, stranded, twisted and shielded communication cable.
3. The unit controls shall operate the indoor unit using one of the five operating modes:
   a. Auto changeover (Heat Recovery System only)
   b. Heating
   c. Cooling
   d. Dry
   e. Fan only
4. The unit shall be able to operate in either cooling or heating mode for testing and/or commissioning.
5. The unit shall be able to operate with the fan turned off during system cooling thermal off.
6. The unit shall be able to operate with a continuous fan setting.
7. The unit shall have adjustable, multi-step cooling and heating mode thermal on/off temperature range settings.
8. The system shall include a product check function to access and display indoor unit type and capacity from a wired programmable thermostat controller.

I. Electrical

1. The unit electrical power shall be 208-230/1/60 (V/Ph/Hz).
2. The unit shall be capable of operating within voltage limits of +/- 10% of the rated voltage.

J. Controls

1. Unit shall use controls provided by the manufacturer to perform all functions necessary to operate the system effectively and efficiently and communicate with the outdoor unit over an RS-485 daisy chain.
2. Seismic Installations

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Install unit on vibration isolators. Reference Section 23 05 48.

C. Locate indoor and outdoor units as indicated on drawings. Provide service clearance per manufacturer’s installation manual. Adjust and level outdoor units on support structure.

D. Components / Piping:

1. Installing contractor shall provide and install all accessories and piping for a fully operational system. Refer to manufacturer's installation manual for full instructions.
2. Traps, filter driers, and sight glasses are NOT to be installed on the refrigerant piping or condensate lines.
3. Standard ACR fittings rated for use with R410A are to be used for all connections. Proprietary manufacturer-specific appurtenances are not allowed.

E. Insulation:

1. Refrigerant lines, as well as any valves, shall be insulated end to end. See 23 07 00 specifications.

END OF SECTION

SECTION 23 82 16

AIR COILS

PART 1 - GENERAL

1.1 SAFETY STANDARDS

A. Provide electric heating coil in compliance with the National Electric Code and listed by UL for zero clearance and so labeled.

1.2 CAPACITY RATINGS

A. Hydronic Coils: Certified per ARI 410.

1.3 SUBMITTALS

A. Submit manufacturer's product data including:

1. Performance data.
2. Accessories description
3. Operating weight.
4. Drawings showing:
   a. Dimensions.
   b. Sizes and locations of connections.
5. Support requirement.

1.4 FACE VELOCITY

Unless otherwise noted face velocities shall not exceed the following:

A. Cooling Coils: 475 fpm.

B. Heating Coils: 700 fpm. (except electric coils)

PART 2 - PRODUCTS

2.1 ELECTRIC HEATING COILS (FINNED TUBULAR HEATER)

A. Manufacturers:

1. Design Basis: Indeeco
   a. Model: Type TFZU Custom Flanged Heater
2. Other Acceptable Manufacturers:
   a. Brasch.
   b. Trane.
   c. Warren

B. Heating elements shall consist of coil, 80% nickel, 20% chromium, Grade A resistance wire precisely centered in a 304 stainless steel tube filled with granular magnesium oxide. A stainless-steel fin is to be helically wound onto the tube. Elements are to be furnished with mounting flanges, making them individually removable through the terminal box.

C. Heater frames and terminal boxes shall be corrosion resistant steel. Unless otherwise indicated, the terminal box shall be NEMA 1 construction and shall be provided with a hinged latching cover and multiple concentric knockouts for field wiring.

D. All heaters shall be furnished with triple overtemperature protection. A disc type and linear, automatic reset thermal cutout are included for primary overtemperature protection. All heaters must also be furnished with a linear type manual reset thermal cutout with backup contactors (as required). For secondary overtemperature protection, heat limiters or other fusible overtemperature devices are not acceptable.

E. Heaters shall be rated for the voltage, phase and number of heating stages indicated in the schedule. All 3-phase heaters shall have equal balanced 3-phase stages. All internal wiring shall be stranded copper with 105°C insulation and shall be terminated in crimped connectors or box lugs.

F. Terminal blocks shall be provided for all field wiring and shall be sized for installation of 75°C copper wire rated in accordance with NEC requirements.

G. Heaters shall be furnished either with the Control Option specified in the schedule and described below or with the specific components listed in the schedule.

1. Thermal cutouts, airflow switch, contactors (where required), SCR (with step controller if heater draws over 96 amps 3-phase or 192 amps single phase), fuses (if over 48 amps), control circuit transformer (where required) and built-in, snap-acting, door interlocked disconnect switch.

H. Description:

1. Heaters shall be U.L. listed for zero clearance and meet all the applicable requirements of the Latest Edition of National Electrical Code or other local codes.

2. Heaters shall be made with galvanized or aluminum steel frame.

3. The terminal box shall be provided with solid hinged cover in order to minimize dust infiltration.

4. Heaters shall be suitable for mounting in a horizontal or vertical duct, as shown on the Drawings, and air flow may be through the heater in either direction.

5. Overcurrent protection shall consist of built-in and pre-wired dual element fuses with clip reinforcing springs.
   a. With one overcurrent device for each 40 ampere circuit.
   b. And with one overcurrent device for entire heater for those heaters rated 40 amperes or less only.

6. A disc type automatic reset thermal cutout in control lines, shall be furnished for primary protection. Heat limiters in all power lines shall be provided for secondary protection. In addition a disc type manual reset thermal cutout with bulb extending the length of the heater shall be furnished. Manual reset thermal cutout to be in series with automatic reset thermal cutout. All three devices shall be serviceable through the terminal box, without having to remove heater from duct. In lieu of heat limiters, disc type manual reset thermal cut-outs will be acceptable.

7. Air ducts rated as Class 1 in accordance with UL 181, air duct coverings and linings shall be interrupted at the immediate area of operation of such heat sources in order to meet the clearances specified by the manufacturer.

8. The following accessories shall be furnished and built in for each heater, unless otherwise noted:
   a. Insulated terminal box.
   b. Magnetic contactors (when load exceeds control device ratings).

c. Transformer with primary fuse protection to supply control voltage, when power supply exceeds 120 volts.
d. Air flow switch - pressure type.
e. Control contact for each step.
f. Non-fused disconnect with interlocking door handle.

9. Controls:
   a. Provide factory mounted and wired control panel.
   b. Control Option: SCR
   c. Thermostat: Room
   d. Standard Features:
      1) Thermal Cutoffs.
      2) Airflow Switch.
      3) Magnetic Contactors.
      4) Control Transformer.
      5) Fuses.

2.2 REFRIGERATION COILS

A. Tubes - Round, seamless copper tubes, arranged in parallel pattern with respect to airflow.

B. Fins - Plate-Tube, Sigma-Flo II configurated, aluminmum fins producing identical capacities. Fins continuous across entire coil width and die-formed in multiple stages for accurate tube fit, fin bonding and spacing. Fins mechanically bonded to tubes for lasting reliability.

C. Casing - Continuous coated galvanized steel, 16 gauge formed end supports and top and bottom channels. 3/8" holes on 3" centers in channels for mounting or fastening coils together. One 16 gauge continuous coated, galvanized steel center tube support on ordering lengths over 42". Two or more supports on lengths over 96".

D. Test and Working Pressure - Proof tested at 450 psig and leak tested at 300 psig air pressure under water, cleaned, dehydrated and sealed with dry nitrogen charge. Suitable for working pressures up to 250 psig.

E. U-Bends - Round, seamless copper tubes, 5/8" O.D., machine die-formed on each end to provide accurate fit for silver brazed joints.

F. Distributor - Equalizing type refrigerant distributors of low pressure drop design, arranged for down feed. Male sweet connections. Maximum of twelve circuits per single distributor. Split evaporator.

G. Air Bypass and Water Carryover Arrestor - Foam sealing strip located between casing channels and fins along top and bottom.

H. Designed to conform to ANSI-B9.1 Safety Code for mechanical refrigeration.

I. Coils to be vertical split.

J. Accessories:

1. Distributor with hot gas bypass connection.
   a. Thermal expansion valve.
   b. Size per manufacturers requirements.
   c. Insulate sensing bulb.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install coils level and plumb.

B. Provide necessary auxiliary support.

C. Adjust air flow switch for safe operation.

D. When electric heating coils are used and the airflow sensor is a pressure sensor type, provide adjustable volume damper(s) as necessary downstream of VAV box before first split in ductwork in order to create sufficient total pressure at the air flow pressure sensor to properly verify air flow.

E. Check and adjust all controls.

F. Pipe condensate drain from cooling coils as shown on the drawings or to nearest floor drain or mop sink.

G. Contractor shall examine location where this equipment is to be installed and determine space conditions and notify architect in writing of conditions detrimental to proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected.

H. Install coils where shown, in accordance with manufacturer's written instructions, and with recognized industry practices, to ensure that coils comply with requirements and serve intended purposes.

I. Coordinate with other work as necessary to interface installation of coils with other components of systems.

END OF SECTION

SECTION 23 82 39

HEATING TERMINAL UNITS

PART 1 - GENERAL

1.1 SUBMITTALS

A. Submit manufacturer's product data:

1. Performance data.
2. Drawings.
   a. Dimensions
   b. Support requirements
   c. Size and location of connections
3. Enclosure gauges.
4. Accessories.
5. Parts lists.
6. Additional Submittal Requirements for Fan Coil Units, Cabinet Heaters and Unit Heaters:
   a. Wiring diagrams.
   b. Installation, operating and maintenance instructions.

PART 2 - PRODUCTS

2.1 GENERAL

A. Except as otherwise indicated, provide manufacturer's standard products as indicated by published product information, and as required for a complete installation.

2.2 CABINET UNIT HEATERS

A. Manufacturers:

1. Design Basis: Trane.
2. Other Acceptable Manufacturers:
   a. Carrier
   b. Modine
   c. McQuay
   d. Mark Hot
   e. Sterling
   f. Vulcan

B. Construction:

1. Coils:
   a. Fins: Aluminum.
   b. Tubes: Copper.
   c. Working Pressure: 250 psig.
2. Casing:
   a. Material: 16 gauge steel.
   b. Corners: Rounded, 1" minimum radius.
   c. Finish: Phosphatized and painted inside and out with one coat of baked-on enamel.

d. Color: Selected by Architect/Engineer from manufacturer's standard colors.
e. Heating Element Supports: Adjustable.
f. Gaskets: Between front panel and enclosure.

3. Grilles: Fabricated steel bar grille.
   a. Directional Louvers: Under grille.
4. Fans:
   a. Arrangement: Blow-through
   b. Type: Multi-wheel, DWDI, FC, aluminum.
   c. Balance: Factory balance, static and dynamic.
   d. Drive: Direct.
5. Motors:
   a. Type: brushless DC (BLDC)/electronically commutated motors (ECM)
   b. Insulation: Class B.
   c. Protection: Built-in thermal overload.
6. Filters: Disposable, ¾" or 1" thick.
7. Filters: Permanent.
   a. Type: Permanent.
   b. Material: Metal.
   c. Thickness: 1"

C. Basic unit shall include chassis, coil, fanboard, fanwheel(s), housing(s), motor and insulation. Chassis is galvanized steel wrap-around structural frame with all edges flanged. Insulation is faced, heavy density glass fiber.

D. Vertical Cabinet Models

1. 16 gauge steel front panels and 18 gauge steel end and top panels have channel-formed edges around entire panel perimeters. Front panel insulated over entire coil section. Integral, stamped outlet grilles have 15˚ deflection from vertical. Stamped lattice discharge grilles on inverted airflow models. Access door on coil connection side of unit. Front panel removable without tools.

E. Vertical Recessed Models

1. 16 gauge steel, four-side overlap front panels, with "M"-shaped stiffener running entire panel length as standard. Integral, stamped inlet and outlet grills have 15º downward deflection. Front panel insulated over entire coil section. Front camlocked access doors on righthand side of unit. Front panel removed with two screws.

F. Horizontal Cabinet Models

1. 18 gauge steel panels. Bottom and end panels have channel-formed edges around entire panel perimeter. Integral, stamped outlet grilles have 15˚ downward deflection. Stamped lattice inlet grilles. Bottom panel hinged at front and camlocked at back.

G. Horizontal Recessed Models

1. 18 gauge steel, removable, four-side overlap bottom panel adjustable 3/8" with full length, piano-type hinge at back and camlocks at front.

H. Electric Heat Coils

1. The auxiliary electric heating coil is provided as either the total source of heat or auxiliary intermediate season heating. The electric heat coils are located in the preheat position, and are the open-wire type. The coils are a nickel chromium element design. The electric heat operates at the same voltage as the unit, and only a single power connection is necessary. All units with factory-mounted electric heat are UL-listed and interlocked with the fan motor switch. A call for electric heat operation will turn the fan on. Motors controls are synchronized with fan/valve operation to ensure safe operation and to ensure that two modes of heat are not operating simultaneously. A transformer is supplied on any voltage unit, eliminating the need for field installation of a step-down transformer. Unit-mounted quiet magnetic relays are supplied on all voltages. A high temperature cutout with automatic reset is provided as an integral part of the elements to de-energize the electric heat in the event of a malfunction.

I. Fans

1. Fan wheels centrifugal, forward-curved, double of non-corrosive, molded, fiberglass-reinforced thermo-plastic material on all units except electric heat and inverted airflow models which use aluminum. Fan housings of formed sheet metal on 200-600 cfm units. 800-1800 cfm units have end caps made of non-corrosive, molded, fiberglass-reinforced thermo-plastic material, and fan scrolls of galvanized steel.

J. Motors

1. All motors are brushless DC (BLDC)/electronically commutated motors (ECM) factory-programmed and run-tested in assembled units. The motor controller is -mounted in a touch-safe control box with a built-in integrated user interface and LED tachometer. If adjustments are needed, motor parameters can be adjusted through momentary contact switches accessible without factory service personnel on the motor control board.

2. Motors will soft-ramp between speeds to lessen the acoustics due to sudden speed changes. Motors can be operated at three speeds or with a field-supplied variable speed controller. The motor will choose the highest speed if there are simultaneous/conflicting speed requests.

3. All motors have integral thermal overload protection with a maximum ambient operating temperature of 104°F and are permanently lubricated. Motors are capable of starting at 50 percent of rated voltage and operating at 90 percent of rated voltage on all speed settings. Motors can operate up to 10 percent over voltage.

K. Controls Interface

1. The control interface is intended to be used with a field-supplied, low-voltage thermostat or controller. The control box contains a relay board which includes a line voltage to 24-volt transformer, quiet contactors (for electric heat units), and an optional disconnect switch. All end devices are wired to a low-voltage terminal block and are run-tested, so the only a power connection and thermostat connection is needed to commission the unit. Changeover sensors and controls are provided whenever a change-over coil is selected. When NO valves are selected, inverting relays are provided for use with standard thermostats.

L. Fan Speed Control

1. The fan speed control is available with or without the control interface option and is available as wall-mount or unit-mount. The speed control incorporates a 0-10 VDC signal providing limitless control of the motor RPM between the factory set low and high speeds. The control box contains a line voltage to 24-volt transformer, ECM motor controller, and an optional disconnect switch.

M. Filters

1. Filters are concealed from sight and easily removable. Filters are located behind an integral access door on horizontal type units. Filters are either 1" throwaway, MERV 8.

2. Units equipped with 1" MERV 8 filters have a rating based on ASHRAE Standard 52.2. The average dust spot efficiency is no less than 35 to 40 percent when tested in accordance with ASHRAE 52.1 atmospheric dust spot method.

N. Tamperproof Locks

1. Key-operated locking access doors and/or panels will help prevent nuisance tampering with unit and/or controls. Tamperproof locks are available on vertical cabinet, horizontal cabinet, vertical wall-hung cabinet, vertical recessed, and vertical slope-top units.

O. False Backs

1. False backs increase the depth of a vertical cabinet unit and provide a cavity through which to run piping behind the unit. False backs are also an excellent application when installing a unit beneath a window sill that extends out past the front of the unit.

2. False backs are 18-gauge steel construction and have the same paint finish as the unit. The false back is available in depths between 2"– 8" in 1" increments, with height and width identical to the unit's dimensions.

P. Quad Grille Outlet

1. Quad grilles are square multi-directional grilles that allow four different discharge directions by rotating the grilles 90°. The quad grille is constructed of a black plastic material (NORYL-SE 1-731) with a 15° angle on the discharge louvers. Quad grilles are available on all cabinet style units.

Q. Electrical Performance

1. All units shall be wired in accordance with National Electric Code. Underwriters Laboratories, Inc. listed. Provide a junction for motor cord.

R. Unit color subject to architect's approval.

2.3 ELECTRIC UNIT HEATERS

A. Manufacturers:

1. Design Basis: Trane.
2. Other Acceptable Manufacturers:
   a. Modine
   b. Carrier
   c. McQuay

d. Dunham-Bush

B. Construction:

1. Casing:
   a. Material: Steel.
   b. Finish: Baked-on enamel.
   c. Heating Element Supports: Adjustable.
   d. Gaskets: Between front panel and enclosure.

2. Grilles: Louver: Adjustable.
3. Heating Element: Finned steel sheaths providing extended surface.
4. Provide manufacturer's written certification that unit is suitable for use at altitude of the project.

C. Control box housing, all heater wiring controls and contractors shall be located at bottom of heater and equipped with swing down hinged cover. Wiring diagram shall be attached to the inside of the control box cover.

D. 3-Pole units shall have a built in heavy duty 3-pole contactor.

E. Heating element shall be of non-flowing design consisting of special resistance wire enclosed in a steel sheath to which steelplate fins are brazed. Heating element shall cover the entire air discharge area for uniform heating.

F. Thermal safety cutout shall be built into system to automatically shut off heater in event of overheating.

G. Electric space thermostat shall be furnished by the unit manufacturer for installation by automatic controls contractor.

H. Disconnect switch shall be provided under Electrical Documents.

2.4 ELECTRIC BASEBOARD

A. Manufacturers:

1. Design Basis: Vulcan
2. Model: SBT-PD
3. Other Acceptable Manufacturers:
   a. Indeeco
   b. Sterling

B. The front cover shall be 12 gauge extruded aluminum construction suitable for Architectural, Commercial and Industrial use with 1/4" pencil proof intake and discharge grills.

C. The cover shall be linear mount to the 12 gauge heater back with no visible fasteners. The 12 gauge heater back shall be suitable for mullion to mullion mounting.

D. Shall have 2" adjustable pedestals and the heater back will be painted to match the front cover. Standard painted finishes or clear anodizing shall be provided as specified by the architect. Color shall match architects specifications, coordinate with architect prior to ordering.

E. All heaters shall contain 3/4" EMT built in raceway with factory wiring to provide field wiring from either end.

F. 1/2" and 3/4" knockouts shall be provided in the side and rear of the heater junction box to permit end to end wiring. All blank sections shall be fully enclosed to allow branch circuit wiring. All heaters shall contain a full length thermal overheat protector with automatic reset. Wattages shall be available from 100 to 500 watts per foot. Heating

elements shall be tubular stainless steel or aluminum tubing with aluminum fins mechanically bonded to ensure efficient heat transfer.

G. Element fin temperature shall not exceed 350 degrees Fahrenheit to ensure long element life. Elements shall be center anchored and free floating in nylon bushings at each end.

H. Control sections include 6" or 12" with: disconnect, thermostat, pneumatic relay, transformer relay, relay, fused disconnect or duplex receptacle. Standard built-in controls shall include thermostats (single and double pole) and disconnect switches.

I. Built-in controls shall be tamper proof and shall be adjustable with a blade screwdriver through the discharge louver.

J. Provide all corners, fillers, blank section, and end caps as required for indicated installation.

K. All heaters are Underwriters Laboratories listed.

2.5 ELECTRIC TRENCH HEATER

A. Manufacturers:

1. Design Basis: Kampmann
2. Model: Katherm QE

B. Construction and Accessories:

1. Heavy gauge galvanized sheet metal trench casing
2. Aluminum roll-up grille by factory for field installation
3. Tangential fan with EC motor
4. Stainless steel heating elements with aluminum-zinc fins
5. High-limit thermal protection with auto reset
6. Height adjustable feet with acoustic decoupling

2.6 AIR CURTAIN FOR LOADING DOCK AREA

A. Air curtain to be furnished as complete factory assembled units consisting of casing, split housing fan scrolls for easy access, min. 16 ga. centrifugal fans, discharge grille and motor specifically designed to provide a uniform velocity across the entire width of unit. Grease fittings located at outside cabinet. Unit shall have a windstopping capability of 17 MPH when mounted 14 feet above floor level.

B. Unit shall be furnished in single increments, multiple units shall not be permitted, and shall be of sufficient structural strength so that it may be supported from both ends without intermediate support. Unit casings shall be a minimum of 14 gauge steel and finished in a blue epoxy enamel.

C. Motors shall be totally enclosed, air over equipped with heavy duty thrust bearings and double extended shafts requiring no outboard bearings. Primary motor voltage shall be 460 V., 3 phase.

D. Fans shall be forward curved centrifugal type, double inlet, double width design with brazed hubs. Tangential type blowers and coupling connections shall not be permitted.

E. Discharge grille shall be double deflection type with airfoil shaped extruded aluminum vanes.

F. Unit shall have proportional volume control for 50% of maximum volume except for fly control units. Under reduced volume, depth of air stream shall remain identical to full grille depth. Volume control shall be designed to save energy on reduced volume.

G. Air curtain shall be furnished with a door switch to energize the unit whenever the door is opened.

H. Units to be provided with factory fabricated, factory wired remote control panels including motor starters, transformer for low voltage door switch and terminal strip for connection to power source and disconnect switch. Integral coil shall be hot water type with capacities as indicated on the Drawing.

I. Coils shall be constructed of non-ferrous fins mechanically bonded to copper tubes. Suitable means for tube expansion shall be made by tube bends or by provision for the coil to move within the casing. All coils shall have a factory performed 400 psi pressure test.

PART 3 – EXECUTION

3.1 GENERAL

A. Locate units so clearance is provided for:

1. Service and maintenance.
2. Enclosure removal.

B. Level or pitch elements as required:

1. Install shims if necessary.

C. Touch-up finish after final adjustment.

D. Replace damaged enclosures.

E. Straighten bent fins.

F. Replace damaged elements.

END OF SECTION

SECTION 23 90 00

PROJECT CLOSEOUT

PART 1 – GENERAL

1.1 WORK INCLUDED

A. The contractor shall summarize and document adherence with the requirements of the specifications for project closeout including:

1. Copies of all warranties
2. Operation & Maintenance Manuals
3. Required tests
4. Test and balance reports
5. Record drawings
6. Permit requirements
7. Valve tag list

B. The contractor shall compile a closeout manual which shall include:

1. A list of all required tests and a place for signoff of date completed.
2. A list of all submittals with dates of acceptance by the engineer.
3. A schedule indicating dates for beginning testing and startup of equipment and dates of tests to be witnessed by the engineer, or designated representative, as required by the specifications.
4. Test procedures to be used for life safety systems.
5. Project close out check list.

C. The final closeout manual shall include the following:

1. Test reports as required by the specifications with signoff by the appropriate individual (engineer, architect, building official, etc.).
2. Documentation indicating all equipment is operating properly and is fully accessible for maintenance.
3. Copies of all warranties.
4. Test and Balance report.

D. This section only includes the requirements for documentation of the contract documents, by the contractor, for project completion. This section does not in any way decrease the scope of any of the drawings or specifications.

1.2 SUBMITTALS

A. Within 90 days after notice to proceed submit a preliminary closeout manual with the following:

1. A list of all required tests.
2. Preliminary schedule showing major milestones for completion of the mechanical systems.

B. Within 30 days of the first major milestone submit the completed closeout manual as described in Part 1.

C. Within 2 weeks of substantial completion submit a completed “Project Closeout Check List”, and the Final Closeout Manual.

D. Listed below is a checklist for use by the contractor. This list is not all inclusive for this project.

Project Close-Out Summary – Mechanical

- ☐ All required submittals have been submitted and either been approved or modified in accordance with the Engineer's "make corrections noted" comments.
- ☐ Clean filters installed in all units. (Install just prior to building turnover)
- ☐ All equipment has been started up and is functioning within manufacturers' recommendations without any undue noise or vibration. (Submit a list of equipment with startup dates. Provide list at a point 65% into construction schedule).
- ☐ All vibration isolation has been installed and is operating properly.
- ☐ Duct access doors have been installed at fire and fire/smoke dampers and are properly fire-stopped and fire and fire/smoke dampers have been visually inspected to confirm that they are open.
- ☐ Access doors have been installed as required for concealed equipment, water hammer arrestors, valves, controls, actuators, etc.
- ☐ Chemical treatment system installed per specification and functioning properly.
- ☐ All equipment has been installed with the manufacturers recommended service clearances and is fully accessible for required maintenance.
- ☐ All equipment and piping is labeled per specifications.
- ☐ All piping cleaned, flushed and tested per specifications. Submit all required test and balance reports for record.
- ☐ All action items are complete as listed in the action items reports. Submit a list of action items with sign off by Architect or Engineer for record. Punch list to be completed prior to turn over of building.
- ☐ Temperature control system complete and tested per specifications.
- ☐ Test and balance complete and report submitted and accepted by Engineer.
- ☐ Operation and maintenance manuals submitted with table of contents and required documentation for extended warranties.
- ☐ Factory Testing documented and submitted for record.
- ☐ Record drawings submitted per specifications.
- ☐ Temperature Control record documents provided per specifications.
- ☐ Temperature Control Point to point checkout documents submitted.

PART 2 – PRODUCTS (Not Used)

PART 3 – EXECUTION

3.1 EQUIPMENT STARTUP AND TESTING

A. Prior to completion and punchlist by the engineer, the contractor shall startup and test each piece of equipment as required by the specifications. The contractor shall provide documentation of all required tests with signoff of by the appropriate individual (engineer, architect, and building official).

3.2 COORDINATION WITH OTHERS

A. The Division 21 through 23 contractor shall coordinate his requirements with the General Contractor to ensure the other building systems are completed to the point that they will not adversely affect the operation of the Division 21 through 23 systems.

3.3 PUNCH LISTS

A. The contractor shall submit in writing that the project is ready for final review by the engineer.

B. Once the project is ready for final review the engineer will create a punch list of any corrections or deficiencies.

C. The contractor shall complete all punch list items and provide a letter to the architect after completion stating all items have been completed or reasons why they were not completed.

D. Upon receipt of this letter the engineer will verify that the punch list has been satisfactorily completed.

END OF SECTION

DIVISION 26
ELECTRICAL

ELECTRICAL TABLE OF CONTENTS
SPECIFICATIONS
DIVISIONS 26 & 28

END OF ELECTRICAL TABLE OF CONTENTS

SECTION 26 05 01

MECHANICAL AND ELECTRICAL COORDINATION

PART 1 - GENERAL

1.1 RESPONSIBILITY

A. The Divisions 21, 22, 23, 24, 25, 26, 27 and 28 contractor(s) shall comply with the provisions of this section. The Divisions 21, 22, 23 and 25 contractor(s) shall verify electrical service provided by the electrical contractor before ordering any mechanical equipment requiring electrical connections. Provide submittals of all mechanical equipment to Division 26, 27 and 28 contractor(s).

B. The final responsibility for properly coordinating the electrical work of this section shall belong to the Divisions 21, 22, 23 and 25 System Contractor performing the work, which requires the electrical power.

1. Each Divisions 21, 22, 23 and 25 contractor shall be responsible for providing power wiring for certain devices as described in the specifications and on the drawings. This work shall be provided by a licensed electrician in accordance with all of the applicable provisions of the Division 26, 27 and 28 specifications, NEC and local codes.

1.2 WORK INCLUDED

A. Carefully coordinate the interface between Divisions 21 through 23 (Mechanical) and Divisions 26 through 28 (Electrical), and Division 23 and 25 (control) before submitting any equipment for review or commencing installation.

1.3 DEFINITIONS

A. Automatic: Pertaining to a function, operation, process or device that, under specified conditions, functions without intervention by human operator.

B. Disconnect Switch: A mechanical switching device used for changing the connections in a circuit, or for isolating a circuit or equipment from a power source.

C. Motor Control Center: A floor mounted assembly of one or more enclosed vertical sections having a common horizontal power bus and primarily containing motor starting units.

D. Control Circuit/Power: The circuit which carries the electrical signals of a control apparatus or system directing the performance of the controller but does not carry the main power circuit.

E. Manual Operation: Operation by hand without the use of any other power.

F. MC: Mechanical Contractor = Divisions 21 through 23 Contractor who furnishes motor.

G. TC: Temperature Controls = Division 22, 23 or 25 Contractor who furnishes control.

H. EC: Electrical Contractor = Divisions 26, 27or 28 Contractor.

I. FA: Fire Alarm Contractor = Division 25 or 28 Contractor who furnishes Fire Alarm System.

J. SC: Sprinkler Contractor

K. EP: Electric to Pneumatic Converter.

L. PE: Pneumatic to Electric Converter.

1.4 RESPONSIBILITY SCHEDULE

A. Responsibility: Unless otherwise indicated, all motors and controls for Divisions 21, 22, 23 and 25 equipment shall be furnished, set in place and wired in accordance with the following schedule:

ITEM -	Furnished By	Set In Place By	Power Wiring By	Control Wiring By
AHU Interior Marine Lights	MC	MC	EC	EC
Equipment Motors	MC	MC	EC	--
Automatically or Manually Controlled Starters/Contactors: (Note 4) -Separate -Factory Mounted and Wired	 MC MC	 EC MC	 EC EC	 TC TC
Motor Speed Controllers: (Note 4) -Separate -Factory Mounted and Wired	 MC MC	 EC MC	 EC EC	 TC TC
Disconnect Switches (Note 1)	EC	EC	EC	--
Thermal Overload Switches (Note 1)	EC	EC	EC	--
Switches (Manual or Automatic other than disconnect) (Note 2)	MC, EC or TC	MC or TC	EC or TC	TC or MC
Control Relays (Note 2)	MC, EC or TC	MC or TC	--	TC
Control Transformers	MC or TC	MC or TC	EC or TC	TC
Push Button Stations, Pilot Lights	MC	EC	EC	EC
Thermostat and Controls: Integral with Equipment or Directly Attached to Ducts, Pipes, etc. (Note 2)	MC, EC or TC	MC or TC	MC or TC	TC
Equipment in Temperature Control Panels	TC	TC	TC	TC
Standalone Control Panels (BAS) (Note 6)	TC	TC	TC	TC
Valve Motors, Damper Motors, Solenoid Valves, etc.	TC	MC	TC	TC
EP Valves or Switches, P.E. Switches, etc.	TC	TC	--	TC
Fire Alarm System (Note 3)	FA	FA	EC	FA
Fire Sprinkler Alarm (Note 3)	SC	SC	EC	FA
Duct System Smoke Detectors (Note 5)	FA	MC	--	TC/FA
Relays for Fan Control via duct detectors (Note 5)	MC	MC	EC	TC/FA
Room Smoke Detectors Including Relays for Fan Control (Note 3)	FA	FA	--	FA
Smoke Management Controls (Note 7)	FA	FA	EC	FA
CO Sensors	TC	TC	TC	TC
Control Air Compressor	TC	TC	TC	TC
Refrigerated Air Dryer	TC	TC	TC	TC
Equipment Interlocks	TC	TC	--	TC
Fire/Smoke and Smoke Dampers (Note 7)	MC	MC	EC	FA/TC (Note 7)
Smoke Control Dampers (for smoke management system) (Note 7)	MC	MC	EC	FA/TC (Note 7)

ITEM -	Furnished By	Set In Place By	Power Wiring By	Control Wiring By
Positive Indication Devices (i.e., current sensors, end switches, airflow sensors)	TC	TC	--	FA/TC (Note 7)

Notes:

1. If furnished as part of factory wired equipment furnished and set in place by MC, wiring and connections by EC. Electrical Contractor shall provide disconnects for all electrical equipment unless otherwise indicated.
2. If float switches, line thermostats, P.E. switches, time switches, or other controls carry the FULL LOAD CURRENT to any motor, they shall be furnished by MC, but they shall be set in place and connected by EC, except that where such items are an integral part of the mechanical equipment, or directly attached to ducts, piping, or other mechanical equipment, they shall be furnished and set in place by MC and connected by EC. If they do not carry the FULL LOAD CURRENT to any motor, they shall be furnished, set in place and wired by TC contractor. Such devices shall be provided at low voltage unless technically impossible
3. Pre-action system initiation signals (such as smoke detectors or general alarm conditions in a pre-action zone) shall be provided by the electrical contractor.
4. Electrical contractor is responsible for wiring from disconnect to starter and from starter to motor, unless factory wired.
5. Temperature control contractor shall provide conduit and wire from auxiliary contact in motor starter to the detector so that the unit shuts down in all operating modes. Fire Alarm Contractor to wire from detector to fire alarm panel.
6. Each division shall be fully responsible for any control panels as called for on the drawings or specifications.
   a. Electrical Contractor shall provide all power and control wiring to fire/smoke or smoke dampers. HVAC, Controls, Electrical, and Fire Alarm Contractors shall provide parallel control wiring (with fire alarm having priority signal) to dampers and equipment utilized in both normal and smoke control modes, unless otherwise indicated.
   b. Fire alarm system shall override automated building control system during smoke exhaust mode.
   c. TC shall provide additional required wiring and controls when damper also serves a temperature control or zoning function.
7. FA wires to components necessary for the operation and monitoring of the Smoke Management System. TC wires to components utilized in the control and monitoring of the Automated Building Control System. This often requires dual wiring where components are controlled by both. In such case wiring and relays shall be provided to ensure FA takes precedence in control over TC.

B. Power Wiring by Divisions 21, 22, 23 and 25: The electrical power for certain equipment provided under Divisions 21, 22, 23 and 25 may not be specifically indicated on the electrical drawings and must be provided by and field coordinated by the Divisions 21, 23 or 25 trade requiring such power.

Sufficient power for this purpose shall be furnished as “spare” dedicated circuit capacity in Division 26’s panelboards. All wiring, conduit and electrical devices downstream of the panelboards is the responsibility of the Divisions 21, 23 and 25 trade requiring the power.

1. Such equipment is hereby defined as:
   a. Electrical heat trace. Required heat trace locations, capacities and specification are shown on the plumbing drawings.
   b. Fire protection air compressors, dry-pipe control panels and valves. Required connections are included in the Fire Protection work, and will be shown by that contractor’s engineered system design drawings.
      1) Pre-action system initiation signals (such as smoke detectors or general alarm conditions in a pre-action zone) shall be provided under fire alarm work.
      2) Sprinkler Contractor shall provide pre-action control panel and interconnection between nearest suitable fire alarm panel and location of pre-action valve(s).

3) Fire Alarm Contractor shall provide interconnection between fire command center alarm panel and/or remote communication fire alarm panel.

c. Infrared plumbing fixtures. Fixtures requiring power are shown on the plumbing drawings and schedules. Provide junction box and or receptacle as required by manufacturer.

d. Temperature control panels, control air compressors and line voltage power for 24v control transformers. Required connections are included in HVAC scope and will be shown by that contractor's control submittal drawings.

e. Motorized dampers and VAV boxes. Required locations and specification are shown on the mechanical drawings and HVAC specifications. HVAC contractor shall provide damper, controls and power.

1.5 GENERAL REQUIREMENTS

A. Connections:

1. Connections to all controls directly attached to ducts, piping and mechanical equipment shall be made with flexible connections.

B. Starters:

1. Provide magnetic starters for all three phase motors and equipment complete with:
   a. Control transformers.
   b. 120V holding coils.
   c. Integral hand-off-auto switch.
   d. Auxiliary contacts required for system operation plus one (1) spare.
   e. Refer to Motors, Starters and Drives, requirements for additional information.

C. Remote Switches and Pushbutton Stations:

1. Provide remote switches and/or pushbutton stations required for manually operated equipment (if no automatic controls have been provided) complete with pilot lights of an approved type lighted by current from load side of starter.

D. Special Requirements:

1. Motors, starters and other electrical equipment installed in moist areas or areas of special conditions, such as explosion proof, shall be designed and approved for installation in such areas with appropriate enclosure.

E. Identification:

1. Provide identification of purpose for each switch and/or pushbutton station furnished. Identification may be either engraved plastic sign permanently mounted to wall below switch, or stamping on switch cover proper. All such identification signs and/or switch covers in finished areas shall match other hardware in the immediate area.

F. Control Voltage:

1. Maximum allowable control voltage 120V. Fully protect control circuit conductors in accordance with National Electrical Code.

G. DDC Control Interface:

1. Fully coordinate the requirements of each division with regard to supplying a complete DDC Control System prior to submitting bid.

2. All power to controllers and controlled equipment shall be furnished via dedicated line voltage circuits.
3. Dedicated control circuits from electrical panelboards to DDC control panels and from electrical panelboards to dedicated DDC J-boxes (for distributed control components such as VAV boxes), and control transformer line voltage connections shall be provided by HVAC Contractor where required.
   a. Exceptions: Where power wiring has been shown on Electrical Drawings.
4. Low voltage wiring from J-boxes to distributed control components, all low voltage connections, all control panels and all control transformers (not part of unitary equipment) shall be provided under Division 23 or 25.
5. Any additional power requirements shall be the responsibility of the Division 23 or Contractor requiring same, and provided at no additional cost to the owner.

1.6 CEILING AND CHASE CAVITY PRECEDENCE

A. Coordinate ceiling cavity space carefully with all trades. In the event of conflict, install mechanical and electric systems within the cavity space allocation in the following order of precedence. A system with higher precedence may direct that systems of lower precedence be relocated from space, which is required for expedient routing of the precedent system.

1. Plumbing waste/sanitary, cooling coil drain piping, and roof drain mains and leaders.
2. Plumbing vent piping.
3. Supply, return and exhaust ductwork.
4. Electrical conduit greater than 3" diameter.
5. Hydronic branch and mains (greater than 2", but less than 12").
6. Domestic water mains piping.
7. Fire sprinkler mains and leaders.
8. Hydronic branch piping (2" and less).
9. Domestic water branches.
10. Electrical conduit branch feeders.
11. Fire sprinkler branch piping and sprinkler runouts.

B. Light fixtures have precedence in a zone, extending from the face of the ceiling to an elevation 2" above the height of the light fixtures.

C. Examine the contract documents of all trades (e.g. all Divisions 21, 22, 23, 25, 26 and 28 the architectural floor plans, reflected ceiling plans, elevations and sections, structural plans and sections, etc.).

D. Coordinate necessary equipment, ductwork and piping locations so that the final installation is compatible with the materials and equipment of the other trades.

E. Prepare shop drawings for installation of all new work before installation to verify coordination of work between trades.

F. Provide access doors for all equipment, valves, clean-outs, actuators and controls which require access for adjustment or servicing and which are located in otherwise unaccessible locations.

1. For equipment located in "accessible locations" such as lay-in ceilings: Locate equipment to provide adequate service clearance for normal maintenance without removing architectural, mechanical, electrical or structural elements such as the ceiling support system, electrical fixtures, etc. "Normal maintenance" includes, but is not limited to: filter changing; greasing of bearings; using p/t ports for pressure or temperature measurements; and replacement of ballasts, fuses, etc.
2. All system components requiring access shall be grouped together to reduce the quantity of access doors required.

G. See "Basic Mechanical Materials and Methods" for additional access door requirements if section has been included in this specification.

PART 2 – PRODUCTS

2.1 MOTOR HORSEPOWER

A. In general, all motors ½ HP and above shall be three phase, all motors below ½ HP shall be single phase.

B. Voltage and phase of motors as scheduled on the electrical drawings shall take precedence in the case of a conflict between the mechanical and electrical drawings or general condition 2.1. A., above.

C. Work under Divisions 21, 22 and 23 includes coordinating the electrical requirements of all mechanical equipment with the requirements of the work under Divisions 26, 27 and 28, before ordering the equipment.

1. If motor horsepowers are changed under the work of Divisions 21, 22 or 23 without a change in duty of the motor's driven device, coordination of additional electrical work (if any) and additional payment for that work (if any) shall be provided under the section of Divisions 21, 22 or 23 initiating the change. Increases or decreases in motor horsepower from that specified shall not be made without written approval from the Architect/Engineer.

PART 3 - EXECUTION - (Not Used)

END OF SECTION

SECTION 26 05 02

ELECTRICAL REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. This Section supplements Division 1, General Requirements.

B. Where contradictions occur between this Section and Division 1, the most stringent of the two shall apply. Architect shall decide which is most stringent.

C. Provisions of Divisions 21, 22, 23, 27 and 28 shall also apply to the work of this section as if fully repeated here.

D. Provision indicate Section 23 05 01/26 05 01 “Mechanical and Electrical Coordination” shall also apply to the work of this section as if fully repeated here.

1.2 DEFINITIONS

A. The definitions of Division 1 and the General Conditions of this specification also apply to Divisions 26, 27 and 28 Contract.

B. “Contract Documents” constitute the drawings, specifications, general conditions, project manuals, etc., prepared by Engineer (or other design professional in association with Engineer) for contractor’s bid or contractor’s negotiations with the Owner. Divisions 26, 27 and 28 drawings and specifications prepared by the Engineer are not construction documents.

C. “Construction Documents”, “construction drawings”, and similar terms for Divisions 26, 27 and 28 Work refer to installation diagrams, shop drawings and coordination drawings prepared by the contractor using the design intent indicated on the Engineer’s contract documents. These specifications detail the contractor’s responsibility for “Engineering by Contractor” and for preparation of construction documents.

D. “(N)” indicates "new" equipment to be provided under this contract.

E. “(E)” indicates "existing" equipment on site which may or may not need to be relocated as a part of this work.

F. “(R)” indicates existing equipment to be relocated as part of this work.

G. "Furnish" means to "supply" and usually refers to an item of equipment.

H. "Install" means to "set in place, connect and place in full operational order".

I. "Provide" means to "furnish and install".

J. “Equal” or "Equivalent" means "meets the specifications of the reference product or item in all significant aspects." Significant aspects shall be as determined by the Architect/Engineer.

K. "Work by other(s) divisions"; "re:_____ Division", and similar expressions means work to be performed under the contract documents, but not necessarily under the division or section of the work on which the note appears. It is the contractor’s sole responsibility to coordinate the work of the contract between his/her suppliers, subcontractors and employees. If clarification is required, consult Architect/Engineer before submitting bid.

L. By inference, any reference to a “contractor” or “sub-contractor” means the entity, which has contracted with the Owner for the work of the Contract Documents.

M. "Engineer" means the design professional firm, which has prepared these contract documents. All questions, submittals, etc. of this division shall be routed to the Engineer (through proper contractual channels).

N. “Conduit” includes, in addition to pipe, all fittings, hangers and other accessories related to such conduit.

O. “Concealed” means hidden from sight as in chases, furred spaces shafts, hung ceilings, or embedded in construction.

P. “Exposed” means, “not concealed” as defined above. Work in trenches, crawl spaces, and tunnels shall be considered “concealed” unless otherwise specifically noted.

Q. “Governmental” means all municipal, state and federal governmental agencies.

R. Where any device or part of equipment is herein referred to in the singular number (such as “the conduit”), such reference shall be deemed to apply to as many such devices as are required to complete the installation as shown on the Drawings.

S. “Electrical Contractor” means the Contractor doing Electrical work.

T. “Security Contractor” means the Contractor doing Security work.

U. “Fire Alarm Contractor” means the Contractor doing Fire Alarm work.

1.3 DESCRIPTION OF WORK

A. The Specifications and the accompanying drawings are intended to secure the provisions of all material, labor, equipment, and services necessary to install complete, tested, and ready for operation the Electrical Systems in accordance with the Specifications and Drawings. The use of the term "provide" shall mean "furnish and install" throughout these specifications and drawings. All systems shall be complete with necessary appurtenances and minor auxiliaries, including pull boxes, offsets to clear interferences, and supports which are not shown but are needed to make each system complete in every respect. All work described in the Specifications and not shown on the Drawings, or vice versa, shall be furnished in complete working order. If mention has been omitted of any item of work or material, necessary for completion of the system, then such items must be and are hereby included. The scope of this project includes, but is not limited to the following work:

1. Raceways and installation components.
2. Wire and Cable.
3. Panelboards.
4. Fuses.
5. Safety and disconnect switches.
6. Distribution equipment.
7. Transformers.
8. Motor controllers.
9. Control equipment.
10. Emergency generators.
11. Transfer switches.
12. Electric service system.
13. Seismic bracing.
14. Utility company coordination and submittals to utility company.
15. Power, control and alarm wiring systems.
16. Grounding system.
17. Lighting fixtures.

18. Dimming system.
19. Site lighting
20. Telephone conduit system.
21. Heating cables and controllers.
22. Lightning protection system.
23. Telecommunications systems.
24. Public address system.
25. Master television cable system
26. Electrical provision for security and building automation system.
27. Door security system.
28. Electrical provisions for fire and life safety.
29. Fire alarm system.
30. Water detection system.
31. Testing.
32. Alternate prices.
33. Furnishing of access doors (see Special Conditions - Article 33).
34. Furnishing and setting of all sleeves through the floors, roof and wall, where required including waterproofing and fireproof sealing and cap flashing.
35. Excavation and backfill (excavation in rock shall be included). All concrete work for pads (including housekeeping pads), bases for outdoor lighting fixtures, and conduit envelopment shall be included.
36. Hardware, such as inserts, bolts, etc., associated with concrete pads.
37. Cutting associated with electrical work.
38. Prime painting, where required for electrical equipment and installation.
39. Removal of existing electrical work in accordance with Architectural Demolition Scheme or as directed and required. Restoration of electrical service in affected adjoining areas which are to continue to function.
40. Provision for temporary light and power.
41. Installation and wiring of starters and controllers.
42. As-built drawings.

1.4 REGULATORY REQUIREMENTS

A. All materials shall conform with the current applicable industry standards. Workmanship and neat appearance shall be as important as electrical and mechanical operation. Defective or damaged materials shall be replaced or repaired prior to final acceptance in a manner meeting approval of the Architect and at no additional cost to the Owner.

B. The latest editions of the following standards are minimum requirements.

1. Underwriters' Laboratories, Inc. (UL)
2. National Electrical Manufacturer's Assoc. (NEMA)
3. American National Standards Institute (ANSI)
4. Institute of Electrical and Electronic Engineers (IEEE)
5. International Electrical Testing Association (NETA)
6. Insulated Cable Engineer's Association (ICEA)

C. All work and materials shall comply with latest rules, codes and regulations including, but not limited to the following:

1. OSHA.
2. National Fire Codes of National Fire Protection Assoc. (NFPA)
3. National Electrical Safety Code (NESC, ANSI C2)
4. National Electrical Code (2014 Edition) with **Poughkeepsie** city, county and state Amendments.
5. **International Building Code 2015 Edition with city, county and state Amendments.**
6. Americans With Disabilities Act (ADA).
7. All applicable Federal, state and local laws, code amendments and regulations.

D. Code compliance is mandatory. Nothing in these drawings and specifications permits work not conforming to these codes.

E. No work shall be concealed until after inspection and approval by proper authorities. If work is concealed without inspection and approval, Contractor shall be responsible for all work required to open and restore the concealed area including all required modifications.

F. Contradictions: Where Codes are contradictory, follow the most stringent. Architect/Engineer shall determine which is most stringent.

1.5 CONTRACT DOCUMENTS

A. Drawings indicate general arrangement of circuits and locations of outlets, conduit, and other work. Information shown on drawings is as accurate as planning can determine, but not guaranteed and field verification of all dimensions, locations, levels, etc., to suit field conditions is directed. Review all architectural, structural and mechanical drawings, and adjust all work to conform to all conditions shown therein. Architectural drawings shall take precedence over all other drawings. Discrepancies between different drawings or between drawings and specifications or regulations and codes governing installation shall be brought to attention of the Architect.

B. Light and power and system riser diagrams and schematic diagrams generally indicate equipment connections to be used for various systems. System conduit and wiring shall be as required for actual systems installed on this project. Provide all work shown on diagrams whether or not it is duplicated on the plans.

C. Where the Drawings and Specifications do not comply with the minimum requirements of the Codes, either notify the Architect/Engineer in writing during the Bidding Period of the revisions required to meet Code requirements, or provide an installation which complies with the Code requirements. After entering into contract, Contractor will be held to complete all work necessary to meet these requirements without additional expense to the Owner.

D. Follow Drawings and Specifications where they are superior to Code requirements. The more stringent of plans and drawing shall apply.

1.6 COORDINATION DRAWINGS

A. Prepare coordination drawings in accordance with Division 1 “Submittals” to a scale of ¼” = 1’-0” or larger; detailing major elements, components, and systems of electrical equipment (i.e., all transformer vaults, switchgear rooms, generator rooms, electrical rooms and telephone rooms) and materials in relationship with other systems, installations, and building components. Where equipment is located outdoors, prepare shop drawings indicating electrical equipment locations and exterior elements in the equipment areas. Indicate locations where space is limited for installation and access and where sequencing and coordination of installations are important to the efficient flow of the work, including (but not necessarily limited to) the following:

1. Indicate the proposed locations of major raceway systems, and materials. Include the following:
   a. Exterior wall and foundation penetrations.
   b. Fire-rated wall and floor penetrations.
   c. Support details.
   d. Sizes and location of required concrete pads and bases.
2. Indicate scheduling, sequencing, movement, and positioning of large equipment into the building during construction.
3. Prepare floor plans, elevations, and details to indicate penetrations in floors, walls, and ceilings and their relationship to other penetrations and installation.
4. Electrical and Transformer Vault Rooms indicating conduit stub-up locations.
5. Cable tray floor plans and elevations showing exact routing.
6. Medium voltage, normal and emergency underground conduit and duct bank routing.

7. Telephone underground conduit and duct bank routing.

1.7 RECORD DRAWINGS

A. Refer to Division 1 for additional requirements.

B. Maintain a blue-line set of Electrical Contract Drawings in clean, undamaged condition, for mark-up of installations which vary from the Contract Drawings. These drawings shall be a separate set of drawings, not used for construction purposes, and shall be kept up to date as the job progresses. This set shall be made available for inspection by the Engineer or Architect at all times.

C. Upon completion of the contract and before final payment is authorized, the contractor shall deliver the Owner a set of computerized “as builts” capable of interfacing with AutoCAD software. Drawings shall have to show to scale, where applicable, all work including equipment, controls, etc., as actually installed.

D. Prepare record documents in accordance with the requirements in Division 1 Section “Project Closeout.” In addition to the requirements specified in Division 1, indicate installed conditions for:

1. Major raceway systems, size and location, for both exterior and interior and locations of handholes and conduit stub-up locations.
2. Panelboard circuit directories reflecting all field changes.
3. Approved substitutions, Contract Modifications, and actual equipment and materials installed.
4. Results of all testing performed as specified in the specification.
5. Certification of inspection from authorities having jurisdiction.

E. Record the locations and invert elevations of underground installations.

1.8 OPERATING AND MAINTENANCE MANUALS

A. Refer to Division 1 for additional requirements.

B. Submission:

1. O&M manuals submitted for review shall be submitted as PDF documents, one document per manual.
2. For final submission to owner, O&M Manuals shall be submitted as hard copies and digital PDF copies.
3. Bind each hard copy Maintenance Manual in one or more vinyl covered, 3-ring binders, with pockets for folded drawings. Mark the back spine of each binder with system identification and volume number.

C. Requirement Contents:

1. Manuals shall have index with tab dividers for each submittal section identifying all equipment and materials installed on the project including a local supplier for replacing a specific piece of equipment.
2. Introduction - Explanation of manual and its use.
3. Description of system or equipment.
    a. Complete schematic drawings of all systems.
    b. Functional and sequential description of all systems.
4. Systems operations:
    a. Operation procedures.
    b. All posted instruction charts.
5. Maintenance
    a. Systems trouble-shooting charts
    b. Procedures for checking out functions.
    c. Recommended list of spare parts.
6. Listing of Manufacturers

7. Manufacturer's Data (where multiple model, type and size listings are included, clearly and conspicuously indicate those that are pertinent to this installation.
   a. Description - literature, drawings, illustrations, certified performance charts, technical data, etc.
   b. Operation
   c. Maintenance - including complete trouble-shooting charts
   d. Parts list
   e. Names, addresses and telephone numbers of recommended repair and service companies.
   f. Guarantee data.
8. Provide certificates for such items of equipment which have warranties in excess of one year.
9. Provide test results for each specification section identified herein.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Deliver products to the project properly identified with names, model numbers, types, grades, compliance labels, and other information needed for identification.

B. Protection of Equipment:

1. All electrical equipment to be used in the construction shall be properly stored and protected against the elements. All equipment shall be stored under cover, and shall not be stored at the construction site on the ground, in mud, water, rain, sleet, or dust. Large diameter cables may be stored on reels outside; however, all cable ends shall be waterproofed and the reels covered with weatherproof materials. Such weatherproof materials shall be heavy-duty, securely fastened, and made impervious to the elements.
2. Conventional electrical construction materials such as building wire, outlet and junction boxes, wiring devices, conduit, lighting fixtures, fittings, etc., shall be stored in construction buildings, covered trailers, or portable covered warehouses. Any equipment subject to damage or corrosion from excessive moisture shall be stored in dry, heated areas. Any equipment containing plastic or material subject to damage caused by excessive heat or sunlight shall be stored to prevent such damage. This includes plastic ducts and lenses.
3. Equipment damaged as a result of the above conditions shall be properly repaired at the contractor's expense or shall be replaced at the contractor's expense, if in the opinion of the Engineer, the equipment has been damaged to such an extent that it cannot operate properly after repairs are made.
4. All electrical enclosures exposed to construction damage such as paint spots, spackling or plaster spatter, grout splashes, waterproofing compound, tar spots or runs, and pipe covering compound splashes, shall be completely covered and protected against damage.
5. In the event leakage into the building of any foreign material or fluid occurs or may occur, the contractor shall take all steps as described above to protect any and all equipment.
6. After connections to electrical equipment are complete and the equipment is ready for operation, all construction debris shall be removed from all enclosures. Such debris includes dust, dirt, wire clippings, tape, and insulation removed in order to make the connection.

C. Owner-furnished equipment and general contractor furnished equipment (such as electrified furniture) shall be delivered, crated or otherwise packaged to the Site delivery point selected by the Construction Manager. This Contractor shall accept delivery of all Owner-furnished and general contractor furnished items which are under his trade jurisdiction and place them in their final location.

D. Where items cannot be immediately placed in their final position, this Contractor shall store and protect all Owner-furnished items until the time of their final installation. He shall be responsible for the care and protection of the items until acceptance by the Owner. Delivery of Utility Company furnished equipment shall be coordinated with the delivery policy of that company

1.10 SAFETY AND INDEMNITY

A. The Contractor shall be solely and completely responsible for conditions of the job site, including safety of all persons and property during performance of the work. This requirement will apply continuously and not be limited to

normal working hours. See also General Conditions.

B. No act, service, drawings review or construction review by the Architect or Engineer, is intended to include review of the adequacy of the Contractor's safety measures in, on, or near the construction site.

1.11 WARRANTIES

A. The warranty period is generally one year after Date of Acceptance.

1. During this period, provide labor and materials as required to repair or replace defects in the electrical systems at no cost to the Owner. Provide certificate with O & M manual submittal which guarantees same day service response to the Owner's call for such warranty service.
2. Provide certificates for such items of equipment which have warranties in excess of one year. Insert copies of O & M manual. Such equipment shall include:

    a. Emergency generator system including transfer switches and transformers
    b. Major electrical switchboard
    c. Lighting fixtures
    d. Lightning protection
    e. Fire alarm system
3. Provide extended manufacturers warranties to cover one full year from Date of Acceptance if standard manufacturers' warranty ends any time prior to that date.

1.12 LIABILITY

A. The Contractor shall assume full responsibility for laying out his work and for any damage caused to the Owner or other sub-contractors by improper location or carrying out of his work.

B. The Contractor shall provide proper guards for prevention of accidents, and provide and maintain any other necessary construction required to secure safety of life or property to secure such protection.

1.13 BYPASS CONNECTIONS

A. The Contractor shall include all costs for removals and relocations in the Contract. These costs shall include work described in the Specifications and shown on the Drawings with allowances for normal unforeseen difficulties when concealed work has been opened. A minimum of 3 bypass connections shall be included. Each bypass connection shall consist of 50 feet of 4 inch EMT conduit with 4 #500 AWG and 1#3 AWG ground conductors, (2) junction boxes, (4) 90 degrees bends, and all appurtenances as required for connections; bypass connections would be Installed 11 feet high in congested area, and be supported from structure above. Include cost of cutting and removal of feeder to be bypassed. Bypass connection installation shall be priced on an overtime schedule basis.

1.14 SHUTDOWNS

A. When installation of a new system or reconnection of an existing system requires the temporary shutdown of an existing operating system, the connection into the existing system shall be performed at such time as designated by the Owner.

B. The Owner shall be notified of the estimated duration of the shutdown period (3) weeks in advance of the date the work is desired to be performed.

C. Work shall be arranged for continuous performance, including overtime, at no extra cost to the Owner to assure that existing operating services will be shut down only during the time actually required to make necessary connections.

1.15 COORDINATION WITH EXISTING OCCUPIED AREAS

A. Minimize disruptions to operation of building systems in occupied areas.

B. Provide temporary connections to prevent long disruptions.

C. Provide multiple crews, premium time labor and/or shift labor to reduce duration of work and impact on the facility.

D. When installation of a new system requires the temporary shutdown of an existing operating system, the connection of the new system shall be performed at such regular time or at overtime when designated by the Owner. Assume all connections to existing operational systems will be on premium time, provide a credit for all work allowed to occur on normal time.

1.16 ENGINEERING BY CONTRACTOR

A. The construction of this work requires the Contractor to perform certain design activities with regard to several of the Contract systems or subsystems that can only be fully ascertained with regard to the prevailing site field conditions during construction activities. All such designs and related activities shall be the complete responsibility of the Contractor. Where these design activities require engineering, it is the responsibility of the Contractor to engage the service of a licensed New York State Professional Engineer experienced in the areas related to the design activities performed by the Contractor.

B. Systems or subsystems which require engineering responsibility by the contractor include, but are not limited to:

1. Any system not fully detailed on the drawings.
2. Fire alarm.
3. Equipment supports, not fully detailed in the drawings.
4. Conduit hangers and anchors not specified in these documents, or cataloged by the manufacturer.
5. Vibration isolators and seismic restraints.
6. Miscellaneous steel as required.
7. Equipment supports, hangers.
8. Pull box and splice box quantities and sizes.

C. Contractor’s design responsibility shall include system design, any required calculations to support system design, any compliance documents or certifications by any governing body up to and including replacement of design engineer with a different engineer of record, retained and paid by the contractor, as determined by authorities or original design engineer.

D. Contractor shall complete all controlled or special inspections and file all required paperwork in a timely manner. Professional engineer retained by contractor to serve as “special inspector” shall meet all requirements for special inspector as determined by the authority having jurisdiction.

1.17 ACCESSIBILITY AND MEASUREMENT

A. All work shall be installed so as to be readily accessible for operation, maintenance and repair. Minor deviations from the plans may be made to accomplish this, subject to the approval of the Engineer/Architect.

B. Before ordering any material or doing any work, the Contractor shall verify all measurements at the Building, and shall be responsible for the correctness of same as related to the work under this Contract.

1.18 NAMES AND TRADE NAMES

A. Where trade and manufacturers' names are specified or indicated on the Drawings, they are intended to indicate the standard of material or articles required. This shall not remove the responsibility of the Contractor from verifying the equipment's compliance with all rules and regulations governing the use of such equipment. No purchase of any equipment shall be done without written authorization, if such equipment will not abide with all rules and regulations, covering its intended use.

1.19 MISCELLANEOUS

A. For watchman, staging, scaffolding, insurance, bond, pumping, rubbish removal, access to work areas, storage on site, and the like, refer to Division 1, General Requirements of these specifications.

PART 2 - PRODUCTS

2.1 EQUIPMENT AND MATERIALS

A. All equipment and materials installed shall be new, unless otherwise specified.

B. All major equipment components shall have manufacturers' name, address, model number and serial number permanently attached in a conspicuous location.

C. All equipment shall be UL listed and bear the UL label.

2.2 GENERAL SUBMITTAL REQUIREMENTS

A. Coordination and Sequencing:

1. After receipt of notice to proceed, the Contractor shall submit to the Architect a typed list of submittals and the scheduled date of submission. List shall include submittal number, section number and scheduled date of submission. Submittals shall be grouped and submitted in no more than ten complete packages.
2. The contractor shall not submit any shop drawings or product data that does not comply with the contract documents. Prior to submitting shop drawings, review submittal for compliance with Contract Documents and place a stamp or other confirmation thereon which states that submittals have been reviewed. Submittals without such verification will be returned disapproved without review.
3. Submittal is for information and record, unless otherwise indicated, and is not a change order request.
4. The Contractor shall submit shop drawings with such promptness as to cause no delay in his own work or that of another contractor.

B. Preparation of Submittals:

1. Refer to Division 1 requirements.
2. Generator submittals shall include the entire generator specification with the words "Comply" or "No Comply" next to each paragraph. If "No Comply", then state what alternate feature is provided.
3. The Contractor shall submit for approval by the Architect data of materials and equipment to be incorporated in the work. Submittals shall be supported by descriptive material, catalogs, cuts, diagrams, performance curves, and charts published by the manufacturer to show conformance to specification and drawing requirements; model numbers alone will not be acceptable. Provide complete electrical characteristics for all equipment. Submit product submittals on items as outlined in sections hereinafter.
4. Product submittals shall be made by specification section. All items of a section, requiring submission, shall be submitted together at one time in a single PDF document. If two or more sections require inter-coordination (e.g., emergency generator and transfer switch; short circuit study, electrical room layouts and electrical switchboards), they shall be submitted at the same time.
5. Each individual submittal items within a PDF document shall be marked to show section number which pertains to the item.
6. Provide the following information in each PDF document: project name, Contractor, Subcontractor, submittal name, date of submission, specification section, and information to distinguish it from other submittals.
7. Submittals not presented in a neat and legible fashion will be returned "Without Action."
8. Submittals shall show Contractor's executed review and approval marking. Submittals which are received from sources other than through Contractor's office will be returned "Without Action."

9. Provide space for Architect's "Action" marking.

C. Substitutions

1. Refer to the General Conditions, which governs "Substitution" of specified equipment or materials.
2. Indicate any portions of work which deviate from the Contract Documents.
   a. Explain the reasons for the deviations.
   b. Show how such deviations coordinate with interfacing portions of other work.
3. Where substitution of materials alters space requirements indicated on the drawings, submit shop drawings indicating proposed layout of space, all equipment to be installed therein and clearances between equipment (i.e., electrical rooms). All clearances required by the National Electrical Code and applicable state and local regulations must be maintained.

D. Review Process

1. The Architect reserves the right to require a sample of any equipment to be submitted for approval and to retain its possession.
2. Refer to the individual sections for identified equipment and material for which submittals are required. In addition, provide shop drawings and product data on the following equipment:

Division 26	Division 27	Division 28
Medium Voltage Cable	Fiber Optic Cabling	Fire Alarm System
Wires and Cables	Telecommunication Backbone Cabling	Security Systems
Grounding	Horizontal Cabling	
Supporting Devices		
Raceways		
Electrical Boxes and Fittings		
Cable Trays		
Underground Service and Manholes		
Vibration Isolation Systems		
Electrical Identification		
Lighting Control Devices		
Architectural Lighting Control		
Network Lighting Control		
Motor Controllers		
Transformers		
Switchboards		
Panelboards		
Wiring Devices		
Motor Disconnect and Fuses		
Diesel Generator Sets		
Transfer Switches		
Lightning Protection Systems		
Transient Voltage Surge Suppression		
Lighting Fixtures		

Do not submit on equipment or materials not requested in the specifications.

3. Review of shop drawings and product data by the Architect/Engineer, including any review annotations or stamp notations, does not relieve the contractor from the required compliance with the contract documents.
4. The shop drawing and product data review stamp notation requirements are defined as follows:

a. "REVIEWED:" The reviewer did not observe any items which were not in compliance with the contract documents. All dimensions, details, and coordination with other trades is the responsibility of the contractor.
b. "FURNISH AS PER COMMENTS:" The reviewer indicated items observed that were not in compliance with the contract documents. The contractor shall not resubmit, but shall make corrections and provide corrected documents with the "Record Drawings."
c. "REVISE AND RESUBMIT:" The reviewer indicated items observed which were not in compliance with the contract documents. The contractor shall resubmit showing corrections of all noted items. Delays for resubmittal does not relieve the contractor from meeting project schedules.
d. "REJECTED:" The submission does not comply with the contract requirements. The entire submittal must be corrected and submitted for review. Delays for resubmittal does not relieve the contractor from meeting project schedules.

5. If shop drawings are submitted and returned as "REVIEWED" or "FURNISH AS PER COMMENTS" and meet contract requirements, the contractor shall not resubmit any other shop drawings for these items.
6. If resubmittals are necessary, they shall be made as specified above for submittals. Resubmittals shall highlight all revisions made and cover shall include the phrase "RESUBMITTAL NO. _____."

Resubmittal requirements do not entitle the Contractor to additional time and are not a cause for delay of the project.

2.3 GREEN BUILDING REQUIREMENTS AND PERFORMANCE CRITERIA

A. Green Building Performance Criteria:

1. All field-applied concrete admixtures, adhesives, sealants, paints and coatings used for interior applications shall meet the volatile organic compound (VOC) and chemical component limitations as defined in Section 018115 "Limitations on VOC Contents".

B. Green Building Submittal Requirements:

The Contractor and their sub-contractors shall submit the GREEN BUILDING CERTIFICATION items listed herein.

1. GBMCF: Submit a completed GREEN BUILDING MATERIALS CERTIFICATION FORM. A copy of the GBMCF is appended to Section 018113 "Sustainable Design Requirements". Information to be supplied for this form shall include:
   a. Cost breakdowns for the materials included in the Contractor or sub-contractor's work. Cost breakdowns shall include total cost plus itemized material costs for and VOC containing products.
2. Validation: Published product literature or manufacturer's letter of certification (on the manufacturer's letterhead) validating all information, other than costs, provided in the GBMCF.
3. Cut Sheets: Product cut sheets for materials listed in the GBMCF. Cut sheets shall be submitted with the Contractor or Trade Contractor's stamp, confirming that the submitted products are the products installed in the Project.
4. VOC Content: Material Safety Data Sheets (MSDS), published product literature, or manufacturer's signed certification (on manufacturer's letterhead) stating the VOC content of all applicable products.
5. Submittal Package: The GREEN BUILDING submittal information shall be assembled into one (1) package per Section or trade, and sent to the Consultant for review. Incomplete or inaccurate Green Building submittals may be used as the basis for rejecting the submitted products or assemblies.

2.4 PROTECTION, MAINTENANCE AND PRODUCT HANDLING OF ELECTRICAL EQUIPMENT

A. Electrical equipment shall be delivered and stored at the site, properly packed and crated until finally installed. Store materials in spaces as designated by the General Contractor. Investigate each space through which equipment must be moved. If necessary, equipment shall be shipped from manufacturer in crated sections of size suitable for moving through restricted spaces.

B. Uninstalled and installed equipment and materials shall be adequately protected against loss or stealing, damage caused by water, paint, fire, plaster, moisture, acids, fumes, dust or other environmental conditions, or physical damage, during delivery, storage, installation and shutdown conditions. This Contractor shall replace any damage or stolen material without extra cost to the Owner.

C. Provide effective protection for all material and equipment against damage that may be caused by environmental conditions. Do no work when conditions of temperature in area of moisture on materials or substrates are not in accordance with material manufacturer's recommended conditions for installation.

D. This Contractor shall be responsible for the maintenance of all equipment and systems installed, until final acceptance by the Architect and the Owner. The Operation of the equipment by the Owner does not constitute an acceptance of the work. Work will be accepted only after the Contractor has adjusted his equipment, demonstrated that it fulfills the requirements of the Drawings and Specifications, and has furnished all required certificates.

E. This Contractor shall guarantee in writing to the Owner that all work installed by him shall be free of defects in workmanship and materials and that all apparatus will develop the capacities and characteristics as indicated, and that, if during a period of one year from date of final approval of work by the Architect, any defects in workmanship, materials or performance appear, he will remedy them without any cost to the Owner. Guarantee requirements shall consist of the aforestated and other requirements, as established under applicable contract documents.

F. Provide effective protection against damage for all material and equipment during shipment, and storage at the Project Site. Cover all stored equipment to exclude dust and moisture. Place stored conduit on dunnage with appropriate weather cover and caps on exposed ends.

G. After cabinets and boxes are installed, cover openings to prevent entrance of water and foreign materials. Close conduit openings with temporary metal or plastic caps, including those terminated in cabinets.

H. Protect all rough and finished floors and other finished surfaces from damage which may be caused by construction materials and methods. Protect floors with tarpaulins, chip pans and oil-proof floor covering. Protect finished surfaces from welding and cutting splatters with baffles and asbestos splatter blankets. Protect finished surfaces from paint droppings, adhesive and other marring agents with drop cloths. Protect other surfaces with appropriate protective measures.

I. Have materials delivered to site. Unload and store materials in designated location, and protect from damage. Deliver materials to their point of installation.

J. Deliver materials to Project site in manufacturer's original unopened containers with manufacturer's name and product identification clearly marked thereon.

2.5 NAMEPLATES

A. Furnish a nameplate for each separately installed feeder, switch and circuit breaker, each individual panel, transformer, disconnect switch, push-button station and equipment enclosure.

B. Unless otherwise noted, nameplates shall be black laminate with white letters of uniform size consisting of reasonably large caps, easily visible.

C. Inscriptions shall consist of name and number of equipment as shown on the Drawings and as approved by the Architect.

2.6 HAZARDOUS LOCATIONS

A. As indicated.

*** OPTION 1 - NEC:**

1. Provide material, equipment and installation as required for Class, Division and Group noted.

PART 3 – EXECUTION

3.1 CONDITIONS AT SITE

A. Visit to site is required of all bidders prior to submission of bid. All bidders will be held to have familiarized themselves with all discernible conditions, and no extra payment will be allowed for work required because of these conditions, whether specifically mentioned or not. Verify all grades, elevations, dimensions, and clearances at the site.

B. Lines of other services and/or equipment that are damaged as a result of this work shall promptly be repaired at no expense to the Owner.

C. Examine all work prepared by others to receive the work of this Section and report any defects affecting installation to the General Contractor for correction. Commencement of work will be construed as complete acceptance of preparatory work by others.

3.2 LICENSES, FEES AND PERMITS

A. Arrange for required inspections and pay all license, permit and inspection fees. Furnish a certificate of final inspections and approvals from local authority having jurisdiction over electrical installation and deliver to Architect.

B. This work shall include the procurement of and payment for all permits, certificates and fees for the performance of the electrical work in compliance with codes, applicable laws and municipal regulations including those from local utilities for services.

3.3 MATERIAL, WORKMANSHIP, AND CONTRACTOR'S QUALIFICATIONS

A. Only professional quality workmanship will be accepted. Haphazard or poor installation practice will be cause for rejection of work.

B. Provide foreman in charge of this work at all times. Foremen for this work shall have had experience in installing not less than 5 such electrical systems of equal or greater complexity.

C. Where specifications call for an installation to be made in accordance with manufacturers' recommendations, a copy of such recommendations shall at all times be kept in job superintendent's office.

D. All material shall be new and of the best quality and shall have the Underwriters Laboratories label attached. The Label shall be of the type for the intended application. The work throughout shall be executed in the best and most thorough manner under the direction of, and to the satisfaction of the Architect who will interpret the meaning of the Drawings and Specifications. The Architect shall have the power to reject any work and materials which, in his opinion, is not in full accordance therewith.

E. If, after installation, operation of the equipment proves to be unsatisfactory to the Owner by reason of defects, errors or omissions, the Owner reserves the right to operate equipment until it can be removed from service for correction by Contractor. Contractor shall pay for damages to work of other trades caused by this defective equipment and its replacement.

3.4 SUPERVISION AND COORDINATION

A. Contractor shall coordinate work of this Division with other trades to avoid conflict and to provide rough-ins and other connections for equipment furnished under other divisions that require electrical connections. Inform other trades of required clearances of accesses for or around electrical equipment to maintain serviceability and code compliance.

B. The work of this Section shall be so arranged that there will be no delay in the proper installation and completion of any part or parts of each respective work wherein it may be interrelated with that of this Contract so that generally all construction work can proceed in its natural sequence without unnecessary delay. All communications of a coordinating nature to the Architect shall be via the General Contractor.

C. Examine all Architectural, Structural, Heating, Ventilating and Air Conditioning, Sprinkler and Plumbing Drawings relating to this Project, and verify all governing conditions at the site and become fully informed as to the extent and character of the work required and its relation to other work in the building. No consideration will be granted for any alleged misunderstanding of the materials to be furnished or work to be done.

D. Scaled and figured dimensions with respect to the items are approximate only; sizes of equipment have been taken from typical equipment items of the class indicated. Before proceeding with work, the Contractor shall carefully check all dimensions and sizes and shall assume full responsibility for the fitting-in of equipment and materials to the building and to meet architectural and structural conditions. Discrepancies shall be reported to the Architect in ample time to prevent delays or unwarranted changes to work.

E. Coordinate work with other disciplines. Confer with other contractors whose work might affect this installation, and arrange all parts of this work and equipment in proper relation to the work and equipment of others, with the building construction and with architectural finish so that this work will harmonize in service, appearance, and function.

F. Exposed piping shall be installed to provide the maximum amount of headroom but in no case shall piping be installed less than seven feet (7'-0") above the finished floor. Piping installed in areas where hung ceilings or other furred spaces are indicated shall be installed concealed.

G. The Contractor is referred to the Architectural drawings for locations and types of hung ceilings and furred spaces.

H. The Contractor shall have competent supervision on the site at all times to layout, check, coordinate and supervise the installation of all electrical work and be responsible for the accuracy thereof. He shall plan the installation of all electrical work, giving consideration to the work of other trades to prevent interference.

I. The Contractor shall take all field measurements necessary for this work and shall assume responsibility for their accuracy.

3.5 RELATED WORK SPECIFIED ELSEWHERE

A. The following items of materials and labor will be provided by other contractors under other Sections of the Specifications and shall be excluded from the work to be furnished by this Contractor:

1. Furnishing of Power (Service) Transformers, and other service equipment as noted in Electrical Service System.
2. Furnishing of Metering Current Transformers and Metering Equipment.
3. Furnishing and setting of motors, adjusting thermal elements and replacing thermal overloads if necessary. Supplying of (Motor Control Centers) individual starters and control devices, unless specifically indicated otherwise.
4. Installation of electric valves, float switches and pressure and pneumatic-electric switches, stats and related control devices, sprinkler devices.
5. Control wiring for boiler and fuel burning not hereinafter specified or shown on Drawings.
6. Furnishing and installing HVAC Temperature Control Boards, Supervisory Temperature Control and Energy Management Systems.
7. Furnishing and installing diesel fuel oil piping, underground storage tank and exhaust piping for emergency generator. Installation of silencer, daytank and flexible connections.

8. Installation of day tank and transfer pump, muffler and flexible connectors.
9. Furnishing of surgical lights, stationary X-ray equipment, and film illuminators.
10. Installation of duct type smoke detectors.
11. Furnishing and installing telephone company cables and instruments.
12. Base flashing for conduits passing through roof.
13. Setting of access doors in walls and ceilings.
14. Furnishing of alarm and supervisory devices for Sprinkler Alarm System.
15. Rough and finish patching.
16. Finish painting of exposed conduits, boxes, hangers, apparatus, etc.
17. Openings for sleeves in foundation walls below grade and floor slabs when noted on foundation Drawings or in foundation Specifications.
18. Dewatering of trenches outside of Building.

3.6 TESTING

A. Provide all labor, materials, and equipment necessary to make required tests. Tests shall be complete and results approved before final inspection is begun.

3.7 PROGRESS OF WORK

A. Order progress of electrical work so as to conform to progress of work of other trades, and complete entire installation as soon as condition of building will permit. Assume any cost resulting from defective or ill-timed work performed under this Division.

3.8 CUTTING AND PATCHING

A. General: Perform cutting and patching in accordance with Division 1 Section “Cutting and Patching.” In addition to the requirement specified in Division 1, the following requirements apply:

1. Perform cutting, fitting, and patching of electrical equipment and materials required to:
   a. Uncover work to provide for installation of ill-timed work.
   b. Remove and replace defective work.
   c. Remove and replace work not conforming to requirements of the Contract documents.
   d. Remove samples of installed work as specified for testing.
   e. Install equipment and materials in newly installed structures.
   f. Upon written instructions from the architect, uncover and restore work to provide for Architect observation of concealed work.

3.9 SLEEVES

A. Place sleeve in forms of walls, floor slabs and partitions for passage of all conduits, pipes, and ducts installed under Divisions 26, 27 and 28. Sleeves shall be set in place a sufficient time ahead of concrete work so as not to delay that work. Install sleeves and raceways through exterior walls so as to provide a waterproof installation. All floor penetrations shall be made watertight. Conduits passing through walls shall be installed to preserve integrity of the wall rating (i.e., fire rating, sound rating, air, etc.). All penetration made through existing concrete slabs or walls shall be x-rayed and approved by Structural Engineer prior to cutting.

3.10 EXCAVATION, TRENCHING, AND BACKFILLING

A. Perform all excavation to install conduit and duct banks indicated on the drawings or specified herein. During excavation, pile material for backfilling back from the banks of the trench to avoid overloading and to prevent slides and cave-ins. Remove and dispose of all excavated materials not to be used for backfill. Grade to prevent surface water from flowing into trenches and excavation. Remove any water accumulating therein by pumping. Do all excavation by open cut. No tunneling shall be done unless indicated on the drawings or unless written permission is

received from the Architect.

B. Grade the bottom of trenches to provide uniform bearing and support for conduits or duct bank on undisturbed soil at every point along its entire length. Tamp over depths with loose, granular, moist earth. Remove unstable soil that is not capable of supporting equipment or installation and replace with specified material for a minimum of 12” below invert of equipment or installation.

C. Backfill the trenches with excavated materials approved for backfilling, consisting of earth, loam, sandy clay, sand and gravel or soft shale. These materials should be free from large clods of earth and stones, deposited in 6” layers and rammed until the installation has cover of not less than the adjacent ground but not greater than 2” above existing ground. Backfilling shall be carried on simultaneously on both sides of the trench so that injurious pressures do not occur. Compaction of the filled trench shall be at least equal to that of the surrounding undisturbed material. Do not settle backfill with water. Reopen any trenches not meeting compaction requirements or where settlement occurs, refill, compact, and restore surface to grade and compaction indicated on the drawings, mounded over and smoothed off.

D. In addition, all excavation and backfilling shall comply with Division 2. The most stringent requirement shall apply.

3.11 LOAD BALANCE

A. Connect branch circuits to panelboards, and panelboards to feeders so that loads are balanced among the phases within practical limits on the basis of connected load.

B. Branch circuit numbers shown on the drawings are for identification only and do not necessarily indicate the final position of the branch circuits in the panelboards

3.12 MOISTURE-DAMP PROTECTION

A. Wherever any electrical components such as: panels, raceways, etc will be in contact with surfaces which may become damp or wet, spacers to hold electrical work 1/4" (.006m) away from such surfaces shall be provided.

3.13 CLEANUP

A. Remove all materials, scrap, etc., relative to electrical installations and leave premises in a clean, orderly condition. Any costs to the Owner for cleanup of site will be charged to the Contractor. At completion, all equipment, raceways, etc., shall be thoroughly cleaned and all residue removed from the inside and outside surfaces. Defaced finish shall be refinished.

3.14 TEMPORARY LIGHTING AND POWER

A. Provide temporary power as requested by the general contractor and in accordance with OSHA and local code requirements. Lighting and power outlets shall be provided throughout the project. Check with general contractor prior to bid for special lighting and power outlets and provide as needed. All temporary power and lighting feeders and branch shall have over-current protection.

B. Electrical services for temporary light and power shall be [obtained from the nearest existing normal switchboard or panelboard and extended as required. Consult the Owner prior to making any connections to existing services. OR arrange with utility company for temporary power connection or generator. Exact size of temporary power required shall be field coordinated by the contractor.]

C. The Electrical Contractor shall furnish, install and maintain the temporary lighting and power system for all Contractors. The use of electricity shall be kept to a minimum.

D. The Owner or Owner's Representative will pay for all energy required by the temporary lighting and power system.

E. Provide all wiring, supports, lamp sockets, receptacle sockets and any other materials, supplies or equipment necessary for temporary light and power system.

F. Ground fault protection required by OSHA for temporary receptacle circuits shall be accomplished by providing branch circuit panels containing ground fault protection branch circuit breakers.

G. Provide a grounding conductor connection to each receptacle grounding terminal. Minimum size branch circuit and ground conductors shall be No. 12 AWG.

H. Install separate stringer circuits for lighting and receptacles. Provide one lamp socket and one duplex receptacle (or two single receptacles) for every 400 square feet of new general construction area. (Approximately 20 feet on centers). Furthermore, provide one lamp socket and one duplex receptacle every 20 feet along the peripheral walls of the construction areas for temporary conditions. Each lamp socket shall be provided with a 100 watt lamp. Replace burned out lamps as required for as long as the temporary lighting system is maintained in operation.

I. Provide sufficient supplementary temporary lighting to permit proper execution of the work. This supplementary lighting shall consist of but not be limited to the following:

1. Construction hoist landings.
2. Stairways and stairway landings where existing illumination is inadequate due to alterations or construction.
3. Interior rooms not covered with general construction area lighting.
4. Provide temporary lighting on construction barriers if barriers block lighting in existing spaces. Provide temporary emergency lighting per code required distances if emergency lighting is obstructed by construction barriers.

J. Provide power wiring to operate construction hoist. Provide fused disconnect switch at hoist location. Fuse size, wiring size and disconnect shall be as required.

K. Provide 50 trailer extension cords, each 25 feet long. Cords shall be 16-3, Type SJ. 25 of the trailer cord sets shall be receptacle type ITT No. 6112 and 25 of the trailer cord sets shall be trouble light type with receptacle ITT No. J-3270.

L. Keep the temporary lighting and power system operational commencing fifteen (15) minutes before the established starting time of that trade which starts work earliest in the morning and ending fifteen (15) minutes after the established quitting time of that trade which stops work latest in the evening. This applies to all weekdays, Monday through Friday inclusive, which are established as regular working days for any trade engaged in the work, and shall continue until Final Acceptance of the work or until these services are ordered terminated by the Owner or the Owner Representative.

M. Any or all of the temporary services herein specified shall be disconnected, removed, or relocated when its or their use is no longer required, or if it or they should impede the progress of the work, and as requested by the Construction Manager and/or General Contractor. Should a change in location of any temporary equipment herein specified be necessary to progress the work, the contractor shall remove and relocate such equipment as directed by the Construction Manager and/or General Contractor at no additional cost to contract. The temporary equipment herein specified shall be removed and disposed of when directed by the Construction Manager and/or General Contractor.

N. Any Contractor requiring overtime use shall reimburse the Electrical Contractor by private agreement between Contractors.

O. Provide construction site lighting as required or directed. This lighting shall be mounted on shanties and shall be wired on separate circuits to permit illumination from dusk to dawn.

P. Immediately upon activation of permanent service, the contractor shall distribute temporary power from the permanent service.

Q. It is the intent of these specifications to generally indicate to the contractor the scope and requirements of temporary light and power. It is understood that these requirements shall vary during construction as required by field conditions, etc and as directed by the Construction Manager and/or General Contractor. It shall be the responsibility of the Contractor to adjust and modify the temporary wiring requirements accordingly.

3.15 MINOR CHANGES

A. The Owner reserves the right to make minor changes in the locations of outlets and equipment up to the time of electrical rough-in without any cost to the Owner.

3.16 ELECTRICAL SYSTEMS OPERATIONAL TESTS, CERTIFICATION, AND DESIGN AUTHORITY ASSISTANCE

A. Testing

1. Refer to the individual specification sections for test requirements.
2. Prior to the final inspection, the systems or equipment shall be tested and reported as herein specified. Six (6) typewritten copies of the tests shall be submitted to the Architect/Engineer for approval.
3. All electrical systems shall be tested for compliance with the specifications.

B. Manufacturers' Certifications

1. The electrical systems specified herein shall be reviewed for compliance with these specifications, installation in accordance with the manufacturers' recommendations and system operation by a representative of the manufacturer. The manufacturer shall submit certification that the system has been installed in accordance with the manufacturers' recommendations and is operating as specified in the contract documents.
2. Provide manufacturers' certification for the emergency generator set/automatic transfer system, architectural lighting control, network lighting control, fire alarm system and lightning protection.

C. Design Authority Assistance

1. The Contractor shall provide personnel to assist the Architect/Engineer or his representative during all construction review visits. The Contractor shall provide all necessary tools and equipment to demonstrate the system operation and provide access to equipment, including screwdrivers, wrenches, ladders, flashlights, circuit testing devices, meters, keys, etc.
2. Remove equipment covers (i.e., panelboard trims, switchboards, panelboards, motor controls, device plates, and junction box covers) as directed for inspection of internal wiring. Accessible ceiling shall be removed as directed for inspection of equipment installed above ceilings. Reinstall all covers or ceilings after inspection.
3. Energize and de-energize circuits and equipment as directed. Demonstrate operation of equipment as directed by Architect/Engineer.
4. The Contractor shall provide authorized representatives of the manufacturers to demonstrate to the Architect/Engineer compliance with the specifications of their respective system during or prior to the final inspection at a time designated by the Architect. Refer to the appropriate specification section for additional testing requirements. Representatives of the emergency generator/automatic transfer switch and fire alarm systems are required for demonstrations.

3.17 ADVISORY BOARD

A. The electrical contractor shall be responsible for filing the service equipment layout with the City of Poughkeepsie, New York Advisory Board.

B. All drawings shall be in a form acceptable to the Advisory Board.

C. Contractor shall pay all required filing fees.

3.18 COMMISSIONING

A. After startup and testing of each system has been completed, the Owner shall have an independent firm conduct detailed observations of the equipment and systems to confirm compliance with the Contract Documents.

B. The Division 26 Contractor shall include, as part of the work of his contract, costs to cover manpower, equipment, tools, ladders, instruments, etc., necessary to expedite the system performance observations.

C. The independent firm shall develop systems, equipment checkout procedures and data forms for recording compliance of the systems to the Contract Documents, performance, and construction observation lists, and will assist in developing schedules for checkout and Owner acceptance, at a future date during the construction phase.

END OF SECTION

SECTION 26 05 03

TESTING

PART 1 - GENERAL

1.1 RELATED WORK SPECIFIED ELSEWHERE

A. Acceptance and startup testing requirements for electrical power distribution equipment and systems. Contractor shall retain and pay for the services of a recognized independent testing firm for purpose of performing inspections and tests as herein specified.

1. The testing firm shall provide all material, equipment, labor, and technical supervision to perform such tests and inspections.
2. It is the purpose of these tests to assure that all tested electrical equipment is operational and within industry and manufacturer's tolerances and is installed in accordance with design specifications.
3. The tests and inspections shall determine suitability for startup and energization.
4. The following equipment shall be tested and or calibrated:

Low Voltage Power Wires and Cables - Section 26 05 19
Medium Voltage Cables - Section 26 05 13
Grounding - Section 26 05 26
Low Voltage Transformers - Section 26 22 00
Switchboards - Section 26 24 13
Panelboards – Section 26 24 13
Diesel Generator Set - Section 26 32 13
Automatic Transfer Switch - Section 26 36 00

1.2 SUBMITTALS

A. Provide submittal per Contract General Conditions, Division 1, and Section 26 05 02.

B. Qualification of testing firm.

C. Submit PDF copies of certified test reports to Engineer for approval.

D. PDF copies of blank forms for checklists, test reports, and other related forms for Engineer's review and approval.

1.3 GENERAL REQUIREMENTS

A. The Contractor shall perform routine insulation resistance, continuity, and rotation tests for all distribution and utilization equipment prior to and in addition to any acceptance testing.

B. The Contractor shall test all lighting, low voltage relays and circuits to ensure proper operating conditions prior to acceptance testing.

C. The Contractor shall perform visual and mechanical inspections, verifying that the equipment nameplate information meets the intent of the drawings and specifications.

D. The Contractor shall be responsible for all final settings and adjustments on protective devices and tap changes, submitting settings to the Architect/Engineer for review.

E. Provide a complete short-circuit study, equipment interrupting/withstand evaluation, and a protective device coordination study for the electrical distribution system described herein. This study shall be submitted with

electrical equipment submission and electrical room layouts.

F. The Contractor shall engage the services of a recognized corporate and financially independent testing firm for the purpose of performing inspections and tests as herein specified.

G. The firm shall provide all material, equipment, labor, and technical supervision to perform such tests and inspections.

H. It is the purpose of these tests to assure that all tested electrical equipment is operational and within industry and manufacturer's tolerances and is installed in accordance with design specifications.

I. The tests and inspections shall determine suitability for energization. Equipment shall not be energized until accepted by the testing firm.

J. Prior to performing tests, the contractor shall notify the Architect a minimum of one week in advance, so that the Architect may schedule a representative to be present while tests are being conducted.

K. Any defects shall be corrected at once, and the tests reconducted.

L. It is the purpose of these tests to assure that all tested electrical equipment is operational and within industry and manufacturer's tolerances and is installed in accordance with design specifications.

M. The tests shall be performed by competent personnel and shall demonstrate the following:

1. That all lighting, power and control circuits are continuous and free from short circuits.
2. That all circuits are free from unspecified grounds.
3. That all connections within panelboards are tight and do not produce excess heating.
4. That the resistance to ground of all non-grounded circuits is not less than one megohm.
5. That all circuits are properly connected in accordance with the applicable wiring diagrams.
6. That all circuits are operable by which a demonstration shall include functioning of each control not less than three times and continuous operation of each lighting and power circuit for not less than 1/2 hour.
7. That all alarm and signal systems and all emergency and exit lights are properly functioning.

N. When wiring systems are "megger" tested, the insulation resistance between conductors and between conductors and grounds, based on maximum load, shall not be less than that required by Electrical Code and local authorities having jurisdiction.

O. A digital copy of record of all test data shall be supplied to the Architect (three copies). The tests shall cover but not be limited to the following:

1. Primary service and distribution system.
2. Secondary service and distribution system.
3. Emergency equipment and distribution system.
4. Fire alarm, sprinkler and smoke detection systems.
5. All communications, signaling and alarm systems.
6. Power installations and motor controls.
7. Light installations and circuit switching.
8. Any part of the work called for in the Specification, or Drawings and as designated by the Architect or Engineers.

P. If in the opinion of the Architect, the results of such tests show that the work has not complied with the requirements of the Specifications or Drawings, the Contractor shall make all additions or changes necessary to put the system in proper working condition and shall pay for all the expenses and for all subsequent tests which are necessary to determine whether the work is satisfactory. Any additional work or subsequent tests shall be carried out at the convenience of the Owner, prior to final payment.

1.4 QUALIFICATIONS OF TESTING FIRM

A. The testing firm shall be a recognized corporate and financially independent testing organization which can function as an unbiased testing authority, professionally independent of the manufacturers, suppliers, and installers of equipment or systems evaluated by the testing firm.

B. The testing firm shall be regularly engaged in the testing of electrical equipment devices, installations, and systems.

C. The testing firm shall meet OSHA criteria for accreditation of testing laboratories, Title 29, Part 1907, or be a Full Member company of the InterNational Electrical Testing Association (NETA).

D. The lead, on-site, technical person shall be currently certified by the InterNational Electrical Testing Association (NETA) or National Institute for Certification in Engineering Technologies (NICET) in electrical power distribution system testing.

E. The testing firm shall utilize engineers and technicians who are regularly employed by the firm for testing and engineering services. All studies, tests, and reports shall be sealed by a registered electrical professional engineer with a current New York State stamp.

F. The testing firm shall submit proof of the above qualifications with bid documents, when requested.

G. The terms used herewith, such as test agency, test contractor, testing laboratory, or contractor test company, shall be construed to mean the testing firm.

1.5 APPLICABLE CODES, STANDARDS, AND REFERENCES

A. All inspections and tests shall be in accordance with the following codes and standards except as provided otherwise herein:

1. National Electrical Manufacturer's Association - NEMA
2. American Society for Testing and Materials - ASTM
3. Institute of Electrical and Electronic Engineers - IEEE
4. InterNational Electrical Testing Association - NETA Acceptance Testing Specifications - ATS-1991
5. American National Standards Institute - ANSI C2: National Electrical Safety Code
6. State and City of Poughkeepsie Codes and Ordinances
7. Insulated Cable Engineers Association - ICEA
8. Association of Edison Illuminating Companies - AEIC
9. Occupational Safety and Health Administration - OSHA
10. National Fire Protection Association - NFPA
    a. ANSI/NFPA 70: National Electrical Code
    b. ANSI/NFPA 70B: Electrical Equipment Maintenance
    c. NFPA 70E: Electrical Safety Requirements for Employee Workplaces
    d. ANSI/NFPA 78: Lightning Protection Standard
    e. ANSI/NFPA 101: Life Safety Code

B. All inspections and tests shall utilize the following references:

1. Project design specifications.
2. Project design drawings.
3. Short-circuit and coordination study.
4. Manufacturer's instruction manuals applicable to each particular apparatus.
5. Project list of equipment to be inspected and tested as stated above.

PART 2 - SHORT-CIRCUIT AND COORDINATION STUDY

2.1 SHORT-CIRCUIT STUDY

The electrical equipment manufacturer shall perform a short-circuit analysis of the specified electrical power distribution system. This analysis shall include:

A. Calculation of the maximum RMS symmetrical three-phase short-circuit current available at significant locations in the electrical system. The results shall represent the highest short-circuit currents to which the equipment might be subjected under the reported system conditions. The short-circuit currents shall be calculated with the aid of a digital computer. Appropriate motor short-circuit contribution shall be included in the calculation.

B. The study shall include all portions of the electrical distribution system from the normal and alternate sources of power throughout the low-voltage distribution system. Normal system operating method, alternate operation, and operations which could result in maximum fault conditions shall be thoroughly covered in the study.

C. The study shall be calculated from the utility meter to the unit substation to the lowest overcurrent device or equipment on the electrical distribution system. The utility conductors shall not be used for calculations.

D. An evaluation of the adequacy of the short-circuit ratings of the electrical equipment supplied by that manufacturer.

E. Provide five copies of the short-circuit analysis for the engineer's approval within 60 days of contract award.

F. A computer printout of input data, a computer printout of calculated results and an explanation of how to interpret the printouts.

G. A one-line diagram identifying all bus locations and the maximum available short-circuit current at each bus.

H. A bus-to-bus listing of the maximum available short-circuit current expressed in RMS symmetrical amperes and the X/R ratio of the fault current.

I. A table of equipment short-circuit ratings versus calculated short-circuit current values.

J. The short circuit and coordination study shall be completed and forwarded for review within 120 days after award of the contract.

K. At the time of the final inspection and tests, all connections at the panels and all splices, etc., must have been completed. All fuses must be in place and the circuits continuous from service switches to all receptacles, outlets, motors, etc.

L. An analysis of the results in which any inadequacies shall be called to the attention of the Engineer and recommendations made for improvements. These recommendations shall be incorporated by the electrical equipment manufacturer to the electrical equipment at no cost to the Owner. Where approved by the Engineer.

2.2 PROTECTIVE DEVICE COORDINATION STUDY

The electrical equipment manufacturer shall perform a protective device time-current coordination analysis of the specified electrical power distribution system. This analysis shall include:

A. A determination of settings or ratings for the over-current protective devices supplied. Where necessary, an appropriate compromise shall be made between system protection and service continuity with system protection and service continuity considered to be of equal importance. The time-current coordination analysis shall be performed with the aid of a digital computer.

B. An evaluation to the degree of system protection and service continuity possible with overcurrent devices supplied.

C. Provide five copies of the protective device time-current coordination analysis for the Engineer's approval.

D. Log-Log plots of time-current characteristic curves.

E. A tabulation of the suggested settings of the adjustable overcurrent protective devices supplied.

F. The key or limiting overcurrent device characteristics, load characteristics, and protection requirements affecting the setting or ratings of the overcurrent protective devices supplied.

G. The degree of service continuity and system protection achieved with the overcurrent protective devices supplied.

H. An analysis of the results in which any inadequacies shall be called to the attention of the Engineer and recommendations made for improvements. These recommendations shall be incorporated by the electrical equipment manufacturer to the electrical equipment at no cost to the Owner, where approved by the Engineer.

2.3 ARC FLASH HAZARD ANALYSIS

A. Provide with the coordination and short circuit studies an Arc Flash study and device by device listing of PPE requirements and ratings as required by the NEC and NFPA 70E. All equipment shall have appropriate labeling installed in the field by the electrical contractor as determined by the study.

B. The flash protection boundary and the incident energy shall be calculated at all significant locations in the electrical distribution system (switchgear, switchboards, panelboards, busway, etc.) where work could be performed on energized parts.

PART 3 - INSPECTION AND TEST PROCEDURES

3.1 PROCEDURE

A. Testing firm to provide and comply with the following:

1. Acceptance test procedures for each individual equipment listed in Part 1 of this section for Engineer review and approval prior to any test and after thorough evaluation of the system. Testing shall conform to the latest version of InterNational Electrical Testing Association (NETA) specifications and standards for electrical power distribution equipment and systems and manufacturer's instructions.
2. Refer to each individual specification section for testing requirements and comply.
3. Inspect installed equipment, record results and report any discrepancy and deficiency with contract documents and governing codes prior to testing. All results shall be submitted to the Engineer for approval.

3.2 SYSTEM FUNCTION TESTS

A. General:

1. Perform system function tests upon completion of equipment component tests as define in this specification. It is the purpose of system function tests to prove the proper interaction of all sensing, processing, and action devices.
2. Implementation:
   a. Develop test parameters for the purpose of evaluating performance of all integral components and their functioning as a complete unit within design requirements.
   b. Test all interlock devices, and trip settings on breakers.
   c. Record the operation of alarms and indicating devices.

3.3 DEFICIENCIES

A. All deficiencies reported by testing firm to be corrected by Contractor and Acceptance Test to be re-done accordingly.

END OF SECTION

SECTION 26 05 05

MANUFACTURERS

PART 1 - GENERAL

1.1 DESCRIPTION

A. The following lists of manufacturers are for the specifications as identified.

B. All submittals and documentation shall be in accordance with the project General Requirements, Division 1.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturing firms regularly engaged in manufacture of this material with characteristics and capacities required, whose products have been in satisfactory use in similar service for not less than 10 years.

B. Provide product produced by the manufacturers, which are listed in Section "Approved Manufacturer's List".

C. Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work are listed herein. All manufacturers not listed shall be pre-approved prior to bid in order to be considered. Refer to Division 1 for pre-approval format.

END OF SECTION

SECTION 26 05 06

BASIC MATERIAL AND METHODS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. This Section supplements Division 1, General Requirements.

1.2 DESCRIPTION OF WORK

A. Work included in this section consists of conduits, wires and other miscellaneous materials not specifically mentioned in other sections of Division 26, but necessary or required for equipment or system operation or function, and the labor to install them.

1.3 SUBMITTALS

A. Materials list with manufacturer, style, series or model identified.

B. Manufacturer's descriptive literature and/or sample if requested by the Architect/Engineer.

PART 2 - PRODUCTS

2.1 MANUFACTURERS: Refer to Section 26 05 05.

2.2 CONDUIT RACEWAYS: Refer to Section 26 05 33.

2.3 WIRES AND CABLES: Refer to Section 26 05 19.

2.4 MEDIUM VOLTAGE CABLE: Refer to Section 26 05 13.

2.5 WIRING DEVICES: Refer to Section 26 27 26.

2.6 OUTLET BOXES, JUNCTION AND PULL BOXES

A. Outlet Boxes: Hot-dipped galvanized or sherardized of required size, 4" square minimum, for flush mounted devices and lighting fixtures. Cast-type FD with gasketed covers for surface-mounted devices.

B. Junction and Pull Boxes: Use outlet boxes as junction boxes wherever possible. Larger junction and pull boxes shall be fabricated from sheet steel, sized according to code, with screw-on covers, galvanized where required for outdoor exposure.

C. All exterior boxes shall be cast, gasketed, weatherproof type with cast covers.

D. Refer to Section 26 05 34 for additional requirements.

2.7 WIRE CONNECTORS

A. For wires that are #8 AWG and smaller: Insulated pressure type with live spring, rated 105°C, 600 volt, for building wiring and 1000 volt in signs or fixtures.

B. For wires that are #6 AWG and larger: Compression type with 3M #33 or equal tape insulation.

2.8 CONDUIT HANGERS

A. Galvanized steel with special accessories for purpose and adequate to support load imposed. Support individual conduit 1-1/2-inch and larger and all multiple conduit runs with hangers. Clamp conduits individually to each support.

B. Refer to Section 26 05 29 for additional requirements.

2.9 FUSES: Refer to Section 26 28 16.

2.10 ACCESS PANELS

A. Electrical Contractor to provide access panels for electrical equipment which are required for accessibility by code.

2.11 TERMINAL CABINETS AND BACKBOARDS

A. Fabricate from code gauge steel, size as indicated on drawings, with flush latch and concealed hinge. Where size is not indicated, minimum size shall be 20" wide x 24" high x 4" deep. Finish shall be ANSI 61 light gray baked enamel.

B. Provide inside terminal cabinet, ¾" thick plywood backboard and terminal strips, one terminal point for each wire within the terminal cabinet.

C. Provide ¾" thick plywood backboards, size as indicated on drawings, for telephone where indicated on drawings.

2.12 CONDUIT SLEEVES

A. Sleeves for Conduit Penetration: Pipe Shields, Inc., model WFB at walls and QDFB at floors. Refer to Division 7 "Firestopping" for additional requirements.

2.13 EQUIPMENT MOUNTING AND SUPPORT HARDWARE

A. Steel channels, bolts and washers, used for mounting or support of electrical equipment shall be galvanized typed. Where installed in corrosive atmosphere, stainless steel type hardware shall be used.

B. Refer to Section 26 05 29 for additional requirements.

2.14 PREFABRICATED CURBS

A. General: Except where curbs are provided with equipment, provide prefabricated curbs for all roof mounted equipment and conduit.

B. Manufacturers:

1. Design Basis: Pace
2. Other Acceptable Manufacturers:
   a. Thycurb

C. Coordinate with roofing Contractor. Exterior insulation, cants, flashing and counter flashing shall be furnished and installed under roofing work, Division 7.

D. Model: As required.

E. Roof Curbs

1. Roof curbs shall have a minimum height of 6” or as specified on the drawings, whichever is greater.

2.15 EQUIPMENT SUPPORTS

A. Provide housekeeping pads for all floor mounted equipment.

1. Housekeeping pads shall have a minimum height of 4” or as specified on the drawings, whichever is greater.
2. Provide pins to tie new pad to existing floor.
3. Provide rebar within new pad to support equipment load and prevent cracking of pad.

PART 3 - EXECUTION

3.1 GENERAL

A. Provide complete raceway systems for all conductors including control wiring and low voltage wiring unless otherwise noted.

B. Electrical system layouts indicated on drawings are generally diagrammatic, but shall be followed as closely as actual construction and work of other trades will permit. Govern exact routing of raceways and locations of outlets by structure and equipment served. Take all dimensions from architectural drawings.

C. All home runs to panelboards are indicated as starting from the outlet nearest to the panel and continuing in the general direction of that panel. Continue such circuits to panel as though routes were completely indicated.

D. Avoid cutting and boring holes through structure or structural members wherever possible. Obtain prior approval of the Architect, and conform to all structural requirements when cutting or boring structure.

E. Furnish and install all necessary hardware, hangers, blocking, brackets, bracing, runners, etc., required for equipment specified under this Section.

3.2 RACEWAY: Refer to Section 26 05 33.

3.3 OUTLETS

A. Exact location of outlets and equipment shall be governed by structural conditions and obstructions or other equipment items. When necessary, relocate outlets so that when fixtures or equipment are installed, they will be symmetrically located according to room layout and will not interfere with other work or equipment. Verify final location of all outlets, panels, equipment, etc., with the Architect/Engineer.

B. Provide zinc-coated or cadmium-plated sheet steel outlet boxes not less than 4” octagonal or square, unless otherwise noted. Equip fixture outlet boxes with 3/8” no-bolt fixture studs. Where fixtures are mounted on or in an accessible type ceiling, provide a junction box and extend flexible conduit to each fixture. Outlet boxes in finished ceilings or walls shall be fitted with appropriate covers, set to come flush with the finished surface. Where more than one switch or device is located on one point, use gang boxes and covers unless otherwise indicated. Sectional switch boxes or utility boxes will not be permitted. Provide tile box or a 4” square box with tile ring in masonry walls which will not be plastered or furred, or where “dry-wall” type materials are applied. Through the wall type boxes are not permitted. Install minimum 12” lateral separation for back to back boxes.

C. Surface-mounted devices are to be mounted in cast type boxes with gasketed covers: (Crouse-Hinds condulets or equal).

D. Dimensions, unless shown on drawings, are given below and are from finished floor to center line of outlets unless noted otherwise. Adjust heights of outlets in masonry walls to correspond with consistent brick or block course. Outlets in block walls shall be installed in core of block.

Wall Switches	4’ - 0” (to top of switch)
Convenience outlets	1’-6” (to bottom of outlet)
Receptacle outlets in mechanical spaces	3’ – 0” (to bottom of outlet)
Hallways	1’ - 6” (to bottom of outlet)
Workroom wall outlet	4’ - 4” (field verify height of backsplash)
Panelboards wall-mounted	6’ - 6” (to top of trim)
Wall phone outlet	4’ - 0”
Telephone outlets	1’ - 6”
Fire alarm horns, speakers	ceiling or wall
Fire alarm pull stations	4’ - 0” (to top of device)
Fire alarm strobes	6’ - 8” or 6” below ceiling (whichever is lower)
Television outlets	Refer to A/V or architectural drawing
Clock outlet	8'-3" or 1'-0" below fin. ceiling
Receptacles at counters	4’-0” or as required.
Motor controllers	5’-0”
Safety and disconnect switches	5’-0”

Confirm final location and heights of all outlets, wall switches, and television outlets with architectural drawings and furniture plans prior to installation.

E. Outlets except over counters, benches, special equipment, baseboards, fin tube radiators, etc., or at wainscotting, shall be at a height to prevent interference to service equipment, or as noted on drawings.

F. Refer to Section 26 05 34 for additional requirements.

3.4 JUNCTION PULL BOXES

A. Construct junction or pull boxes not over 150 cubic inches in size shall be standard outlet boxes, and those over 150 cubic inches shall be constructed the same as “Cabinets,” with screw covers of same gauge metal. Removal covers must be accessible at all times.

B. Provide a standard access panel having a hinged metal door neatly fitted into a flush metal trim, where a junction box or equipment is located above non-accessible ceilings or behind finished walls. Coordinate location and type with the Architect.

END OF SECTION

SECTION 26 05 07

FOOD SERVICE EQUIPMENT WIRING

PART 1 - GENERAL

1.1 DESCRIPTION

A. General: Provide food service equipment wiring, complete, as shown and specified per Contract Documents.

B. Related Sections: The following Sections apply to Work under this Section.

1. Division 26 Section “Electrical Requirements” and “Basic Material and Methods”.

1.2 GENERAL

A. Obtain and verify electrical requirements and location of food service equipment prior to installation of related electrical Work.

PART 2 - PRODUCTS (Refer to Section 26 05 06 “Basic Material and Methods.”)

PART 3 - EXECUTION

3.1 FOOD SERVICE EQUIPMENT WIRING

A. All final connections to equipment by Electrical Contractor.

B. All electrical lines shall be extended from rough-in to connection point or points on the fixture by the Electrical Contractor furnishing all labor and materials.

C. Where electrical lines are shown out of floor on drawings, Electrical Contractor shall stub up 6" above finished floor and connect, after equipment has been set in place and leveled by Kitchen Equipment Contractor (KEC).

D. All rough-ins shall be concealed in walls or columns wherever possible.

E. All fabricated equipment shall be completely wired internally, and all electrical outlets and receptacles mounted on or in fabricated equipment shall be furnished and installed by KEC who shall run all lines to suitable terminal boxes or subpanels; starters or disconnect switches by Electrical Contractor. Final connection shall be made by the Electrical Contractor. Where equipment wiring terminates in a junction box, switch, or terminal box, the Electrical Contractor shall make all connections between the branch circuit and equipment wiring. Where terminal is a receptacle, connect branch circuit to receptacle. Where terminal is a sub-panel, connect branch circuit to the mains of the sub-panel. All receptacles shall be furnished by Electrical Contractor, except those which are built into an item of equipment.

F. All plug-in equipment receptacles shall be polarized. The Electrical Contractor shall provide the appropriate grounding type receptacles for all wall- and floor-mounted outlets to be used for plug-in equipment as noted on the drawings, with characteristics as noted. All plug-in equipment shall have the appropriate cord and plug set furnished and installed by the KEC. The KEC and Electrical Contractor shall coordinate their work so that the receptacles provided will match the specific plugs installed as part of the plug-in equipment, and any changes in cords and plugs

or receptacles required in the field will be done at no cost to the Owner.

G. The Electrical Contractor shall provide power and control wiring in the field between various equipment components as required, such as, but not limited to, ventilator control panels to ventilators, fans and detergent systems, and disposer control panels to disposer motors and solenoids.

H. Electric switches with thermal overload protection will be mounted on the dishwashing machine by KEC or dishmachine manufacturer. Machine may be shipped to the job site in one or more sections. After machine is assembled by the KEC, the Electrical Contractor shall interconnect machine sections and provide final connections.

I. The KEC shall supply, one each motor-driven appliance or electrical heating unit, a suitable control switch or starter of the proper type in accordance with Underwriter's Laboratory requirements wherever such switch or starter is not furnished integrally with the equipment by its manufacturer. All other line switches; safety cut-outs; disconnect switches; control panels; fuse boxes; other controls, fittings, and connections, when not an integral part of the unit, will be furnished and installed by the Electrical Contractor.

J. All conduit, junction boxes, and other fittings for equipment which is freestanding, or open tubular construction, exposed to public view, shall be stainless steel or chrome- plated. Assemblies in non-public areas shall be epoxy-painted aluminum.

K. The Electrical Contractor shall supply power and interconnecting services and all final connections to walk-in refrigeration and freezer compressor/condensers and evaporators, solenoid valves and switches required for a complete operating system. Furnish and install a disconnect switch for each compressor. Walk-in refrigerator lights shall be furnished by the KEC and installed and fully connected by the Electrical Contractor. Exposed conduit inside the walk-in compartment is unacceptable.

L. The Electrical Contractor shall furnish and install control wiring between refrigeration temperature alarm systems and remote monitoring panel.

M. "Sealtite" type flexible conduit shall be used for all flexible conduit installations, depending on code requirements. Junction boxes for equipment requiring flexible conduit should be mounted right on conduit at elevations which will limit the total length of the flexible conduit to 24" overall.

N. Sleeve collars shall extend 2" above top of the finished floor. Openings between collar and conduit shall be sealed watertight.

O. Electrical Contractor shall connect electrical supply from rough-in location to the disposer control panel and then to the disposer motor and solenoids. Control panel contains overload and under-voltage protection and fused disconnect switch.

P. The KEC shall provide microswitches as part of the fire suppression system, which, when wired to, will allow for the interruption of power to all electrically operated equipment as required in case of fire. Power source for the fire suppression system shall be interwired to an emergency generator or external battery system by the Electrical Contractor so that the fire system will remain energized in the event of a power failure. The Electrical Contractor shall provide adequate contactors, shunt-trips, or other equipment to interrupt power as required by code and inter-wire with system as supplied by KEC. (If Utility Distribution System is specified, shut-offs will be provided by KEC as part of the system and the Electrical Contractor will need to interwire from the microswitch at the fire suppression system tanks to the terminal block in the system.)

Q. Electrical Contractor shall interwire ventilator exhaust and washdown system per directions of KEC and manufacturer. The ventilator control system shall be interwired to an emergency generator or external battery system so that the ventilator system is constantly energized in the event of a power failure.

END OF SECTION

SECTION 26 05 10

PROJECT CLOSEOUT

PART 1 – GENERAL

1.1 WORK INCLUDED

A. The contractor shall summarize and document adherence with the requirements of the specifications for project closeout including:

1. Copies of all warranties
2. Operation & Maintenance Manuals
3. Required tests
4. Certifications
5. Record drawings
6. Permit requirements

B. The contractor shall compile a closeout manual which shall include:

1. A list of all required tests and a place for signoff of date completed.
2. A list of all submittals with dates of acceptance by the engineer.
3. A schedule indicating dates for beginning testing and startup of equipment and dates of tests to be witnessed by the engineer, or designated representative, as required by the specifications.
4. Test procedures to be used for life safety systems.
5. Project close out check list.

C. The final closeout manual shall include the following:

1. Test reports as required by the specifications with signoff by the appropriate individual (engineer, architect, building official, etc.).
2. Documentation indicating all equipment is operating properly and is fully accessible for maintenance.
3. Copies of all warranties.

D. This section only includes the requirements for documentation of the contract documents, by the contractor, for project completion. This section does not in any way decrease the scope of any of the drawings or specifications.

1.2 SUBMITTALS

A. Within 90 days after notice to proceed submit a preliminary closeout manual with the following:

1. A list of all required tests.
2. Preliminary schedule showing major milestones for completion of the electrical and technology systems.

B. Within 30 days of the first major milestone submit the completed closeout manual as described in Part 1.

C. Within 2 weeks of substantial completion submit a completed “Project Closeout Check List”, and the Final Closeout Manual.

D. Listed below is a checklist for use by the contractor. This list is not all inclusive for this project.

Project Close-Out Summary - Electrical

- ☐ The following tests have been completed. Submit test report for record.
  - ☐ Feeder Testing and Reporting (Megger Result)
  - ☐ Medium Voltage cable Testing and Reporting
  - ☐ Transformers Testing and Reporting
  - ☐ Grounding System Testing and Reporting
  - ☐ Diesel Generator Testing and Reporting
  - ☐ Secondary Switchboard Infrared Scans, Testing and Reporting
- ☐ All main components of the electrical system cleaned and vacuumed. This includes unit substations, switchboards, distribution boards, panel boards, etc. Provide M-E Engineers with schedule when this is going to occur and a letter stating it has been completed.
- ☐ The contractor shall schedule a walk through with the engineer to inspect all main feeder sizes. Covers for panel boards and distribution boards should be removed by the contractor for visual inspection of feeder sizes.
- ☐ Temporary cable tray hooks inspected.
- ☐ Fixtures re-lamped per specifications.
- ☐ The fire alarm system manufacturer shall provide the Owner/Architect with a “Letter of Certification” indicating the system is fully functional and meets all manufacturers requirements as well as code and design requirements. Fire department must sign off the system.
- ☐ Provide spare fuses and fuse cabinets ((1) in each switch gear room) per specifications.
- ☐ Panelboard directories completed.
- ☐ Record drawings submitted.
- ☐ All lighting control systems complete with controls fully operational for visual inspections.
`
- ☐ The lightning protection system manufacturer shall provide the Owner/Architect with a “Letter of Certification” indicating the system meets all manufacturers requirements as well as code and design requirements.

PART 2 – PRODUCTS (Not Used)

PART 3 – EXECUTION

3.1 EQUIPMENT STARTUP AND TESTING

A. Prior to completion and punchlist by the engineer, the contractor shall startup and test each piece of equipment as required by the specifications. The contractor shall provide documentation of all required tests with signoff of by the appropriate individual (engineer, architect, and building official).

3.2 LIFE SAFETY SYSTEMS

A. All life safety systems shall be fully and successfully tested by the contractor before being witnessed by the engineer or building official.

B. The contractor shall provide a detailed test procedure, with instrumentation to be used, for approval by the engineer and building official prior to any testing.

C. Once tested by the contractor and fully operation the systems shall be demonstrated to the engineer. Once accepted by the engineer the system shall be demonstrated to the building and fire officials.

3.3 COORDINATION WITH OTHERS

A. The Division 26 contractor shall coordinate his requirements with the general contractor to ensure the other building systems are completed to the point that they will not adversely affect the operation of the Division 26, 27 and 28 systems.

3.4 PUNCH LISTS

A. The contractor shall submit in writing that the project is ready for final review by the engineer.

B. Once the project is ready for final review the engineer will create a punch list of any corrections or deficiencies.

C. The contractor shall complete all punch list items and provide a letter to the architect after completion stating all items have been completed or reasons why they were not completed.

D. Upon receipt of this letter the engineer will verify that the punch list has been satisfactorily completed.

END OF SECTION

SECTION 26 05 11

ELECTRIC SERVICE SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specification sections, apply to work of this section.

B. Division 26 Basic Electrical Material and Methods sections apply to work specified in this section.

1.2 SUMMARY

A. The work includes the providing of all labor, materials, equipment, accessories, services and tests necessary to complete and make ready for operation by the Owner, electrical service as shown on the drawings and hereinafter specified.

B. Equipment and wiring shall be provided and installed in part by Central Hudson referred to as Utility Company and in part under this contract.

1.3 SUBMITTALS

A. Materials list with manufacturer, style, series or model identified.

B. Manufacturer's descriptive literature and/or sample if requested by the Architect/Engineer

1.4 QUALITY ASSURANCE

A. Installer's Qualifications: Firms with at least 5 years successful installation experience on projects utilizing switchboards and panelboards similar to those required for this project.

B. All work shall be performed in accordance with all rules, regulations, and standards of Utility Company, and all applicable codes.

C. Where deemed necessary, perform all work under the supervision of the Utility Company representative.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store equipment in clean dry space. Protect units from dirt, fumes, water, construction debris and traffic; where necessary to store outdoors, store electrical components above grade and enclose with watertight wrapping.

B. Handle equipment carefully to prevent internal components damage, breakage, denting, and scoring enclosure finish. Do not install damaged components; replace and return damaged units to equipment manufacturer.

1.6 SEQUENCING AND SCHEDULING

A. Coordinate installation of property line box, enclosures and all required appurtenances with the utility company.

PART 2 - PRODUCTS

2.1 MANUFACTURERS: Refer to Section 26 05 05.

2.2 CONDUIT RACEWAYS: Refer to Section 26 05 33.

2.3 WIRES AND CABLES: Refer to Section 26 05 19.

2.4 MEDIUM VOLTAGE CABLE: Refer to Section 26 05 13.

2.5 PULL BOXES: Refer to Section 26 05 06.

2.6 WIRE CONNECTORS: Refer to Section 26 05 06.

2.7 CONDUIT HANGERS: Refer to Section 26 05 06.

2.8 CONDUIT SLEEVES: Refer to Section 26 05 06.

2.9 EQUIPMENT MOUNTING AND SUPPORT HARDWARE: Refer to Section 26 05 06.

PART 3 - EXECUTION

3.1 SCOPE OF WORK

A. The following work shall be performed by the Utility Company:

1. Service wiring as noted.
2. Supply metering transformers.
3. Supply and install watt hour and demand meters.
4. Final connections to metering equipment.

B. The following work shall be performed by the Contractor.

1. Arrange with the Utility Company for service facilities and pay all charges.
2. Extend service from Utility Company termination.
3. Provide property line box.
4. Provide outdoor metering enclosure.
5. Provide sleeves for service entrance raceways.
6. Metering transformer enclosures and meter pans.
7. Install metering transformers.
8. Meter wiring except final connections
9. Obtain Utility Company approval for all electric service work and service equipment shop drawings.
10. Obtain local review board / inspector approval for all electric service work and service equipment shop drawings.
11. Provide all associated installation components and accessories.

3.2 SERVICE EQUIPMENT AND CONNECTIONS

A. Service and meter equipment indicated on the drawings or the service layouts of the utility company, shall be furnished and installed complete with all connections.

B. Contractor shall apply and receive from the utility company all information relative to the requirements for property

line splice boxes, meter pans, meter blocks, all metal enclosures, current transformer cabinets, meter loops, service wiring, etc.

C. The contractor shall note that after the contract award, the final approved equipment, current transformer cabinet and meter provisions, including property-line box and end-line boxes shall be of the type which includes terminating devices (crab-joints) and protective devices (limiters), connections, hardware, etc.

D. Any work the utility company performs as part of this installation which is chargeable to the project shall be paid for by this contractor as part of this Contract.

3.3 TYPE OF ELECTRIC SERVICE

A. Unless otherwise noted, the voltage supply for this building shall be the standard electric service 480/277V, 3 phase, 4 wire, 60 Hz Alternating Current Service.

B. If 480/277 volt, then provide ground fault sensing and tripping on all mains 1000 Amps or more.

3.4 LIMITER LUGS

A. In the service end-line box, furnish and install straight line limiter lugs on each conductor of each phase of the incoming secondary service feeder, if required by the utility company.

B. Limiter lugs shall have proper link element characteristics, based on applicable cable size that will carry normal overloads of short duration, but will clear on overloads liable to damage cable insulation.

C. Limiters shall have heat resistant shell to confine the arc and insulating sleeve. Provide sufficient cable slack for replacement for at least one unit per phase.

D. Limiter lugs shall be equal to Burndy type YFS-CR.

3.5 METER CABINETS, ETC

A. Cabinets of meter pans, current transformers, service switches, and all other service equipment shall be constructed from galvanized or other approved rust resistant steel or aluminum and shall be painted on all exposed surfaces with a priming coat and a coat of paint (color as selected). Cabinet doors shall have steel hinges and non-ferrous pins.

3.6 MOUNTING OF SERVICE EQUIPMENT, ETC

A. Service equipment shall be mounted a minimum of ½" out from wall. Lightweight equipment may be mounted on spacers, while heavy equipment shall be fastened to wall by using suitable metal framework.

B. The various elements of the service equipment, such as service switches, cutouts, metering equipment with conduit and cable connections are indicated diagrammatically on the drawings. Contractor may re-arrange and/or group the various elements including main distribution panel where practical using separate or common wireways or equivalent built-in gutters for cable or copper bus connections in one or more cabinets with separate access doors to fit space available.

C. Each unit of equipment shall be completely identified by attaching phenolic nameplates with lettering, etc 1 " in height.

D. This contractor shall be responsible for the number, location and size of all necessary openings in the building walls for the entrance of service conduits and other conduits into the building.

3.7 INSPECTION

A. Contractor shall examine location where electric service equipment and raceways are to be installed, determine space conditions and notify Architect in writing of conditions detrimental to proper and timely completion of the work.

B. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.8 INSTALLATION

A. Install equipment and components where shown or as directed, in accordance with manufacturer's written instructions, Utility Company's instructions (where applicable), and with recognized industry practices, to ensure that installation complies with requirements and serves intended purposes.

B. Coordinate with other work as necessary to coordinate installation of equipment with other components of systems.

END OF SECTION

SECTION 26 05 13

MEDIUM VOLTAGE CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Requirements of the following Division 26 Sections apply to this section:

1. Electrical Requirements.

1.2 SUMMARY

A. This Section includes wires, cables, and connectors for power, distribution on related systems rated over 600 volts.
B. Medium voltage cables must meet Central Hudson Utility requirements.

C. Related Sections: The following Sections contain requirements that relate to this section:

1. Division 2 Section “Earthwork” for trenching and backfilling.
2. Division 26 Section “Electrical Boxes and Fittings” for connectors for terminating cables in boxes and other electrical enclosures.

1.3 SUBMITTALS

A. Cables 15KV Rated:

1. Submit manufacturer’s product data, for the review and approval on medium voltage cables including, but not limited to, the following:
   a. Acceptance by Central Hudson Utility with Pictorial diagram showing construction of cable.
   b. Written indication that cable meets or exceeds the specification and any exceptions taken to the specification.

B. Joints and Splices:

1. Submit manufacturer’s product data and Central Hudson Utility requirements for the review and approval on cable joints and splice including, but not limited to the following:
   a. Material and construction of joint.
   b. Manufacturer’s written instruction for installation of joint.

C. Terminations:

1. Submit manufacturer’s product data for review of 15KV cable terminations including, but not limited to the following:
   a. Material and construction of termination.
   b. Manufacturer’s written instructions for installation of termination.

1.4 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with provisions of the following code:

B. NFPA 70 “National Electrical Code.

1. Conform to applicable codes and regulations regarding toxicity of combustion products of insulating materials.
2. Meets Central Hudson Utility requirements.

C. UL Compliance: Provide components which are listed and labeled by UL under the following standards.

1. UL Std. 44: Rubber Insulated Wires and Cables.
2. UL Std. 83: Thermoplastic-Insulated Wires and Cables.
3. UL Std. 486A: Wire Connectors and Soldering Lugs for Use with Copper conductors.
4. UL Std. 854 Service Entrance Cable.

D. NEMA/ICEA Compliance: Provide components which comply with the following standards:

1. WC-5: Thermoplastic-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy.
2. WC-7: Cross Linked Thermosetting Polyethylene-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy.
3. WC-8: Ethylene-Propylene-Rubber-Insulated Wire and Cable for the Transmission and Distribution of Electrical Energy.
4. AEIC CS-6: Associated Edison Illuminating Co. - EPR insulated power cable 1.5 - 69KV (10/87).

E. IEEE Compliance: Provide components which comply with the following standard.

1. Std. 82: Test procedures for Impulse Voltage Tests on Insulated conductors.

PART 2 - PRODUCTS

2.1 MEDIUM VOLTAGE CABLES

A. Provide single conductor 15KV shielded power cable insulated with ethylene propylene rubber (EPR) rated for 133% insulation level. The cable shall have a continuous temperature rating of 90°C, an emergency overload temperature rating of 130°C, and a short-circuit temperature rating of 250°C. The cable shall be suitable for operation in wet or dry locations and for installation in duct or conduit. The cable shall be listed as Type MV-90 and shall carry a UL label.

B. Insulation shield shall be semi-conducting extruded, semi-conducting EPR, and uncoated copper tape. Shield ampacity shall be equivalent to one overlapped 5 mil copper tape (with a 12.5% (mini-overlap)). Jacket thickness shall not be less than 80 mils, of black polyvinyl chlorides. The cable must be triple tandem extruded and all ethylene propylene system. The insulation, inner screen, and outer screen shall all be EPR. The insulation should not contain any polythlene. The cable must be flat line corona tested with less than 5 picocoulombs. Cable shall meet the requirements of AEIC CS6, ICEA S-68-516, and UL1072.

C. Separable insulated connectors shall conform to IEEE Standard 386 “Separable Insulated Connectors for Power Distribution Systems Above 600V.”

D. Termination shall be Class 1 or Class 2; of the molded elastomer, wet-process porcelain, pre-stretched elastomer, heat shrinkable elastomer, or taped type. Acceptable elastomers are track-resistant, silicon-rubber, or tract-resistant ethylene-propylene compounds. Indoor Class 2 terminations shall be used except where termination is exposed to outdoor environment, then Class 1 terminations shall be used. Class 3 terminations are not acceptable.

E. Separable insulated connectors may be used for apparatus terminations, when such apparatus is provided with suitable bushings. Connectors shall be of suitable construction for the application and type of cable connected, and shall include cable shield adapters.

PART 3 - EXECUTION

3.1 WIRE

A. Install all above grade medium voltage cable in rigid metallic conduit on line and load side of main service switchgear unless noted otherwise.

B. A wire pulling lubricant must be used when pulling conductors through conduit or duct runs over 10 feet in length. The pulling compound shall be compatible with the raceway, conductor and jacket material.

C. Cable splices and joints shall be allowed only in pull boxes.

D. Ground conductors shall be installed in the same duct with their associated phase conductors.

E. Wires shall be pulled in using pulling eyes securely attached to the conductor. Pulling grips which transmit the pulling tension directly to the jacket or insulation shall not be permitted.

3.2 JOINTS AND SPLICES

A. Joints and splices shall be performed based on the manufacturers' written instructions.

B. Shields shall be applied as required to continue the shielding system through each entire cable joint. Shield may be integrally molded parts of preformed joints. Shields shall be grounded at each joint.

3.3 TERMINATIONS

A. Terminations shall be of the type required for equipment termination, and shall be performed based on the manufacturer's written instructions.

B. Terminations, where required, shall be provided with mounting brackets suitable for the intended installation and with grounding provisions for the cable shielding.

3.4 TESTING

A. Products.

1. Material: Contractor shall provide all necessary testing equipment and devices required to perform the tests described in this Section.

3.5 EXECUTION

A. Insulation Resistance (Megger) Testing

1. This procedure will provide the necessary guidelines to ensure an acceptable insulation resistance test.
   a. This procedure is applicable to Megger testing only.
   b. Megger testing shall be done during both construction and start-up.
   c. This procedure applies to the following equipment:
      1) Medium Voltage Cable.

2. In all cases, the manufacturer's instructions shall be consulted and integrated into this test guideline to assure full compliance and acceptance without jeopardizing equipment warranties.
3. Test Preparation:
   a. Verify that proper Megger apparatus of the correct voltage is available.
   b. Equipment to be tested shall be clean and dry.
   c. All equipment shall be tested before being initially energized. All necessary precautions shall be taken to prevent the equipment from becoming energized during the test.
   d. Except as required for testing, all construction related to the equipment shall be finished.
   e. Ensure equipment frame grounds are complete.
4. Test Procedure:
   a. Voltage shall be applied.
   b. After each test, the equipment shall be adequately grounded to remove any residual charge.
   c. Equipment shall be tested both phase to phase and phase to ground where applicable.
   d. Medium voltage 15KV cables shall be tested twice.
      1) After pulling but before termination, all cables shall be tested just prior to termination to determine if any damage occurred during pulling.
      2) After termination, medium voltage cables shall be tested just prior to being energized, as part of the system including the intended load.
5. Test Acceptance:
   a. The tests shall be considered satisfactory on the equipment being tested if all recorded readings meet the manufacturers' acceptance criteria.

3.6 DIRECT CURRENT OVERPOTENTIAL TEST

A. This test procedure will provide the necessary guidelines to accomplish an acceptable insulation overpotential test.

1. This procedure is applicable to cable rated for 15KV.
2. This test is to be performed after equipment or cable installation but prior to initial operation.

B. In all cases the manufacturer's instructions shall be consulted and integrated into this procedure to assure compliance and acceptance without jeopardizing equipment warranties.

C. Preparation:

1. Take necessary steps to insure that equipment will not become energized during the test.
2. Appropriate D.C. hi-pot equipment is available and the user is familiar with its operations.
3. The equipment to be tested has successfully passed an insulation resistance test (Megger) immediately prior to this test.
4. The equipment to be tested is isolated from all associated equipment (motors, transformers, potential transformers, etc.).
5. The equipment must be clean and dry.
6. Cables should be terminated, installed but not connected to equipment.
7. Signs have been posted at all necessary locations warning "High Voltage Tests in Progress."
8. Appropriate grounding devices are available.

D. Test Procedure:

1. Single conductors are to be tested from conductor to ground with the shield adequately grounded.
2. Three phase conductors are to be tested individually to ground with the shield and other two phases adequately grounded.
3. Ensure that equipment is de-energized and necessary measures are taken to prevent it from becoming energized during the test.
4. Ensure that equipment is isolated from all associated equipment.
5. Ensure all appropriate safety precautions have been followed.

6. Determine test voltage and test duration from TABLE 1 in this section.
7. For cables, to limit the maximum voltage stress on the insulation at the conductor to a safe value, the minimum size of the conductor shall be in accordance with the tables.
8. Set up the D.C. hi-pot apparatus following the manufacturer's instructions. A non-fluctuating power source may be required. If required the regulated power source shall be provided by the Contractor.
9. Apply the initial voltage and read the microampere leakage as quickly as possible and record the data. Do not wait for the reading to stabilize.
10. Quickly raise the voltage in 5KV increments stopping only long enough to obtain a microampere reading, until the test voltage is obtained.
11. Take microampere leakage readings at the rated test voltage at intervals of 15 sec., 30 sec., 45 sec., 1 min. and every 1 minute thereafter for the duration of the test (15 minutes). Record the readings.
12. After the test is complete, the conductor shall be grounded for a period not less than 4 times the charging time to remove any residual charge.

E. Test Acceptance:

1. The leakage current will generally start off at a relatively high value and drop off rapidly, becoming constant at some low value. The fact that the current levels off and becomes constant is more important than the actual value of the leakage current.
2. If the current does not drop down or after dropping starts to rise again, this is a strong indication of trouble in the circuit.
3. Leakage values are generally not compared to leakage rates from other similar conductors or even the same conductor tested at another time. Temperature and moisture have a considerable influence so that values are not usually representative of the actual insulation value of the equipment.
4. Results of the test shall be documented and submitted to the Engineer for approval. Submittal shall also include cable length, cable identification, cable size, temperature and humidity in which the test was performed.

3.7 REFERENCES

A. AEIC CS6-79 Specification for Ethylene Propylene Rubber Insulated shielded Power Cables Rated 5 through 69KV.

TABLE 1

Rated Voltage Phase to Phase KV	Conductor AWG or KCMIL	Insulation Thickness MILS		After Insulation 15 minute DC test Voltages KV	
		A	B	A	B
15	2 to 1000	125	115	25	25

NOTES:

(1) After installation test values are based on 80% of AEIC factory test values.
(2) Cables having the same voltage rating may have different insulation thicknesses. The test voltage applied should correspond to the thickness. Column A refers to 100% insulation level whereas Column B refers to 133% insulation level.

END OF SECTION

SECTION 26 05 19

WIRES AND CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Requirement of the following Division 26 Sections apply to this section:

1. Electrical Requirements

1.2 SUMMARY

A. This Section includes wires, cables, and connectors for power, lighting, signal, control and related systems rated 600 volts and less.

B. Related Sections: The following Sections contain requirements that relate to this section:

1. Division 2 Section “Earthwork” for trenching and backfilling.
2. Division 26 Section “Electrical Boxes and Fittings” for connectors for terminating cables in boxes and other electrical enclosures.

C. The work includes providing wire and cable complete with all accessories in accordance with Drawings and Specifications and as required for a complete system. Wiring size referenced in this Section shall be AWG, except as noted. For special wiring for individual systems refer to respective Section of these Specifications.

1.3 SUBMITTALS

A. Product Data for electrical wires, cables and connectors.

B. Shop drawings shall include detail drawings and data sheets for all wire and cable, compression wire connectors, large aluminum wire connectors, and large copper wire connectors.

C. Cable Pulling Submittals:

1. The following requirements pertain to all 600 volt or less feeders, sized 4/0 AWG or larger that are either in excess of 200 feet or requiring more than 180° of bend:
2. The Contractor shall utilize a pulling calculation software package, such as Polywater Cable Management Software or SKM Cable Pulling Analysis Software, to model and determine the expected pulling tensions and sidewall pressures that the conductor(s) will be exposed to. If the calculations determine that the expected pulling tensions and sidewall pressures will exceed the manufacturer's recommended values, the contractor is responsible making modifications necessary to correct the problem and re-run the analysis. Contractor shall submit the results of the analysis for the intended conduit routing prior to commencement of cable pulling for engineer’s approval. If the intended conduit routing is modified due to engineers comments or coordination with the other trades the contractor must re-run the analysis and resubmit for approval.
3. Contractor to submit detail conduit routing drawings showing pulling set ups and direction of cable pulls. These drawings shall clearly detail the intent of the cable pulls with reference to cable pull models. Indicate all splice locations for approval by engineer and owner.

4. Submit wire manufacture's maximum pulling tension and sidewall pressure recommendation.
5. Submit cable pulling machine for approval.
6. Submit UL listed pulling lubricants for approval.
7. Utilize Tensiometer similar or equal to, Condux Running Line Tensiometer, CableGlider HD.

1.4 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with provisions of the following code:

B. NFPA 70 "National Electrical Code."

1. Conform to applicable codes and regulations regarding toxicity of combustion products of insulating materials.
2. Comply with most restrictive code.

C. UL Compliance: Provide components, which are listed and labeled by UL under the following standards.

1.	UL Std. 44	Rubber Insulated Wires and Cables
2.	UL Std. 83	Thermoplastic-Insulated Wires and Cables
3.	UL Std. 486A	Wire Connectors and Soldering Lugs for Use with Copper Conductors
4.	UL Std. 854	Service Entrance Cable

D. NEMA/ICEA Compliance: Provide components which comply with ANSI/NEMA WC 70-2009 / ICEA S-95-658-2009.

E. IEEE Compliance: Provide components, which comply with the following standard.

1. Std. 82: Test procedures for Impulse Voltage Tests on Insulated Conductors.

F. QUALITY ASSURANCE

1. "Manufacturers" - Firms regularly engaged in manufacture of wire and cable of types and ratings whose products have been in satisfactory use in similar service for not less than 5 years.
2. Provide wire and cable which has been listed and labeled by Underwriters' Laboratories, and comply with applicable portions of National Electrical Manufacturers Association Standards.
3. Provide wire and cable produced by a manufacturer listed as an Approved Manufacturer in this section.
4. Provide equipment whose performance under specified conditions, is certified by the Manufacturer.

PART 2 - PRODUCTS

2.1 WIRES AND CABLES (600 VOLT COPPER CONDUCTORS)

A. General: Provide suitable wire and cable for the temperature, conditions and location where installed. All wires and cables shall be new and delivered to the site in unbroken packages and reels.

B. All wires and cables shall be of the same manufacturer throughout the entire project.

C. Conductors:

1. Provide solid conductors for power and lighting circuits #10 AWG and smaller. Provide stranded conductors for #8 AWG and larger.
2. Minimum conductor size shall be No. 12 for lighting and power and No. 14 for control and alarm. Increase wire as noted hereinafter for long runs.

3. Communications and signal wiring shall conform to the recommendations of the manufacturer's communication and signal systems and shall be as specified in respective Sections of these Specifications.

D. Conductor Material: All wires and cables shall be copper, single conductor rated at 600 volts, which conform to or exceed ICEA specifications. Use XHHW-2 or THWN-2/THHN, UNO.

1. Emergency system feeders shall either be a listed 2-hour cable paired with listed conduit, MI cable, or encased in minimum of 2 inches of concrete.

E. Grounding conductors: Shall be of the same type as its associated phase conductors.

F. All conductors shall be label with wire size, insulation rating, etc using an engraved process. Computer scan or labels are not permitted.

G. Color Coding for phase identification in accordance with Table 1 in Part 3 herein.

1. Where color-coded cable is not available, certify in writing and request permission for overlap color taping conductors (minimum length 6 in.) in accessible locations.
2. Conductors for control circuits and signal systems shall also be consistently color coded to avoid confusion and permit easy identification of conductors. The IPCEA color code shall be used wherever possible. No two wires in the same raceway shall be the same color, unless provided with flameproof linen identification tags on each end.

H. Connectors for Conductors:

1. Provide UL-listed factory-fabricated, solderless metal connectors of sizes, ampacity ratings, materials, types and classes for applications and for services indicated. Use connectors with temperature ratings equal to or greater than those of the wires upon which used.
2. For wires that are #8 AWG and smaller: Insulated pressure type with live spring, rated 105°C, 600 volt, for building wiring and 1000 volt in signs or fixtures.
3. For wires that are #6 AWG and larger: Compression type with 3M #33 or equal tape insulation.

I. Splices and Taps:

1. No. 10 AWG and smaller - Connectors for solid conductors shall be solderless, screw-on, spring pressure cable type, 600 volt, 105°C with integral insulation and UL approved for aluminum and copper conductors. Connectors for stranded conductors shall be crimp-on type with integral insulating cover.
2. No. 8 AWG and larger - Hydraulically applied crimping sleeve or tap connector sized for the conductors. Insulate the hydraulically applied connector with 90-degree, 600-volt insulating cover provided by the connector manufacturer. Insulator materials and installation shall be approved for the specific application, location, voltage, and temperature and shall not have an insulation value less than the conductors being joined.

J. Wire Sizes

1. For General Use:
   a. No. 12 minimum copper wire shall be used for lighting and power.
   b. No. 10 minimum copper wire shall be used at 120 volts and over 90 ft. for 15 amp circuit and 60 ft. for 20 amp circuit length.
   c. No. 10 minimum copper wire shall be used at 265 volts and over 175 ft. circuit length.
2. For Control and Alarm (unless otherwise noted):
   a. No. 14 minimum copper wire shall be used.
   b. No. 12 minimum copper wire shall be used at 120 volts and over 60 ft. circuit length.

3. For Other Voltages and Phases and for Longer Circuit Lengths: Size wire as required to maintain equivalent voltage drop.

4. Raceways: Increase raceway sizes for larger wire as required.

K. Insulation:

1. Rubber and thermoplastic insulation shall comply with ASTM and IPCEA standards. Paper and lead insulation shall comply with AEIC standards

PART 3 - EXECUTION

3.1 WIRING METHOD

A. Use the following wiring methods as indicated:

1. Install all wire in raceway. Power and control wiring shall be installed in separate raceways.

3.2 INSTALLATION OF WIRES AND CABLES

A. General: Install electrical cables, wires, and connectors in compliance with NEC.

B. Coordinate cable and wire installation with other Work.

C. Wire and cable shall not be drawn into conduit and raceways until all conduit work is complete - joints made up tightly and the entire run secured in place.

D. Do not install more conductors in a raceway than indicated on the drawings. A maximum of six branch circuits are to be installed in any one conduit on a 3-phase, 4-wire system, unless specifically noted otherwise on the drawings. When more than three branch circuits are installed in a raceway, the conductor size shall be increase per code for derating.

E. Minimum wire size shall be a No.12 AWG except for control or signal circuits, which may be No. 14 AWG.

F. Unless otherwise indicated on drawings, all wiring for branch circuits shall be a minimum No. 12 AWG in ¾" conduit, protected by 20 amperes circuit breakers.

G. Size of current carrying conductors, unless noted otherwise on drawings, shall be determined from Table 310-16 of the latest National Electric Code for the load served.

H. Pull conductors simultaneously where more than one is being installed in same raceway. Use UL listed pulling compound or lubricant, where necessary.

I. Care shall be exercised in pulling to avoid damage to the wire or cable. Lubricants shall be used for pulling wire or cable if the character of the pull would otherwise damage the conductors, insulation or jacket. Pull no thermoplastic wires at temperatures lower than 0□C.

J. Use pulling means including: fish tape, cable, rope, and basket weave wire/cable grips which will not damage cables or raceways. Do not use rope hitches for pulling attachment to wire or cable.

K. Size of conduits, unless specifically shown, shall be determined from Appendix C of the latest National Electrical Code.

L. Keep conductor splice to minimum. All splices shall be made within junction boxes, wiring troughs and other enclosures as permitted by the National Electrical Code. Do not splice conductors in panelboards, safety

switches, switchboards, or motor control enclosures. Splices in conductors installed below grade will not be permitted, unless approved in writing by the Architect.

M. Install splice and tap connectors, which possess equivalent or better mechanical strength and insulation than conductors being spliced.

N. Use splice and tap connectors which are compatible with conductor material.

O. Provide adequate length of conductors within electrical enclosures and train the conductors to terminal points with no excess. Bundle multiple conductors, with conductors larger than No. 10 AWG cabled in individual circuits. Make terminations so there is no bare conductor at the terminal.

P. Tighten electrical connectors and terminals, including screws and bolts, in accordance with manufacturers' published torque tightening values. Where manufacturers' torque requirements are not indicated, tighten connectors and terminals to comply with tightening torque values specified in UL 486A and UL 486B.

Q. 600 Volt Wire and Cable:

1. The inside of conduits and raceways shall be dry and clean before wires are pulled.
2. Cables shall be supported at the upper end of all risers and at intermediate points as required by the NEC. Supports shall be O.Z. Type "R" or approved equal, insulation wedges or Kellems grips.
3. Wire and cable shall be installed in accordance with manufacturer's instructions.
4. Seal, between the wire and conduit with a non hardening compound approved for the purpose, all cable and wire entering a building from underground where cable exits the conduit.
5. Cable spacers shall be installed where required. Spacers shall be conduit fittings for spacing of cables at terminations and shall consist of galvanized or cadmium plates, steel or malleable iron threaded conduit and fittings and inserts of non-metallic insulating material with openings adequate to accommodate cables being spaced. Cable spacers shall be adequate to accommodate cables being spaced. Cable spacers shall be O.Z. Mfg. Co., Inc. Type E or Type EL with grounding lug or approved equal.
6. Provide separate raceways for conductors of 120/208 and 277/480 volt systems.
7. Install cable limiters at each end of each conductor of more than three (3) paralleled conductors per phase, over 100 ft. in length. Limiters shall be rated 600 volts, 200,000 amps RMS interrupting capacity and shall have waterproof sleeves.
8. Direct burial cables shall be covered with a 1 in. thick by 8 in. wide white-pine board pressure-treated with a non-creasote-type wood preservative, placed over 3 in. layer of clean, well-tamped sand.
9. Under all paving and at crossover of all other utilities, underground cables shall be installed in PVC conduit and encased in concrete.
10. Thermoplastic wires shall not be installed in computer area raised floors.
11. Provide individual raceways for two pole ungrounded circuits.
12. In certain systems, equipment furnished by an approved manufacturer may require a different number and arrangement of conductors from that indicated on the Drawings. In such cases, the Contractor for the work under this Division shall comply with such requirements at no additional cost to the Owner.
13. In the event the Contractor for the work under this Division or Section chooses to furnish and install a system or item of equipment of different arrangement from that shown or specified, he shall furnish and install any additional wiring and conduit required by the system at no additional cost to the Owner.
14. In wireways and large pull boxes, lace and tie off conductors in groups of 3 phases and neutral (if used) to limit conductor unbalanced loading. Conductor group shall be as installed in conduits.
15. Tag all feeders and risers in all pull boxes and in all gutter spaces through which they pass. Tags shall be engraved white core nameplates identifying feeders as shown on the Drawings or the circuit protective device from which they originate.
16. Leave all wires with enough slack at terminals ends for convenient connections and fixtures and for convenient servicing. Stow loose ends neatly in outlet box.
17. Splices and taps shall be made in accessible boxes, panelboards fittings, gutters, terminal panels, etc. only. Materials shall be compatible with the conductors, insulations and protective jackets on the cables and wires.

18. All copper conductors No. 8 & larger shall be spliced, and tapped with color-keyed compression connectors, as manufactured by Thomas & Betts Co., Series 54000, Ideal Industries Series 87000, or approved equal. The manufacturers recommended tooling shall be used. Mechanical type connectors shall not be used. All copper conductors No. 8 and larger shall be terminated with self crimping, self adjusting, spring action type cable terminators, as manufactured by CYTOLOK or approved.
19. All copper conductors No. 10 AWG & smaller shall be terminated and spliced with Ideal Industries wing-nut wire connectors, or approved equal compression connectors. The nylon self-insulated type shall be used to isolate the terminal from other metal parts and equipment.
20. Splices and joints shall be insulated with materials approved for the particular use, location, voltage, and temperature. Insulation shall be not less than that of the conductors being joined.
21. Plastic electrical insulating tape shall be flame retardant, cold and weather resistant.
22. All circuit and control wiring in cabinets, panels, pullboxes, and junction boxes shall be tied and held with nylon Ty-Rap cable ties as manufactured by Thomas & Betts Co. or approved equal.
23. Wire identification ties fastened to conductors at the point of attachment to terminal blocks and equipment components shall be nylon, self-locking Ty-Raps as manufactured by Thomas & Betts Co., Series Ty-51M, 53M, or approved equal.
24. Cables shall be tagged in all pull boxes, wireways and wiring gutters of panels. Where two or more circuits run to or through a control device, outlet box or junction box, each circuit shall be tagged as a guide in making connections.
25. Tags for feeders shall indicate feeder number, size, phase, voltage, origin and termination. Feeder tags shall identify all phases individually.
26. Tags for control and alarm wiring shall indicate type of control or alarm, size of wire and origin and termination.
27. Tags shall be Thomas Betts Co., Ideal Industries wire-marker dispenser type, self-laminated wire markers.
28. Wire lubricating compound shall be suitable for the wire insulation and conduit with which it is used, and shall not harden or become adhesive. Lubricating compound shall be Ideal Industries, Type Yellow 77, or approved equal. Lubricating compound shall not be used on wire for isolated type electrical power systems.
29. Contractor shall examine the areas and conditions under which wire and cable are to be installed, and notify Architect in wiring of conditions detrimental to proper and timely completion of the work.
30. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.3 FIELD QUALITY CONTROL

A. Prior to energizing, check installed wires and cables with megohm meter to determine insulation resistance levels to assure requirements are fulfilled.

B. Prior to energizing, test wires and cables for electrical continuity and for short circuits.

C. Subsequent to wire and cable hook-ups, energize circuits and demonstrate proper functioning. Correct malfunctioning units, and retest to demonstrate compliance.

D. Prior to completion of project, an infrared scan of switchgear and panelboard feeder equipment connection shall be performed when all loads are energized.

E. TABLE 1: Color Coding for Phase Identification:
1. Color code secondary service, feeder, and branch circuit conductors with factory applied color as follows:

208V/120 Volts	Phase	480V/277 Volts
Black	A	Brown
Red	B	Orange
Blue	C	Yellow
White	Neutral	Gray
Green		Ground Green

3.4 FEEDER TESTING

A. Products

1. Material: Contractor shall provide all necessary testing equipment and devices required to perform the test described in this section.

B. Execution

1. Visual and Mechanical Inspection
   a. Inspect cables for physical damage and proper connection in accordance with one-line diagrams.
   b. Test cable mechanical connections to manufacturer's recommended values using a calibrated torque wrench.
   c. Check cable color coding with Table I in this section and National Electrical Code standards.
2. Electrical Tests
   a. Perform insulation-resistance test on each conductor with respect to ground and adjacent conductors. Applied potential shall be 1000 volts dc for 1 minute.
   b. Perform continuity test to insure proper cable connection.
   c. Megger conductors phase-to-phase and phase-to-ground for continuity and insulation tests before connection to utilization devices for the following:

      1. 100 percent of feeders.
      2. 10 percent of branch circuits.
      3. 100 percent of 3-phase motor branch circuits.

   d. Verify phase rotation for all three-phase motor circuits.
3. Test Values
   a. Evaluate results by comparison with cables of same length and type. Investigate any values less than 50 megohms.
   b. Submit results to Engineer for approval in accordance with Section 26 05 02 and 26 05 03.

END OF SECTION

SECTION 26 05 26

GROUNDING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specification sections, apply to work of this section.

B. Division-26 Basic Materials and Methods sections apply to work of this section.

C. Requirements of this section apply to electrical grounding and bonding work specified elsewhere in these specifications.

1.2 SUMMARY

A. Extent of electrical grounding and bonding work is indicated by drawings and schedules and as specified herein. Grounding and bonding work is defined to encompass systems, circuits, and equipment.

B. Type of electrical grounding and bonding work specified in this section includes the following:

1. Solidly grounded.

C. Applications of electrical grounding and bonding work in this section includes the following:

1. Underground metal piping.
2. Underground metal water piping.
3. Underground metal structures.
4. Building frames - structural steel.
5. Electrical power systems.
6. Grounding electrodes.
7. Separately derived systems.
8. Raceways.
9. Service equipment.
10. Enclosures.
11. Equipment.
12. Lighting Standards.
13. Landscape Lighting.
14. Signs.
15. Lightning Protection System

D. Refer to other Division-26 sections for wires/cables, electrical raceways, boxes and fittings, and wiring devices which are required in conjunction with electrical grounding and bonding work; not work of this section.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer’s data on grounding and bonding products and associated accessories.

B. Wiring Diagrams: Submit wiring diagrams for electrical grounding and bonding work which indicates layout of ground rods, location of system grounding electrode connections, routing of grounding electrode conductors, also include diagrams for circuits and equipment grounding connections.

C. Submit ground riser diagram for entire project. Show bus bars with transformer ground electrode conductors, etc.

D. Shop drawings shall include splice kits, ground rods, and ground wire.

1.4 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of grounding and bonding products, of types, and ratings required, and ancillary grounding materials, including stranded cable, copper braid and bus, grounding electrodes and plate electrodes, and bonding jumpers whose products have been in satisfactory use in similar service for not less than 10 years.

B. Installer's Qualifications: Firms with at least 5 years of successful installation experience on projects with electrical grounding work similar to that required for project.

C. Codes and Standards:

1. Electrical Code Compliance: Comply with applicable local electrical code requirements of the authority having jurisdiction, and NEC as applicable to electrical grounding and bonding, pertaining to systems, circuits and equipment.
2. UL Compliance: Comply with applicable requirements of UL Standards No.'s 467, Electrical Grounding and Bonding Equipment", and 869 "Electrical Service Equipment", pertaining to grounding and bonding of systems, circuits and equipment. In addition, comply with UL Std 486A, "Wire Connectors and soldering Lugs for Use with Copper Conductors." Provide grounding and bonding products which are UL-listed and labeled for their intended usage.
3. IEEE Compliance: Comply with applicable requirements and recommended installation practices of IEEE Standards 80, 81, 141 and 142 pertaining to grounding and bonding of systems, circuits and equipment.
4. For patient care area electrical power systems, grounding shall conform to Article 517 of the NEC.

PART 2 - PRODUCTS

2.1 GENERAL

A. Materials and Components:

1. Provide electrical grounding and bonding system; with assembly of materials, including, but not limited to, cables/wires, connectors, solderless lug terminals, grounding electrodes and plate electrodes, bonding jumper braid, surge arresters, and additional accessories needed for a complete installation. Where more than one type component product meets indicated requirements, selection is installer's option. Where materials or components are not indicated provide products which comply with NEC, UL, and IEEE requirements and with established industry standards for those applications indicated.

2.2 CONDUCTORS

A. Insulated Conductors: Copper wire or cable insulated for 600V unless otherwise required by applicable Code or authorities having jurisdiction.

B. Bare Copper Conductors:

1. Solid Conductors: ASTM B3.
2. Stranded Conductors: ASTM B8.
3. Tinned Conductors: ASTM B33.
4. Bonding Cable: 28 kcmil, 14 strands of No. 17 AWG conductors, 1/3 inch (6 mm) in diameter.
5. Bonding Conductor: No. 4 or No. 5 AWG, stranded conductors.

6. Bonding Jumper: Copper tape, braided conductors, terminated with copper ferrules; 1-5/8 inches (41 mm) wide and 1/16 inch (1.6 mm) thick.
7. Tinned Bonding Jumper: Tinned-copper tape, braided conductors, terminated with copper ferrules; 1-5/8 inches (41 mm) wide and 1/16 inch (1.6 mm) thick.

C. Bare Grounding Conductor and Conductor Protector for Wood Poles:

1. No. 4 AWG minimum, soft-drawn copper.
2. Conductor Protector: Half-round PVC or wood molding. If wood, use pressure-treated fir or cypress or cedar.

D. Grounding Bus: Rectangular bars of annealed copper (1/4 by 2 inches (6 by 50 mm) in cross section, unless otherwise indicated; with insulators.

2.3 CONNECTORS

A. Listed and labeled by a nationally recognized testing laboratory acceptable to authorities having jurisdiction for applications in which used, and for specific types, sizes, and combinations of conductors and other items connected.

B. Bolted Connectors for Conductors and Pipes: Copper or copper alloy, bolted pressure-type, with at least two bolts.

1. Pipe Connectors: Clamp type, sized for pipe.

C. Welded Connectors: Exothermic-welding kits of types recommended by Cadweld (or approved equal) manufacturer for materials being joined and installation conditions.

2.4 GROUNDING ELECTRODES

A. Ground Rods: Copper clad steel; not less than 3/4 inch by10 feet (19 mm by 3 m) in diameter.

B. Chemical-Enhanced Grounding Electrodes: Copper tube, straight or L-shaped, charged with nonhazardous electrolytic chemical salts.

1. Termination: Factory-attached No. 4/0 AWG bare conductor at least 48 inches (1200 mm) long.
2. Backfill Material: Electrode manufacturer's recommended material.

C. Ground clamps shall be bronze, solderless type with bronze screws suitable for receiving required or noted conductors.
D. Grounding wires shall be UL and NEC approved types, copper, with insulation color identified green, except where otherwise shown on the Drawings, or specified.

PART 3 – EXECUTION

3.1 APPLICATIONS

A. Conductors: Install solid conductor for No.10 AWG and smaller, and stranded conductors for No.8 AWG and larger, unless otherwise indicated.

B. Underground Grounding Conductors: Install bare tinned copper conductor, No.3/0 AWG minimum.

1. Bury at least 24 inches (600 mm) below grade.
2. Duct-Bank Grounding Conductor: Bury 12 inches (300 mm) above duct bank when indicated as part of duct-bank installation.

C. Isolated Grounding Conductors: Green-colored insulation with continuous yellow stripe. On feeders with isolated ground, identify grounding conductor where visible to normal inspection, with alternating bands of green and yellow tape, with at least three bands of green and two bands of yellow.

D. Grounding Bus: Install in electrical and telephone equipment rooms, in rooms housing service equipment, and elsewhere as indicated.

1. Install bus on insulated spacers 1 inch (25 mm), minimum, from wall 6 inches (150 mm) above finished floor, unless otherwise indicated.
2. Where indicated on both sides of doorways, route bus up to top of door frame, across top of doorway, down to specified height above floor, and connect to horizontal bus.

E. Conductor Terminations and Connections:

1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.
2. Underground Connections: Welded connectors, except at test wells and as otherwise indicated.
3. Connections to Ground Rods at Test Wells: Bolted connectors.
4. Connections to Structural Steel: Welded connectors.

3.2 GROUNDING UNDERGROUND DISTRIBUTION SYSTEM COMPONENTS

A. Comply with IEEE C2 grounding requirements

B. Grounding Manholes and Handholes: Install a driven ground rod through manhole or handhole floor, close to wall, and set rod depth so 4 inches (100 mm) will extend above finished floor. If necessary, install ground rod before manhole is placed and provide No. 1/0 AWG bare, tinned-copper conductor from ground rod into manhole through a waterproof sleeve in manhole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive insulating tape or heat-shrunk insulating sleeve from 2 inches (50 mm) above to 6 inches (150 mm) below concrete. Seal floor opening with waterproof, nonshrink grout.

C. Grounding Connections to Manhole Components: Bond exposed-metal parts such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or handhole, to ground rod or grounding conductor. Make connections with No. 4 AWG minimum, stranded, hard-drawn copper bonding conductor. Train conductors level or plumb around corners and fasten to manhole walls. Connect to cable armor and cable shields as recommended by manufacturer of splicing and termination kits.

D. Pad-Mounted Transformers and Switches: Install two ground rods and ground ring around the pad. Ground pad-mounted equipment and noncurrent-carrying metal items associated with substations by connecting them to underground cable and grounding electrodes. Install tinned-copper conductor not less than No.3/0 AWG for ground ring and for taps to equipment grounding terminals. Bury ground ring not less than 6 inches (150 mm) from the foundation.

3.3 EQUIPMENT GROUNDING

A. Install insulated equipment grounding conductors with all feeders and branch circuits. The conduit shall not be acceptable as an equipment ground.

B. Install insulated equipment grounding conductors with the following items, in addition to those required by NFPA 70:

1. Feeders and branch circuits.
2. Lighting circuits.
3. Receptacle circuits.
4. Single-phase motor and appliance branch circuits.
5. Three-phase motor and appliance branch circuits.
6. Flexible raceway runs.
7. Armored and metal-clad cable runs.

8. Computer and Rack-Mounted Electronic Equipment Circuits: Install insulated equipment grounding conductor in branch-circuit runs from equipment-area power panels and power-distribution units.

C. Air-Duct Equipment Circuits: Install insulated equipment grounding conductor to duct-mounted electrical devices operating at 120 V and more, including air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping.

D. Water Heater, Heat-Tracing, and Antifrost Heating Cables: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.

E. Isolated Grounding Receptacle Circuits: Install an insulated equipment grounding conductor connected to the receptacle grounding terminal in addition to the equipment grounding conductor. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service, unless otherwise indicated.

F. Isolated Equipment Enclosure Circuits: For designated equipment supplied by a branch circuit or feeder, isolate equipment enclosure from supply circuit raceway with a nonmetallic raceway fitting listed for the purpose. Install fitting where raceway enters enclosure, and install a separate insulated equipment grounding conductor. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service, unless otherwise indicated.

G. Signal and Communication Equipment: For telephone, alarm, voice and data, and other communication equipment, provide No. 4 AWG minimum insulated grounding conductor in raceway from grounding electrode system to each service location, terminal cabinet, wiring closet, and central equipment location.

1. Service and Central Equipment Locations and Wiring Closets: Terminate grounding conductor on a 1/4-by-2-by-12-inch (6-by-50-by-300-mm) grounding bus.
2. Terminal Cabinets: Terminate grounding conductor on cabinet grounding terminal.

H. Metal Poles Supporting Outdoor Lighting Fixtures: Install grounding electrode and a separate insulated equipment grounding conductor in addition to grounding conductor installed with branch-circuit conductors.

3.4 EXAMINATION

A. Examine areas and conditions under which electrical grounding and bonding connections are to be made and notify Engineer in writing of conditions detrimental to proper completion of work. Do not proceed with work until unsatisfactory conditions have been corrected.

3.5 INSTALLATION OF ELECTRICAL GROUNDING AND BONDING SYSTEMS

A. General: Install electrical grounding and bonding systems in accordance with manufacturer's instructions and applicable portions of NEC, NECA's "Standard of Installation", and in accordance with recognized industry practices to ensure that products comply with requirements.

B. Coordinate with other electrical work as necessary to interface installation of electrical grounding and bonding system work with other work.

C. Grounding Conductors: Route along shortest and straightest paths possible, unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.

D. Common Ground Bonding with Lightning Protection System: Comply with NFPA 780 and UL 96 when interconnecting with lightning protection system. Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor, and install in conduit.

E. Ground Rods: Drive rods until tops are 2 inches (50 mm) below finished floor or final grade, unless otherwise indicated.

1. Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating, if any.
2. For grounding electrode system, install at least three rods spaced at least one-rod length from each other and located at least the same distance from other grounding electrodes, and connect to the service grounding electrode conductor.
3. Where required to obtain the specified ground resistance, install multiple rods.
4. Where rock prevents the driving of vertical ground rods, install grounding electrodes in horizontal trenches to achieve the specified resistance.

F. Test Wells: Ground rod driven through drilled hole in bottom of manholes. Manholes are specified in Division 26 Section "Underground Services and Manholes," and shall be at least 12 inches (300 mm) deep, with cover.

1. Test Wells: Install at least one test well for each service, unless otherwise indicated. Install at the ground rod electrically closest to service entrance. Set top of test well flush with finished grade or floor.

G. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance, except where routed through short lengths of conduit.

1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.
2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install so vibration is not transmitted to rigidly mounted equipment
3. Use exothermic-welded connectors for outdoor locations, but if a disconnect-type connection is required, use a bolted clamp.

H. Grounding and Bonding for Piping:

Bond the water piping to the building ground with approved grounding clamps. All ground connections shall be executed with the same thorough workmanship as the connections for normal current carrying parts. The work must be neatly installed, as careless grounding either in appearance or workmanship will be rejected.

1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment each unit substation, or each main electrical room grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes, using a bolted clamp connector or by bolting a lug-type connector to a pipe flange, using one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.
2. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.
3. Bond each aboveground portion of gas piping system downstream from equipment shutoff valve.

I. Bonding Interior Metal Ducts: Bond metal air ducts to equipment grounding conductors of associated fans, blowers, electric heaters, and air cleaners. Install tinned bonding jumper to bond across flexible duct connections to achieve continuity.

J. Grounding for Steel Building Structure: Install a driven ground rod at base of each corner column and at intermediate exterior columns at distances not more than 60 feet (18 m) apart.

K. Ground Ring: Install a grounding conductor, electrically connected to each building structure ground rod and to each steel column, extending around the perimeter of building.

1. Install tinned-copper conductor not less than No.4/0 AWG for ground ring and for taps to building steel.
2. Bury ground ring not less than 24 inches (600 mm) from building foundation.

L. Under Ground (Concrete-Encased Grounding Electrode): Fabricate according to NFPA 70, using a minimum of 20 feet (6m) of bare copper conductor not smaller than No. 4/0 AWG.

1. If concrete foundation is less than 20 feet (6 m) long, coil excess conductor within base of foundation.
2. Bond grounding conductor to reinforcing steel in at least four locations and to anchor bolts. Extend grounding conductor below grade and connect to building grounding grid or to grounding electrode external to concrete.

M. Tighten grounding and bonding connectors and terminals, including screws and bolts, in accordance with manufacturer's published torque tightening values for connectors and bolts. Where manufacturer's torquing requirements are not indicated, tighten connections to comply with tightening torque values specified in UL 486A to assure permanent and effective grounding.

N. Apply corrosion-resistant finish to field-connections, buried metallic grounding and bonding products, and places where factory applied protective coatings have been destroyed, which are subjected to corrosive action.

O. Install all connectors on clean metal contact surfaces, to ensure electrical conductivity and circuit integrity.

P. The complete electrical installation shall be permanently and effectively grounded before the water meter and grounded in accordance with all code requirements, whether or not such connections are specifically shown or specified. Measured resistance to ground shall be 5 ohms. maximum.

Q. Parts of the electrical installation to be grounded shall include, but not be limited to, the following: underground distribution, outdoor substation service equipment, electrical service system neutral, conduit system for light and power, switchgear housings, cabinets, housings and neutrals of transformers, motor frames, housings of alarm and control panels and associated devices, lighting fixtures, lightning protection system, emergency distribution system, telephone system, fire alarm system, smoke detection system, communications and security system, busway enclosures, motor control centers, individual starters and other non-current carrying metal parts of electrical equipment.

R. All copper bars for grounding shall be medium hard drawn. After installation, the copper bar shall be painted with one coat of an approved lacquer.

S. Ground conductors shall be of sizes and material in accordance with the requirements of the National Electrical Code. Cable for grounding connections shall be bare in accordance with the latest revisions of ASTM Designations B3 and B8. All open bare grounding cable shall be secured in place with cast and honed malleable clamps and clamp backs, and 1/4 inch bolts.

T. Ground wires shall be continuous without splices. There shall be no soldered joints in any ground connection. Connectors, clamps, etc. shall be solderless type.

U. Ground outdoor electrical equipment to driven ground rods, as required by code.

V. Ground interrupted metallic raceways with ground conductors connected to metallic raceway at each end.

W. Separately ground center taps of wye connected transformers in accordance with National Electrical Code (NFPA 70).

X. Where ground connections will be permanently concealed, make the connections by the exothermic process to form solid metal joints. Make accessible ground connections with mechanical pressure type ground connections.

Y. Service at power company interface points shall comply with the power company ground resistance requirements.

Z. Connect all sections, poles and doors of outdoor fences to the grounding electrode system.

AA. Connect lightning arrestor grounds to the equipment ground bus, or ground rods as applicable.

BB. For duct banks and manholes provide a bare equipment grounding conductor in each duct bank containing medium or high voltage cables. Connect the grounding conductor to the switchgear ground bus, to all the manhole hardware, to the cable shielding of medium or high voltage cable splices and terminations, and equipment enclosures.

3.6 FIELD QUALITY CONTROL

A. Upon completion of installation of electrical grounding and bonding systems, test ground resistance with ground resistance tester. Where tests show resistance to ground is over 5 ohms, take appropriate action to reduce resistance to 5 ohms, or less, by driving additional ground rods; then retest to demonstrate compliance.

B. Inspect all connections prior to concealing same.

PART 4 – APPROVED MANUFACTURERS

A. For ground rods.

1. Carolina Galvanizing.
2. Weaver Electric

END OF SECTION

SECTION 26 05 29

SUPPORTING DEVICES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Requirements of the following Division 26 Sections apply to this section:

1. "Electrical Requirements."

1.2 SUMMARY

A. This Section includes secure support from the building structure for electrical items by means of hangers, supports, anchors, sleeves, inserts, seals, and associated fastenings.

B. Related Sections: The following Sections contain requirements that related to this Section:

1. Division 3 Section "Mild Steel Concrete Reinforcement" for inserts, anchors, and sleeves to be installed in concrete for use with supporting devices.
2. Division 5 Section "Metal Fabrications" for requirements for miscellaneous metal items involved in supports and fastenings.
3. Division 7 Section "Firestopping" for requirements for firestopping at sleeves through walls and floors that are fire barriers.
4. Refer to Division 26 Sections for additional specific support requirements that may be applicable to specific items.

1.3 SUBMITTALS

A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections.

B. Product data for each type of product specified.

1. Hanger and support schedule showing manufacturer's figure number, size, spacing, features, and application for each required type of hanger, support, sleeve, seal, and fastener to be used.

C. Shop drawings indicating details of fabricated products and materials.

D. Engineered Design consisting of details and engineering analysis for supports for the following items:

1. Cable Tray.
2. Conduit (racked)
3. Ceiling mounted boxes, transformers.
4. Conduit - Ceiling mounted, concrete encased.

1.4 QUALITY ASSURANCE

A. Electrical Component Standard: Components and installation shall comply with local codes as well as NFPA 70 “National Electrical Code.”

B. Electrical components shall be listed and labeled by UL, ETL, CSA, or other approved, nationally recognized testing and listing agency that provides third-party certification follow-up services.

C. Installation shall comply with local authorities’ seismic requirements.

PART 2 - PRODUCTS

2.1 COATINGS

A. Coating: Supports, support hardware, and fasteners shall be protected with zinc coating or with treatment of equivalent corrosion resistance using approved alternative treatment, finish, or inherent material characteristic. Products for use outdoors shall be hot-dip galvanized.

2.2 MANUFACTURED SUPPORTING DEVICES

A. Raceway Supports: Clevis hangers, riser clamps, conduit straps, threaded C-clamps with retainers, ceiling trapeze hangers, wall brackets, and spring steel clamps.

B. Fasteners: Types, materials, and construction features as follows:

1. Expansion Anchors: Carbon steel wedge or sleeve type.
2. Toggle Bolts: All steel springhead type.

C. Conduit Sealing Bushings: Factory-fabricated watertight conduit sealing bushing assemblies suitable for sealing around conduit, or tubing passing through concrete floors and walls. Construct seals with steel sleeve, malleable iron body, neoprene sealing grommets or rings, metal pressure rings, pressure clamps, and cap screws.

D. Cable Supports for Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug for nonarmored electrical cables in riser conduits. Provide plugs with number and size of conductor gripping holes as required to suit individual risers. Construct body of malleable-iron casting with hot-dip galvanized finish.

E. U-Channel Systems: 16-guage steel channels, with 9/16-inch-diameter holes, at a minimum of 8 inches on center, in top surface. Provide fittings and accessories that mate and match with U-channel and are of the same manufacture.

2.3 FABRICATED SUPPORTING DEVICES

A. General: Shop- or field-fabricated supports or manufactured supports assembled from U-channel components.

B. Steel Brackets: Fabricated of angles, channels, and other standard structural shapes. Connect with welds and machine bolts to form rigid supports.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install supporting devices to fasten electrical components securely and permanently in accordance with local codes and NEC requirements.

B. Coordinate with the building structural system and with other electrical installation.

C. Raceway Supports: Comply with local codes, the NEC and the following requirements:

1. Conform to manufacturer's recommendations for selection and installation of supports.
2. Strength of each support shall be adequate to carry present and future load multiplied by a safety factor of at least four. Where this determination results in a safety allowance of less than 200 lbs., provide additional strength until there is a minimum of 200 lbs safety allowance in the strength of each support.
3. Install individual and multiple (trapeze) raceway hangers and riser clamps as necessary to support raceways. Provide U-bolts, clamps, attachments, and other hardware necessary for hanger assembly and for securing hanger rods and conduits.
4. Support parallel runs of horizontal raceways together on trapeze-type hangers.
5. Support individual horizontal raceways by separate pipe hangers. Spring steel fasteners may be used in lieu of hangers only for 1-1/2-inch and smaller raceways serving lighting and receptacle branch circuits above suspended ceilings only. For hanger rods with spring steel fasteners, use ¼-inch diameter or larger threaded steel. Use spring fasteners that are specifically designed for supporting single conduits or tubing.
6. Space supports for raceway in accordance with NEC.
7. Support exposed and concealed raceway within 1 foot of an unsupported box and access fittings. In horizontal runs, supports at the box and access fittings may be omitted where box or access fittings are independently supported and raceway terminals are not made with chase nipples of threadless box connectors.
8. In vertical runs, arrange support so the load produced by the weight of the raceway and the enclosed conductors is carried entirely by the conduit supports with no weight load on raceway terminals.

D. Vertical Conductor Supports: Install simultaneously with installation of conductors (i.e., strain reliefs).

E. Miscellaneous Supports: Support miscellaneous electrical components as required to produce the same structural safety factors as specified for raceway supports. Install metal channel racks for mounting cabinets, panelboards, disconnects, control enclosures, pull boxes, junction boxes, transformers, and other devices.

F. In open overhead spaces, cast boxes threaded to raceways need not be supported separately except where used for fixture support; support sheet metal boxes directly from the building structure or by bar hangers. Where bar hangers are used, attach the bar to the raceways on opposite sides of the box and support the raceway with an approved type of fastener not more than 24 inches from the box.

G. Sleeves: Install in concrete slabs and walls and all other fire-rated floors and wall for raceways and cable installations. For sleeves through fire-rated wall or floor construction, apply UL-listed firestopping sealant in gaps between sleeves and enclosed conduits and cables in accordance with "Fire Stopping" requirement of Division 7.

H. Conduit Seals: Install seals for conduit penetrations of slabs on grade and exterior walls below grade and where indicated. Tighten sleeve seal screws until sealing grommets have expanded to form watertight seal.

I. Fastening: Unless otherwise indicated, fasten electrical items and their supporting hardware securely to the building structure, including but not limited to conduits, raceways, cables, cable trays, cabinets, panelboards, transformers, boxes, disconnect switches, and control components in accordance with the following:

1. Fasten by means of wood screws or screw-type nails on wood, toggle bolts on hollow masonry units, concrete inserts or expansion bolts on concrete or masonry, and machine screws, welded threaded studs, or spring-tension clamps on steel. Do not weld conduit, pipe straps, or items other than threaded studs to steel structures. In partitions or light steel construction, use sheet metal screws.
2. Holes cut to depth of more than 1-1/2 inches in reinforced concrete beams or to depth of more than ¾ inch in concrete shall not cut the main reinforcing bars. Fill holes that are not used.
3. Ensure that the load applied to any fastener does not exceed 25 percent of the proof test load. Use vibration- and shock-resistant fasteners for attachments to concrete slabs.

J. TESTS: Test pull-out resistance of one of each type, size, and anchorage material for the following fastener types:

1. Expansion anchors.
2. Toggle bolts.

Provide all jacks, jigs, fixtures, and calibrated indicating scales required for reliable testing. Obtain the structural Engineer's approval before transmitting loads to the structure. Test to 90 percent of rated proof load for fastener. If fastening fails test, revise all similar fastener installations and retest until satisfactory results are achieved.

NOTES:

1. Maximum spacing of supports (feet).
2. Maximum spacing for IMC applies to straight runs only. Otherwise the maximum of EMT applies.
3. Support for cable tray shall be as directed in their respective sections.

END OF SECTION

SECTION 26 05 33

RACEWAYS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this section.

B. Requirements of the following Division 26 Sections apply to this Section:

1. "Electrical Requirements."

1.2 SUMMARY

A. This Section includes raceways for electrical wiring. Types of raceways in this section include the following:

1. Rigid metallic conduit (RMC).
2. Intermediate metal conduit (IMC).
3. Electrical metallic tubing (EMT).
4. Flexible metal conduit (FMC).
5. Liquid-tight flexible conduit (LFMC).
6. Rigid aluminum (RA).
7. Metal clad cable (MC).
8. Rigid non-metallic conduit (PVC).
9. Wireway (WW).
10. Surface metal raceways (SMR).

B. Related Sections: The following section contains requirements that relate to this section:

1. Division 26 Section "Electrical Boxes and Fittings" for conduit connectors, fittings, and couplings.
2. Division 7 Section "Firestopping" for conduit penetrations through rated walls and slabs.
3. Division 28 Section "Fire Alarm".

1.3 SUBMITTALS

A. General: Submit the following in accordance with Conditions of contract and Division 1 Specification Section.

B. Product Data for the following products:

1. Raceways and fittings.
2. Wireways and fittings.
3. Boxes and fittings.
4. Color selection chart for wall plates.

C. Installation Instructions: Manufacturer's written installation instructions for wireway, surface raceway, and nonmetallic raceway products.

1.4 QUALITY ASSURANCE

A. Electrical Component Standard: Components and installation shall comply with NFPA 70 “National Electrical Code.”

B. NEMA Compliance: Comply with applicable requirements of NEMA standards pertaining to raceways.

C. UL Compliance and Labeling: Comply with applicable requirements of UL standards pertaining to electrical raceway systems. Provide raceway products and components listed and labeled by UL.

D. Manufacturers - Firm regularly engaged in manufacture of raceways of types and capacities required and whose products have been in satisfactory use in similar service for not less than 5 years.

PART 2 - PRODUCTS

2.1 METAL CONDUIT AND TUBING

A. Rigid Steel Conduit: ANSI C80.1

1. Shall be full weight steel pipe, hot dip galvanized inside and outside, threaded, minimum 3/4 inch.
2. Shall be painted with two protective coats of asphaltum compound where located underground or below slab.

B. Intermediate Steel Conduit: UL 1242.

1. Shall be intermediate weight steel pipe, hot dip galvanized, threaded, minimum 3/4 inch.
2. Shall be painted with two protective coats of asphaltum compound where located underground or below slab.

C. Electrical Metallic Tubing and Fittings: ANSI C80.3.

1. Shall be thin wall steel pipe, galvanized, thread-less, minimum 3/4 inch. EMT shall not be used for cable rated above 600 volts.

D. Flexible Metal Conduit: UL 1, zinc-coated steel.

1. Shall be continuous single strip, galvanized, minimum 3/4 inch.

E. Liquid-tight Flexible Metal Conduit and Fittings: UL 360.

1. Liquid-tight, flexible steel, conduits shall be zinc coated flexible galvanized steel tubing over which is extruded a liquid- tight jacket of polyvinyl chloride (PVC). Conduit shall be provided with a continuous copper bonding conductor wound spirally between the convolutions.

F. Rigid Aluminum Conduit:

1. Rigid aluminum conduit shall be full weight pipe, threaded, minimum ¾ inch.

2.2 METAL CLAD CABLE, TYPE MC

A. The multi-conductor metal clad cable shall comply with UL 1569 “Metal Clad, Type MC,” UL 83 “Thermoplastic Insulated Wires and Cables” Federal Specification J-C-30B “Wire and Cable,” Local and National Electrical Codes.

B. The metal clad cable shall be THHN insulation, copper conductors in sizes #12 through #8 AWG only for continuous operation at a maximum conductor temperature of 90 degree C dry.

C. These cables shall bear appropriate Underwriters Laboratories labels for metal clad cable and be suitable for use as branch circuits in both concealed, and very limited exposed work, in accordance with applicable sections of the National Electrical Code.

D. An insulated grounding conductor sized in accordance with Table 5.3 Underwriter's Standard UL 1569 shall be cabled with the circuit conductors and shall be identified in compliance with Section 29 of UL 1569. The grounding conductor shall not be smaller than size indicated in NEC Article Table 250.122.

E. A galvanized steel or aluminum armor shall be applied over the inner cable assembly with a positive interlock in compliance with Section 10 of UL 1569. A PVC jacket shall completely cover the steel or aluminum armor where liquid tight flexible metal conduit is required.

2.3 NONMETALLIC CONDUIT AND DUCTS

A. Rigid Nonmetallic Conduit (RNC): NEMA TC 2 and UL 651, Schedule 40 or 80 PVC.

B. PVC Conduit Fittings: NEMA TC 3; match to conduit type and material.

1. Shall be self-extinguishing, UL listed.
2. Located in building interiors and direct burial, shall be heavy wall, Schedule 40.

C. Conduit and Duct Accessories: Types, sizes and materials complying with manufacturer's published product information. Mate and match accessories with raceway.

2.4 CONDUIT BODIES AND FITTINGS

A. General: Types, shapes, and sizes as required to suit individual applications and NEC requirements. Provide matching gasketed covers secured with corrosion-resistant screws.

B. Metallic Conduit and Tubing: Use metallic conduit bodies. Use bodies with threaded hubs for threaded raceways.

1. Metallic conduit fittings shall be corrosion resistant.

C. EMT Conduit Bodies: Use bodies with steel set screw connectors and couplings for interior applications and steel compression gland connectors and couplings for exterior applications.

1. Material shall be steel or malleable iron only.
2. Couplings and connectors shall be "concrete tight" or "raintight", couplings and connectors for conduit sizes 2-inch and smaller shall be of the gland and ring compression type. Connectors shall have insulated throats.
3. Set screw or indent type connectors are not permitted. Compression waterproof connection type fittings only shall be utilized.

D. Nonmetallic Conduit: Use nonmetallic conduit bodies conforming to UL514B.

E. Liquid-Tight Flexible Conduit Fittings: With threaded grounding cone, a steel, nylon or equal plastic compression ring, and a gland for tightening. Either steel or malleable iron only with insulated throats and male thread and locknut or male bushing with or without O-ring seal. Each connector shall provide a low resistance ground connection between the flexible conduit and the outlet box, conduit or other equipment to which it is connected.

F. Bushings: Insulated type, designed to prevent abrasion of wires without impairing the continuity of the conduit grounding system, for rigid steel conduit and IMC – and EMT, larger than ¾" size.

1. Bushings shall be of the metallic insulated type.

G. Expansion Fittings: Each conduit that is buried in or secured to the buildings construction on opposite sides of a building expansion joint and each long run of exposed conduit that may be subject to excessive stresses shall be provided with an expansion fitting. Expansion fittings for rigid steel conduit shall be hot-dipped galvanized malleable iron with factory installed packing and a grounding ring. Expansion fittings for rigid non-metallic conduit shall be of the short type in runs 25' or less, and the long type in runs 26' to 80'. The long type shall be a two piece barrel and piston joint, providing 6" of the total movement range in ¾" through 6" conduit sizes. The short type shall be a one piece, coupling with O-ring, providing 2" of total movement range in ¾" to 2" conduit sizes.

1. Shall comply with UL 467 and UL 514 and shall accommodate, 0.75 inch deflection, expansion, or contraction in any direction, and shall allow 30 degree angular deflections.
2. Shall include internal flexible metal braid sized to guarantee conduit ground continuity and fault currents in accordance with UL 467, and the NEC tables for ground conductors.
3. Shall be watertight, seismically qualified, corrosion- resistant, threaded for and compatible with rigid or intermediate metal conduit.
4. Jacket shall be flexible, corrosion-resistant, watertight, moisture and heat resistant molded rubber material with stainless steel jacket clamps.

H. Seal Off Fittings: Threaded, zinc or cadmium coated, cast or malleable iron type for steel conduits. Fittings used to prevent passage of water vapor shall be of the continuous drain type.

I. For weatherproof and dust-tight installations provide liquid-tight fittings with sealing ring and insulated throat.

J. Rigid steel and IMC conduit fittings:

1. Fittings shall be standard threaded couplings, locknuts, bushings, and elbows. Material shall be steel or malleable iron only.
2. Locknuts shall be of the bonding type with sharp edges for digging into the metal wall of an enclosure.
3. Bushings shall be of the metallic insulating type, and shall consist of an insulating insert molded or locked into the metallic body of the fitting. Bushings made entirely of metal or nonmetallic material are not permitted.
4. Sealing fittings shall be of the threaded cast iron type. Sealing fittings used to prevent passage of water vapor shall be of the continuous drain type. In concealed work, each fitting shall be installed in a flush steel box with blank coverplate having the same finish as that of other electrical plates in the room.

K. Rigid aluminum conduit fittings:

1. Fittings shall be standard threaded couplings, locknuts, bushings, and elbows. Material shall be malleable iron, steel or aluminum alloy. Iron or steel fittings shall be zinc or cadmium plated. Aluminum fittings shall not contain more than 0.4 percent copper.
2. Locknuts and bushings shall be as specified for rigid steel and IMC conduit.
3. Set screw fittings shall not be used with aluminum conduit.

L. Direct burial plastic conduit fittings shall be as recommended by the conduit manufacturer.

M. Surface metal raceway fittings shall be as recommended by the raceway manufacturer

N. Flexible steel conduit (Greenfield) fittings:

1. Material shall be steel or malleable iron only.
2. Shall be multiple point type, threading into the wall of the conduit convolutions, and shall have insulated throat.

2.5 WIREWAYS

A. General: Electrical wireways shall be of types, sizes, and number of channels as indicated. Fittings and accessories including but not limited to couplings, offsets, elbows, expansion joints, adapters, hold-down straps, and end caps shall match and mate with wireway as required for complete system. Where features are not indicated, select to fulfill wiring requirements and comply with applicable provisions of NEC. Wireways shall be steel and of sizes noted and shall have a minimum of No. 16 gauge thickness.

B. Wireway covers shall be hinged type.

2.6 SURFACE METAL RACEWAYS

A. General: Sizes and channels as indicated. Provide fittings that match and mate with raceway. Provide internal barriers for areas with power and communications sections. Shall be steel with baked enamel finish, of sizes noted, and a minimum of No. 20 gauge thickness.

B. Surface Metal Raceway: Construct of two piece galvanized steel with snap-on covers, with 9/32-inch mounting screw knockouts in base approximately 8 inches o.c. Finish with manufacturer's standard prime coating suitable for painting. Provide raceways of types suitable for each application required. Sizes 1-3/4" H x 4-3/4" W.

C. Provide labeling for each outlet with panel and circuit number where multi-outlet raceways are utilized.

D. Accessories:

1. Couplings for joining raceway sections.
2. Wire clips for conductors.
3. Blank end fittings.
4. Circuit breaker housings for single pole breakers.
5. Device brackets for single or two gang devices.
6. Combination receptacle and telephone outlet covers.
7. Outlet boxes with hubs for conduit connectors.

E. Covers for the surface metal raceways shall be snap-on type, unless otherwise noted.

2.7 CONDUIT SUPPORTS:

A. All parts and hardware shall be zinc-coated or have equivalent corrosion protection.

B. Individual conduit hangers shall be designed for the purpose, with pre-assembled closure bolt and nut, and provisions for receiving hanger rod.

C. Multiple conduit (trapeze) hangers shall be of not less than 1-1/2 by 1-1/2 inch, 12 gage steel, cold formed, lipped channels. Hanger rods shall be not less than 3/8-inch diameter steel.

D. Solid masonry and concrete anchors shall be a type approved for the purpose.

2.8 SLEEVES

A. Provide and assume responsibility for locating and maintaining in proper position all sleeves required for the work.

B. For raceways in sleeves, provide seals of oakum packing and lead or O.Z. Type WSK series compound on both sides.

C. For cables through sleeves, provide seals similar to O.Z. Type WSCS compound.

D. Through floors, exterior masonry walls, roof, and underground, sleeves shall be schedule 40 galvanized steel pipe. For area not requiring schedule 40 pipe, sleeves shall be 18 gauge galvanized steel pipe.

2.9 CONCRETE MARKERS

A. Provide over all underground raceway bends and terminations, cylindrical concrete columns markers. The markers shall be 5 in. diameter and 18 in. deep and shall have imbedded marked bronze plate noting the direction of the raceway.

2.10 FIRE SEALANTS

A. Openings through floors and walls in which cables, conduits, or pipe pass shall be sealed by U.L. classified smoke and fire stop fittings, and have an hourly rating equal to the fire rating of the floor or wall. Fittings shall be similar to O-Z Gedney Type "CES" or "CAFS".

B. Penetrations through fire-rated floors in which wiring for floor service outlets are routed shall be sealed by U.L. classified smoke and fire-stop fittings, and shall have an hourly rating equal to the floor rating. Fittings shall be similar to O-Z Gedney Type "PTFS".

PART 3 - EXECUTION

3.1 WIRING METHOD

A. Use the following wiring methods:

USES	TYPE Rigid Metallic Conduit (RMC)	TYPE Interm. Metal Conduit (IMC)	TYPE Elec Metal Tubing (EMT)	TYPE Flex metal Conduit (FMC)	TYPE Liquid Tight Flex Metal Conduit (LFMC)	TYPE Rigid Alum. (RA)	TYPE Metal Clad Cable (MC)	TYPE Rigid Non Metal (PVC)	TYPE Wire-Way (WW)	TYPE Surface Metal Raceways (SMR)
Outdoor underground concrete encased, below building or away from building	X							X		
Outdoor above ground exposed or concealed	X	X								
Outdoor above ground final connection to vibrating equip: xfrms, solenoids, motors, etc.					X					
Indoor 600 volts and above concrete encased.	X									
Indoor exposed 10 feet to floor in “back of house”	X	X								

USES	TYPE Rigid Metallic Conduit (RMC)	TYPE Interm. Metal Conduit (IMC)	TYPE Elec Metal Tubing (EMT)	TYPE Flex metal Conduit (FMC)	TYPE Liquid Tight Flex Metal Conduit (LFMC)	TYPE Rigid Alum. (RA)	TYPE Metal Clad Cable (MC)	TYPE Rigid Non Metal (PVC)	TYPE Wire-Way (WW)	TYPE Surface Metal Raceways (SMR)
spaces such as mechanical, electrical, basements, attics, etc.										
Indoor exposed above 10 feet to floor.			X			X				
Indoor concealed homerun to panelboards, and for branch circuits			X							
Indoor concealed final branch wiring to receptacles and light fixture. Max 50' length from homerun j-box to outlet. MC not allowed for isolated ground circuits, or homeruns to panels, or connections to mechanical equipment. Max conductor is #8 AWG MC Cable.							X			
Indoor final connection to vibrating equipment: xfrms, solenoids, motors, etc. in dry areas				X						
Indoor final connection to vibrating equipment: xfrms, solenoids, motors, etc., in moist, humid, wet, or corrosive areas.					X					

USES	TYPE Rigid Metallic Conduit (RMC)	TYPE Interm. Metal Conduit (IMC)	TYPE Elec Metal Tubing (EMT)	TYPE Flex metal Conduit (FMC)	TYPE Liquid Tight Flex Metal Conduit (LFMC)	TYPE Rigid Alum. (RA)	TYPE Metal Clad Cable (MC)	TYPE Rigid Non Metal (PVC)	TYPE Wire-Way (WW)	TYPE Surface Metal Raceways (SMR)
Within concrete slabs, or connections to cast-in-place floor boxes. LFMC not allowed for homerun. Maximum sizes and locations of conduit subject to approval by structural engineer and Architect	X	X			X					
Hazardous Areas	X									
Terrazzo floor with conduit routed underneath, not within terrazzo.	X									
Fire Alarm initiating circuits and signaling circuits.			X							
Fire alarm system auto dialer telephone circuit	X									

3.2 INSTALLATION

A. General: Install electrical raceways in accordance with manufacturers' written installation instructions, applicable requirements of NEC, and as follows.

B. Conceal conduit and EMT, unless indicated otherwise, within finished wall, ceilings, and floors. Keep raceways at least 12 inches away from parallel runs of flues and steam or hot water pipes. Install raceways level and square and at proper elevations.

C. Elevation of Raceway: Where possible, install horizontal raceway runs above water and steam piping.

D. Complete installation of electrical raceways before starting installation of conductors within raceways.

E. Provide supports for raceways as specified elsewhere in Division 26 and in accordance with NEC and local authorities' seismic requirements.

F. Prevent foreign matter from entering raceways by using temporary closure protection.

G. Protect stub-ups from damage where conduits rise from floor slabs. Arrange so curved portion of bends is not visible above the finished slab. All elbow penetration through the slab shall be PVC coated rigid metallic conduit Ells.

H. Make bends and offsets so the inside diameter is not effectively reduced. Unless otherwise indicated, keep the legs of a bend in the same plane and the straight legs of offsets parallel.

I. Use raceway fittings that are of types compatible with the associated raceway and suitable for the use and location. For intermediate steel conduit, use threaded rigid steel conduit fittings except as otherwise indicated.

J. Run concealed raceways with a minimum of bends in the shortest practical distance considering the type of building construction and obstructions except as otherwise indicated.

K. Install exposed raceways parallel and perpendicular to nearby surfaces or structural members and follow the surface contours as much as practical. All exposed conduit runs shall be approved by the Architect prior to installing.

L. All exposed conduits in public areas shall first be approved to be routed in public areas, then be painted to match surrounding walls. Verify exact color with the Architect.

M. Run exposed, parallel, or banked raceways together. Make bends in parallel or banked runs from the same center line so that the bends are parallel. Factory elbows may be used in banked runs only where they can be installed parallel. This requires that there be a change in the plane of the run such as from wall to ceiling and that the raceways be of the same size. In other cases, provide field bends for parallel raceways. All exposed conduit routing shall be approved by the Architect prior to installing.

N. Join raceways with fittings designed and approved for the purpose and make joints tight. Where joints cannot be made tight, use bonding jumpers to provide electrical continuity of the raceway system. Make raceway terminations tight. Where terminations are subject to vibration, use bonding bushings or wedges to assure electrical continuity. Where subject to vibration or dampness, use insulating bushings to protect conductors. Use expansion fittings at building expansion joints.

O. Tighten set screws of threadless fittings with suitable tool.

P. Terminations: Where raceways are terminated with locknuts and bushings, align the raceway to enter squarely and install the locknuts with concave side against the box. Where terminations cannot be made secure with one locknut, use two locknuts, one inside and one outside of the box. All conduit connections to junction boxes shall have insulated bushings.

Q. Where terminating in threaded hubs, screw the raceway or fitting tight into the hub so the end bears against the wire protection shoulder. Where chase nipples are used, align the raceway so the coupling is square to the box, and tighten the chase nipple so no threads are exposed.

R. Install pull wires in empty raceways. Use No. 14 AWG zinc-coated steel or monofilament plastic line having not less than 200-lb tensile strength. Leave no less than 12 inches of slack at each end of the pull wire.

S. Telephone and Signal System Raceways: In addition to the above requirements, raceways 2-inches and smaller, shall have a maximum length of 150 feet with a maximum of two 90° bends or equivalent. Install pull or junction boxes where necessary to comply with these requirements.

T. Install raceway sealing fittings in accordance with the manufacturer's written instructions. Locate fittings at suitable, approved, accessible locations and fill them with UL-listed sealing compound. For concealed raceways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces. Install

raceway sealing fittings at the following points and elsewhere as indicated:

1. Where conduits pass from warm locations to cold locations, such as the boundaries of refrigerated spaces, air-conditioned spaces and walk-in coolers.
2. Where required by the NEC.

U. Stub-up Connections: Extend conduits through concrete floor for connection to freestanding equipment with an adjustable top or coupling threaded inside for plugs and set flush with the finished floor. Extend conductors to equipment with rigid steel conduit; flexible metal conduit may be used 6 inches above the floor. Where equipment connections are not made under this contract, install screwdriver-operated threaded flush plugs flush with floor.

V. Flexible connection: Use length (maximum of 6 ft.) of flexible conduit for recessed and semi-recessed lighting fixtures, for equipment subject to vibration, noise transmission, or movement. Install separate equipment grounding conductor across flexible connections.

W. PVC externally coated rigid steel conduit: Use only fittings approved for use with that material. Patch all nicks and scrapes in PVC coating after installing conduit.

X. All underground conduits shall be installed a minimum of 48 inches below finish grade for primary medium voltage feeders and 30 inches for 480 volt feeders. All other conduits shall be installed in accordance with the NEC and coordinated depth with other trades.

Y. Grounding: Install a separate green equipment grounding conductor in all raceways from the panelboard/junction box supplying the raceway to the receptacle or equipment ground terminals. Conduits will not be permitted as a ground conductor.

3.3 RACEWAYS

A. Install conduit and tubing products as indicated, in accordance with manufacturer's written instructions, applicable requirements of NEC and National Electrical Contractors Association's "Standard of Installation", and in accordance with the recognized industry practices to ensure that products serve intended function.

B. Run raceways concealed, except as noted. Exposed raceways shall be run parallel with or at right angles to walls.

C. Raceways supports shall be provided by means of ceiling trapeze, strap hangers, or wall brackets, structural steel angles or channels. Provide U-bolts at each floor level or riser raceways and connected to acceptable supports. Secure raceways to supports with pipe straps or U-bolts. Spacing of support shall be as per NEC and per manufacturer's recommendations.

D. Mount supports to structure with toggle bolts on hollow masonry, expansion shields or inserts on concrete and brick, machine screws on metal, wood screws on wood. Nails, rawl plugs or wood plugs are not permitted.

E. Provide a 12 in. minimum separation between raceways and steam and hot water pipes. Provide approved thermal insulation for electric lines where this separation cannot be maintained.

F. Keep raceways clear of motor foundations and from underside of boilers. Also, install raceway so that they will not obstruct headroom, doorways, or walkways.

G. For outlets located in hung ceilings, run raceways in hung ceilings and support from structure above. For lay-in ceilings, install conduits high enough to permit removal of ceiling tiles.

H. In walls, run raceways vertically only.

I. Mechanically join all metal raceways, enclosures and junction boxes to form a continuous electrical conductor. Connect all electrical boxes, fittings and cabinets so as to provide effective electrical continuity and firm mechanical assembly. Maintain grounding continuity of interrupted metallic raceways with ground conductor.

J. Install complete conduit runs before pulling in wire or cable. Install raceways so that required conductors may be drawn in without injury or excessive strain to raceway or cable. Where raceway size is not indicated, follow applicable code.

K. Do not cross pipe shafts or ventilation duct openings with raceway. Route raceway to avoid present or future openings in floor, wall or ceiling construction, when so indicated on the drawings.

L. Keep end of raceways plugged or capped during construction.

M. For empty raceways over 10 ft. long, provide fish or pull wire. Pull wire shall consist of steel core nylon rope and terminal ball.

N. In cold rooms and food refrigeration, raceway installations shall be weatherproof and sealing fittings and compounds shall be employed at entries.

O. Concrete encased conduits run exposed inside the building shall have Class I concrete encasement. They shall be marked (stenciled) 10 ft. on centers, including in hung ceiling, with the notations, "Danger, High Voltage".

P. Damaged or deformed raceway is not permitted and shall be removed.

Q. Branch circuit conduits shall not be supported by the suspended ceiling or its supporting members, lighting fixtures, mechanical piping, or air-conditioning ducts.

R. Conduits located underground beyond the building shall be concrete encased and shall be installed as follows:

1. With a minimum of 30 in. top cover, above the conduits, and sloped away from the building.
2. Placed over well-tamped trench bottom and on concrete blocks 5 ft. on center. Conduits shall be anchored to prevent their movement. Conduit joints shall be staggered a minimum of 6 in. apart. All joints shall be watertight.
3. With a minimum separation between the electric and low voltage conduits of 12 in., if fiber only, or 24 in. if any copper is used present or future, of well tamped earth or concrete.
4. With entry into manholes through end bells.

S. For conduits and direct burial cable entering the building, and for the manholes preceding the conduits entry to the building, perform the following:

1. Plug all empty raceways.
2. Enter through floor or wall entrance fittings. The entrance fittings shall have a gland assembly which shall be capable of providing a seal around the conduit or cable to withstand 50 foot head of water without leakage. For greater than 50 foot head, the sealing assembly shall be similar to O-Z Gedney Type "FSK" or "FSCS".

T. Work with extreme care near existing ducts, conduits, cables and other utilities to avoid damaging them.

U. Galvanized Rigid steel conduit:

1. Paint male threads of field threaded conduit with graphite base pipe compound.

   a. Where located in slabs, the maximum outside diameter of the conduit shall be less than 1/3 the slab thickness. When locating in the slab, place conduits in a manner so as to not interfere with the placement of reinforcing bars or cause damage to structural members or structural support.
   b. Where located in concrete fill, the conduit shall have a minimum of 1 in. cover.
   c. Where located under the building, conduit shall be concrete encased.

V. Intermediate metal conduit:

1. Paint male threads of field threaded conduit with graphite base pipe compounds.
2. Where located in slabs, the maximum outside diameter of the conduit shall be less than 1/3 the slab thickness. When locating conduit in the slab, place conduits in a manner so as not to interfere with the placement of reinforcing rods or cause damage to structural members of structural support.
3. Where located in concrete fill, the conduit shall have a minimum of 1 in. cover.
4. In terrazzo floor finish, intermediate metal conduit is not permitted.
5. Where located under the building, conduit shall be concrete encased.
6. IMC shall not be used in hazardous areas or for direct burial.

W. Electric metallic tubing (EMT):

1. EMT is permitted to be used with the following limitations: for branch circuits only, and in dry locations (hung ceilings, hollow block walls and furred spaces).

X. Flexible steel conduit:

1. Flexible steel conduit "Greenfield", shall be used for the following applications: for short connections where rigid conduit or tubing is impracticable, from outlet box to recessed lighting fixture with minimum length of 4 ft. and a maximum length of 6 ft.
2. Connect the ground conductor to the enclosure or raceway at each end.

Y. Aluminum conduit:

1. Shall not be used in or on concrete or masonry, and shall not be used in wet locations.
2. Where routed through concrete and masonry walls and floors, conduit shall be painted with asphaltum.
3. Maintain clearance between aluminum conduits and surfaces for the following conditions: in moist locations, in interior spaces below exterior finished grade, and boiler rooms.
4. When connecting to steel surfaces, maintain galvanized-to-aluminum contact, or paint with asphalt base paint.

Z. Polyvinyl chloride conduit (PVC):

1. Cut ends square, ream smooth, wipe clean, apply approved solvent cement and quarter turn as drawing up tight.
2. Convert to steel conduit using adaptors when entering the building from underground locations.
3. Maintain a 3 ft. minimum clearance of PVC conduits from hot water and steam lines.

AA. Surface metal raceways shall be used only where shown on the drawings or as directed by the Architect.

BB. Provide expansion-deflection fittings at expansion joints and on length of runs in accordance with manufacturer's recommendations. Expansion-deflection fittings shall be of size as required complete with bonding jumper.

CC. For Hazardous Locations:

1. UL approved sealing fittings shall be installed, to prevent passage of explosive vapors as required by the NEC.

DD. For Wet, Damp, or Moist Locations:

1. Provide sealing fittings, to prevent passage of water vapor, where conduits pass from warm to cold locations, much as refrigerated spaces, air conditioned spaces, or similar spaces.

3.4 SLEEVES

A. Sleeves shall be provided in accordance with the following guidelines:

1. Set required sleeves and inserts in place during progress of construction to avoid cutting of completed work.
2. Provide sleeves for raceway passing through floors and foundations. Determine exact location of sleeves in field to avoid interference with structural members or equipment of all trades.
3. Install sleeves rigidly so that proper position and alignment will be maintained during construction and pouring of concrete.

3.5 FIRE STOPS

A. Where wiring, conduits, wireways, and other electrical raceways pass through fire partitions, fire walls, or floors, install an approved fire-stop that provides an effective barrier against the spread of fire, smoke and gases. Fire-stop material shall be packed tight and shall completely fill clearances between raceways and openings.

B. Floor, exterior wall, and roof seals shall also be made watertight.

3.6 ADJUSTING AND CLEANING

A. Upon completion of installation of raceways, inspect interiors of raceways; clear all blockages and remove burrs, dirt, and construction debris.

3.7 FIELD QUALITY CONTROL

A. Contractor shall perform continuity tests by testing the resistance of all feeder conduits from the service to the point of their final distribution using 1 conductor return. The maximum resistance shall be 25 ohms.

END OF SECTION

SECTION 26 05 34

ELECTRICAL BOXES AND FITTINGS

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to work of this section.

B. This section is a Division 26 Basic Electrical Material and Methods section, and is a part of each Division 26 section making reference to electrical wiring boxes and fittings specified herein.

1.2 DESCRIPTION OF WORK

A. Drawings are diagrammatic. All bends, boxes, fittings, couplings are not necessarily shown. Supply as necessary to comply with the National Electric Code.

B. Types of electrical boxes and fittings specified in this section include the following:

1. Outlet boxes.
2. Junction boxes.
3. Pull boxes.
4. Bushings.
5. Locknuts.
6. Knockout closures.

1.3 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in manufacture of electrical boxes and fittings, of types, sizes, and capacities required, whose products have been in satisfactory use in similar service for not less than five years.

B. Installer's Qualifications: Firms with at least five years of successful installation experience on projects utilizing electrical boxes and fittings similar to those required for this project.

C. Local Code and NEC Compliance: Comply with local code and NEC as applicable to construction and installation of electrical wiring boxes and fittings.

D. UL Compliance: Comply with applicable requirements of UL 50, UL 514-Series, and UL 886 pertaining to electrical boxes and fittings. Provide electrical boxes and fittings which are UL-listed and labeled.

E. NEMA Compliance: Comply with applicable requirements of NEMA Stds/Pub No.'s OS1, OS2 and PUB 250 pertaining to outlet and device boxes, covers and box supports.

F. Federal Specification Compliance: Comply with applicable requirements of FS W-C 586, "Electrical Cast Metal Conduit Outlet Boxes, Bodies, and Entrance Caps."

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's data on electrical boxes and fittings.

B. Shop Drawings: Submit layout drawings of electrical floor, junction and pull boxes showing accurately scaled box layouts and their spatial relationship to associated equipment.

PART 2 - PRODUCTS

2.1 OUTLET BOXES

A. Outlet boxes for concealed work shall be galvanized steel, 4 in. square or octagon (except as otherwise required by construction, devices or wiring) and as follows:

1. Above ceiling: 1-1/2 in. deep.
2. In ceiling or slab: 3 in. deep.
3. In wall for fixtures: 2-3/4 in. deep.
4. In wall for receptacles and switches: 2-1/2 in. deep.
5. With raised covers and fixtures studs where required.
6. Through-the-wall type are not permitted.

B. Outlet boxes for exposed work shall be galvanized cast iron or aluminum with threaded hubs. Except as otherwise required by construction, devices or wiring the outlet boxes shall be in 4 in. round x 2 in. deep for mounting on ceilings and 4 in. square x 2 in. deep for mounting on walls.

C. Outlet boxes without fixture or device, shall have blank cover.

D. Extension rings shall be provided as required to suit various conditions.

E. Grounding screw and cable wiring connector shall be provided as required by wiring method.

F. Construct outlet boxes with mounting holes, and with cable and conduit-size knockout openings in bottom and sides.

G. Provide boxes with threaded screw holes, with corrosion-resistant cover and grounding screws for fastening surface and device type box covers, and for equipment type grounding.

H. Provide outlet box accessories as required for each installation, including box supports, mounting ears and brackets, wallboard hangers, box extension rings, fixture studs, cable clamps and metal straps for supporting outlet boxes, which are compatible with outlet boxes being used to fulfill installation requirements for individual wiring situations. Choice of accessories is Installer's code-compliance option.

I. Outlet boxes located outdoors and damp locations shall be weatherproof corrosion-resistant cast-metal raintight outlet wiring boxes, of types, shapes and sizes, including depth of boxes, with threaded conduit holes for fastening electrical conduit, cast-metal face plates with spring-hinged watertight caps suitably configured for each application, including face plate gaskets and corrosion-resistant plugs and fasteners.

2.2 JUNCTION AND PULL BOXES

A. Junction and pull boxes shall be made of galvanized code-gauge sheet steel junction and pull boxes, with screw-on covers; of types, shapes and sizes, to suit each respective location and installation; with welded seams and equipped with stainless steel nuts, bolts, screws, and washers. Pull boxes installed in finished spaces must be flush mounted cabinets provided with trim, hinged door and flush latch and lock to match flush mounted panelboard trim.

B. Provide junction and/or pull boxes as noted or as required. All junction and pull boxes shall be accessible.

C. Junction and pull boxes located outdoors and in damp locations shall be galvanized cast iron with threaded hubs and gaskets.

D. Junction or pull box to be mounted flush with grade shall be polymer composite raintight with screw cover lids. Box dimensions shall be 30"W x 48"L x 36"D. Covers shall be polymer composite suitable for pedestrian traffic secured to box with stainless steel screws. Box to be furnished with continuous neoprene gasket to seal cover. Conduit entry shall be on side of box with bell ends.

E. Provide barriers in junction boxes or pull boxes between:

1. 277/480 volt wiring energized from separate services.
2. 120/208 volt and 277/480 volt wiring.
3. Emergency and normal wiring.

2.3 FLOOR BOXES

A. Floor boxes shall be galvanized cast iron watertight, corrosion-resistant with brass covers and flanges. They shall be suitable for the conduits and the devices noted. Floor Boxes shall be similar to Hubbell Dualevel Series.

B. Flush poke-thru fire rated fittings shall be utilized where indicated on the drawings. Poke-thru fitting shall be adaptable for flush mounted duplex receptacle, combination receptacle/telephone jack or conduit adapter (flex) for power and communications. Fitting shall be similar to that as manufactured by Raceway Components Inc.

2.4 BUSHINGS, KNOCKOUT CLOSURES AND LOCKNUTS

A. Provide corrosion-resistant box knockout closures, conduit locknuts and malleable iron conduit bushings, offset connectors, of types and sizes, to suit respective installation requirements and applications.

PART 3 - EXECUTION

3.1 INSTALLATION OF ELECTRICAL BOXES AND FITTINGS

A. General: Install electrical boxes and fittings in accordance with manufacturer's written instructions, applicable requirements of local codes, NEC and NECA's "Standard of Installation," and in accordance with recognized industry practices to fulfill project requirements.

B. Coordinate installation of electrical boxes and fittings with wire/cable, wiring devices, and raceway installation work.

C. Provide raintight "in use" outlets for interior and exterior locations exposed to weather or moisture.

D. Install electrical boxes in those locations which ensure ready accessibility to enclosed electrical wiring.

E. Boxes separated by less than 24 inches shall be provided with firestop putty pads on the backside of all boxes exceeding 16 sq. inches in area. Provide Firestop putty pads on the back side for all outlet boxes within 24 inches of each other, in opposite sides, and at same elevation, in the same wall. Provide Firestop putty pads on the back side for all boxes in a wall or ceiling where the aggregate surface area of the outlet boxes exceeds 100 sq. inches per 100 sf of surface of wall or ceiling area. Firestop putty pads shall be Hilti CP617XI (9" x 9") for each box 16 sq inches or less.

F. Position recessed outlet boxes accurately to allow for surface finish thickness.

G. Avoid using round boxes where conduit must enter box through side of box, which would result in difficult and insecure connections when fastened with locknut or bushing on rounded surfaces.

H. Fasten electrical boxes firmly and rigidly to substrates, or structural surfaces to which attached, or solidly embedded electrical boxes in concrete or masonry.

I. Provide electrical connections for installed boxes.

J. Exterior junction or pull boxes shall be mounted flush with grade, unless noted otherwise or indicated to be above ground on the drawings. Boxes shall be surrounded on all sides with 6 inches minimum of concrete. Top of concrete shall flush with grade. Seal all conduit entries into box with duct seal to prevent entrance of moisture, after

conductors are installed.

K. Tap and splices, where permitted by these specifications within exterior junction boxes, shall be performed with an encapsulating watertight splice or tap kit which insulates and moisture seals the connection. Kit shall consist of the appropriate size and type mold, encapsulating resin and end sealing tape.

L. Subsequent to installation of boxes, protect boxes from construction debris and damage.

M. Set boxes square and true with the building finish. Boxes shall be secured to the building structure by adjustable strap irons.

N. Verify outlet locations in finished spaces with Architectural Drawings of interior details and finishes. Take caution in locating outlet to allow for overhead pipes, ducts, and variations in arrangement, thickness in finish, window trim and other Architectural Construction Details.

O. Correct any inaccuracy in locating outlets without additional expense to the Owner. Refer to Architect any condition that would place an outlet box in an unsuitable location, such as a molding, break glass in wall finish, or behind radiator.

P. Mount outlet boxes for similar equipment at uniform height within same or similar areas. Where mounting height or location of outlets is not shown or specified, mount outlet as best suited for equipment connected thereto, or as directed.

Q. Close all unused openings in outlet boxes with knockout closers manufactured for this purpose. Provide blank plates on outlet boxes in which no device is installed or device installed does not provide a suitable cover.

R. Provide barriers between switches connected to different phases for voltages exceeding 150 volts to ground.

S. Outlet boxes for fixtures recessed in hung ceilings, shall be accessible through the opening created by the removal of the fixture.

T. Securely fasten exposed outlet boxes by attaching to permanent inserts or lead anchors with machine screws. Adequately support all boxes during construction to prevent movement.

U. Boxes for concealed work shall be pressed steel galvanized and shall conform to UL's "Standard for Outlet Boxes and Fittings." Outlet boxes shall be provided with a galvanized steel cover or extension ring depth as required.

V. All ceiling fixture outlet boxes, except as noted, shall be 4" octagonal and 1-5/8" deep and with 3/8" fixture stud. Where cast in slab, boxes shall be open back concrete type.

W. Wall bracket outlets shall be 4" square and 1-5/8" deep with cover having 2-7/8" round openings and except for lampholders shall be furnished with fixture stud.

X. Junction outlets shall be the same as bracket outlets but without stud, furnished with covers to suit each condition and as directed. Where number of conductors exceed capacity of standard box, provide special size box.

Y. All outlet boxes for concealed convenience receptacles or local switches shall be 4" square and 1-5/8" deep with regular deep switch extension cover, except where installed on columns they shall be of sufficient depth so that conduits may be installed into these boxes in back of fireproofing. Outlet boxes for gang receptacles and switches shall suit space conditions.

Z. Boxes for use with surface mounted raceways shall be of the same construction and manufacture as the raceway.

AA. Boxes shall be of the cast type for switches and receptacles when installed on the exterior of the project. Such boxes shall be aluminum or malleable iron of the threaded hub type, with covers without projecting edges or corners

and with openings suitable for the devices to be contained therein. Outlet boxes and covers shall be galvanized or anodized and shall be gasketed.

BB. Except where special outlets are required, wall outlets for signaling systems shall be 4" square with single gang raised cover and bushed plate.

CC. Panel, junction and pull boxes:

1. Panel, junction and pull boxes shall be located clear of other trades equipment, accessible, supported from the building structure, and independent of the conduits.
2. Conceal junction and pull boxes in finished spaces.
3. Coordinate size of motor terminal boxes with motor branch circuit conduit and wiring.

3.2 GROUNDING

A. Upon completion of installation work, properly ground electrical boxes and demonstrate compliance with requirements.

END OF SECTION

SECTION 26 05 43

UNDERGROUND SERVICE AND MANHOLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and General Provisions of Contract.

B. Materials and Methods, Sections of Division 26.

C. Excavating, backfilling and Compacting and Division 3, concrete.

D. All excavation is unclassified.

E. Definitions:

1. Engineer: Soils Engineer employed by Owner and empowered to undertake necessary inspections and approvals.
2. Unclassified excavation: Excavate and grade all materials that can be removed without drilling or blasting.

1.2 SUMMARY

A. Furnish all labor, materials, tools, equipment, and services for all underground service and manholes as indicated, in accordance with provisions of Contract Documents.

B. Completely coordinate with work of all other trades.

C. Although such work is not specifically shown or specified, furnish and install all supplementary or miscellaneous items, appurtenances and devices incidental to or necessary for a sound, secure and complete instaltion.

1.3 SUBMITTALS

A. Product data for the following: Electrical Manholes, Duct Spacers.

B. Test reports as required for compaction and concrete work in Division 2 and 3.

1.4 QUALITY ASSURANCE

A. Compaction density test: ASTM D1557.

B. Owner will hire an independent soils laboratory to conduct in place moisture-density tests to insure that all work complies with this specification.

1. Notify Construction Manager or Owner’s representative at least 2 weeks prior to anticipated date of testing.
2. Contractor will pay additional cost if work is delayed due to his failure to notify Owner’s agent as specified above.

C. Comply with all aspects of “Safety Rules & Regulations for Excavation: as promulgated by the state in which excavation will occur.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Store conduit to avoid warping or deterioration.

B. Store plastic conduit on flat surface protected from direct rays of sun.

PART 2 - PRODUCTS

2.1 DUCT SYSTEM

A. Duct System: Multiple and single, conduits completely encased in concrete.

1. Separators: Plastic or other non-metallic, non-decaying material.
2. Concrete: 3500 PSI. Conform to Division 3 requirements.

B. Pull Wire: No. 9 galvanized iron, or heavy nylon cord, free of kinks and splices.

2.2 MANHOLES

A. Electric Manholes: Types as indicated:

1. Concrete: 4500 PSI. Conform to Division 3 requirements.
2. Cover and frame: 36" diameter, gray cast iron with machine finished seat for perfect joint between cover and frame.
3. Provide floor drain with grate.
4. Provide cable racks, ladder rungs, 2 ground rods, cable pulling iron.
5. Provide manholes with 3500 psi, single pour concrete with reinforcement. Manholes shall have a minimum size of that noted on the Drawings. Increase the depth of the manholes to accommodate the raceway entry plus 2 ft. Provide sump pit in every manhole.
6. Locate raceway entries at right angles to and near end of the walls of the manhole. Seal openings watertight and paint exterior with 2 coats of asphaltic compound. Clear interior prior to energizing cables.
7. Frames and covers shall be heavy duty, cast iron, approximately 75 lbs., with machined bearing surfaces. Covers shall be solid, with indented top, and with inscription of identification as approved by the Engineer.
8. Windows for duct bank terminations shall be provided and shall be filled with concrete after duct placement.
9. Manhole shall have pulling eye irons located on the walls opposite the raceway entries. Pulling eye irons shall be imbedded in the concrete and fastened to the reinforcing rods.
10. All hardware provided in the manhole shall be hot dipped galvanized.
11. Double manholes shall include a 3 in. drain pipe at the floor between compartments.

B. Cable Racks: Galvanized, mounted on wall.

1. Equipment with minimum of 8 adjustable hooks; minimum 2 spare hooks on each rack.
2. Insulators: Best quality, high glazed porcelain; provide for each hook.
3. Space racks so each end of splices are supported horizontally.
4. Manhole shall be provided with cable racks. The rack supports shall consist of channels, approximately 2 ft. on center, similar to Globe Co. NO. G-3812.

C. Ladder Rungs: Galvanized, 12" x 12" x ¾" diameter.

1. Set with 7" clearance from rung to wall.
2. Ladder rungs shall be imbedded in the concrete and fastened to the reinforcing rods. The ladder rungs shall be located directly under the manhole cover, and they should clear all raceway entries.

D. Ground Rods: ¾" x 10' long, copper weld.

2.3 HANDHOLES

A. Provide heavy weight traffic handholes with 3500 psi, single pour concrete. Handholes shall have a minimum size of that noted on the Drawings. Handholes shall be provided complete with lifting ring or lifting eye, ribbed non-skid top surface and 4" high letters on cover spelling "ELEC" for power and "TELE" for size.

B. Handhole cover shall consist of a bolted 3/8 in. checkered steel plate with neoprene gasket.

C. Seal openings watertight and paint exterior with two coats of asphaltic compound.

2.4 WARNING TAPE

A. Provide plastic ribbon designed for direct burial in earth; yellow background with black warning letters.

PART 3 - EXECUTION

3.1 INSTALLATION OF MANHOLES

A. Determine exact location of each manhole after careful consideration has been given to location of other utilities, grading, and paving.

1. Do not begin construction until location of each manhole has been approved by Architect/Engineer.

B. Construct manholes of type indicated in accord with applicable details.

1. Mix, place and cure concrete or set precast unit on non-expansive soil bed in accord with Division 3 requirements.

C. Set frames and cover:

1. Paint exterior with 2 coats asphaltic paint after inspection and approval by Architect/Engineer, and before setting.
2. In paved areas, set top of manhole covers flush with finished surface of paving.
3. In unpaved areas, set top of manhole covers approximately ½" above finished grade.
4. Where final grades are higher than top of manhole, install sufficient number of courses of grade rings between top of manhole and manhole frame to elevate manhole cover to final grade level.

D. The manhole chimney shall consist of a sufficient number of brick and mortar courses between top of manhole and manhole frame to reach the required level. The manhole frame shall be grouted to the chimney.

E. Frames and covers in roadways and paved areas shall be traffic type. In unpaved areas, frames and covers may be nontraffic type.

F. Install cable racks, ladder rungs and cable pulling iron.

G. Drive 2 ground rods into earth not less than 9' before manhole floor is placed.

1. Extend ground rods approximately 4" above manhole floor.
2. Drive a ground rod into the earth, before the floor is poured, at a convenient point close to the manhole wall. Ground rods shall protrude approximately four inches above the manhole floor.

3. Install ground wires around the inside perimeter of the manhole and anchor them to the walls. Connect the wires to the ground rods by the exothermic welding process to form solid metal joints, and bond the ground wires to the exposed non-current carrying metal parts of racks, etc., in the manholes. Also bond the wires to duct bank bare equipment grounding conductors.

3.2 DUCT BANK

A. Form all duct banks in square or rectangular fashion as shown, and place concrete so that voids around ducts are filled.

B. Provide minimum concrete thickness between duct of 2 inches.

C. Adjust final slopes on-site to coordinate with utilities and structure.

D. Install drain assembly with saddle cutouts for each conduit. Tape drain assembly to each conduit to prevent entrance of concrete. Band drain assembly with ½ inch stainless steel straps to conduit assembly to prevent mechanical displacement. Connect to (piping drain) washed gravel sump 36 inch square by 36 inches deep.

E. Install on undisturbed soil where possible. Use pit run gravel and sand, placed in 8 inch lifts and compacted for backfill.

F. After installation, clean and swab ducts.

G. Install galvanized steel pullwires in spare ducts. Cap empty ducts with screw covers.

H. Label conduit at stub-up and manhole penetrations in accordance with Section 26 05 53.

3.3 DUCT LINE

A. Duct lines shall be in accordance with the NEC, as shown on the drawings, and as herein specified.

B. Ducts shall be sloped to drain towards manholes and handholds, and away from building and equipment entrances. Pitch shall be not less than four inches in 100 feet. Curved sections in duct lines shall consist of long sweep bends with a minimum radius of 50 feet in the horizontal and vertical directions. The use of manufactured bends is limited to building entrances and stub-ups to equipment.

C. Underground conduit stub-ups to equipment inside of buildings shall be galvanized rigid steel, and shall extend a minimum of 10 feet clear of foundations. Stub-ups to equipment, mounted on outdoor concrete slabs, shall be galvanized rigid steel, and shall extend a minimum of five feet away from edge of slab. Install insulated grounding bushings on the terminations. Steel conduits shall be coupled to the ducts with suitable adapters, and the whole encased with three inches of concrete.

D. Upon completion of the duct bank installation, a standard flexible mandrel shall be pulled through each duct to loosen particles of earth, sand, or foreign material left in the line. The mandrel shall be not less than 12 inches long, and shall have a diameter 1/2-inch less than the inside diameter of the duct. A brush with stiff bristles shall then be pulled through each duct to remove the loosened particles. The diameter of the brush shall be the same as, or slightly larger than, the diameter of the duct.

E. Seal the ducts and conduits at building entrances, and at outdoor terminations for equipment, with a suitable nonhardening compound to prevent the entrance of moisture and gases.

F. Install concrete encased ducts for both high and low voltage systems, unless otherwise shown on the drawings.

G. Duct lines shall consist of single or multiple duct assemblies encased in concrete installed with top of duct bank not less than 30 inches below established grade. Ducts shall be uniform in size and material throughout the installation, unless otherwise shown or specified.

H. Rigid, unplasticized, polyvinyl chloride spacers shall securely support and maintain uniform spacing of the duct assembly a minimum of three inches above bottom of trench during the concrete pour. Spacer spacing shall not exceed five feet.

I. Provide plastic spaces to maintain the following clearances between individual ducts:

1. For like services: Not less than three inches.
2. For power and signal services: Not less than 24 inches.

J. Couple the ducts with proper couplings. Couplings shall be staggered in rows and layers to insure maximum strength and rigidity of the duct bank.

K. The concrete envelope encasing the ducts shall extend not less than three inches beyond the outside walls of the outer ducts and conduits.

L. Within five feet of building and manhole and handhold wall penetrations, install reinforcing steel bars within the top and bottom of each concrete envelope to provide protection against vertical shearing. Where shown on the drawings, incorporate steel reinforcing in the duct envelopes.

M. Ducts shall be kept clean of earth, sand, or gravel during construction, and sealed with tapered plugs upon completion of each portion of the work.

N. Where new ducts, conduits, and concrete envelopes are to be joined to existing manholes, handholes, ducts, conduits and concrete envelopes, make the joints with the proper fittings and fabricate the concrete envelopes to insure smooth durable transitions.

END OF SECTION

SECTION 26 05 48A

NOISE AND VIBRATION CONTROL FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions, apply to this section.

1.2 WORK INCLUDED

A. Vibration Isolation

B. Sealing Around Penetrations Through Walls and Slab

C. Sealant

D. Installation of flexible conduit between non-isolated construction and isolated construction, including mechanical equipment, fans, pumps, and bridging between isolated room-within-a-room and non-isolated adjacent construction.

1.3 RELATED WORK SPECIFIED ELSEWHERE

A. Consult all other Sections to determine the extent of work specified elsewhere but related to this Section. This work shall be properly coordinated to produce an installation satisfactory to the Owner.

B. Installation of Transformers

C. Performance Lighting System

D. Electric Service Distribution

E. Concrete Housekeeping Pads

F. General Lighting Systems

1.4 DEFINITIONS

A. The term “or as approved” means the contractor may propose an alternate product, but the consultant shall be sole judge of acceptability of alternate products. The term “Contractor” as used in this Section refers to that contractor directly responsible for the supply and installation of the Electrical Systems, including noise and vibration control.

1.5 CONTRACTOR'S RESPONSIBILITY

A. The Electrical Contractor shall be directly responsible for the supply and installation of noise and vibration control equipment and work for the Electrical Systems.

B. The Contractor shall be responsible for providing a complete and suitable installation of isolation equipment to meet the intent of this specification. Any additional equipment needed to meet the intent of this specification, even if not specifically mentioned herein or on the drawings, shall be supplied by the Contractor without claim for additional payment.

C. The Contractor shall provide seismic restraints for all vibration isolation systems where required by code. The Contractor shall submit drawings and specifications, certifying that the installation will meet all local seismic restraint requirements. The Contractor shall also certify that none of the required seismic restraints will reduce the isolation efficiency of any vibration isolation systems.

D. Performance or waiving of inspection, testing or surveillance for any portion of the Work shall not relieve the Contractor of the responsibility to conform strictly with the Contract Documents. The Contractor shall not construe performance or waiving of inspection, testing or surveillance by the Owner or Architects to relieve the Contractor from total responsibility to perform in strict accordance with the Contract Documents.

1.6 MANUFACTURER'S RESPONSIBILITY

A. Manufacturer of vibration isolation equipment shall have the following responsibilities:

1. Determine vibration isolation for all equipment and systems in accordance with all codes and authorities having jurisdiction on this project.
2. Provide equipment isolation systems as scheduled or specified.
3. Guarantee specified isolation system deflection.
4. Provide installation instructions, drawings and field supervision to assure proper installation and performance.
5. The vibration isolation systems shall be guaranteed to have deflection indicated on the schedule on the drawings. Mounting sizes shall be determined by the mounting manufacturer, and the sizes shall be installed in accordance with the manufacturer's instructions.
6. The vibration isolator vendor shall ensure that all equipment to be isolated has sufficient support structure to distribute equipment loads onto isolators. Where additional support structure is required, this shall be provided by vibration isolator vendor.

1.7 APPROVED MANUFACTURERS

A. All noise and vibration control apparatus shall be furnished by a single manufacturer who has supplied isolation equipment for at least five years. The vendor shall design and provide all hangers, isolators, bases, pads, sleeves and other devices specified, required, or detailed for the vibration isolation of all electrical equipment and conduit. The vendor for vibration control equipment shall be one of the following, or as approved:

1. Mason Industries Inc.
2. Amber-Booth
3. Kinetics Noise Control

1.8 BID PROPOSALS

A. The Contractor shall submit at the time of bidding the names and qualifications of the noise and vibration control supplier(s). If a supplier is not one of the pre-approved vendors, then the submittal shall be accompanied by a complete catalog of that supplier's products and samples of each proposed vibration isolator with reference to the specification part number.

1.9 SHOP DRAWINGS

A. Fully coordinated shop drawings for all vibration and noise control equipment and systems shall be submitted by the Contractor for review by the Owner's Consultants. These submittals shall state the performance of the noise and vibration control products to be provided, such as, but not limited to, the following: vibration isolator model or type, size and static deflection; isolator location shown on an outline of the isolated equipment; seismic restraints; installation details; locations of isolated conduit hangers on conduit layout plans; materials and details for penetrations, including penetrations by groups of conduits, and locations of acoustically sealed pull boxes.

B. Seismic restraints, including attachment calculations by the Seismic Restraint Manufacturer's licensed Engineer substantiating the seismic restraints are furnished and installed in accordance with local building codes. A registered professional engineer having a PE from the same state as the project, or state of restraint manufacturer shall stamp all analysis, or as required by local building codes.

1.10 NOISE CRITICAL SPACES

A. Many areas of the building, referred to as "Noise-Critical Spaces", require special attention (special acoustical provisions and restrictions). The table below designates the Noise-Critical Spaces:

Private Office	NC-35
Open Plan Work Area	NC-35
Phone Room	NC-35
Conference Room	NC-35
TV Studio	NC-25
News Room	NC-30
Interview Room	NC-25
Central Control	NC-40
Narration Booth	NC-20
Control Room	NC-35
Ingest	NC-35
Edit Rooms	NC-25
Audio Sweetening	NC-20
Audio Booth	NC-20
Playout	NC-30
Equipment Center	NC-45
Radio Studio	NC-20
Radio Control	NC-25
Green Room	NC-30
All other Occupied Space	NC-40
Private Office	NC-35
Open Plan Work Area	NC-35

B. Penetrations by ducts, pipes and conduit between Noise-Critical Spaces shall be sleeved, packed and sealed airtight with non-hardening sealant, and treated with Acoustically-Sealed Pull Boxes as described herein.

1.11 DESCRIPTION OF SYSTEMS

A. Vibration Isolation

1. Vibration isolators shall be installed to attenuate the vibration transfer from equipment such as transformers, lighting dimmers, lighting ballasts, controls and relays to reduce vibration.
2. Flexible connections shall also be supplied for conduit and wiring serving electrical equipment on vibration isolators to ensure complete isolation of such equipment.

B. Transformers

1. Transformers shall be located only where shown on the drawings. The noise sensitivity of this facility requires that all noise critical spaces be well isolated from transformer noise and vibration.

C. Sealing Of Penetrations

1. Electrical equipment generates “tuned” noise that can be very disturbing in performance spaces. Walls and doors within the cave can effectively isolate air-borne noises from noise critical spaces, but the effectiveness of sound isolating structures can be severely compromised by penetrations for electrical conduit. Proper sealing around and inside conduits passing through penetrations as described herein will maintain the integrity of the sound isolating structure.
2. Special “Acoustically Sealed Pull Boxes” shall be used where a group of conduits penetrate a noise critical wall. These heavy-duty, airtight pull boxes are used to reduce the leakage of sound through the conduit walls and thus through the structure.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Foam Rod

1. Foam backer rod shall be closed cell polyethylene suitable for use as a backing for non-hardening sealant.

B. Non-Hardening Sealant

1. Sealant for electrical penetrations shall be non-hardening polysulphide type.
2. Permanently flexible, approved firestop putty may be used in lieu of the sealant on foam rod in noise sensitive walls that are also fire rated.

2.2 EQUIPMENT

A. General

1. All equipment provided for vibration isolation or noise control shall be new and manufactured specifically for the purpose intended.

B. Vibration Isolators

1. General

a. The static deflection of isolators shall be as given in the equipment schedule and specified below.
b. Vibration isolator sizes and layout shall be determined by the vibration isolator supplier to meet performance criteria below. Static deflections specified shall be met with equipment fully operational.

2. Isolator Type WP

a. Type WP (Waffle Pads) shall be minimum 5/16” thick neoprene pads ribbed or waffled on both sides. The pads shall be selected for 15% strain. Neoprene shall be bridge-bearing quality with a maximum durometer of 50. Where required to meet this strain criterion, steel load-spreading plates shall be incorporated between the equipment and the neoprene pad. If the isolator is bolted to the structure, a neoprene vibration isolation washer and sleeve (Uniroyal Type 620/660 or as approved) shall be installed under the bolt head between the steel washer and the base plate.

(Type WP: Mason Industries Type W, Super W, or as approved.)

3. Isolator Type MWP

   a. Type MWP (Metal and Waffle Sandwich Pads) shall consist of two 5/16" thick ribbed or waffle neoprene pads sandwiching a 16-gauge stainless steel plate. The pad shall be designed for 15% strain. Neoprene shall be bridge-bearing quality with a maximum durometer of 50. If the isolator is bolted to the structure, a neoprene vibration isolation washer and sleeve (Uniroyal Type 620/660 or as approved) shall be installed under the bolt head between the steel washer and the base plate.

      (Type MWP: Mason Industries Type WSW or as approved.)

4. Isolator Type RBA

   a. Type RBA isolators shall be designed with a neoprene element to provide isolation in tension, shear or compression. Neoprene shall be bridge bearing quality with a maximum durometer of 30.

      (Type RBA: Mason Industries Type RBA or as approved.)

5. Isolator Type DDNM

   a. Type DDNM (Double Deflection Neoprene Mounts) shall be laterally stable, double deflecting, molded neoprene isolators. All metal surfaces shall be covered with neoprene. The top and bottom surfaces shall be ribbed, and bolt holes shall be provided in the base. The mounts shall have leveling bolts rigidly secured to the equipment. The strain on the neoprene shall not exceed 15%. Neoprene shall be bridge bearing quality with a maximum durometer of 50. DDNM mounts shall be selected for a static deflection of 3/8" unless otherwise specified.

      (Type DDNM: Mason Industries Type ND or as approved.)

6. Isolator Type DDNH

   a. Type DDNH (Double Deflection Neoprene Hangers) shall consist of a molded neoprene element in a steel hanger box. A neoprene sleeve shall be located where the lower hanger rod passes through the steel box supporting the isolator, such that the hanger rod cannot contact the steel hanger body. The diameter of the clear hole in the mounting box shall be at least 3/4" larger than the diameter of the hanger rod and permit the hanger rod to swing through a 30º arc. When installed, the hanger box shall be allowed to rotate through a full 360º arc without encountering any obstructions.
   b. Unless otherwise specified, the static deflection of DDNH hangers shall be 0.3" with a strain not exceeding 15%. Neoprene shall be bridge-bearing quality with a maximum durometer of 50.

      (Type DDNH: Mason Industries Type HD or as approved.)

7. Isolator Type SPNM

   a. Type SPNM (Spring and Neoprene Mounts) shall be free standing and laterally stable without any housing. Springs shall be designed so that the ratio of the horizontal to vertical spring constant is between one and two. The spring diameter shall be not less than 80% of the compressed height of the spring at rated load. Loaded springs shall have a minimum additional travel to solid equal to 50% of the specified static deflection.
   b. Unless otherwise specified, the minimum static deflection of SPNM isolators for equipment mounted on grade slabs shall be 1", and the minimum static deflection for equipment mounted above grade level shall be 2".
   c. Two Type WP isolation pads sandwiching a 16-gauge stainless or galvanized steel separator plate shall be bonded to the isolator base plate.
   d. Unless otherwise specified, isolators need not be bolted to the floor for indoor installations. If the base plates are bolted to the structure, a neoprene vibration isolation washer and sleeve (Uniroyal Type 620/660 or as approved) shall be installed under the bolt head between the steel washer and the base plate.

(Type SPNM: Mason Industries Type SLFSW or as approved.)

8. Isolator Type SPNH

   a. Type SPNH (Spring and Neoprene Hangers) shall consist of a steel spring in series with a neoprene element. The spring shall have a minimum additional travel to solid equal to 50% of the specified deflection. The neoprene element shall have a static deflection of not less than 0.3" with a strain not exceeding 15%. Neoprene shall be bridge-bearing quality with a maximum durometer of 50.
   b. Unless otherwise specified, the static deflection of SPNH hangers shall be 2".
   c. Spring diameter and hanger box hole size shall be large enough to permit the hanger rod to swing through a 30º arc. A neoprene sleeve shall be inserted in the steel hanger box where the lower hanger rod passes through it, such that the hanger rod cannot contact the steel hanger body. The diameter of the clear hole in the mounting box shall be at least 3/4" larger than the diameter of the hanger rod. When installed, the spring element shall not be cocked, and the hanger box shall be allowed to rotate through a full 360º arc without compromising a minimum clearance of 1".

   (Type SPNH: Mason Industries Type 30N or as approved.)

9. Neoprene Mounting Sleeves

   a. Neoprene mounting sleeves for hold-down applications of equipment with vibration isolators shall be Uniroyal Type 620/660 or as approved.

10. Acoustically Sealed Pull Boxes

   a. Sides and cover shall be formed of minimum 14-gauge cold rolled steel. Inside surfaces of sides and cover shall be lined with 1" thick, neoprene-coated duct liner board of 3 pcf density. Entire perimeter of closure shall be sealed with 1" x 1/4" closed-cell sponge neoprene sound seal. Sides of the box shall be sealed airtight to the wall with non-hardening sealant on foam backer rod. Conduit penetrations through wall shall be packed and caulked as described herein.

PART 3 - EXECUTION

3.1 GENERAL

A. Ballasts, relays, dimmers, equipment controls and all transformers shall be located as shown on the drawings. If not shown, location is subject to review by architect and acoustical consultant prior to installation. Under no circumstances shall such devices be located within noise critical spaces or on walls, slabs or ceilings that are common to such spaces.

3.2 TRANSFORMERS

A. All transformers shall be supported on Type DDNM or Type DDNH isolators. All wiring connections to transformers shall be made with flexible conduit having sufficient slack so as not to impede movement of equipment on isolators.

B. Transformers shall not be hung from or supported on other equipment, pipes or ductwork installed on vibration isolators, but shall be supported on or suspended from building structure.

3.3 DIMMER RACKS

A. Dimmer racks and other lighting equipment containing transformers, fans, choke coils or relays shall be installed on Type MWP isolation pads and shall be located a minimum of 3" from adjacent walls. Conduit within the dimmer rooms shall be suspended on Type DDNH neoprene hangers.

3.4 MOTORS AND ELECTRICAL EQUIPMENT

A. All wiring connections to motors and electrical equipment supported on Type SPNM or Type SPNH isolators shall be made with a slack U-shaped section of flexible conduit. Wiring connections to motors and electrical equipment supported on Type DDNM and or Type DDNH isolators shall be made with a slack U-shaped flexible conduit. Flexible conduit and cable shall be capable of and recommended for such curvature.

3.5 SOUND SYSTEM RACKS

A. All sound and communication racks shall be mounted on Type MWP isolators.

3.6 ACOUSTICALLY SEALED PULL BOXES

A. Acoustically sealed pull boxes as described herein shall be installed at one side of each penetration at noise critical walls and slabs where the pull box exceeds 8” in at least one dimension.

3.7 PENETRATIONS OF WALLS AND SLABS

A. All conduit and cable penetrations of noise critical spaces shall be sleeved, packed and caulked airtight.

B. Where a conduit or cable passes through such a wall or slab, a steel sleeve shall be cast or grouted into the structure. The internal diameter of the sleeve shall be larger than the external diameter of the conduit passing through it by 2” for conduit 2” and over and by 1” for conduit under 2”. After all conduit is installed, the Electrical Contractor shall check the clearance and correct it, if necessary, to within 1/2”. The void shall be packed full depth with glass fiber; install foam backer rod on both sides, recessed into the sleeve by 1/2”. Cover the backer rod 1/2” deep with non-hardening, non-aging sealant. Alternatively, the void between sleeve and conduit shall be filled full-depth with GE silicone sealant Type RTV6428 or approved material with equal density and flexibility. For penetrations in fire-rated assemblies, use approved non-hardening, non-shrinking fire stop putty in lieu of the sealant and foam rod.

C. Where conduit crosses a building expansion joint between new and existing buildings, an 18” length of flexible conduit shall be used to bridge between the two constructions. Rigid conduit shall not be acceptable.

3.8 FIELD QUALITY

A. Contractor shall work in accord with best trade practices, shall fabricate and install all items in accordance with manufacturer's recommendations and Architect's directions, and shall consult and coordinate with trades doing adjoining work in order to provide an installation of first class quality.

3.9 TESTING AND ADJUSTMENT

A. Contractor shall test and adjust noise and vibration control products and installations to achieve specified performance.

3.10 CONTRACTOR'S REPORT

A. The vibration isolation manufacturer shall inspect and approve the installation of the vibration isolators, and shall submit a report to the Architect and Acoustics Consultant which verifies that all of the isolators for electrical equipment has been properly installed and that the installation is in full conformance with the specification. The report shall contain the type and measured static deflection of all spring isolators provided.

3.11 SITE ACCESS

A. During installation of equipment, Contractor shall arrange for access as necessary for inspection of isolation and noise control equipment by Architect and Acoustics Consultant.

3.12 CONSULTANT'S INSPECTION

A. Upon completing installation and adjustment for suitable operation of all work specified under this section, the Contractor shall notify in writing the Architect, who will schedule an inspection by the Acoustics Consultant. The letter shall certify that all work specified under this section is complete, operational and adjusted in every respect, and that all work is ready for the completion checkout. Defective equipment and installation shall be repaired at the cost of the Contractor, and another inspection shall be scheduled.

B. In the event that a second (or subsequent) inspection is required, the Contractor shall reimburse the Owner for travel, food and accommodation expenses incurred by the Consultant and passed on to the Owner.

C. For each inspection, workmen shall be furnished to perform such functions as are necessary for inspection of the equipment.

END OF SECTION

SECTION 26 05 49

SEISMIC DESIGN

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Seismic restraints and/or bracing shall be provided for selected electrical equipment and wiring methods as described hereinafter. These seismic design requirements are complementary to the requirements specified elsewhere for the fastening and support of electrical work. Nothing on the drawings or elsewhere in these specifications shall be interpreted as a reason to waive any of the requirements of this Seismic Design section.

B. This project is located in Seismic zone 2.

C. Provide seismic support for the following items:

switchboards
Generators, day tanks, and associated piping
Uninterruptible power supplies and battery racks
Automatic transfer switches
Emergency panelboards
All lighting fixtures and exit signs
Emergency battery packs and/or central systems
Fire alarm/detection systems
Raceways associated with emergency lighting/power, fire alarm/detection system
Dry type transformers
Raceways 2½" and larger suspended on individual hangers longer than12 inches, and all raceways on trapezes.

D. All seismic restraint and isolation devices, braces, and supports shall be capable of accepting without failure forces produced by seismic acceleration (expressed in multiples of the acceleration of gravity "G") based on the level grade of the attachment of the equipment support system. For design purposes, the following acceleration levels shall be used.

DESIGN LEVEL OF ACCELERATION AT EQUIPMENT CENTER OF GRAVITY			
ELEVATION ABOVE GRADE	RIGIDLY FLOOR OR WALL MOUNTED EQUIPMENT	RESILIENTLY MOUNTED AND/OR SUPPORTED FROM CEILING OR STRUCTURE ABOVE	LIFE SAFETY EQUIPMENT (FIRE ALARM, EMERGENCY
SEISMIC ZONE 2 A_v = 0.10 TO 0.19			
BELOW GRADE UP TO 20 FEET ABOVE GRADE	0.125 "G"	0.500 "G"	
21 FEET – 300 FEET	0.500 "G'	0.750 "G"	
301 FEET – 600 FT.	0.750 "G"	1.000 "G"	1.000 "G"

1.3 OEM EQUIPMENT ISOLATION PACKAGES

A. Internal and/or External Systems

1. Substitution of internally or externally isolated or restrained equipment instead of the isolation and restraints specified in this section is acceptable provided all requirements of this section are met. The equipment manufacturer shall provide a letter of guarantee from their Engineering Department stamped and certifying that the seismic restraints are in full compliance with these specifications. Letters from field offices and representatives are unacceptable.
2. All costs for converting to the specified vibration isolation and/or restraints shall be borne by the equipment manufacturer in the event of non-compliance with the preceding.
3. In the event that the equipment is internally isolated and restrained, the entire unit assembly must be seismically attached to the structure.

1.4 SUBMITTALS

A. Seismic Certification and Analysis

1. Provide seismic restraint calculations certifying that all seismic restraint devices are capable of accepting, without failure, the "G" forces shown in the table above. Calculations shall be provided for all connections of the equipment to the structure. All performance of products (such as strut, cable, anchors, clips, etc.) associated with restraints must be supported by the manufacturer's data sheets or certified calculations. For roof mounted equipment, both the seismic acceleration and wind loads shall be calculated. The highest load shall be used for the design of the restraints and isolators.
2. Calculations to support seismic restraint designs must be stamped by a registered professional engineer with at least five years of seismic design experience.
3. Analysis must indicate calculated dead loads, derived loads, and materials used for connections to equipment and structure. Analysis must detail anchoring methods, bolt diameter, embedment and/or weld length.

1.5 RELATED WORK

A. Housekeeping Steel

1. Where steel sills are called for under a piece of electrical equipment, attachment shall be designed and certified according to this section by the seismic/isolation supplier.
2. Steel sills shall be sized to accommodate a minimum of six inches of clearance all around the equipment and its mounting package. In addition, ¾" clearance shall be provided between the electrical equipment and the steel sills so that the space may be kept clear of debris that would inhibit the isolation.

B. Supplementary Support Steel

1. Structural support and connections for all electrical equipment, including roof mounted equipment, specified in other sections shall comply with the seismic requirements of this section.

C. Design Responsibilities

1. Include the following in the responsibility of the seismic equipment supplier:

a. Determine guidelines for vibration isolation and restraint size and location.
b. Provide equipment vibration isolation and seismic restraints as required.
c. Guarantee specified isolation system deflections.
d. Provide installation instructions, drawings, and field supervision to insure proper installation and performance of systems.

e. Certify correctness of installation upon completion.

1.6 QUALITY ASSURANCE

A. Installation of electrical equipment shall, as a minimum, be installed in accordance with the latest applicable edition of the Building Code of the State of New York.

B. Listing and Labeling: Provide products that are Underwriters Laboratories listed and labeled for their applications and installation conditions and for the environments in which installed.

1. The Terms “Listed” and “Labeled”: As defined in the “National Electrical Code”, Article 100.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. Available manufactures: Subject to compliance with requirements, manufacturers offering products that may be incorporated in the Work include, but are not limited to, the following:

1. AVNEC, Inc. of Floral Park, NY
2. Mason Industries, Inc. of Hauppage, NY
3. Vibration Mounting and Control of Butler, NJ
4. Consolidated Kinetics of Columbus, OH

B. Attachments

1. Hardware and devices such as beam clamps, anchor bolts, cables, and cast-in-place plates must be by this section’s supplier to ensure seismic compliance and certification. Alternate anchor bolts may be provided so long as the sizing and dimensions on the seismic submittals are followed:

2.2 SEISMIC RESTRAINTS AND VIBRATION ISOLATORS

A. General

1. All isolation and seismic restraint devices shall be capable of accepting, without failure, the “G” forces as determined by the seismic certification and calculations described above.
2. Corrosion protection for both indoor and outdoor applications shall be as follows:
   a. Springs – Cadmium plated, zinc electroplated, or powder coat.
   b. Hardware – cadmium plated
   c. All other metal parts – hot spray or hot dipped galvanized.
3. All seismic restraint devices:
   a. Shall maintain the equipment in a captive position and not short circuit isolation devices during normal operating conditions.
   b. Shall have provisions for boiling and/or welding to the structure.

B. Seismic Restraint Types

1. Restraints for suspended systems
   a. Isolated systems and, where required elsewhere by this specification, lighting fixtures – braced with multiple steel cable with approved fastening devices to equipment and structure.
   b. Non-isolated systems – braced with structural steel strut with approved fastening devices to equipment and structure.

2. Restraints for systems rigidly connected to walls or floor or ceiling slabs.

a. Rigid attachment to structure using wedge type expansion anchors for bolting and steel plates, either cast-in or anchored with wedge type expansion bolts, for welding. Power shots are not acceptable. Concrete anchor bolt spacing shall be in accordance with ICBO National Standards for seismic anchorage.

C. Vibration Isolator Types

1. For Dry Type Transformers –

a. Double deflection neoprene isolators encased in ductile iron or steel casing.

2. For Emergency Generators on Grade – Pad Type Elastomer Isolator

a. Neoprene pad shall have 0.75" minimum thickness and shall have opposed cylindrical supports spaced on one inch centers to provide uniform deflection of 0.1 inch under rated load. Supports shall be connected under in the center by an 1/8" tear strip to facilitate trimming to desired size in one inch increments. Supports will also have through holes to accept up to 3/8" bolts without special drilling or coring.
b. 1/16" galvanized steel plate between multiple pad layers.
c. Load distribution plate where attachment to equipment bearing surface is less than 75% of the pad area.
d. When bolting is required for seismic compliance, neoprene washers and bushings shall be provided to prevent short circuiting.

3. For Conduit Risers – Resilient Conduit Anchors and Guides

a. One inch of six pound density Fiberglass packed around the conduit.

2.3 FLEXIBLE CONNECTORS

A. All connectors to the generator and day tank shall be installed on the equipment side of shutoff valves. Piping shall be supported and/or anchored to resist pipe movement beyond the allowable movement of the flexible connector.

PART 3 – EXECUTION

3.1 APPLICATION

A. Isolation and seismic restraint systems must be installed in strict accordance with the manufacturer's written instructions and all submittal data.

B. Vibration isolators shall not cause any change of position of equipment resulting in stress on equipment connections.

3.2 INSTALLATION

A. Equipment shall be restrained as indicated in the table at the end of this specification.

B. Additional Requirements

1. All bases shall be placed in position and supported temporarily by blocks or shims prior to the installation of the equipment, isolators, and restraints.
2. Spring isolators shall be installed after all equipment is installed without changing equipment elevations.
3. After the entire installation is complete and under full operation load, the spring isolators shall be adjusted so that the load is transferred from the blocks to the isolators.
4. Remove all debris from beneath the equipment and verify that there are no short circuits of the isolation. The equipment's movement shall be free in all directions.
5. All electrical connections to isolated equipment such as transformers and generators shall be in flexible conduit.
6. Use wedge type expansion bolts to bolt the base to the structure.

3.3 SEISMIC RESTRAINTS

A. Installation

1. All equipment specified to receive seismic support shall be restrained per the table at the end of this section.
2. All floor mounted equipment whether isolated or not shall be snubbed, anchored, bolted, or welded to the structure to comply with the required acceleration. Calculations that determine that isolated equipment movement may be less than the operating clearance of snubbers (restraints) do not preclude the need for snubbers. All equipment must be positively attached to the structure.
3. Lighting fixtures shall be seismically restrained in accordance with the following:

    a. All lighting fixtures and exit signs throughout the building shall be provided with seismic restraints.

    b. Lighting fixtures recessed into suspended ceilings shall be supported from the ceiling structure by not less than two earthquake clips, or other approved supports, each capable of supporting 50% of the fixture weight.

    c. Lighting fixtures surface mounted on the underside of suspended ceilings shall be provided with at least two supports, each independently connected to the slab above with cable type restraints as described hereinbefore for suspended systems and each capable of supporting 100% of the fixture weight.

    d. Pendant mounted lighting fixtures shall be supported from the slab above utilizing approved fixture hangers designed to permit a swing of at least 20" in any direction without damage to the fixture, hangers, or structure. Each support shall be capable of supporting 100% of the fixture weight. If there are obstructions preventing the free swing, provide additional support bracing to restrain 50% of the fixture weight. Pendant mounted fixtures below suspended ceilings shall be supported at the ceiling level and shall have cable to the slab above.

    e. Lighting fixtures surface mounted directly to ceiling slabs, walls or structural elements shall be rigidly attached using restraints specified hereinbefore for rigidly connected ceiling slabs or walls.

4. All horizontally suspended conduit systems shall use restraints for non-isolated suspended systems. Spacing of seismic bracing shall be according to table below. All bus ducts and cable trays passing through floors shall be bolted at each floor level or secured above and below each floor with riser clamps. This restraint shall be in addition to the spring type hangers specified.

SEISMIC BRACING TABLE		
EQUIPMENT	ON CENTER SPACING	
	TRANS-	LONGITU-
CONDUIT	40 FEET	80 FEET

5. For all seismically supported trapeze supported conduit, the individual conduits shall be transversely and vertically restrained to the trapeze support at the designated restraint locations. Restrain at least every third trapeze hanger transversely and every fifth one longitudinally as well as the trapeze on both sides of every change of direction.
6. For overhead supported equipment, overstress of the building structure must not occur. Bracing may occur from:

    a. Flanges of structural steel beams.
    b. Upper truss chords in bar joists.
    c. Cast in place or drilled and shielded inserts in concrete structures.
7. For dry type transformers suspended from the slab above, use isolators with 0.20" deflection and seismic restraints for isolated, suspended equipment.
8. Where conduits pass through cored or sleeved holes, the holes shall be a maximum of 2" larger than the conduit O.D. Pack the space with fireproofing material. No additional horizontal seismic bracing is required at these locations.
9. All non-isolated floor or wall mounted equipment such as switchboards, panelboards, etc. which require restraint shall use restraint for rigid attachment. For floor mounted transformers up to and including 300 KVA, use isolators with a 0.30" deflection and rigid attachment seismic restraints. For larger transformers, provide a calculation for the isolators and restraints required. Where base anchoring of equipment such as switchboards is insufficient to resist seismic forces, additional restraints for suspended, non-isolated equipment shall be located above the unit's center of gravity to suitably resist "G" forces specified.

10. Emergency generators shall be a "factory package" mounted on rigid base consisting of a full length skid or rail of structural steel on each side and cross bracing members of each end. An additional auxiliary matching rigid base shall be furnished and installed anchored to the floor as dunnage. The emergency generator set shall be resiliently isolated from the building structure or grade by means of bare stable spring isolators (with 1.50" deflection and 0.10" deflection respectively) mounted between the rigid base of the generator and the matching auxiliary base. Provide seismic restraints for rigid attachment.

3.4 INSPECTION

A. Upon completion of installation of all vibration isolation and seismic restraint devices, a certification report prepared by the manufacturer shall be submitted in writing to the architect/engineer indicating that all systems are installed properly and in compliance with the specifications. The report shall identify those areas that require corrective measures or certify that none exist. Any field coordination type changes to the originally submitted seismic restraint designs must be clearly defined and detailed in this report.

END OF SECTION

SECTION 26 05 53

ELECTRICAL IDENTIFICATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Requirements of the following Division 26 Sections apply to this Section:

1. "Electrical Requirements."

1.2 SUMMARY

A. This Section includes identification of electrical materials, equipment, and installations. It includes requirements for electrical identification components including but not limited to the following:

1. Buried electrical line warnings.
2. Identification labeling for raceways, cables, and conductors.
3. Operational instruction signs.
4. Warning and caution signs.
5. Equipment labels and signs.

B. Related Sections: The following Sections contain requirements that relate to this Section;

1. Division 9 Section "Painting" for related identification requirements.
2. Division 26 Section "Wires and Cables" for requirements for color coding of conductors for phase identification.

C. Refer to other Division 26 Sections for additional specific electrical identification associated with specific items.

1.3 SUBMITTALS

A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections.

B. Product Data for each type of product specified.

C. Schedule of identification nomenclature to be used for identification signs and labels.

D. Samples of engraved, plastic laminate to be used on switchgear, switchboards, disconnect switches and panelboards.

1.4 QUALITY ASSURANCE

A. Electrical Component Standard: Components and installation shall comply with NFPA 70 "National Electrical Code."

B. ANSI Compliance: Comply with requirements of ANSI Standard A13.1, "Scheme for the identification of Piping Systems," with regard to type and size of lettering for raceway and cable labels.

PART 2 - PRODUCTS

2.1 ELECTRICAL IDENTIFICATION PRODUCTS

A. Colored Adhesive Marking Tape for Raceways, Wires, and Cables: Self-adhesive vinyl tape not less than 3 mil thick by 1 inch to 2 inches in width.

B. Underground Line Marking Tape: Permanent, bright-colored, continuous-printed, plastic tape with magnetic tracer strip not less than 6 inches wide by 4 mil thick. Printed legend indicative of general type of underground line below.

C. Wire/Cable Designation Tape Markers: Vinyl or vinyl-cloth, self-adhesive, wrap around, cable/conductor markers with preprinted numbers and letters.

D. Engraved, Plastic-Laminated Labels, Signs, and Instruction Plates: Engraving stock melamine plastic laminate, 1/16-inch minimum thick for sign up to 20 square inches, or 8 inches in length; 1/8-inch thick for larger sizes. Engraved legend in black letters on white face for normal power and red letters on white face for emergency power. Plastic laminate shall be punched for mechanical fasteners.

E. Baked-Enamel Warning and Caution Signs for Interior Use: Preprinted aluminum signs, punched for fasteners, with colors, legend, and size appropriate to the location.

F. Exterior Metal-Backed Butyrate Warning and Caution Signs: Weather-resistant, non-fading, preprinted cellulose acetate butyrate signs with 20-gage, galvanized steel backing, with colors, legend, and size appropriate to the location. Provide ¼-inch grommets in corners for mounting.

G. Fasteners for Plastic-Laminated and Metal Signs: Self-tapping stainless steel screws or number 10/32 stainless steel machine screws with nuts and flat and lock washers.

H. Cable Ties: Fungus-inert, self-extinguishing, one-piece, self-locking nylon cable ties, 0.18-inch minimum width, 50-lb minimum tensile strength, and suitable for a temperature range from minus 50°F to 350°F. Provide ties in specified colors when used for color coding.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Lettering and Graphics: Coordinate names, abbreviations, colors, and other designations used in electrical identification work with corresponding designations specified or indicated. Install numbers, lettering, and colors as approved in submittals and as required by code.

B. Install identification devices in accordance with manufacturer's written instructions and requirements of local codes and the NEC.

C. Sequence of Work: Where identification is to be applied to surfaces that require finish, install identification after completion of finish work.

3.2 CONDUIT IDENTIFICATION

A. Identify Junction, Pull, and Connection Boxes: Code-required caution sign for boxes shall be pressure-sensitive, self-adhesive label indicating system voltage in black, preprinted on orange background. Install on outside of box cover. Also label box covers with identity of contained circuits. Use pressure-sensitive plastic labels at exposed locations and similar labels at concealed boxes.

B. Underground Electrical Line Identification: During trench backfilling, for underground power, signal, and communications lines, install continuous underground plastic line marker, located directly above line at 6 to 8 inches

below finished grade. Where multiple lines, installed in a common trench or concrete envelope, do not exceed an overall width of 16 inches; install a single line marker.

C. Install line marker for underground wiring, both direct-buried and in raceway.

D. Identify Raceways of Certain Systems with Color Banding: Band exposed or accessible raceways of the following systems for identification. Bands shall be painted with colors indicated below. Make each color band 2 inches wide, completely encircling conduit, and place adjacent bands of two-color markings in contact, side by side. Install bands at changes in direction, at penetrations of walls and floors, and at 40-foot maximum intervals in straight runs. Apply the following colors:

1. Fire Alarm Systems: Red.
2. Fire Suppression Supervisory and Control System: Red and Yellow.
3. Mechanical and Electrical Supervisory System: Green and Blue.
4. Telephone System: Green and Yellow.
5. Tag or label conductors as follows:
   a. Future Connections: Conductors indicated to be for future connection or connection under another contract with identification indicating source and intent.
   b. Multiple Circuits: Where multiple branch circuits or control wiring or communications/signal conductors are present in the same box or enclosure label each conductor or cable. Provide label on each box indicating source, voltage, circuit number, and phase for branch circuit wiring. Phase and voltage of branch circuit wiring may be indicated by mean of coded color of conductor insulation. For control and communications/signal wiring, use color coding or wire/cable marking tape at terminations and at intermediate locations where conductors appear in wiring boxes, troughs, and control cabinets. Use consistent letter/number conductor designations throughout on wire/cable marking tapes.
   c. Match identification markings with designations used in panelboards shop drawings, Contract Documents, and similar previously established identification schemes for the facilities' electrical installations.

E. Install labels at locations indicated and at locations for best convenience of viewing without interference with operation and maintenance of equipment.

F. Conductor Color Coding: Provide color coding for secondary service, feeder, and branch circuit conductors throughout the project secondary electrical system as follows:

208/120 Volts		Phase	480/277 Volts
Black	A	Brown	
Red		B	Orange
Blue		C	Yellow
White	Neutral	Gray	
Green	Ground	Green	

G. Use conductors with color factory-applied the entire length of the conductors except as follows:

1. The following field-applied color-coding methods may be used in lieu of factory-coded wire for sizes larger than No. 10 AWG:
   a. Apply colored, pressure-sensitive plastic tap in half-lapped turns for a distance of 6 inches from terminal points and in boxes where splices or taps are made. Apply the last two laps of tape with no tension to prevent possible unwinding. Use 1-inch-wide tape in colors as specified. Do not obliterate cable identification markings by taping. Tape locations may be adjusted slightly to prevent such obliteration.
   b. In lieu of pressure-sensitive tape, colored cable ties may be used for color identification. Apply three ties of specified color to each wire at each terminal or splice point starting 3 inches from the terminal

and spaced 3 inches apart. Apply with a special tool or pliers, tighten for snug fit, and cut off excess length.

2. All grounded conductors No. 6 AWG and smaller shall be a factory applied color across the entire length of conductors.

H. Power Circuit Identification:

1. Securely fasten wrap-around marker bands to cables, feeders, and power circuits in pull boxes, junction boxes, and switchgear rooms.

I. Apply warning, caution, and instruction signs and stencils as follows:

1. Install warning, caution, or instruction signs where required by NEC where indicated, or where reasonably required to assure safe operation and maintenance of electrical systems and of the items to which they connect. Install engraved plastic-laminated instruction signs with approved legend where instructions or explanations are needed for system or equipment operation. Install butyrate signs with metal backing for outdoor items.
2. Emergency Operating Signs: Install engraved laminate signs with white legend on red background with minimum 3/8-inch high lettering for emergency instructions on power transfer, load shedding, or other emergency operations.

J. Install equipment/system circuit/device identification as follows:

1. Apply equipment identification labels of engraved plastic-laminate on each major unit for electrical equipment including central or master unit of each electrical system. This includes communication/signal/alarm system, unless unit is specified with its own self-explanatory identification. Except as otherwise indicated, provide single line of text, with 3/8-inch-high lettering on 1-1/2-inch-high label (2-inch-high where two lines are required), black lettering in white field for normal power and red lettering on white field for emergency power. Text shall match terminology and numbering of the Contract Documents and shop drawings. Apply labels for each unit of the following categories of electrical equipment:
   a. Panelboards, electrical cabinets, and enclosures.
   b. Access doors and panels for concealed electrical items.
   c. Electrical switchboards.
   d. Motor starters
   e. Pushbutton stations.
   f. Power transfer equipment.
   g. Contactors.
   h. Remote-controlled switches.
   i. Dimmers.
   j. Control devices.
   k. Transformers.
   l. Power generating units.
   m. Telephone switching equipment.
   n. Fire alarm master station or control panel.
   o. Lighting control panel.
   p. Multi-outlet raceways shall have each outlet labeled with panelboard and circuit number.

K. Apply circuit/control/item designation labels of engraved plastic laminate for disconnect switches, breakers, pushbuttons, pilot lights, motor control centers, and similar items for power distribution and control components above, except panelboards and alarm/signal components, where labeling is specified elsewhere. For panelboards, provide framed, typed circuit schedules with explicit description and identification (including room numbers) of items controlled by each individual breaker.

L. Fire Pump Service Identification: A placard shall be externally installed on the Fire Pump primary disconnecting means stating “Fire Pump Disconnecting Mean.” The lettering shall be at least one inch in height. In addition, a placard shall be placed adjacent to the Fire Pump controller stating the location of this disconnecting means and the

location of the key (if the disconnecting means is locked).

M. Electrical Service Room Distribution Placard: In each of the main electrical rooms, provide a single line riser diagram placard of the entire electrical distribution fed from that room. The placard shall also identify where other services are located per NEC 230.2(e). The riser diagram shall be framed under glass and mounted on the wall in the electrical room. The print shall be of diffusion transfer process to eliminate fading.

N. Arc Flash Warning Signs: Provide arc flash warning signs at all panelboards, switchboards, control panels, meter enclosures, starters, motor control centers, transfer switches, etc., that may be subject to inspection or repair. Warning signs shall be white letters on a red background with informative text in black on a white background. Signs shall be permanently affixed directly to the equipment in a readily visible location or located adjacent to the equipment with a smaller warning label on the equipment that directs maintenance personnel to the more informative sign. Warning sign data shall be appropriate and specific to each piece of equipment or device and shall identify flash hazard category, incident energy, VAC shock hazard, flash protection boundary, limited approach boundary, restricted approach boundary, restricted approach boundary, and prohibited approach boundary. Warning sign shall also indicate all recommended protective equipment. Calculations supporting the data on each warning sign shall be completed by a licensed professional engineer hired by the Contractor and presented to the owner in book form for future reference. Arch flash warning signs shall be in accordance to the most stringent of NFPA 70E, NFPA 70, and OSHA.

END OF SECTION

SECTION 26 08 00

COMMISSIONING

GENERATOR AND ATS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specification sections, apply to work of this section.

B. Division 26 Basic Electrical Material and Methods sections apply to work specified in this section.

1.2 SUMMARY

A. The work includes the providing of all labor, materials, equipment, accessories, services and tests necessary to complete and make ready for operation by the Owner, electrical generator and automatic transfer switch as shown on the drawings and hereinafter specified.

B. Equipment and wiring shall be provided and installed by Electrical Contractor under this contract.

1.3 SUBMITTALS

A. Materials list with manufacturer, style, series or model identified.

B. Manufacturer's descriptive literature and/or sample if requested by the Architect/Engineer

1.3 QUALITY ASSURANCE

A. Installer's Qualifications: Firms with at least 5 years successful installation experience on projects utilizing switchboards and panelboards similar to those required for this project.

B. All work shall be performed in accordance with all rules, regulations, and all applicable codes.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store equipment in clean dry space. Protect units from dirt, fumes, water, construction debris and traffic; where necessary to store outdoors, store electrical components above grade and enclose with watertight wrapping.

B. Handle equipment carefully to prevent internal components damage, breakage, denting, and scoring enclosure finish. Do not install damaged components; replace and return damaged units to equipment manufacturer.

1.6 SEQUENCING AND SCHEDULING

A. Coordinate installation, wiring, and commissioning within owners pre-arranged time frame.

PART 2 - PRODUCTS

2.1 LOAD BANKS: Refer to Section 26 05 05.

2.2 WIRES AND CABLES: Refer to Section 26 05 19.

PART 3 - EXECUTION

3.1 SCOPE OF WORK

A. The following work shall be performed by the Contractor, Generator representative, and ATS representative.

COMMISSIONING

After the complete installation of generator and ATS, these individual equipment's shall be tested as stand-alone, then followed by testing of the complete system as a whole. This process is divided into two parts. Part one, Static proof of the equipment, and part two, dynamic proof of the system. Throughout these two parts, all vendors and contractors shall simultaneously perform their roles.

Provide temporary load bank for testing/commissioning

Signatures are required by each vendor and contractor for both the static and dynamic parts of the testing. All static testing check lists shall be filled out and signed and the dynamic testing sectioned shall be signed by all.

PART 1 – STATIC EQUIPMENT TESTING

Generators

Generator

- ☐ Provide Warranty Validation Sheet , Start-up Validation and Pre-Inspection
- ☐ (Inspections to be performed by factory authorized personnel only)
- ☐ Start-up Date _____/_____/_____
- ☐ Authorized Representative Performing start up :_____
- ☐ Technician Name (print)_____
- ☐ Owner or Owner's Representative Name (print)_____
- ☐ Genset Nameplate Data
- ☐ Model # _____
- ☐ Engine Serial # (found on engine block)_____
- ☐ Fuel Type □Diesel □NG □LP Vapor □Liquid LP
- ☐ RPM
- ☐ HZ
- ☐ Utility Service kW_____ kVA_____
- ☐ Volts_____ Phase_____

- ☐ Amps Per Terminal
- ☐ Phase Rotation
- ☐ Adjustments for location Altitude _____
- ☐ Is the equipment installed in an outdoor weather protected housing? _____
- ☐ Is there emergency lighting available at the equipment room ?_____
- ☐ Is the mounting surface(s) visually properly constructed and leveled?_____
- ☐ Is the mounting surface made from non-combustible material?_____
- ☐ Has the wood skid been removed?_____
- ☐ Is the radiator duct connected to the air vent or louver?_____
- ☐ Is there an adequate/dedicated fuel supply?_____
- ☐ Are the fuel filters installed?_____
- ☐ Is fuel transfer tank pump motor connected to the corresponding voltage?
- ☐ Is the fuel transfer tank pump connected to the emergency power source?_____
- ☐ Are flexible fuel lines installed between the engine fuel inlet and fuel piping?____
- ☐ Are the manually operated fuel and cooling water valves installed allowing manual operation or bypass of the solenoid valves? _____
- ☐ Does the exhaust line have flexible connector(s)?_____
- ☐ Is the flexible connector(s) straight?_____
- ☐ Is there an exhaust line condensate trap with a drain installed?_____
- ☐ Is the specified silencer installed and are the hanger and mounting hardware tightened?_____
- ☐ Is a heat-isolating thimble(s) installed at points where exhaust lines pass through combustible wall(s) or partition(s)? _____
- ☐ Is the exhaust line free of excessive bends and restrictions?_____
- ☐ Is the exhaust line installed with a downward pitch toward the outside of the enclosure?_____
- ☐ Is the exhaust line protected from entry by rain, snow, and animals?_____
- ☐ Are individuals protected from exposure to high temperature exhaust parts and are hot parts safety decals present? _____
- ☐ Does the nameplate voltage/frequency of the generator set and transfer switch match normal/utility source ratings? _____
- ☐ Do the generator set load conductors correctly connect to the circuit breakers and/or the emergency side of the transfer switch?_____
- ☐ Are the load conductors, remote start loads, battery charger cables, and remote annunciator leads installed in separate conduits?_____
- ☐ Is the battery charger AC circuit connected to the corresponding voltage and energized? _____
- ☐ Is the tank heater AC circuit connected to the corresponding voltage and energized?_____
- ☐ Is the battery(ies) filled with electrolyte and connected to the charger?_____
- ☐ Are the engine starting cables connected to the battery(ies)? _____
- ☐ Inspect unit for freight damage (ensure components are tight).
- ☐ Verify that the engine is filled with oil, the cooling system is filled with coolant/antifreeze and battery(ies) are filled with acid.
- ☐ Inspect for proper belt alignment and tension.
- ☐ Inspect all electrical connections in control panel verify connections are tight and secure.
- ☐ Open all water and fuel valves. Temporarily remove the radiator cap to eliminate air in the cooling system. Replace radiator cap.

- ☐ Prime the fuel system.
- ☐ Press the LED test, if equipped on controller. Do all the LEDs on the panel illuminate?_____
- ☐ Place the generator set engine control switch in the OFF/RESET position. Observe Not-in-Auto LED and alarm, if equipped, on the controller.
- ☐ Open the generator main line circuit breakers.
- ☐ Verify the presence of lube oil in the turbocharger, if equipped.
- ☐ Verify power on to the water/oil heaters and fuel lift pumps.
- ☐ Place the generator set engine control switch in the RUN position. Allow the engine to start and run.
- ☐ Check the battery charger voltmeter and ammeter for battery charging indication.
- ☐ Verify whether there is sufficient oil pressure.
- ☐ If the speed is unstable, adjust.
- ☐ Adjust the AC output voltage to match the utility voltage using the voltage adjusting control.
- ☐ Allow the engine to reach normal operating coolant temperature. Check for oil, coolant, and exhaust leaks. Check and tighten all hose connectors and clamps.
- ☐ Manually overspeed (if applicable) the engine to cause an engine shutdown (71 Hz on 60 Hz models). Place the generator set engine control switch in the OFF/RESET position.
- ☐ Check the coolant level, add coolant as necessary, and replace the radiator cap. Verify that all hose clamps are tight and secure. Place the generator set engine control switch in the RUN position.
- ☐ Verify the engine low oil pressure and high coolant temperature shutdowns.
- ☐ Check the overcrank shutdown.
- ☐ Check and verify any additional protective devices
  List them: _____, _____, _____
- ☐ Place the generator set engine control switch in the OFF/RESET position.
- ☐ Check the utility source voltage, frequency, and phase sequence on three-phase models. The generator set must match utility source and load.
- ☐ Verify that all the wire connections from the generator set to the transfer switch and optional accessories are tight and secure.
- ☐ Close the generator set main line circuit breakers connected to the transfer switch.
- ☐ Place the generator set engine control switch in the RUN position.
- ☐ Check the generator set voltage, frequency, and phase sequence on three-phase models. The generator set must match utility source and load.
- ☐ Place the generator set engine control switch in the OFF/RESET position.
- ☐ Place the transfer switch in the TEST position. NOTE: Obtain permission from the building authority before proceeding. This procedure tests transfer switch
  operation and connects building load to generator set
  power.
- ☐ Readjust frequency to 60 Hz with total building loads.* Verify no load frequency to be no more than 62.0. Adjust if necessary. (Mechanical governor only)
- ☐ Verify that the current phase is balanced for three phase systems.
  List them _____
- ☐ Release the transfer switch test switch. The transfer switch should retransfer to the utility source after appropriate time delay(s).
- ☐ Allow the generator set to run and shut down automatically after the appropriate cool down time delay(s).
- ☐ Set the plant exerciser with load to the customer's required exercise period, if equipped.
- ☐ Verify that all options on the transfer switch are adjusted and functional for the customer's requirements. Transfer Switch delay setting: TDES____TNE____TDN____TDEC____

- ☐ In phase monitor ON_____ OFF_____
- ☐ Verify that all options on the transfer switch are adjusted and functional for the customer's requirements.
- ☐ Run the the load bank test.

Pre-start checks to be made

- ☐ Check and/or fill lube oil level per engine manufacturer's recommendations (and note). Also, check all hoses and clamps for tightness.
- ☐ Check and/or fill engine coolant per engine manufacturer's recommendations (and note). Also, check all hoses and clamps for tightness.
- ☐ Inspect all electrical connections for completion, quality, and safety per installation guide. In the case where items are not met, abort start-up until completed or corrected satisfactorily. (Consult the factory with questions.)
- ☐ Inspect unit mounts for completion. Rubber pad type mounts should be installed between unit base and concrete or sub-base tank. The anchor bolts should be double-nutted and not tightened to base to allow for slight movement. (See installation guide.) Note: Gen-set should never be mounted tightly to concrete due to inconsistencies in the surface that could cause twisting in the drive alignment and result in damage.
- ☐ Spring type mounts must be installed per Installation Guide.

- Inspect and/or make battery connections with respect to polarity and voltage. Incorrect installation can damage equipment.
- Inspect transfer switch installation. Be sure the ATS is free from all foreign materials (filings, metal particles and tools, etc.). Check all connections. Manually transfer before energizing.

Now that all the above checks are made and complete, the gen-set can be started in the manual position. (Note: do not transfer load at this time.)

- With gen-set running, check engine gauges and unit meters (oil pressure, water temperature, battery ammeter, AC voltage, and AC frequency) to see that the unit is operating accordingly. Also at this time check phase rotation of both normal and emergency sources and check voltage of both sources for proper match. (Always perform these checks at the ATS if possible.) If phase rotation is reversed, stop gen-set and correct. If voltage is incorrect readjust. When correct, stop gen-set. Put gen-set switch in auto position. (Unit should not start.)
- To Test system, shutting off utility power is recommended but not always possible. If necessary follow the ATS test procedures to put the system online. Make recordings of load test on warranty validation sheet. Include all meter readings. Watch for proper operation, leaks, etc., and make notes of such.
- When normal power is restored the ATS will timeout, re-transfer to normal, then, in most cases allow for engine cool down before stopping automatically. (Timing functions may vary.)

Final mechanical checks and visual inspection

- Check for oil leaks, note and/or repair as necessary.
- Check for coolant leaks, note and/or repair as necessary.
- Check exhaust for tightness and leaks, make necessary repairs.
- Check heater(s) and battery charger.
- Check belts for proper tension

Safety Switch Checks

- Start unit in manual position and perform static test on LOP, HWT, by switching terminal to ground until shutdown occurs. May take up to 20 seconds on LOP.
- Now restart unit again to test over-speed safety. Run engine speed slowly until shutdown occurs. Use speed adjust pot on electronic governors. Note: Do not pull throttle open fast. This could cause damage to unit. Speed must be raised slowly.
- Overcrank test: With unit in the off position, disconnect start solenoid wire #3 on engine controls. Then put switch in manual position. This will initiate start. After the programmed time, the over-crank light will come on. Times are as follows: One shot time – 45 seconds; Cycle crank time – 10 seconds crank, 10 seconds rest, total of 5 cycles. Reconnect wire and start unit to be sure unit is again fully operational. Stop unit. Put unit switch in automatic.
- Check existing generator is connected to ATS with both power and control.

Load Bank Test

- After pre-start checks are completed, load bank(s) can be connected to new generator preferably at the mainline breaker on gen-set. Provide sufficient load banks to match the output Kw rating of the generator and burn generator in for 4 hours.

Switch Type: __ ATS __ ATS/ Bypass __ w/ Acc.28 (Overlapping Neutral)

Pre- Operational Checks :

- Visual Inspection: Inspect and verify the following prior to Energizing any power source to the switch.
- Power termination's completed and properly dressed. __ YES __ NO
- Manually operate the ATS using the manual transfer handle to verify that the Barriers have been properly reinstalled. __ATS __ YES __ NO __ Bypass Sw. __ YES __ NO Important Note: If the ATS switch barriers are not properly re-installed, they can cause the switch to bind up during a transfer and cause severe damage to the switch and controls.
- Control termination's completed and properly dressed. __ YES __ NO
- Cabinet has been Cleaned of all construction dust and debris. __ YES __ NO
- Proper clearance has been maintained for maintenance. __ YES __ NO
- All cabinet hardware and mechanical fasteners installed. __ YES __ NO
- Switch Identification Nameplate installed. __ YES __ NO
- Optional- Communications equipment and termination's completed and properly dressed. __ YES __ NO
- Phase rotation: Normal source __ CW__CCW, Emergency source __CW__ CCW

Operational Checkout: Normal and Emergency power must be available to verify the following.

- Status Indications:__ Feat. 9A (ATS connected to Normal) __ YES __ NO
- Feat. 9B (ATS connected to Emergency) __ YES __ NO
- Feat. 9C (Normal Source available) __ YES __ NO
- Feat. 9D (Emergency Source available) __ YES __ NO
- Feat. 5 (Test Switch) __ YES __ NO
- Feat. 6B (Reset to Normal) __ YES __ NO
- Feat. 17 (Area Protection) __ YES __ NO
- Feat. 30B (Load Shed Controls) __ YES __ NO
- Feat. 30BL (ATS Load Shed Active Indication) __ YES __ NO
- ATS/Bypass Status Indications: Optional
- Bypass connected to Normal __ YES __ NO
- Bypass connected to Emergency __ YES __ NO
- Normal Source available __ YES __ NO
- Emergency Source available __ YES __ NO
- ATS connected to Normal __ YES __ NO
- ATS connected to Emergency __ YES __ NO
- ATS Disconnected __ YES __ NO
- ATS in TEST position __ YES __ NO
- ATS Connected __ YES __ NO

- ☐ Existing generator control and power is connected YES____NO____

Functional ATS Tests

- ☐ ATS Transfer Tests - __ Normal to Emergency
- ☐ Emergency to Normal

Functional ATS/Bypass/Isolation switch Tests. The following Bypass Switch transfer tests will be performed with the ATS DISCONNECTED.

- ☐ Bypass Switch Transfer Tests - __ Auto to Normal
- ☐ Normal to Auto to Emergency
- ☐ Emergency to Auto to Normal
- ☐ Normal to Auto

The following Automatic Transfer Switch tests will be performed with the ATS in the TEST position.

- ☐ ATS Transfer Tests - Normal to Emergency
- ☐ Emergency to Normal

The following Automatic Transfer Switch tests will be performed with the ATS in the CONNECTED position.

- ☐ ATS Transfer Tests - Normal to Emergency
- ☐ Emergency to Normal
- ☐ ATS Load Shed Tests - Shed ATS to Normal (No Normal Power available)
- ☐ Bypass ATS to Emergency

The following Automatic Transfer Switch tests will be performed with the ATS in the CONNECTED position.

- ☐ Simulate Generator and ATS failures to trigger automatic emails and texts to designated Client, Generator, and ATS personnel.

SECTION 26 09 33

ARCHITECTURAL LIGHTING CONTROLS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specification sections apply to work of this section.

B. Division-26 Basic Electrical Materials and Methods sections apply to work specified in this section.

1.2 SUMMARY

A. Provide and install dimming lighting controls as shown on drawings and as described in these Specifications.

B. Provide interface module for each dimming lighting control specified in this Section with the Building Lighting Control System specified in Section 26 09 43.

C. Provide all lighting controls as shown, completely wired, operative and securely attached to supports.

D. Where a catalog number and a narrative or pictorial description are provided, the written description shall take precedence and prevail.

E. General Contractor shall provide electrical subcontractor with entire lighting control specification (including illustrations and sketches); electrical subcontractor shall provide each specified manufacturer with complete information about the lighting controls they will supply.

F. Type of lighting controls shall be as indicated alphanumerically and as specified.

G. Lighting control details shown may be modified by the manufacturer provided all of the following conditions have been met:

1. Lighting control performance is equal or improved;
2. Performance of fixtures connected to lighting control is equal or improved;
3. Structural, mechanical, electrical, safety, and maintenance characteristics are equal or improved.
4. Cost to the Owner is reduced or equal.
5. Modifications have been reviewed by the Architect and have been approved by the Architect in writing.

1.3 SUBMITTALS

A. For standard catalog items with no modifications, submit catalog cut sheets prepared by the manufacturer. Cut sheets to clearly show all elements to be supplied and all corresponding product data (including dimming range, lamp and ballast compatibility, voltage, faceplate design and finish, accessories, options, all dimensions and any miscellaneous items detailed in the written description of the specification). If a cut sheet shows more than one (1) product, all non- applicable information shall be crossed out.

B. For standard cataloged lighting controls submit a complete list of materials, including catalog or part numbers, load schedule, address description, function and location.

C. For custom lighting controls submit a reproducible shop drawing prepared by the manufacturer and drawn to scale. Shop drawing to include the name and location of the project. Indicate all corresponding product data including all elements to be supplied, dimming range, lamp and ballast compatibility, voltage, faceplate design and finish, accessories, options, all dimensions and any miscellaneous items detailed in the written description of the specification.

D. For all submittals under paragraphs A through C above, manufacturer shall provide submittals within two weeks of receipt of order. All submittals shall have project name and lighting control type clearly shown.

E. Lighting control cuts and shop drawings shall be submitted in quantities and formats as described in the General Conditions Section of these Specifications.

F. The Engineer and Architect shall make the final determination as to whether or not the submittal contains sufficient information and reserves the right to request a shop drawing if the lighting control cut is insufficient.

1.4 SUBSTITUTIONS

A. Bidders' attention is called to the following procedure to be followed in submitting alternate lighting control manufacturers to those specified:

1. Request for approval shall be accompanied by working lighting control samples (with appropriate mechanical and electrical data, list of materials and finishes and unit cost to the Owner) of both the specified brand and the proposed substitutes as required to make complete comparison and evaluation. These samples shall be in addition to those required by these Specifications. The above data shall be delivered separately to the Architect and Engineer. The samples may be required to be furnished and installed, at the bidder's expense, at a location selected by the Architect. In addition, the bidder shall furnish the Architect and the Engineer with the name and location of at least one completed project where each proposed substitute has been in operation for a period of at least one year (12) months, as well as the names and addresses of the Owner, the Architect and the Lighting Designer.

1.5 QUALITY ASSURANCE

A. All lighting controls and assembled components shall be new, of good quality, and be approved by and bear the label of UL or other approved testing agency (i.e. CSA, ETL) unless otherwise specified in writing.

B. All lighting controls shall meet all required local, state and/or national building, electrical and energy codes and regulations.

1.6 CUSTOMER SUPPORT SERVICES

A. Commissioning: The manufacturer shall supply factory-trained representatives to commission the lighting control system. They shall verify that the contractor has properly installed and interconnected all supplied components. They shall start up all equipment and demonstrate that it meets the requirements of this specification.

B. Training: As part of the commissioning procedures, the manufacturer shall train the owner’s representatives in the operation of the system.

C. Technical Support: The manufacturer shall supply telephone support at no additional cost to the owner for the duration of the warranty period.

D. Replacement components: The manufacturer shall be able to ship replacement parts within 24 hours for any component that fails during the warranty period.

E. Extended Service Coverage: Maintenance agreements shall be available from the manufacturer to provide service for the system both during and after the warranty period.

1.7 WARRANTIES

A. All lighting controls, including parts and workmanship, shall have a warranty of a minimum of one year after the acceptance of the project by the Owner. Any lighting controls found to be defective during the warranty period will be repaired or replaced at no cost to the Owner.

1.8 DELIVERY, STORAGE AND HANDLING

A. Deliver lighting control equipment and components in factory-fabricated type containers or wrappings, which properly protect equipment from damage.

B. Store lighting control equipment in original packaging and protect from weather and construction traffic. Wherever possible, store indoors; where necessary to store outdoors, store above grade and enclose with watertight wrapping.

C. Handle lighting control equipment carefully to prevent physical damage to equipment and components. Do not install damaged equipment; remove from site and replace damaged equipment with new.

PART 2 - PRODUCTS

2.1 GENERAL MATERIAL REQUIREMENTS

A. Acceptable manufacturer: Lutron, etc. or approved equal.

B. Manufacturer's Qualifications: The basis of design is Lutron Grafic Eye 4000 series. Similar systems from other manufacturers that meet the functional and performance requirements listed herein will be considered. A detailed line-by-line compliance comparison shall be submitted for the Engineer's review of any alternate system. It is the sole responsibility of the Electrical contractor to ensure that all equipment meets the specifications.

C. Lighting controls shall be fully compatible with all specified fixtures, lamps, transformers and ballasts.

D. Unless otherwise specified, all lighting controls shall be by the same manufacturer.

1. The listing of a manufacture as "acceptable" does not imply automatic approval. It is the responsibility of the Contractor to ensure that any price quotations received and submittals are made for devices that meet or exceed these Specifications.

E. Lighting controls shall operate at the voltage shown in the LIGHTING FIXTURE SCHEDULE and confirmed on the electrical drawings.

F. Dimmers and preset dimming lighting controls shall operate the following sources/load types with a smooth continuous Square Law dimming curve. Dimmers shall also be capable of operating these sources on a non-dim basis. Dimmers shall be electronically assigned to the appropriate load type/dimming curve and can be reassigned at any time. Universal-type dimmers that do not adjust the dimming curve shall not be acceptable.

1. Incandescent, Tungsten and Magnetic Low Voltage Transformer
   a. Dimmer shall contain circuitry specifically designed to control and provide a symmetrical AC waveform to the input of magnetic low voltage transformers.
   b. Dimmer shall not cause a magnetic low voltage transformer to operate above the transformer's rated operating current and temperature.
   c. Dimmer shall contain circuitry to control dioded lamps.

2. Electronic Low Voltage Transformer
   a. No flicker or interaction shall occur at any point in the dimming range.
   b. For integral dimming, an interface shall be required.
3. Electronic Fluorescent Dimming Ballast
   a. Dimmer shall be rated to control ballasts for T-12, T-12 high output, T-8, and T-5 lamps as well as T-4 compact lamps. All lamps on the same circuit must have the same current rating (i.e., T-8), but may be different lengths (i.e., 3' and 4'). Ballasts for fluorescent fixtures must be manufactured by Lutron. The dimming performance shall be as specified in the Lighting Fixture Specifications.
4. Neon and Cold-Cathode
   a. Dimmer shall provide the ability to dim lamps down to 10% of full light output when used with normal (low) power factor transformers. Transformers shall be sized per table developed by dimming system manufacturer.
5. Non-Dim/Switched Loads
   a. Non-dim shall be rated to 16A of resistive, tungsten, induction, or capacitive loads. Non-dim shall incorporate an air gap relay to open circuit when load is off.

G. Dimming Panels

1. Panel shall be wall or floor mounted NEMA grade, constructed of sheet steel plates not less than #16 U.S gauge. Contractor shall reinforce wall as required for wall-mounted panels.
2. Panel shall be completely pre-wired by the manufacturer. The contractor shall be required to provide input feed wiring, load wiring, and control wiring. No other wiring or assembly by the contractor shall be permitted.
3. Unless otherwise indicated, panels shall contain branch circuit protection for each dimming module. Branch circuit breakers shall have the following performance characteristics:
   a. Be U.L listed under U.L 489 as molded case circuit breaker for use on lighting circuits.
   b. Contain a visual trip indicator and shall be rated at 10,000 AIC (120V) or 14,000 AIC (277V), unless otherwise noted.
   c. Be thermal-magnetic in construction for both overload and dead short protection. The use of fully magnetic breakers shall not be acceptable, even when used in conjunction with individual dimmer thermal cutouts.
   d. Be switched duty (SWD) rated so that the loads can be switched off via the breaker.
4. Panel shall be shipped with each dimmer in a BYPASS position via a jumper bar inserted between the input and load terminals. These jumpers shall carry the complete load current and shall be reusable at any time.
5. Panels shall be cooled via free-convection, unaided by fans, and capable of continuous operation to all of these Specifications within an ambient temperature range of 0°C (32°F) to 40°C (104°F).
6. Panel shall provide capability to electronically assign each circuit any zone in the dimming system. Panels using mechanical switches, rewiring, or EPROMS shall not be acceptable.
7. Multiple panels shall be capable of operating in one system, up to a maximum of 32 panels and 768 dimmers. Panels shall have the ability to control individual circuits without controls.
8. For panels fed with normal/emergency feeder, panel shall include electronics to bring all circuits to full on condition upon loss of normal power and subsequent presence of emergency power. Electronics shall switch both the intensity signal and the on/off signal of each dimmer connected to an emergency circuit between the local and a full-on constant drive supply. This type of emergency may be used with either a normal/emergency generator or a constant hot secondary utility feed where the emergency transfer occurs on the line side (upstream) of the dimming panel and requires only a single normal/emergency feeder.
9. Panels shall have the following additional characteristics:
   a. Be designed to prevent any foreign objects from coming into contact with any part of the panel which would be at an elevated temperature, such as the dimmer extrusions or heat fins.
   b. Be designed to provide airflow across the heat sink areas and through the dimmer chassis. Panel sections which provide airflow only across heat sinks shall not be mounted one above another in order to allow for adequate heat dissipation.

H. Dimming Modules

1. One type of modular dimming card shall be used for all sources. Systems requiring different types of modules or modular dimming cards shall not be acceptable.
2. A positive air gap relay shall be employed with each dimmer to ensure that the load circuits are open when the “off” function is selected at a control station. These relays need not be integral to the dimming module but must be integral to the dimming panel. Lighting control manufacturer shall provide necessary control interface(s) as part of the control system.
3. All dimmers shall be voltage regulated so that a nominal change in the voltage shall not cause a perceptible change in output voltage.
4. The silicon thyristors used to control the power furnished to the loads shall be both designed and tested to withstand surges, without impairment to performance, of 6000VA , 3000A (equivalent to near lightning strike) as specified by ANSI/IEEE std. C62.41. Upon request, the manufacturer shall provide a means to demonstrate conformance to this specification using the appropriate surge-generation equipment.
5. Under full-load conditions in a 40°C environment, all silicon thyristors shall operate at minimum 20°C safely margin below the component temperature rating.
6. Filtering shall be provided in each circuit so that the current rise time shall be at least 400 μsec at 50% rated dimmer capacity as measured from 10-90% of the load current waveform at a 90° conduction angle, and at no point rise faster than 30mA/μsec. Manufacturers should note that additional filters may be required to meet this specification. These filters need not be integral to the dimming module, but must be integral to the dimming cabinet.
7. Dimmer output voltage shall be a minimum 95% of input voltage at maximum intensity setting.
8. Minimum and maximum light levels shall be user adjustable for each dimmer.

I. Integral Dimming

1. Preset dimming controls shall be capable of operating at rated capacity without adversely affecting design lifetime.
2. Preset dimming controls shall mount individually in standard 2, 3, or 4-gang U.S wall boxes.
3. Preset dimming controls shall operate in an ambient temperature range of 0°C (32°F) to 40°C (104°F).
4. Preset dimming controls shall incorporate an airgap switch, which shall be accessible without removing faceplate. The airgap switch shall be capable of meeting applicable requirements of UL 20 for airgap switches in incandescent dimmers.
5. Preset dimming controls shall meet IEC 801-2, tested to withstand 15kV electrostatic discharge without damage or loss of memory.
6. Preset dimming controls shall meet ANSI/IEEE Std. C62.41-1980, tested to withstand voltage surges of up to 6000V and current surges up to 200A without damage.
7. Preset dimming controls shall meet the UL 20 limited short circuit test requirement for snap switches.
8. Preset dimming controls shall be voltage regulated.
9. Preset dimming controls shall utilize an LC filtering network to minimize interference with properly installed radio, audio, and video equipment.
10. Minimum light levels shall be user adjustable in order to compensate for different sources and loading.
11. Separate power booster/interface(s) shall increase dimmer capacity. Capacity shall range from 1000W/VA to 30,000W/VA. Quantities and size of each type of power booster shall be provided to control each type of load shown on the load schedule and/or the drawings.

J. Wall Box Dimmers

1. All devices shall be UL listed specifically for the required loads (i.e., incandescent, fluorescent, low voltage, electronic low voltage). Manufacturer shall provide file card upon request. Universal dimmers shall not be acceptable.
2. Manufacturer shall maintain ISO 9001 certification. Provide a copy of the certificate as part of the submittal.

3. All dimmers and switches shall incorporate an air gap which shall be accessible without removing the faceplate. The air gap switch shall be capable of meeting all applicable requirements of UL 20 and UL 1472 for air gap switches in incandescent dimmers.
4. All dimmers and switches shall provide power failure memory. Should power be interrupted and subsequently returned, the lights will come back on to the same levels set prior to the power interruption. Restoration to some other default level is not acceptable.
5. Dimmers and switches shall meet ANSI/IEEE Std.C62.41-1980, tested to withstand voltage surges of up to 6000V and current surges of up to 200A without damage.
6. Dimmers and switches shall meet the UL 20 and UL 1472 limited short circuit test requirement for snap switches.
7. Dimmer control shall be linear slide. Dimmer shall provide a smooth and continuous Square Law dimming curve.
8. Dimmer shall be voltage regulated so that +10% variation in line voltage shall cause not more than a +5% variation in load voltage when dimmer is operating at 40V (5% light output).
9. Dimmers shall utilize a LC filtering network to minimize interference with properly installed radio, audio, and video equipment.
10. Dimmer control slider shall be captured.
11. Faceplate shall snap on to device with no visible means of attachment. Heat-fins shall not be visible on front of device. At locations with multiple devices, one seamless, multi-gang faceplate shall be provided. Contractor is responsible for coordination of proper back box size and faceplate type.

K. Four Scene Preset Control

1. Controls shall provide access to 4 preset lighting scenes and off for up to 8 control zones. Control shall be capable of storing an additional 12 preset lighting scenes. Scenes shall be changeable as required. Up to 8 controls may be tied together for more than 8 zones. Controls shall incorporate built-in wide angle infrared receiver, providing control via a separate a separate infrared wireless remote control transmitter from up to 50 feet away. Preset shall be set via easy-to-use raise/lower switches, one raise and lower switch per zone. The intensity for each zone shall be indicated via an illuminated bargraph Programming of preset scenes shall be accomplished without the use of an ENTER or STORE button. One or more zones may be temporarily overridden without altering the scene values which are stored in memory. Lighting levels shall fade smoothly between scenes at time intervals of 0-59 seconds or 1 to 60 minutes. The fade time shall be separately selectable for each scene. Additionally, control shall provide power failure memory for ten years.
2. Manufacturer shall maintain ISO 9001 certification. Provide a copy of the certificate as part of the submittal.

L. Accessory Control Options

Provide the following controls for use with the preset control(s) as shown on the drawings and/or described in LIGHTING CONTROL DESCRIPTIONS:

1. Two Scene Entrance Control(s) shall be capable of recalling Scene One plus Off, Scenes 7 and 8, or Scenes 13 and 14. Also can be used as raise/lower partition control and Lockout. All above based on dipswitch settings.
2. Four Scene Control(s) shall be capable of recalling any one of four scenes, master raise/lower, and Off. Control shall provide access to up to 16 scenes.
3. Fine Tuning Control(s) shall allow the temporary override of a particular zone or zones from the preset light level.
4. Infrared Wireless Transmitter(s) shall be capable of recalling any one of four preset scenes and Off. In addition, a master raise/lower shall be provided. The transmitter shall be manufactured by the dimming system manufacturer. The range of the transmitter to any single receiver shall be at least 50 feet. Wall receiver shall incorporate buttons for four scene select, master raise/lower, and off. Ceiling receiver shall provide 360° view and an integral LED to provide feedback of proper infrared signal.

5. Special Function Control(s) shall provide the following functions:
   a. Sequencing shall allow the user to set up and operate a sequence of 4, 12, or 60 steps. A sequence shall be defined as a series of steps, while a step shall be defined as the recall of a scene. Each step interval is adjustable from 1 second to 60 minutes.
   b. Zone lockout shall allow temporary changes without altering light levels preset for each scene.
   c. Scene lockout shall lockout the control, maintaining current scene and disabling all buttons on the preset dimming controls.
   d. Fade override shall set all fade times to zero.
6. Partition Control(s) shall provide two or four buttons for operating multiple preset units independently or in combination. Each button shall have a corresponding LED to indicate status of a specific partition "door."
7. Photocell Interface Control(s) shall provide scene selection via daylight photosensor.
8. Equipment Interface(s) shall allow access to preset dimming control(s) via one of the following methods:
   a. Isolated momentary/maintained dry contact closures. Where indicated on the drawings, each interface shall provide isolated maintained contact closures rated at 200mA at 30VDC for pilot light status feedback.
   b. For use with four scene preset control, RS232 serial communication.
   c. For use with four scene preset control, astronomic time clock with 60 events/day and 4 schedules.
   d. For use with multiple area-centralized control, DMX512 interface with control of 32 continuous dimming zones via external DMX512 device.

M. Wiring of lighting controls shall comply with all applicable Sections of these Specifications, as well as manufacturer's specifications and local, state and/or national building, electrical and energy codes and regulations.

N. Equipment shall not use analog technology for communication.

O. Equipment shall be manufactured using surface mount technology.

PART 3 - EXECUTION

3.1 LOCATION

A. Locations of lighting controls are shown diagrammatically. Verify exact location and spacing with Plans, Sections and other reference data before ordering of lighting controls and during installation.

B. Notify Architect about field conditions at variance with Contract Documents before commencing installation.

C. Coordinate space conditions with other trades before ordering of lighting controls.

3.2 INSTALLATION

A. Wiring from dimming panel to preset dimming control and accessory controls shall be low voltage Class 2 wiring. All lighting control wiring shall be in an approved raceway specified in Section 26 05 33.

B. Provide accessories as required for construction type indicated on Finish Schedule. Lighting control catalog numbers do not necessarily denote specific mounting accessories for type of wall or surface in which a lighting control may be installed.

C. Provide adequate and sturdy support for each lighting control component. Contractor shall be responsible for verifying weight and mounting method of all lighting controls and furnishing and installing suitable supports. Lighting control mounting assemblies shall comply with all local codes and regulations.

D. Contractor shall be responsible for mounting the lighting controls at the proper depth, and for coordinating the cutout size and shape in wall to ensure that the faceplate covers the cutout entirely. Refer to drawings for location and mounting height of controls.

E. Install lighting controls with vent holes free of air-blocking obstacles.

F. Support elements shall not be mounted to or in contact with ducts or pipes.

G. Mask the lighting controls as necessary to protect the controls during construction.

H. At the completion of construction, clean the face plates and exposed surfaces of all lighting controls, so as to render them free of any material, substance or film foreign to the lighting control. Use soft, non-abrasive cloth and a cleaning solution recommended by the lighting control manufacturer. If the lighting controls are deemed dirty by the Architect at the completion of the project, the Contractor shall clean them at no additional cost to the Owner. Lighting control components whose finishes are damaged shall be replaced at no cost to the Owner.

I. Contractor shall furnish all equipment, labor and materials for the proper installation and system setup of all lighting controls and components as shown on drawings and as specified. System setup includes defining each dimmer's load type, assigning each load to a zone, and setting the control functions. System setup shall take place before building is turned over to Owner, after regular working hours where required.

3.3 FIELD SUPPORT

A. Upon completion of installation, the Manufacturer shall provide a qualified field technician to make one (1) visit to the project site for 5 days to assist the Contractor in commissioning the control system. Manufacturer to be capable of providing on-site service support within 24 hours anywhere in the continental U.S.A., and within five business days anywhere in the world, except where special visas are required.

B. A local factory-trained technician within 50 miles of the project is required. Spare parts should be stocked locally.

END OF SECTION

SECTION 260943 - Digital-Network Lighting Controls

PART 1 – GENERAL

1.1 SUMMARY

1.1 Section Includes:

1. Networked Central Lighting Control systems. Systems are composed of:
    a. Network integrated power switching systems.
    b. Network integrated dimming systems.
    c. Standalone power switching and dimming systems.
    d. Automation control processors.
    e. Sensors
    f. User Interfaces:
        1) Keypad
        2) Touch screen
        3) Virtual touch screen
2. System Functions and Sequences

A. Related Requirements:

1. Section 12 24 13 Roller Window Shades
2. Section 25 08 00 Commissioning of Integrated Automation
3. Section 25 10 00 Integrated Automation Network Equipment
4. Section 25 11 13 Integrated Automation Network Servers
5. Section 25 13 13 Integrated Automation Control and Monitoring Network Supervisory Control
6. Section 25 13 19 Integrated Automation Control and Monitoring Network Interoperability
7. Section 25 15 16 Integrated Automation Software for Control and Monitoring Networks
8. Section 26 05 00 Common Work Results for Electrical
9. Section 26 27 26 Wiring Devices
10. Section 26 51 00 Interior Lighting
11. Section 27 15 00 Communications Horizontal Cabling
12. Section 27 41 00 Audio-Video Systems

1.2 REFERENCES

A. Definitions

1. Control: Effecting a change in state by one PC program onto a microprocessor or device.
2. Scene: Predetermined light level of a single fixture of group of fixtures.
3. DALI: Digital addressable lighting interface.
4. RS-485: A serial network protocol complying with TIA-485-A.
5. UTP: Unshielded twisted pair.

B. Reference Standards

1. California Energy Commission (CEC):
2. CEC CCR Title 24, Part 6: California Energy Efficiency Standards for Residential and Nonresidential Buildings, California's Appliance Energy Efficiency program: Listed for lighting control devices.
3. National Fire Protection Association (NFPA):
4. NFPA 70 - National Electrical Code.
5. Underwriters Laboratories (UL)
   a. UL 508 – Industrial Control Equipment.
   b. UL924 – Emergency Lighting and power Equipment.
   c. UL1008 – Transfer Switch Equipment.

1.3 REQUIREMENTS

A. Coordination

1. Contractor shall place daylight and occupancy sensors per plans to achieve optimal performance. Proper placement shall be coordinated with others in order to avoid interference with prescribed lighting levels.
2. Contractor shall provide luminaries and lamps that are compatible with the lighting control system to be installed.
3. Contractor shall locate touch screen and keypad stations as per plans.
4. Contractor shall notify engineer of record of any conflicts or deviations from the contract documents to obtain direction prior to proceeding with work.

1.4 SYSTEM DESCRIPTION

A. Web Accessible, network connected, lighting control system utilizing preset control software, central signal microprocessor, lighting control panel including integrated branch circuit protection, and [power switching modules and relays] [Dimming Modules] [DALI Control Modules] [Sensors User Interfaces].

B. System Components: System includes the following addressable components:

1. Keypad controls.
2. Touch screen controls.
3. Window treatment controls.

4. Remote occupancy sensors.

5. Lighting load shedding.

6. Timed room lighting.

7. Daylight compensating lighting controls.

8. Communication interface to facility-wide room management system.

9. Communication interface to building automation system gateway/interface.

1.5 SUBMITTALS

A. Product Data: For each type of product required for complete network lighting control system, demonstrating compliance with requirements.

B. Shop Drawings: Indicated the following:

1. Schematic diagram showing complete network lighting control system and accessories.

2. Circuits and emergency circuits with capacity and phase, control zones, load type and voltage per circuit.

1.6 CLOSEOUT SUBMITTALS

A. Operating and maintenance manuals.

1.7 QUALITY ASSURANCE

A. Manufacturer Qualification: Manufacturer of network lighting controls with minimum [five] years record of satisfactory manufacturing and support of components comparable to basis of design system.

B. Source Requirements: Provide Network Lighting System through a single source from a single manufacturer.

C. Manufacturer Qualifications: Approved manufacturer of network lighting controls listed in this Section with minimum [five] years record of satisfactory manufacturing and support of components comparable to basis of design system.

1. Approval of Comparable Products: Submit the following in accordance with project substitution requirements, within time allowed for substitution review:

a. Product data, including certified independent test data indicating compliance with requirements.

b. Samples of each component.

c. Sample submittal from similar project.

d. Project references: Minimum of 5 installations not less than 5 years old, with Owner and Architect contact information.

e. Sample warranty.

2. Substitutions following award of contract are not allowed except as stipulated in Division 01 General Requirements.

D. Approved manufacturers must comply with separate requirements of Submittals Article.

E. Electrical Components, Devices, and Accessories: UL listed and labeled per NFPA 70.

F. California Appliance Efficiency Listing: Provide products that comply with provisions of CEC CCR Title 24, Part 6.

1.8 COORDINATION

A. Coordinate integrated lighting and dimming controls with systems and components specified in the following sections:

1. Division 11 Section "Audio-Visual Equipment".
2. Division 12 Section "Window Treatments".
3. Division 23 Section "Instrumentation and Control for HVAC".
4. Division 25 Section "Integrated Automation Control of Electrical Systems".
5. Division 26 Section "Panelboards".
6. Division 26 Section "Wiring Devices".
7. Division 26 Section "Lighting Devices".
8. Division 26 Section "Interior Lighting".
9. Division 27 Section "Communications Horizontal Cabling".
10. Division 27 Section “Audio-Video Systems”
11. Division 28 Section "Electronic Access Control and Intrusion Detection".

1.9 PROJECT CONDITIONS

A. Environmental Conditions Range:

1. Temperature: 32 – 104 deg F (0 - 40 deg C).
2. Relative Humidity: 10 – 90 percent, noncondensing.

1.10 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of modular dimming controls system the fail in materials or workmanship within the specified warranty period following substantial completion.

1. Warranty Period: Commercial lighting dimmers and switches, sensors, keypads, lighting enclosures, terminal blocks, power supplies, thermostats, and control processors, when dedicated for use as part of a commercial lighting control system: 5 year warranty
2. Manufacturer's Extended Support Service: Extended telephone support: Unlimited period.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. MANUFACTURERS: Subject to compliance with requirements, provide products by one of the following Manufacturers:

1. Crestron Electronics INC.

2. [XXXXXXXX]

3. [XXXXXXXX]

B. Substitutions:

1. All substitutions must be submitted in writing to the Engineer of Record within [14] days prior to bid date.

2. Proposed substitutions must be documented with a compliance review.

2.2 GENERAL

A. Contractor shall provide system hardware that is manufactured and warranted by a single manufacturer.

B. Provide control system with compatibility for BACNET/IP.

C. System shall provide time clock functionality as well as support for multiple interface devices.

D. System must automatically adjust for daylight savings time and leap year.

2.3 ZUM WIRED DIMMING SOLUTIONS

A. Load Controllers

1. ZUMNET-Junction Box Zone Controllers

a. Junction box mounted using ½" knockout.

b. 120/277 VAC input

c. Real-time Power monitoring

d. Connections

1) ZUMLINK RJ45 ports x 2 (Cresnet)

2) ZUMNET RJ45 ports x 2 (Ethernet)

3) Occ Sensor Input (24V, G, OCC)

4) Photo Sensor Input (24V, G, PHO)

5) Override Input (OVR, G)

6) Integrated Ethernet Switch allowing daisy chaining (up to 20 devices)

e. Products:

1) CRESTRON ZUMNET-JBOX-16A-LV (16A, 0-10V)

2) CRESTRON ZUMNET-JBOX-16A-DALI (16A, 1 DALI LOOP)

2. ZUMLINK-Junction Box Zone Controllers

a. Junction box mounted using ½" knockout.

b. 120/277 VAC input

c. Real-time Power monitoring

d. Connections

1) ZUMLINK RJ45 ports x 2 (Cresnet)

2) Occ Sensor Input (24V, G, OCC)

3) Photo Sensor Input (24V, G, PHO)

4) Override Input (OVR, G)

e. Products:

1) CRESTRON ZUMLINK-JBOX-16A-LV (16A, 0-10V)

2) CRESTRON ZUMLINK-JBOX-20A-SW (20A, SWITCHED)

3) CRESTRON ZUMLINK-JBOX-20A-PLUG (20A, SWITCHED PLUG LOAD)

4) CRESTRON ZUMLINK-JBOX-DIMU. (5A UNIVERSAL PHASE DIMMING)

B. User Interfaces

1. ZUMLINK-keypads

a. Field configurable remote keypad , engravable programmable buttons in number indicated, with Single Green LED indicator, configured to fit in standard single-gang box.

b. Trimmed using decorator style faceplate (not included) or Crestron decorator-style faceplates (FP-G series)

c. RJ45 connection for power and communication (2 x RJ45 ZUMLINK ports facing up)

d. Bluetooth connectivity

e. Minimum Buttons: 2, Maximum Buttons:8.

f. Color shall be White

g. Mounting: Mounts in a 1-gang or larger electrical box or mud ring

h. Products

1) ZUMLINK-KP

2) ZUMLINK-KP-GOV

a) No Bluetooth

2. ZUMLINK-WAP

a. Wireless Access Point for ZUMMESH system integration

b. Mounting: Mounts in a 1-gang box.

c. RJ45 connection for power and communication (2 x RJ45 ZUMLINK ports)

d. Supports integration of ZUMMESH wireless communication products using a Wi-Fi friendly 2.4 GHz peer-to-peer mesh network topology.

e. Supports integration of 6 zummesh battery devices and 20 AC powered devices

3. ZUMLINK-IO

a. Control Port Expansion Module

1) 4 x Contact Closure Inputs

2) 2 x Contact Closure Outputs

3) Bi-directional RS232 for room control

b. RJ45 ZUMLINK connection for power and communication (2 x RJ45 ZUMLINK ports)

c. Product: ZUMLINK-IO

4. ZUMLINK-PART

a. Partition Sensor Integration Module

b. Accepts signal from GLS-PART-CN Partition Sensor

c. RJ45 connection for power and communication (4 x RJ45 ZUMLINK ports)

d. Product: ZUMLINK-PART

C. Networking the wired Spaces

1. Zumwired spaces shall be networked together to enable time clock, load shedding and global management features.

2. The space shall be networked using a ZUMNET RJ45 ports (Ethernet)

3. Networking the space shall incorporate BMS integration as specified hereto after.

D. Devices

1. Floor Hub

a. Connects up to 1000 Rooms connected via ZUMNET.

b. Contains astronomical time clock.

c. Maintenance is performed via standard web browser.

d. 1 rack unit mounted

Product: Crestron ZUM-FLOOR-HUB

2.4 ZUM WIRELESS DIMMING SOLUTIONS

A. Wireless technology shall be fully compatible and scalable with all manufacturer lighting control solutions

B. All batteries shall be field replaceable with non-proprietary standard sizes

C. Wireless device characteristics

1. Lighting control devices shall communicate using a Wi-Fi friendly 2.4 GHz peer-to-peer mesh network topology.

2. Devices shall be commissionable as an autonomous control system without the need for additional equipment.

3. Each device shall auto negotiate its RF channel to avoid noisy commercial environments.

4. Shall be secured using 128-bit encryption.

5. Up to 32 devices can make up a space.

6. The range within wireless devices shall be 50'.

D. Devices

1. Junction Box Zone Controllers

a. ZUMMESH Wireless Communication.

b. Junction box mounted using ½" knockout.

c. 120/277 VAC input

d. Products:

1) Crestron ZUMMESH-JBOX-16A-SW (16A, SWITCHED)

2) CRESTRON ZUMMESH-JBOX-5A-LV (5A, 0-10V)

3) CRESTRON ZUMMESH-JBOX-16A-LV (16A, 0-10V)

4) CRESTRON ZUMMESH-JBOX-20A-PLUG (20A, SWITCHED PLUG LOAD)

5) CRESTRON ZUMMESH-JBOX-DALI-1. (1 DALI LOOP)

6) CRESTRON ZUMMESH-EXP-JBOX-16A-DIMU. (16A UNIVERSAL PHASE DIMMING)

2. Wall Box Zone Controllers

a. ZUMMESH Wireless Communication

b. Trimmed using gangable decorator trim plates

c. Mounted in 3.5" back box.

d. Color shall be white [black] [Almond]

e. Products:

1) Crestron ZUMMESH-5A-SW-W-[B][A] - S (switched load, 5A)

2) Crestron ZUMMESH-5A-LV-W-[B][A] - (0-10v dimmed load, 5 amps)

3) Crestron ZUMMESH-DIM-W-[B][A] - (forward phase load, 4 amps)

4) Crestron ZUMMESH-DELV-W-[B][A] - (reverse phase load, 4 amps)

3. Keypads (Battery Powered)

a. ZUMMESH wireless communication

b. Electrical Box, wall, or glass mount

c. Trimmed using gangable decorator trim plates

d. Replaceable coin cell battery (5-year life)

e. Color shall be white [black] [Almond]

f. 1 Button (rocker with ON/OFF/DIM UP/DIM DOWN features)

1) Product: Crestron ZUMMESH-KP10ABATT-W [B][A]-S

g. 4 Button (ON/SCENE 1/SCENE 2/OFF)

1) Product: Crestron ZUMMESH-KP10BBATT-W-[B][A]-S

h. 6 Button (ON/SCENE 1/SCENE 2/OFF/DIM UP/DIM DOWN)

1) Product: Crestron ZUMMESH-KP10CBATT-W-[B][A]-S

i. 6 Button (ON/SCENE 1/SENSOR DISABLE/OFF/DIM UP/ DIM DOWN)

1) Sensor Disable – Lights will not turn off automatically for 2 hours.

2) Product: Crestron ZUMMESH-KP10DBATT-W-[B][A]-S

4. Keypads (AC Powered)

a. ZUMMESH wireless communication

b. Electrical Box Mountable

c. Trimmed using gangable decorator trim plates

d. 120/277 VAC input

e. Color shall be white [Black][Almond]

f. 1 Button (Rocker with ON/OFF/DIM UP/DIM DOWN features)

1) Product: Crestron ZUMMMESH-KP10A-W-[B][A]-S

g. 4 Button (ON/SCENE 1/SCENE 2/OFF)

1) Product: Crestron ZUMMESH-KP10B-W-[B][A]-S

5. Dual Loop daylight sensors

a. ZUMMESH wireless communication

b. Uses open and closed loop technologies for auto calibration

c. Open loop sensing technology for daily sensing

d. Replaceable (2) lithium-ion AAA batteries (10-yr life)

e. Product: Crestron ZUMMESH-PHOTOCELL-BATT

6. Motion Sensors

a. ZUMMESH wireless communication

b. Passive infrared sensing technology

c. Ceiling Mounted

d. 500 SQFT. Coverage (8-12 ft. ceilings)

e. Grace Occupancy – When lights turn off due to vacancy, a 15-second grace period starts during which the room lights can be turned on again by waving a hand to trigger the sensors.

f. Vacancy sensors shall go to occupancy mode when keypad low battery detected.

g. Replaceable lithium-ion 9V battery (10-Year life)

h. Products:

1) Crestron ZUMMESH-PIR-OCCUPANCY-BATT (auto on, auto off)

2) Crestron ZUMMESH-PIR-VACANCY-BATT (manual on, auto off)

7. Partition Sensor

a. ZUMMESH wireless communication

b. 24 VDC Input

c. Sensor Technology: Diffuse reflective

d. Light Source: Pulse modulated infrared LED

e. Mounts in a 1-gang US electrical box

f. Product: ZUMMESH-PART

8. Sensor Interface Device

a. ZUMMESH wireless communication

b. Junction box mounted using ½" knockout

c. 120/277 VAC Input

d. Supplies 24 VDC, 250MA to connected sensors wired in parallel

e. Product: ZUMMESH-JBOX-SIM

E. Networking the Wireless Spaces

1. Wireless spaces shall be networked together to enable time clock, load shedding and global management features.

2. The space shall be networked using a Wi-Fi friendly 2.4 GHz mesh network topology.

3. The range between the wireless devices shall be no more than 150'

4. The wireless technology shall be Crestron zūm Net.

5. Networking the space shall incorporate BMS integration as specified hereto after.

6. Wireless solutions shall be fully compatible with all other lighting control solutions specified herein.

F. Devices

1. Wireless Bridge

a. Each space shall have minimum one wireless bridge that links the space with the network connection.

b. Wireless bridge shall enable IOS or Android app to configure space using Bluetooth technology.

c. Crestron Zūm wireless bridge shall have communication with up to 32 MESH devices.

d. Product: ZUMMESH-NETBRIDGE

2. Wireless Gateway

a. Crestron Zūm NET gateway shall have bi-directional MESH communication with up to 50 ZUMMESH-NETBRIDGE devices.

b. Powered via IEEE 802.3 at Type 1.

c. Product: Crestron ZUMNET-GATEWAY

3. Floor Hub

a. Connects up to 1000 Crestron ZUMMESH-NETBRIDGE devices.

b. Contains astronomical time clock.

c. Maintenance is performed via standard web browser.

d. 1 rack unit mounted

e. Product: Crestron ZUM-FLOOR-HUB

2.5 WIRED LOAD CONTROLLERS

A. Product Family: Crestron Spacebuilder GLPP

1. Characteristics:

a. Provide 1, 2, or 3 zone lighting controllers for 0-10v zones.

b. Shall operate as an autonomous lighting controller for the space.

c. All sensors and zones within the space shall be controlled without additional equipment.

d. Lighting controller shall be surface-mounted. Industrial control enclosure mounts directly on two side by side 4” square electrical junction boxes, suitable for concealed locations.

e. Circuit Input: 100 – 277 VAC, 50/60 Hz. Input, one 16 amp.

f. [Lighting controller shall be networked as part of the building wide lighting control system using Cresnet communication]

2. Zone Outputs

g. 1,2, or 3 high inrush mechanically held relays for switching loads.

h. 1,000,000 cycle mechanically latching relays

i. Zero-cross arc-less high inrush

j. Air gap off protection on each channel

k. 0-10v dimming models shall include 0-10v 4 wire dimming for each channel.

3. Products

a. Crestron GLPP-SWCN (1 Zone Switching)

b. Crestron GLPP-1SW2CN (2 Zone switching)

c. Crestron GLPP-1SW3CN (3 Zone switching)

d. Crestron GLPP-DIMFLVCN-PM (1 ZONE 0-10v with Power Monitoring)

e. Crestron GLPP-1DIMFLV2CN-PM (2 ZONE 0-10v with Power Monitoring)

f. Crestron GLPP-1DIMFLV3CN-PM (3 ZONE 0-10v with Power Monitoring)

B. Product Family: Crestron GLPAC

1. Characteristics

a. Provide 4 or 8 zone lighting controller for switching or 0-10v zones.

b. Unit shall operate as an autonomous lighting controller for the space.

c. Up to 4 occupancy sensors and photocells per space

d. Up to 10 devices can connect without additional power

e. [Lighting controller shall be networked as part of the building wide lighting control system using ethernet communication]

f. Lighting controller shall be a surface-mounted NEMA 1 industrial control enclosure, suitable for concealed locations.

2. Zone Outputs

a. 4 or 8 circuit inputs

b. 100 – 277 VAC, 50/60 HZ. 16amps each.

c. [Barriered 4 normal and 4 emergency relays (-4E models only)]

d. 4 or 8 zone outputs

e. 100,000 cycle mechanically latching relays

f. Air gap off protection on each channel.

g. 0-10v 4-wire dimming for each channel (60mA max current sink)

h. Override port for UL924 life safety applications

i. [Real time power monitoring on all channels (-PM models only)]

j. [4 normally open isolated relays (-PM models only)]

k. [Chicago Plenum rated enclosure (-CP models only)]

3. Products

a. Crestron GLPAC-DIMFLV4 [-CP] [-PM] (4-CH controller)

b. Crestron GLPAC-DIMFLV8 [-CP] [-PM] (8-CH controller)

c. Crestron GLPAC-DIMFLV8-4E [-CP] [-PM] (4-ch NORMAL & 4-ch emergency controller)

C. Product Family: CAEN, CAEN MLO

1. Characteristics

a. Panel shall be digitally addressable using serial or Ethernet communication from Control Processor Panel specified here to after.

b. Lighting dimmers shall be compatible with drivers / ballasts and LEDs / lamps as listed in SS26 50 00 LIGHTING.

c. Dimmers shall be provided in quantities, control types, and rated for the connected load as shown on the Contract Drawings.

d. Line and load phases shall be coordinated per manufacturers recommendations.

e. Dimming modules shall be field replaceable.

f. Dimming panels shall be listed to UL508.

g. Emergency Override: Remote override capability.

h. Microprocessor based control for time clock override and remote dimming.

i. Lighting control panels shall comply with NEMA PB 1 and UL 50 (CAN/CSA C22.2, No. 94), UL 67 (CSA C22.2, No. 29), UL 489 (CAN/CSA C22.2, No. 65), and UL 916 (CSA C22.2, No. 205).

j. Panel may contain Crestron 3-Series Control Processor

1) Product: Crestron DIN-AP3

k. Panel may contain 24V power supply

1) Product: Crestron DIN-PWS60

l. Panel may contain ethernet to serial converter

1) Product: Crestron DIN-CENCN-2

2. FEED TYPES

a. Reference contract drawing schedules for required feed types and breaker ratings

b. FEED-THROUGH (FT)

1) No Branch circuit overcurrent protection.

c. Main Lug Only (MLO)

1) 120vac 3-phase; 120/240 VAC split-phase

a) 20 AMP thermal magnetic BREAKER

b) AIC rated to 10,000A

c) 20 breakers max per enclosure.

3. Control Modules

a. GL-CAEN-4HSW4-KIT

1) (4) 16A High Inrush Switching Outputs

2) Arc-less high inrush, lifetime rated minimum 1,000,000 on/off cycles, with air gap off protection.

3) 120V AC, 50/60 Hz.

4) 32 degrees to 104 degrees Fahrenheit

5) UL924 for emergency lighting control.

b. GL-CAEN-2DIMFLV8- [277]-KIT

1) (8) 4A 0-10V LED, fluorescent or switching outputs

2) [120] – [277] V, 50/60Hz.

3) 32 to 104 degrees Fahrenheit

4) UL924 for emergency lighting control.

c. GL-CAEN-2DIMU8-[277]-KIT

1) (8) 4A Forward, Reverse Phase or switching outputs

2) [120] – [277] V, 50/60Hz.

3) 32 to 104 degrees Fahrenheit

4) UL924 for emergency lighting control.

d. CLX-1DIMU4-HP

1) (4) Forward, Reverse Phase or switching outputs.

2) Up to 16A total, 10A Max per output.

3) 120 V, 50/60Hz.

4) 32 to 104 degrees Fahrenheit.

5) UL924 for emergency lighting control.

e. GL-CAEN-2DIM8-[277]-KIT

1) (8) 4A Forward, Reverse Phase or switching outputs

2) [120] – [277] V, 50/60Hz.

3) 32 to 104 degrees Fahrenheit

4) UL924 for emergency lighting control.

f. CLX-1FAN4

1) 4 Fan Control Channels

2) 2 Amps Per Channel

3) Module Total 8 Amps

4) Load Types Ceiling Fan Motors

5) 32 to 104 degrees Fahrenheit

6) 120 Volts AC, 50/60Hz, single-phase

4. Enclosures CAEN-FT

a. CAEN-2x1

1) 16AWG Galvanized steel backbox

2) Height: 23.50 in (596.9 mm)

3) Width: 14.38 in (365.1 mm)

4) Depth: 4.00 in (101.6 mm)

5) 120-277 VAC.

b. CAEN-4x1

1) 16AWG Galvanized steel backbox

2) Height: 38.25 in (971.6 mm)

3) Width: 14.38 in (365.1 mm)

4) Depth: 4.00 in (101.6 mm)

5) 120-277 VAC.

c. CAEN-7x1

1) 16AWG Galvanized steel backbox

2) Height: 62.00 in (1574.8 mm)

3) Width: 14.38 in (365.1 mm)

4) Depth: 4.00 in (101.6 mm)

5) 120-277 VAC.

d. CAEN-4x2

1) 16AWG Galvanized steel backbox

2) Height: 38.25 in (971.6 mm)

3) Width: 25.50 in (647.7 mm)

4) Depth: 4.00 in (101.6 mm)

5) 120-277 VAC.

e. CAEN-7x2

1) 16AWG Galvanized steel backbox

2) Height: 62.00 in (1574.8 mm)

3) Width: 25.50 in (647.7 mm)

4) Depth: 4.00 in (101,6 mm)

5) 120-277 VAC.

5. Enclosures CAEN-MLO

a. CAEN-3x1-MLO-120/3P

1) 16AWG Galvanized steel backbox

2) Height: 39.65 in (1008 mm);

3) Width: 16.10 in (409 mm);

4) Depth: 4.98 in (127 mm)

5) 120/208 AC, 225 Amps MAX.

b. CAEN-5x1-MLO-120/3P

1) 16AWG Galvanized steel backbox

2) Height: 62.75 in (1594 mm);

3) Width: 16.10 in (409 mm);

4) Depth: 4.98 in (127 mm)

5) 120/208 AC, 225 Amps MAX.

c. CAEN-5x2-MLO-120/3P

1) 16AWG Galvanized steel backbox

2) Height: 62.75 in (1594 mm);

3) Width: 27.25 in (693 mm);

4) Depth: 4.98 in (127 mm)

5) 120/208 AC, 225 Amps MAX.

D. Product Family: GLEX-FT, GLEP-MLO

1. Characteristics: GLEX-FT

a. Panel shall be digitally addressable using serial or Ethernet communication from Control Processor Panel specified here to after.

b. Lighting dimmers shall be compatible with drivers / ballasts and LEDs / lamps as listed in SS26 50 00 LIGHTING.

c. Dimmers shall be provided in quantities, control types, and rated for the connected load as shown on the Contract Drawings.

d. Line and load phases shall be coordinated per manufacturers recommendations.

e. Dimming modules shall be field replaceable.

f. Dimming panels shall be listed to UL508.

g. Dimming panels shall be listed to UL924.

h. Emergency Override: Remote override capability.

i. Microprocessor based control for time clock override and remote dimming.

j. Lighting control panels shall comply with NEMA PB 1 and UL 50 (CAN/CSA C22.2, No. 94), UL 67 (CSA C22.2, No. 29), UL 489 (CAN/CSA C22.2, No. 65), and UL 916 (CSA C22.2, No. 205).

k. No Branch circuit overcurrent protection.

l. All SpaceBuilder panels will be UL508 factory assembled.

m. Panels may contain 3-series control processor.

1) Product: Crestron DIN-AP3

n. Panel may contain 24V power supply

1) Product: Crestron DIN-PWS60

o. Panel may contain ethernet to serial converter

1) Product: Crestron DIN-CENCN-2

2. Control Modules

a. GLXP-DIMFLV8-LP

1) (8) 16A 0-10V LED, fluorescent or switching outputs.

2) Arc-less high inrush, lifetime rated minimum 1,000,000 on/off cycles, with air gap off protection.

3) 120-277 VAC, 50/60 Hz.

4) 32 degrees to 104 degrees Fahrenheit

5) UL924 for emergency lighting control.

b. GLXP-SW16-LP

1) (16) 16A switching outputs

2) 120-277 VAC, 50/60 Hz.

3) 32 to 104 degrees Fahrenheit

4) UL924 for emergency lighting control.

5) 500,000 on/off cycles

c. GLXP-HSW12-LP

1) (12) 16A High-Inrush switching outputs.

2) 120-277 VAC, 50/60 Hz.

3) 32 to 104 degrees Fahrenheit

4) Arc-less high inrush, lifetime rated minimum 1,000,000 on/off cycles, with air gap off protection.

5) UL924 for emergency lighting control.

d. GLXX-2DIM8

1) (8) (4A) Forward Phase, 2-wire or switching outputs.

2) 4 channels of 3-wire fluorescent dimming.

3) 120 – 277 VAC, 50/60Hz.

4) 32 to 104 degrees Fahrenheit.

e. GLXX-HDSW8

1) Up to 8 channels of heavy duty modular relays

a) Relays: GLR-HD-1P and GLR-HD-2P

b) Supports 120, 230, 277 & 347 Volt applications

2) Requires 24 Volts DC, delivered via 16 pin GLXX-CTRL

f. GLXX-HDSW16

1) Up to 8 channels of heavy duty modular relays

a) Relays: GLR-HD-1P and GLR-HD-2P

b) Supports 120, 230, 277 & 347 Volt applications

2) Requires 24 Volts DC, delivered via 16 pin GLXX-CTRL

3. Enclosures GLEX-FT

a. GLEX-FT-24

1) 16AWG Galvanized steel backbox. Surface Mount.

2) Height: 124.25 in (616 mm)

3) Width: 16.13 in (409 mm)

4) Depth: 4.44 in (113 mm)

5) 120-277 VAC.

b. GLEX-FT-56

1) 16AWG Galvanized steel backbox

2) Height: 39.66 in (1007 mm)

3) Width: 16.13 in (409 mm)

4) Depth: 4.44 in (113 mm)

5) 120-277 VAC.

c. GLEX-FT-84-HC

1) 16AWG Galvanized steel backbox

2) Height: 63 in (1600.2 mm)

3) Width: 15.25 in (387.35mm)

4) Depth: 4.5 in (114.3 mm)

5) 120-277 VAC.

4. Enclosures GLEP-MLO

a. GLEP-277-30

1) 16AWG Galvanized steel backbox

2) Height: 70 in (1778 mm)

3) Width: 20.25 in (514 mm)

4) Depth: 6.63 in (168 mm)

5) 30 Zone cabinet @ 277V VAC

b. GLEP-120-30

1) 16AWG Galvanized steel backbox

2) Height: 70 in (1778 mm)

3) Width: 20.25 in (514 mm)

4) Depth: 6.63 in (168 mm)

5) 30 Zone cabinet @ 120V VAC

c. GLEP-277-42

1) 16AWG Galvanized steel backbox

2) Height: 78 15/16 in (2005 mm)

3) Width: 20.25 in (514 mm)

4) Depth: 6.63 in (168 mm)

5) 42 Zone cabinet @ 277V VAC

d. GLEP-120-42

1) 16AWG Galvanized steel backbox

2) Height: 78.93 in (2005 mm)

3) Width: 20.25 in (514 mm)

4) Depth: 6.63 in (168 mm)

5) 42 Zone cabinet @ 120V VAC

e. Branch Circuit Breakers

1) 120V/10K AIC

a) 120 VAC 20 AMP

b) Product: GLE/GLEPB-120-20A-10K

2) 120V/22K AIC

a) 120 VAC 20 AMP

b) Product: GLE/GLEPB-120-20A-22K

3) 120V/65K AIC

a) 120 VAC 20 AMP

b) Product: GLE/GLEPB-120-20A-65K

4) 277V/18K AIC

a) 277 VAC 20 AMP

b) Product: GLE/GLEPB-277-20A-18K

5) 277V/35K AIC

a) 277 VAC 20 AMP

b) Product: GLE/GLEPB-277-20A-35K

6) 277V/65K AIC

a) 277 VAC 20 AMP

b) Product: GLE/GLEPB-277-20A-65K

E. Product Family: DIN

1. Characteristics

a. Panel shall be digitally addressable using serial or Ethernet communication from Control Processor Panel specified here to after.

b. Lighting dimmers shall be compatible with drivers / ballasts and LEDs / lamps as listed in SS26 50 00 LIGHTING.

c. Dimmers shall be provided in quantities, control types, and rated for the connected load as shown on the Contract Drawings.

d. Dimming modules shall be field replaceable.

e. Dimming panels shall be listed to UL508.

f. Dimming panels shall be listed to UL924.

g. Emergency Override: Remote override capability.

h. Microprocessor based control for time clock override and remote dimming.

i. Lighting control panels shall comply with NEMA PB 1 and UL 50 (CAN/CSA C22.2, No. 94), UL 67 (CSA C22.2, No. 29), UL 489 (CAN/CSA C22.2, No. 65), and UL 916 (CSA C22.2, No. 205).

j. Panel may contain 3-series control processor.

1) Product: Crestron DIN-AP3

k. Panel may contain 24V power supply

1) Product: Crestron DIN-PWS60

l. Panel may contain serial hub capable of 3 subnets

1) Product: Crestron DIN-HUB

m. Panel may contain ethernet to serial converter

1) Product: Crestron DIN-CENCN-2

n. Cabinet may contain POE Switch

1) Product: CEN-SW-POE-5

F. Enclosures

1. Enclosure Family: DIN-EN

a. DIN-EN-2X18

1) 16AWG Galvanized steel backbox

2) Height: 12.32 in (323 mm)

3) Width: 14.13 in (359 mm)

4) Depth: 4.38 in (111 mm)

5) 120-277 VAC.

6) DIN Rail Detail: (2) 342 mm x 35 mm rails

b. DIN-EN-3X18

1) 16AWG Galvanized steel backbox

2) Height: 23.50 in (597 mm)

3) Width: 14.38 in (366 mm)

4) Depth: 4.44 in (113 mm)

5) 120-277 VAC.

6) DIN Rail Detail: (3) 342 mm x 35 mm rails

c. DIN-EN-6X18

1) 16AWG Galvanized steel backbox

2) Height: 38.88 in (989 mm)

3) Width: 14.38 in (366 mm)

4) Depth: 4.44 in (113 mm)

5) 120-277 VAC.

6) DIN Rail Detail: (6) 342 mm x 35 mm rails

d. GLEX-FT-84-HC

1) 16AWG Galvanized steel backbox

2) Height: 63 in (1600.2 mm)

3) Width: 15.25 in (387.35mm)

4) Depth: 4.5 in (114.3 mm)

5) 120-277 VAC.

6) DIN Rail Detail: (10) 342 mm x 35 mm rails

2. Control Modules

a. DIN-DALI-2

1) Din-rail mount Module shall contain 2 channels of digital DALI loop containing 64 devices per channel.

2) Sensors and user interfaces shall not reside on the DALI bus. These accessories shall be networked to the DALI interface controller as part of the turnkey solution. Reference specifications hereto after for more details on sensor and user interface selections that shall be compatible with the turnkey DALI solution.

3) The DALI bus shall be class 2 (1) twisted pair #18 AWG or larger and be shielded. Install in free air per DIV 26.

4) Module shall contain an override input to allow an external contact closure to override the control system program and force each device to its “System failure level”

5) Module shall contain an internal power supply

6) 32 to 104 degrees Fahrenheit operating temperature

7) DIN-DALI-2 module is utilized in GL-DALI spacebuilder

b. DIN-DMX- [1][2] UNIVERSE

1) DIN-rail mountable module shall contain [1] or [2] universe of DMX control.

2) Controller shall allow individually controllable and independently running timelines and scenes.

3) Controller shall be scalable allowing multiple units to connect via ethernet.

4) Programmed and configured using proprietary system software.

5) Shall support RDM, SACN, and ART-NET.

6) DIN-DMX module is utilized in GL-DMX spacebuilder

c. GLA-ISP-4R-RJ45A

1) DIN-rail mountable module shall contain 4 optically isolated DMX outputs

2) Shall support RDM, SACN, and ART-NET.

3) Terminations utilize convenient RJ45 568B connections

d. DIN-AO8

1) Eight 0-10V analog output control ports

2) Interface for 3rd-party lighting and heating/cooling

3) Fully programmable functionality via DIN-AP2

4) Setup via front panel or software

5) Override input

6) Cresnet communications

7) 6M wide DIN rail mounting

e. DIN-IO8

1) 8 Versiport I/O ports

2) Interface for 3rd-party sensors, detectors, contact closures, and alarms

3) Fully programmable functionality via DIN-AP2

4) Cresnet communications

5) 6M wide DIN rail mounting

f. DIN-4DIMFLV4

1) Provides 4 channels of 0-10 Volt dimming control

2) Supports 120 and 220 to 240 Volt, 50/60 Hz applications

3) Allows switching of lighting and exhaust fans[1]

4) Includes an override input

5) Communicates using Cresnet®

6) Sets up via the front panel or through software

7) Offers programmable functionality via DIN-AP3

8) Mounts on a 9M wide DIN rail

9) CEC Title 24 2013 Compliant

g. DIN-1DIM4

1) 4 channels of dimming

2) 120 to 277 Volt 50/60 Hz operation

3) Selectable non-dim mode

4) Master air-gap relay

5) Override input

6) Cresnet® communications

7) Setup via front panel or software

8) Programmable functionality via DIN-AP3

9) 12M wide DIN rail mounting

10) CEC Title 24 2013 Compliant

h. DIN-1DIMU4

1) 4 channels of forward or reverse phase dimming

2) Auto load detection

3) 120 to 240 Volt 50/60 Hz operation

4) Selectable non-dim mode

5) Extreme stability in noisy environments

6) Short circuit and overload protection

7) Master air-gap relay

8) Override input

9) Cresnet® communications

10) Setup via front panel or software

11) Programmable functionality via DIN-AP3

12) 12M wide DIN rail mounting

13) CEC Title 24 2013 Compliant

i. DIN-8SW8-I

1) 8 channels of power switching

2) 8 voltage-driven isolated digital inputs

3) Support for 120 to 240 Volt 50/60 Hz lighting and motor loads

4) Override input

5) Cresnet® communications

6) Setup via front panel or software

7) Programmable functionality

8) 9M wide DIN rail mounting

j. DIN-SACN-DMX

1) Converts between DMX512A and sACN, Art-Net, or ESP protocols

2) Enables distribution of DMX over Ethernet or Wi-Fi®

3) Enables Crestron® control of DMX lighting fixtures and systems

4) Supports a single universe Ethernet to DMX node in output mode

5) Supports a single universe DMX to Ethernet node in input mode

6) Supports broadcast or unicast (unicast in input mode only)

7) Supports HTP/LTP merging of up to 2 DMX sources (output mode only)

8) Supports RDM over Art-Net

9) Easy web browser based setup and firmware update

10) 4U 35 mm DIN rail mountable

11) PoE or 7-24 Volt DC powered (power supply not included)

2.6 USER INTERFACES

A. Product: Crestron C2N-CBD-P-W [B][A]-S

1. Provide keypad quantities and locations as specified herein and shown on the contract drawings.

2. Field configurable remote keypad with auto-adjusting backlight illuminating replaceable, engravable programmable buttons in number indicated, with white LED indicators, configured to fit in standard single-gang box.

3. Trimmed using decorator style faceplate (not included) or Crestron decorator-style faceplates (FP-G series)

4. Cresnet connected for power and communication

5. Minimum Buttons: 2, Maximum Buttons: 8.

6. Color shall be White [black][almond].

7. Mounting: Mounts in a 1-gang or larger electrical box or mud ring

B. Product: Crestron GLPPA-KP[1][2][3][4]-W [B][A]-S

1. Connects to lighting controller with class II (2) #18 AWG or greater conductors.

2. Colors shall be white [black] [almond].

3. Scene Functions

a. Rocker (ON/OFF/hold to dim) or 4 Button (ONSCENE 1/SCENE 2/OFF)

1) Product: Crestron GLPPA-KP-W [B][A]-S

4. Zone Functions

a. Rocker controlling zone 1 (ON/OFF/hold to dim)

1) Product: Crestron GLPPA-KP1-W[B][A]-S

b. Rocker controlling zone 2 (ON/OFF/hold to dim)

1) Product: Crestron GLPPA-KP2-W[B][A]-S

c. Rocker controlling zone 3 (ON/OFF/hold to dim)

1) Product: Crestron GLPPA-KP3-W[B][A]-S

d. 4 Button controlling zones 1-3 (ZONE 1 toggle/ZONE 2 toggle/ZONE 3 toggle/OFF)

1) Product: Crestron GLPPA-KP4-W[B][A]-S

C. Configuration Remote Control

1. Lighting controller shall be adjustable using the handheld battery-operated configuration remote.
2. Pre-programmed at the factory, no configuration or programming required.
3. Remote shall provide features:
   a. Zone control
   b. Scene setting
   c. Motion sensor mode select and timeout
   d. Daylight sensor calibration
4. Product: Crestron GLPPA-REMOTE-PROG

2.7 FACEPLATES

1. keypad devices Provide decorator faceplates for all keypad devices.
2. Multiple devices adjacent to door jams shall be ganged together.
3. Decorator faceplates shall be white [Black][Almond] and shall match in texture and color of the
4. Products:
   a. FP-G1-W [B][A]-S
   b. FP-G2-W [B][A]-S
   c. FP-G3-W [B][A]-S
   d. FP-G4-W [B][A]-S

B. Touch Screens

1. TFT active-matrix color LCD touch screen
2. Projected capacitive, 5-point multi-touch technology
3. 24-bit 16.7M colors, and dual-window HD video, HDTV, and high-resolution RGB streaming multimedia, IP intercom, and web browsing capabilities. Dynamic graphics and text capability. Enables custom control screen programming.
4. 5 hard keys pushbuttons.
5. Bidirectional 10/100 Mbps Ethernet communication.
6. H.264 and MJPEG streaming video.

7. 5.0 MP camera.
8. Built-in microphone and speaker with multi-language voice recognition.
9. Rava SIP intercom.
10. Connected via IEEE 802.3af Class 3 PoE Powered Device.
11. Surface mount over 2-gang or 3-gang electrical box.
12. Color: [Black] [White].
13. Products
    a. Crestron TSW-760-W-S (7” white, 2-gang mounted)
    b. Crestron TSW-1060-W-S (10” white, 3-gang mounted)
    c. Crestron TSW-560P-W-S (5” white, 1-gang mounted)
    d. Crestron TSW-760-B-S (7” black, 2-gang mounted)
    e. Crestron TSW-1060-B-S (10” black, 3-gang mounted)
    f. Crestron TSW-560P-B-S (5” black, 1-gang mounted)

C. XPANEL Interface: Virtual Touch Screen
1. Touch screen user interface, network-connected lighting management interface running on Crestron lighting control processor to provide lighting control, daylight harvesting, occupancy sensing, lighting schedules and overall adjustment to system functionality
2. Virtual touch screen is to be accessible via computer or laptop interface furnished by other.
3. Access to XPanel shall be via browser-based IP address or .EXE file application.
4. Product: Crestron XPANEL

D. Mobile App Interface: Virtual Touch Screen via Crestron Mobile Pro® Control App for iPhone® and Android™
1. Mobile phone application for network-connected lighting management interface configured with any Crestron 3-Series lighting control processor to provide lighting control, daylight harvesting, occupancy sensing, lighting schedules and overall adjustment to system functionality, as setup and configured by certified Crestron programmer / service provider (CSP).
2. Virtual touch screen is to be accessible via iPhone® and Android™ (furnished by others)
3. Access to a modified XPanel via application interface configuration settings.
4. Product: CRESTRON-MOBILE-PRO as provided by app store associated with iPhone® and Android™ devices.

PART 3 – SENSORS

3.1 DUAL-TECHNOLOGY MOTION SENSORS

A. Product: Crestron GLS-ODT-C-CN
1. Characteristics

2. Detects movement within space while reducing false triggering or shutoffs while space is occupied.
3. Both technologies shall be trigged to force on, one or the other must be triggered to reset time.
4. Combination of ultrasonic motion detection and passive infrared detection with internal microprocessor.
5. Sensitivity is independently adjustable for installed conditions.
6. Delayed time off adjustment.
7. Walk-through mode.
8. Equipped with 4-wire interface for direct connection to control bus.
9. Includes connection port for remote mount photocell.
10. Coverage: 360 deg. 2000 SQFT.
11. Setup and commissioning parameters shall be configurable via handheld wireless remote.
12. Mounts to a 3” octagon box.

B. Product: Crestron GLS-ODT-C-NS

1. Characteristics

a. Detects movement within space while reducing false triggering or shutoffs while space is occupied.
b. Both technologies shall be trigged to force on, one or the other must be triggered to reset time.
c. Combination of ultrasonic motion detection and passive infrared detection with internal microprocessor.
d. Sensitivity is independently adjustable for installed conditions.
e. Delayed time off adjustment.
f. Walk-through mode.
g. Equipped with 4-wire interface for direct connection to control bus.
h. Includes connection port for remote mount photocell.
i. Coverage: 360 deg. 2000 SQFT.
j. Setup and commissioning parameters shall be configurable via handheld wireless remote.
k. Mounts to a 3” octagon box.

C. Product: Steinel GLA-DT-QUATTRO-COM1[2]-24

1. Characteristics

a. Sensing Technology: Passive infrared (PIR), single pyro, 11 detection levels, 520 switching zones, ultrasonic 40 kHz.

b. Mounts to a 4” octagon box.

c. Time Delay Setting

d. Light Level Setting: 1 - 100 fc (10 - 1000 lux)

e. Dip Switch Settings

f. HVAC dry contacts: (COM2 Version only)

g. Test Mode: Dip switch setting or programming remote

h. Ultrasonic Coverage at 9 feet (2.7 m):

1) Presence: Maximum 20 feet by 20 feet (6 by 6 m) or 400 sf (36 sm).

2) Radially and Tangentially: Maximum 32 feet by 32 feet (10 by 10 m) or 1,000 sf (100 sm).

i. PIR Detection Zones:

1) Presence: Maximum 10 feet by 10 feet (3 by 3 m) or 100 sf (9 sm).

2) Radially: Maximum 13 feet by 13 feet (4 by 4 m).

3) Tangentially: Maximum 26 feet by 26 feet (8 by 8 m).

D. Product: Steinel GLA-DT-CM-COM1[2]-24

1. Characteristics

a. Sensing Technology: Passive infrared (PIR), single pyro, 11 detection levels, 520 switching zones, ultrasonic 40 kHz

b. Mounting:

1) Direct to the wall or ceiling with anchor bolts

2) Ceiling mounted with 1/2 inch snap in chase nipple, washer and lock nut. Time Delay Setting

c. Light Level Setting: 1 - 100 fc (10 - 1000 lux)

d. Dip Switch Settings

e. HVAC dry contacts: (COM2 Version only)

f. Test Mode: Dip switch setting or programming remote

g. Ultrasonic Coverage at 9 feet (2.7 m):

1) Presence: Maximum 22 feet (7 m) or 426 sf (130 sm).

2) Radially: Maximum 38 feet (11.5 m) or 1,236 sf (376 sm).

3) Tangentially: Maximum 26 feet (8 m) or 718 sf (218 sm).

h. PIR Detection Zones:

1) Presence: Maximum 22 feet (7 m) or 440 sf (134 sm).

2) Radially: Maximum 26 feet (8 m) or 655 sf (200 sm).

3) Tangentially: Maximum 82 feet (25 m) or 5290 sf (1612 sm).

E. PIR Motion Sensors

1. Product: Steinel GLA-IR-QUATTRO-COM1[2]-24

a. Characteristics

1) Sensing Technology: Passive infrared (PIR)

2) Mounts to a 4” octagon box.

3) Delay Setting

4) Light Level Setting: 1 - 100 fc (10 - 1000 lux)

5) Dip Switch Settings

6) HVAC dry contacts: (COM2 Version only)

7) Test Mode: Dip switch setting or programming remote

8) Coverage at 9 feet (2.7 m): 360 deg square mechanically scalable detection zones.

a) Presence: Maximum 15 feet by 15 feet (4.7 by 4.7 m) or 225 sf (21.2 sm).

b) Radially: Maximum 15 feet by 15 feet (4.7 by 4.7 m) or 225 sf (21.2 sm).

c) Tangentially: Maximum 23 feet by 23 feet (7 by 7 m) or 529 sf (50.4 sm).

2. Product: Steinel GLA-IR-QUATTRO-HD-COM1[2]-24

a. Characteristics

1) Sensing Technology: Passive infrared (PIR)

2) Mounts to a 4” octagon box.

3) Delay Setting

4) Light Level Setting: 1 - 100 fc (10 - 1000 lux)

5) Dip Switch Settings

6) HVAC dry contacts: (COM2 Version only)

7) Test Mode: Dip switch setting or programming remote

8) Coverage at 9 feet (2.7 m): 360 deg square mechanically scalable detection zones.

a) Presence: Maximum 25.5 feet by 25.5 feet (7.9 by 7.9 m) or 650.25 sf (62.4 sm).

b) Radially: Maximum 25.5 feet by 25.5 feet (7.9 by 7.9 m) or 650.25 sf (62.4 sm).

c) Tangentially: Maximum 65.5 feet by 65.5 feet (20 by 20 m) or 4,290.25 sf (400 sm).

3. Product: Steinel GLA-IR-CM-COM1[2]-24

a. Characteristics

1) Sensing Technology: Passive infrared (PIR)

2) Mounting:

a) Direct to the wall or ceiling with anchor bolts

b) Ceiling mounted with 1/2 inch snap in chase nipple, washer and lock nut. Time Delay Setting

3) Light Level Setting: 1 - 100 fc (10 - 1000 lux)

4) Dip Switch Settings

5) HVAC dry contacts: (COM2 Version only)

6) Test Mode: Dip switch setting or programming remote

7) Coverage at 9 feet (2.7 m): 360 deg square mechanically scalable detection zones.

a) Presence: Maximum 22 feet (7 m) or 440 sf (134 sm).

b) Radially: Maximum 26 feet (8 m) or 655 sf (200 sm).

c) Tangentially: Maximum 82 feet (25 m) or 5290 sf (1612 sm).

F. Ultra Sonic Motion Sensors

1. Product: Steinel GLA-US-QUATTRO-COM1[2]-24

a. Characteristics

1) Sensing Technology: Ultrasonic

2) Mounts to a 4” octagon box.

3) Delay Setting

4) Light Level Setting: 1 - 100 fc (10 - 1000 lux)

5) Dip Switch Settings

6) HVAC dry contacts: (COM2 Version only)

7) Test Mode: Dip switch setting or programming remote

8) Coverage at 9 feet (2.7 m):

9) Presence: Maximum 20 feet by 20 feet (6 by 6 m) or 400 sf (36 sm).

10) Radially and Tangentially: Maximum 32 feet by 32 feet (10 by 10 m) or 1,000 sf (100 sm).

2. Product: Steinel GLA-US-HALLWAY-COM1[2]-24

a. Characteristics

1) Sensing Technology: Ultrasonic

2) Mounts to a 4” octagon box.

3) Delay Setting

4) Light Level Setting: 1 - 100 fc (10 - 1000 lux)

5) Dip Switch Settings

6) HVAC dry contacts: (COM2 Version only)

7) Test Mode: Dip switch setting or programming remote

8) Coverage at 9 feet (2.7 m): Maximum 6.5 feet by 65 feet (2 by 20 m) or 422.5 sf (40 sm).

3. Product: Steinel GLA-US-ONEWAY-COM1[2]-24

a. Characteristics

1) Sensing Technology: Ultrasonic

2) Mounts to a 4” octagon box.

3) Delay Setting

4) Light Level Setting: 1 - 100 fc (10 - 1000 lux)

5) Dip Switch Settings

6) HVAC dry contacts: (COM2 Version only)

7) Test Mode: Dip switch setting or programming remote

8) Coverage at 9 feet (2.7 m): Maximum 6.5 feet by 33 feet (2 by 10 m) or 214.5 sf (20 sm).

3.2 DAYLIGHT SENSORS

A. Indoor Daylight Sensor (Open Loop)

1. Continually monitors daylight entering window or skylight to enable daylight harvesting applications to provide control of room lighting based on presence of daylight.

2. Equipped with 3-wire interface for direct connection to control system utilizing control processor; 24 VDC power from network control bus.

3. Light sensitivity: 3 to 6,000 foot-candles

4. Mounting: [Ceiling flush mounted] [Ceiling surface mounted] [As indicated].

5. Product: Crestron GLS-LOL

B. Indoor Daylight Sensor (Closed Loop)

1. Continually monitors daylight at work station location to enable daylight harvesting or lumen maintenance applications to provide control of room lighting based on lighting level at workstation.

2. Equipped with 3-wire interface for direct connection to control system utilizing control processor; 24 VDC power from network control bus.

3. Light sensitivity: 0 to 70 foot-candles

4. Mounting: [Ceiling flush mounted] [Ceiling surface mounted] [Wall flush mounted] [Wall surface mounted] [As indicated].

5. Product: Crestron GLS-LCL

C. Outdoor Daylight and Color Temperature Sensor

1. Measures true color temperature and intensity of natural sunlight.

2. Communicates over serial to control system to match indoor lighting with the outdoors.

3. Outdoor rated for rooftop installation.

4. IP67 for watertight operation.

5. CCT of 2,000K to 25,000K.

6. 0 to 100,000 lux.

7. 360 degree semispherical.

8. Product: GLS-LCCT

D. Partition Sensors

1. Single sided diffuse reflective sensing technology.

2. Digital device with control bus connectivity.

3. Surface mounted to 1-gang back box.

4. Trim using decorator face plate to match mounting surface.

5. Product: Crestron GLS-PART-CN

E. Sensor Interface Module

1. Sensor Interface Device: Integrates occupancy sensors and related sensors with control network. In separate enclosure. 4-wire bus providing 24 VDC power to network devices, with two independent sensing inputs.

2. Product: Crestron GLS-SIM

3.3 CONTROL PROCESSOR PANEL AND DISTRIBUTION PANELS

A. Product Family – GLNET and CLP

B. Control processor Panels shall be provided in quantities and locations per the contract drawings, or as required for a fully networked lighting control system.

C. Control processor panels shall be factory assembled in a UL508 Panel shop

D. Shall include the following equipment to support lighting control devices

1. Cabinets
    a. Made of 16AWG galvanized steel
    b. NEMA 1 rated
    c. Product: DIN-EN
2. Processors
    a. Crestron 3-series control system
    b. Modular architecture supports multiple simultaneous running programs.
    c. Ethernet 10/100Base-T and Cresnet Connected
    d. Astronomical time clock with events stored in non-volatile RAM
    e. Native BACnet/IP with support for up to 500 BACnet objects
    f. Built-In Web Server: IIS v.6.0
    g. SNMP remote management.
    h. Active Directory support.
    i. IPv6 ready.
    j. DHCP and DNS Support
    k. Native Email Client
    l. Remote Diagnostics
    m. Remote Program Loading and Administration
    n. SSL security plug in
    o. Support user assigned or dynamic IP address.
    p. Product: Crestron DIN-AP3
3. Power Supplies
    a. Provide regulated 24 VDC power supplies as required to support lighting control equipment
    b. 120 VAC input
    c. Product: Crestron DIN-PWS60
4. Cresnet to Ethernet Bridge
    a. 24v DC Input

b. IEEE 802.3 Power of ethernet connection.

c. Serial communication

d. USB 2.0 for setup.

e. Product: DIN-CENCN-2-POE

5. Ethernet Distribution

a. 48V DC Input, 100-240 VAC 50/60 Hz Supply

b. (5) [16] IEEE 802.3 Ethernet Ports

c. 32 to 104 degrees Fahrenheit

6. Floor Hub

a. Connects up to 200 Crestron ZUMMESH-NETBRIDGE devices.

b. Contain astronomical time clock.

c. Maintenance is performed via standard web browser.

d. 1 rack unit mounted

e. Product: Crestron ZUM-FLOOR-HUB

7. GLNET-CN

a. Enclosure: DIN-EN-2X18

1) 16AWG Galvanized steel backbox

2) 120 Volts AC, 60 Hz

3) Height: 12.32 in (323 mm)

4) Width: 14.13 in (359 mm)

5) Depth: 4.38 in (111 mm)

6) DIN Rail Detail: (2) 342 mm x 35 mm rails

8. GLNET-ZUM

a. Enclosure: DIN-EN-3X18

1) 16AWG Galvanized steel backbox

2) 120 Volts AC, 60 Hz

3) Height: 23.50 in (597 mm)

4) Width: 14.38 in (366 mm)

5) Depth: 4.44 in (113 mm)

6) DIN Rail Detail: (3) 342 mm x 35 mm rails

9. GLNET-ZUM-CN
    a. Enclosure: DIN-EN-6X18
        1) 16AWG Galvanized steel backbox
        2) 120 Volts AC, 60 Hz
        3) Height: 38.88 in (989 mm)
        4) Width: 14.38 in (366 mm)
        5) Depth: 4.44 in (113 mm)
        6) DIN Rail Detail: (6) 342 mm x 35 mm rails
10. CLP-HUB-SW-POE-5
    a. Enclosure: DIN-EN-2X18
        1) 16AWG Galvanized steel backbox
        2) 120 Volts AC, 60 Hz
        3) Height: 12.32 in (323 mm)
        4) Width: 14.13 in (359 mm)
        5) Depth: 4.38 in (111 mm)
        6) DIN Rail Detail: (2) 342 mm x 35 mm rails
11. CLP-HUB-SW-POE-10
    a. Enclosure: DIN-EN-2X18
        1) 16AWG Galvanized steel backbox
        2) 120 Volts AC, 60 Hz
        3) Height: 23.50 in (597 mm)
        4) Width: 14.38 in (366 mm)
        5) Depth: 4.44 in (113 mm)
        6) DIN Rail Detail: (3) 342 mm x 35 mm rails
12. CLP-HUB-SW-POE-16
    a. Enclosure: DIN-EN-6X18
        1) 16AWG Galvanized steel backbox
        2) 120 Volts AC, 60 Hz
        3) Height: 38.88 in (989 mm)
        4) Width: 14.38 in (366 mm)
        5) Depth: 4.44 in (113 mm)

6) DIN Rail Detail: (6) 342 mm x 35 mm rails

3.4 UL924 EMERGENCY OVERIDE

A. Phase Loss Sensor

1. Lighting control panels shown on the contract drawings as emergency life safety shall contain UL924 listed modules and OVR inputs.

2. Provide phase loss sensor with sense for all 3 phases.

3. Upon loss of any of the 3 phases, the phase loss sensor shall trigger the emergency life safety panel's override port(s).

4. Product: Crestron GLS-PLS-120/277.

B. Bypass Relays

1. Switched and 2-wire dimmed loads

a. The UL924 listed 2-wire Emergency Shunt Relay shall allow emergency power to go around the control device to bring emergency power to the load.

b. Product: GLA-ESR

C. Automatic Load Control Relays (ALCR)

1. Switched Loads

a. UL924 listed 2-wire automatic load control relay shall bring emergency life safety lights on to 100% upon loss of power

b. Upon the loss of normal power, the ALCR shall bypass the control device allowing emergency power to access the loads regardless of switch position.

c. Products:

1) Crestron GLA-EPC-PM

2) Crestron GLA-EPC-2

2. 4-Wire dimming loads

a. UL924 listed 4-wire automatic load control relay shall bring emergency life safety lights on to 100% upon loss of power

b. Upon the loss of normal power, the ALCR shall bypass the control device allowing emergency power to access the load regardless of switch position.

c. The ALCR shall contain a normally open relay to open the control wires allowing the lights to come to full bright.

d. The ALCR shall allow for integration with fire alarm.

e. Product: Crestron GLA-EPC-FLV

D. UL1008 Emergency Override

1. Automatic transfer switch (ATS)

2. All dimming and switching loads

a. UL1008 listed automatic transfer device shall transfer emergency power to the load upon 100% loss of power.

b. Upon loss of normal power, the ATS shall allow the flow of emergency power from the emergency circuit regardless of switch position.

c. The ATS shall operate on the branch side of the circuit

d. The ATS shall allow integration with fire alarm

e. Product: Crestron GLA-EPC-D-F-ATS

3.5 PROGRAMMING AND CONFIGURATION SOFTWARE

A. Lighting system configuration software shall allow custom programming for lighting control system.

B. Lighting system configuration software shall generate custom software control interface modules for communication with compatible remote integrated systems.

C. The lighting system configuration software shall be GUI based for programming and development.

D. The custom software control interface shall include the following control data:

1. Complete lighting system control functions.

2. System specific control sets for sub systems and supervisory systems

3. Bidirectional digital and analog data communication.

4. Bidirectional serial data communication.

3.6 CONDUCTORS AND CABLING

A. Power Supply Side of Remote-Control Power Sources: Comply with requirements of Division 26 Section "Low-Voltage Electrical Power Conductors."

B. UTP Cable: 100-ohm, UTP. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 444 and NFPA 70 for the following types:

C. Communications Control Cable, Non-Plenum Rated: 22 AWG data pair stranded bare copper, and 18 AWG power pair stranded bare copper, Type CM.

1. Product: Crestron CRESNET-NP.

D. Communications Control Cable Plenum Rated: 22 AWG data pair, stranded bare copper and 18 AWG power pair, stranded bare copper, Type CMP, complying with NFPA 262.

1. Product: Crestron CRESNET-P.

E. Communications High-Power Control Cable, Non-Plenum Rated: 22 AWG stranded bare copper data pair, and 12 AWG stranded bare copper power pair, Type CM.

1. Product: Crestron CRESNET-HP-NP.

PART 4 – EXECUTION

4.1 FIXTURE TESTING

A. Contractor shall provide lighting control factory test reports for each fixture specified on this project

B. Test report shall include

1. Confirmation of compatibility with control device

2. Dimming Range

3. Performance notations

4.2 PLUG LOAD CONTROL

A. Plug load controls as shown on the contract drawing shall be part of the lighting control system.

B. Plug loads shall operate in occupancy mode (Auto-on, Auto-off).

4.3 ENGRAVING

A. Keypad buttons shall be factory engraved using laser technology

B. Initial shipment of keypads shall be factory engraved per the sequence of operations specified herein and shown on the contract documents

C. Custom keypad engravings shall be provided as part of the close out procedures.

4.4 BMS INTEGRATION

A. The lighting control system shall be integrated with the BMS system as specified in DIV. 25.

B. Communication shall occur using BACNET/IP Protocol.

C. Contractor shall provide licenses for each of the following objects and shared amongst the BMS system

1. Occupancy Status

2. Zone On/Off/Dim

3. Photocell reading

D. The lighting control system shall also accept time clocked events from the BMS system

E. Provide necessary coordination labor for integration of all BACNET objects listed.

4.5 AV INTEGRATION

A. The lighting control system shall be integrated with the AV solutions as specified in DIV.26

B. The lighting and AV systems shall interface via Ethernet communication or RS232.

C. Contractor shall provide ethernet drops as required for the lighting control system to connect to the AV system.

D. The following objects shall be shared with the AV system:

1. Occupancy Status

2. Zone On/Off/Dim

3. Photocell reading

4. Scene preset recalls

E. Provide necessary coordination labor for integration of all AV objects listed hereto before.

4.6 SYSTEM FUNCTIONS AND SEQUENCES

A. The system shall be capable of the following lighting control functions:

1. Scene Creation: Store levels of selected fixture circuits in preset groups.
2. Scene Recall: recall previous stored scenes.
3. All zones off
4. Raise/lower level of all zones
5. Password entry for touchscreen access
6. Room/Zone selection
7. Raise/lower room shades
8. Schedule events to be automatically recalled

4.7 USER INTERFACE CONTROL FUNCTIONS

A. The keypad interface shall be capable of the following system control functions:

1. Scene Recall
2. Raise/Lower
3. Off

B. Touchscreen and Virtual touch screen interfaces shall be capable of the following system control functions:

1. Password Entry
2. Multiple levels
3. Room/Zone selection
4. Scene Recall
5. Raise/Lower
6. Shade Control
7. Timeclock Events
8. Customer logo and color scheme

C. Optional control sequences for advanced control:

1. Occupancy adjustments
2. Sensor Timeout
3. Control logic (occupancy or vacancy)
4. Lighting Scenes
5. Individual zone control override

6. Timeclock adjustments
7. Modify timeclock activation schedule
8. Select/unselect pre-programmed timeclock events
9. Display all timeclock events
10. Daylight Harvesting Adjustments
11. Low end trim
12. Response time
13. Zone control
14. Scene Recall
15. Fade time
16. Color scene recall

4.8 TIME CLOCK EVENTS

A. The lighting control system shall have astronomical time clocked events. 6-time clock events shall be provided.

B. End user shall have the option to create additional time clock events via touch screen or XPANEL interfaces.

4.9 INSTALLATION

A. Prior to installation, examine work area to verify measurements, and that commencing installation complies with manufacturer's requirements.

B. Comply with requirements of Division 26 Sections "Common Work Results for Electrical."

C. Do not install network power controls until space is enclosed, HVAC systems are running, and overhead and wet work in space are complete.

D. Install network power switching controls in accordance with manufacturer's instructions.

E. Grounding: Provide electrical grounding in accordance with NFPA 70.

4.10 MANUFACTURER SUPPORTED SERVICES

A. Pre-wire

1. Manufacturer trained and authorized personnel shall provide on-site visit during the rough-in stage of the installation. At this time wiring topologies and terminations shall be reviewed with the Contractor.

B. Startup

1. Provide manufacturer's certified system startup and adjustment.
2. Switch each load on and off with manual line test feature of the power switching module before installing processors.
3. Perform operational testing to verify compliance with Specifications. Adjust as required.

C. Tuning

1. Within 3 months of the date of Substantial Completion provide onsite service to adjust the system to account for actual occupied conditions.

D. Training

1. Within 30 days, Factory authorized service representative to instruct owner's staff to adjust, operate and maintain network power switching systems; and provide instruction using the system software.

2. Demonstration: Schedule demonstration with Owner.

3. Training: Train Owner's personnel to operate, maintain, and program network power switching systems.

4. Furnish set of approved submittals, and record drawings of actual installation for Owner's personnel in attendance at training session.

SECTION 26 12 19

PAD MOUNTED, LIQUID FILLED, MEDIUM VOLTAGE TRANSFORMER

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification sections, apply to work of this section.

B. Division 26 Basic Electrical Materials and Methods sections apply to work specified in this section.

1.2 SUMMARY

A. Transformer shall meet all specific utility company requirements.

B. Extent of liquid filled transformer work is indicated by drawings and specification.

C. Refer to applicable Division 26 sections for testing requirements, wire/cables, electrical raceways, and boxes and fittings.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's data and installation instructions for liquid filled transformers.

B. Shop Drawings: Submit shop drawings of liquid filled transformer showing accurately scaled equipment locations and spatial relationships to associated pads, primary conduit and secondary conduit.

1.4 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of liquid filled types and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Installer Qualifications: Firm with at least 5 years experience of successful installation experience with projects utilizing liquid filled transformers similar to that required for this project.

C. Code Compliance: Units shall be constructed in accordance with ANSI Standard C57.12.26 (latest revision).

All characteristic, definitions, terminology, and voltage designations and tests, except as otherwise specified herein, shall be accordance with the following American National Standard Requirements, Terminology, and Test Code for Distribution, Power and Regulating Transformers.

General Requirements, C57.12.00 (IEEE Std 462) (latest revision).
Terminal Marking and Connections, C57.12.70 (latest revision).
Terminology, C57.12.80, including Supplement C57.12.80a (latest revision).
Test Code, C57.12.90 (IEEE Std. 262) (latest revision).

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver liquid filled transformer properly packaged in factory-fabricated palletized crate.

B. Store liquid filled transformers in a clean dry space; protect from weather and construction traffic.

C. Handle liquid filled transformer carefully to avoid breakages, impacts, denting and scoring finish. Do not install damaged equipment; replace and return damaged units to equipment manufacturer.

1.6 SEQUENCING AND SCHEDULING

A. Coordinate with other electrical work including underground duct banks to properly interface installation of liquid filled transformers with other work.

B. Sequence liquid filled transformer installation work with other work to minimize possibility of damage and soiling during remainder of construction period.

1.7 MAINTENANCE

A. Maintenance Data: Submit maintenance data and parts list for liquid filled transformers; including “trouble shooting” maintenance guide. Include that data, product data and shop drawings in a maintenance manual; in accordance with requirements of Division 1.

B. Maintenance Stock, Fuses: For types and rating required, furnish additional set of spare fuses.

PART 2 - PRODUCTS

2.1 LIQUID FILLED TRANSFORMERS

A. Provide transformers as indicated here-in with KVA rating(s) per drawings. Transformer rated KVA shall be at altitude of project with 100% load, i.e.: increase transformer size to achieve KVA indicated on drawings if necessitated by project altitude.

B. Transformer shall meet all specific utility company requirements, and be approved by utility company.

C. General: Provide a 3-phase delta (primary) – WYE (secondary), dead front, loop feed, oil-filled, pad-mounted transformer with a 5.75% impedance and kva and voltages indicated on drawing with two 2-1/2% full capacity above normal and two 2-1/2% below normal taps. Tap changes shall be externally operated. The average temperature rise of the windings, measured by the resistance method, shall be 65° C when the transformer is operated at rated kVA output in a 40° C ambient. The transformer shall be capable of being operated at rated load in a 30° C average, 40° C maximum ambient, as defined by IEEE C57.12.00™ without loss of service life expectancy. Coolant and insulating fluid shall be less flammable seed-oil based fluid.

D. The pad mounted, compartmental type, liquid immersed, self-cooled transformer shall consist of the transformer tank with high and low voltage cable terminating compartment. The transformer tank and compartment shall be assembled as an integral unit for mounting on a pad. There shall be no exposed screws, bolts, or other fastening devices which are externally removable. There shall be no openings through which foreign objects such as sticks, rods, or wires might contact live parts. There shall be means of padlocking the compartment door(s). The construction shall limit the entry of water (other than flood water) into the compartment so as not to impair the operation of the transformer.

E. Full height, air-filled incoming and outgoing terminal compartments with hinged doors shall be located side-by-side separated by a steel barrier, with the incoming compartment on the left. The high-voltage (incoming) compartment will be accessible only after the door to the low voltage (outgoing) compartment has been opened. To facilitate making connections and permit cable pulling, the doors and compartment hood shall be provided to permit rolling or skidding of unit into place over conduit studs in foundation.

F. The compartments will have hinged doors equipped for latching in the open position. The high-voltage compartment door will have a fastening device which is accessible only through the low-voltage compartment.

G. The hinge assemblies shall be made of corrosion resistant material. Stainless steel hinge pins of 3/8 inch minimum diameter will be provided.

H. Both compartment doors must be capable of being secured with a single padlock having a maximum ½ inch diameter shackle.

I. Lifting provisions in accordance with ANSI Standards shall be provided.

J. Jacking and rolling provisions shall be provided.

K. The instruction nameplate is to be located in the low voltage portion of the compartment and shall be readable with cables in place. Where the nameplate is mounted on a removable part, the manufacturer's name and transformer serial number shall be permanently affixed to a non-removable part.

L. Transformer tank shall be seal tank construction with a welded main cover.

M. Bolded tamper resistant handhole shall be provided in the tank cover for access to internal connections.

N. Provisions for tank grounding shall be supplied in both the high voltage and low voltage compartments. These provisions shall consist of:

1. 500kVA and below: ½-13 UNC tapped hole 7/16 inch deep.
2. 750kVA and above: (2) ½-13 UNC tapped holes ½ inch deep.

O. Low voltage bushings shall be tinned, spade type with 9/16 inch holes spaced on ¾ inch centers in accordance with the Latest Revisions of ANSI.

P. Primary (separable insulated high voltage connector) bushings for looped primary cable systems.

1. High Voltage Terminating and Equipment: The high voltage terminations and equipment shall be dead front and conform to ANSI C57 requirements. Provide with bushing wells and inserts for use with elbow terminators and parking stands for mounting accessory equipment. The terminations and equipment shall be arranged for loop feed. Elbow termination shall be Elastimold load break up to 200A, non-load break at 600A, with test point and fault indicators.
2. Six bushing wells in accordance with ANSI Standard C119.2.

Q. The following are to be provided on all units.

1. One inch filling provision.
2. One inch drain provision.
3. Liquid level indication.

R. Three Bayonet type, oil immersed, expulsion fuses accessible through the primary compartment. The fuses shall be removable using a hot stick, (without disassembly of the primary cabinet) for external replacement of fuse cartridges.

S. One loop feed, internal, oil-immersed, gang-operated, loadbreak, manually operated switch for a looped, primary cable system. The switch shall be a four position loop feed switch. The switch must be capable of switching 600 amperes to permit sectionalizing of the looped system.
The switch handles shall be located in the primary compartment and must be hot stick operable. Six primary bushings will be provided.

T. Low Voltage Terminations and Equipment: The low voltage bushings shall be molded epoxy and provided with blade type spade terminals with NEMA standard hole spacing arranged for vertical take-off. The low voltage neutral shall be an insulated bushing grounded to the transformer tank by a removable grounding strap. Wye-Wye connected transformers shall have the high and low voltage neutrals internally tied with a removable link for testing.

U. Accessories:

1. Nameplate in low voltage compartment.
2. One inch drain valve with sampling device.
3. One inch upper filter press and filling plug.
4. Liquid level indication (pipe plug at 25ºC. oil level).
5. Dial type thermometer.
6. Liquid level gauge.
7. Pressure relief valve.
8. Mounting provision for low voltage current transformers and potential transformers. Current transformers (CTs) and potential transformers (PTs) shall be provided with unit where necessary to support metering as specified here-in or on drawings. The addition of CTs or PTs shall not cause the quantity of outgoing parallel feeders to be reduced below the quantity normally available with CTs and PTs.
9. Instruction nameplates shall include the number of gallons of transformer oil. High voltage warning signs reading “DANGER KEEP OUT” shall be permanently attached to each side of transformer stations. Stainless steel ground connection pads shall be provided in both the high and low voltage compartments.

V. Testing - Tests shall be conducted in accordance with the provisions of IEEE C57.12.90™ and shall include, as a minimum, the following tests:

1. Ratio
2. Polarity
3. Phase Rotation
4. No-Load Loss
5. Excitation Current
6. Impedance Voltage
7. Load Loss
8. Applied Potential
9. Induced Potential
10. QA Impulse Test

W. Provide unit-mounted digital meter with network tie-in capability. Meter to show phase amps, phase to phase and phase to neutral voltage, peak demand and time/date of occurrence and kilowatt hours.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Arrange equipment to provide adequate spacing for cooling air circulation.

B. Identify transformers in accordance with Division 26 Section “Electrical Identification”.

C. Tighten electrical connector and terminals in accordance with manufacturer’s published torque-tightening values. Where manufacturer’s torque values are not indicated, use those specified in UL 486A and Ul 486B.

D. Verify transformer location has adequate clearance from combustible materials and building openings.

3.2 EQUIPMENT BASES

A. Construct concrete equipment pads as follows:

1. Coordinate size of equipment bases with actual unit sized provided. Construct base 4 inches high and 2 inches larger in all direction than the overall dimensions of the supported unit.
2. Form fiberglass per manufacturers' instructions.
3. Install anchor bolts and sleeves to facilitate securing units.

3.3 GROUNDING

A. Ground transformers and tighten connections to comply with tightening torques specified in UL Standard 486A.

3.4 ADJUSTING AND CLEANING

A. Upon completion of installation, inspect interiors and exteriors of accessible components. Remove paint splatters and other spots, direct and construction debris. Touch up scratches and mars of finish to match original finish.

3.5 PROTECTION

A. Temporary Heating: Apply temporary heat in accordance with manufacturer's recommendations within enclosure of each transformer throughout periods during which equipment is not in a space that is continuously under normal control of temperature and humidity.

END OF SECTION

SECTION 26 22 00

LOW VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to work of this section.

B. Requirements of the following Division 26 Sections apply to this section.

1. “Electrical Requirements.”

1.2 SUMMARY

A. This section includes general purpose and specialty dry type transformer with winding rated 600V or less, with capacities up to 1000 KVA.

B. The work includes the providing of all labor, materials, equipment, accessories, services and tests necessary to complete and make ready for operation by the Owner. All dry type transformers shall be in accordance with Drawings and Specifications.

C. Related Sections: The following Division 26 Sections contain requirements that relate to this section:

1. “Electrical Identification” for signs associated with transformer installations.

D. All switchboards, panelboards, switchgears, transformers, disconnect switches, starters, etc., shall be fabricated by same manufacturer throughout the entire project.

1.3 SUBMITTALS

A. General: Prior to fabrication submit the following in accordance with Conditions of Contract and Division 1 Specification Sections:

1. Product data for each transformer, including dimensional plans view electrical rooms, sections, and elevations showing minimum clearances, installed devices, and material lists.
2. Wiring diagrams from manufacturer differentiating between manufacturer-installed and field-installed wiring.
3. Product certificates, signed by manufacturer of transformers certifying that their products comply with the specified requirements.
4. Product Test Reports: Certified copies of manufacturer’s design and routine factory tests required by the referenced standards.

1.4 QUALITY ASSURANCE

A. Manufacturer’s Qualifications: A firm member of NEMA who is regularly engaged in manufacturing components that comply with the requirements of these Specifications and that have been used on at least five projects of similar size and scope as this Project, and whose products have been in satisfactory use in similar service for not less then 10 years.

B. Provide dry type transformers produced by a manufacturer listed as an Approved Manufacturer in this Section.

C. Provide dry type transformers whose performance under specified conditions is certified by the manufacturer.

D. Field Testing Organization Qualifications: To qualify for acceptance, an independent testing organization must demonstrate, based on evaluation of organization-submitted criteria conforming to ASTM E 699, that it has the experience and capability to conduct satisfactorily the testing indicated.

E. Electrical Component Standard: Components and installation shall comply with NFPA 70 “National Electrical Code”, and applicable portions NECA’S “Standard of Installation” .

F. ANSI/IEEE Compliance: Comply with applicable requirements of ANSI/IEEE Standard including C2, “National Electrical Safety Code,” and C57.12.80, “Terminology for Power and Distribution Transformers.”

G. DOE 2016 LV Energy Efficiency levels as per DOE 10 CFR Part 431 – effective as of Jan. 1, 2016.

H. UL Listing and Labeling: Items provided under this section shall be listed and labeled by UL.

I. Nationally Recognized Testing Laboratory Compliance (NRTL): Items provided under this section shall be NRTL listed and labeled. The term “NRTL” shall be as defined in OSHA Regulation 1910.7.

PART 2 - PRODUCTS

2.1 TRANSFORMERS, GENERAL

A. Transformers: Factory assembled and tested, air cooled units of types specified, having characteristics and ratings as indicated on drawings. Units shall be designed for 60 Hz service.

B. Cores: All cores shall be constructed of high grade, grain oriented non-aging silicon steel with high magnetic permeability, and low hysteresis and eddy current losses. Magnetic flux densities are to be kept well below the saturation point.

C. Coils: Continuous windings without splices except for taps.

D. Internal Coil Connections: The core laminations shall be clamped together with structural steel angles. The completed core and coil shall then be bolted to the base of the enclosure by isolator from the base of the enclosure by means of rubber vibration-absorbing mounts. There shall be no metal-to- metal contact between the core and coil and the enclosure. The vibration isolation system shall be designed to provide a permanent fastening of the core and coil to the enclosure. Sound isolating systems requiring the complete removal of all fastening devices will not be acceptable.

E. Wiring compartment and termination shall be accessible by removing enclosure front panels.

F. The use of fans to obtain rated KVA or TP-1 rating shall not be permitted for all transformer types.

G. Transformer "K" rating shall be K-13.

H. The entire transformer enclosure shall be degreased, cleaned, phos-phatized, primed, and finished with a grey baked enamel.

I. The maximum temperature of the top of the enclosure shall not exceed 35˚C rise above a 40˚C ambient.

J. Transformers 15 KVA through 75 KVA shall be designed so they can be either floor or wall mounted. Above 75 KVA they shall be floor mounted, design except as noted on drawings.

2.2 GENERAL PURPOSE, DRY-TYPE TRANSFORMERS

A. Comply with NEMA Standard ST 20 “Dry-Type” Transformers for General Applications.

B. Three phase transformers shall be 480 volt delta primary 208Y/120 Volt, 3-phase, 4-wire secondary unless otherwise noted. Other voltages shall be as shown on the drawings or otherwise required.

C. Windings: 2 winding type. Three phase transformers shall use one coil per phase in primary and secondary.

D. Provide aluminum windings.

E. Sound Level:
Sound levels shall not exceed NEMA ST-20 sound levels.

F. Each layer shall have end fillers, or tie downs, to provide maximum mechanical strength. Materials used shall have a minimum of one year of proven field usage. Insulation system shall be component recognized by Underwriter's Laboratories. The coils shall also have a final wrap of electrical insulating material to prevent mechanical injury to the wire as well as increasing the electrical breakdown strength. Coils with exposed wire will not be acceptable.

G. Transformers shall have the following features and ratings:

1. Enclosure: Transformers 25 KVA and larger shall be in a heavy gauge, sheet steel, ventilated enclosure. The ventilating openings shall be designed to prevent accidental access to live parts in accordance with UL, NEMA, and National Electrical Code standards for ventilated enclosures. Outdoor transformers are to have rain-tight ventilation and a NEMA 3R rating.
2. Insulation Class: All insulating materials to be in accordance with NEMA ST-20 1972 standards for a 220˚C UL component recognized insulation system.
3. Basic Impulse Level: 10 kV for all 3-phase transformers.
4. Insulation Temperature Rise: Transformers 25 KVA and above shall be 115˚C temperature rise above 40˚C ambient unless otherwise noted. 115˚C rise in transformers shall be capable of carrying a 15% continuous overload without exceeding a 150˚C rise in a 40˚C ambient.
5. Taps: For transformer 3KVA and larger, full capacity taps in high-voltage winding as follows:
   a. 3 KVA through 30 KVA: Four 2.5% taps, two above and two below normal voltage.
   b. 30 KVA through 500 KVA: Four 2.5% taps, two above and two below rated normal voltage.
   c. 500 KVA through 1000 KVA: Four 2.5% taps, two above and two below rated normal voltage.
   d. Step-up to higher voltage transformers shall include +/- (1) tap AN and BN at the minimum percentage available based on the amount of primary turns.

H. Accessories: As follows:

1. Wall mounting brackets: Manufacturers standard brackets for transformers sized between 15 KVA and 75 KVA where wall mounting is indicated on drawings.
2. Core and coil assemblies 30 KVA and larger to be mounted on rubber vibration isolators on concrete pads.

2.3 NOISE ISOLATION TRANSFORMER (WHERE INDICATED ON THE ONE-LINE DIAGRAMS)

A. Transformers: Factory assembled and tested, air cooled units of types specified, having characteristics and ratings as indicated on drawings. Units shall be designed for 60 Hz service.

B. Coils shall use high grade magnet wire. Coils shall have clearly marked terminal pads attached to a rugged fiberglass termination strip. Windings shall have continuous wire wound construction and shall be vacuum impregnated with nonhydroscopic thermosetting varnish for superior strength and heat transfer. Each layer shall have end fillers, or tie downs, to provide maximum mechanical strength. Materials used shall have a minimum of one year of proven field usage. Insulation system shall be component recognized by Underwriter's Laboratories.

The coils shall also have a final wrap of electrical insulating material to prevent mechanical injury to the wire as well as increasing the electrical breakdown strength. Coils with exposed wire will not be acceptable.

C. Transformer shall have (2) 2.5 percent above nominal and (4) 2.5 percent below nominal universal full capacity taps.

D. Insulation system shall be UL Recognized at 220 degree C and shall be capable of continuous operation at 40 degree C ambient without windings exceeding 150 degree C temperature rise. Surface temperature rise shall not exceed UL 50 degree C limit. Wiring compartment temperature rise shall not exceed UL 35 degree C limit.

E. Floor mount enclosure shall be constructed of heavy gauge steel for indoor use. Weathershield kits shall be available to modify enclosures for NEMA 3R outdoor use.

F. Wiring compartment shall be sized for aluminum cable rated 125 percent of current, using long shanked crimp type connectors. Wiring compartment shall be accessible by removing enclosure front panel.

G. Vibration from core and coil assembly shall be isolated from enclosure by neoprene vibration pads and sleeves. A flexible copper grounding strap shall connect core to enclosure sized in accordance with applicable NEMA and NEC standards. A schematic connection diagram shall be located on enclosure nameplate for quick referral.

H. A premium electrostatic shield shall be included, consisting of a full width copper sheet placed between primary and secondary windings. Effective coupling capacitance shall be thirty picofarads. Average common mode noise attenuation shall be 120 db.

I. A rugged filter shall provide an average 60 db normal mode noise attenuation.

J. Surge suppression components shall be included to eliminate low voltage spikes and surges.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Contractor shall examine location where this equipment is to be installed, determine space conditions and notify Architect/Engineer in writing of conditions detrimental to proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected.

B. Install equipment where shown, in accordance with manufacturer's written instruction, and with recognized industry practices, to ensure that equipment complies with requirements and serves intended purposes.

C. Coordinate with other work as necessary to harmonize installation of transformers with other equipment in the area.

D. Coordinate installation of transformers with cable and raceways installation work.

E. Arrange equipment to provide adequate spacing for cooling air circulation.

F. Identify transformers in accordance with Division 26 Section “Electrical Identification.”

G. Tighten electrical connectors and terminals in accordance with manufacturer’s published torque-tightening values. Where manufacturer’s torque values are not indicated, use those specified in UL 486A and UL 486B.

H. Use flexible metal conduit to contain the conductors from the transformer to the raceway system.

3.2 EQUIPMENT BASES

A. Construct concrete equipment pads as follows:

1. Coordinate size of equipment bases with actual unit sizes provided. Construct base 4 inches high and 2 inches larger in all directions than the overall dimensions of the supported unit.
2. Form concrete pads with framing lumber with form release compounds. Chamfer top edge and corners of pad.
3. Install reinforcing bars, tied to frame, and place anchor bolts and sleeves to facilitate securing units.
4. Place concrete and allow to cure before installation of units. Use Portland Cement conforming to ASTM C 150, 4000 psi compressive strength, and normal weight aggregate.

B. Anchor mounting hardware firmly to walls, floors, or ceilings to ensure enclosures are permanently and mechanically secured. Provide all hardware and accessories for proper mounting including vibration mounts designed to suppress transformer noise and vibration.

3.3 GROUNDING

A. Ground transformers and tighten connections to comply with torque tightening requirements specified in UL Standard 486A.

3.4 FIELD QUALITY CONTROL

A. Inspect for physical damage, broken insulation, tightness of connections, defective wiring, and general condition.

B. Thoroughly clean unit prior to making any tests.

C. Perform insulation-resistance test. Calculate dielectric absorption ratio and polarization index. Make measurements from winding-to-winding and winding-to-ground. Test voltages and minimum resistance shall be in accordance with Table below:

Minimum dc Test Voltage	Recommended Minimum Insulation Resistance in Megohms
1000 volts	500

D. Verify taps and connect transformer to desired tap, if applicable.

E. Energize primary winding with system voltage. Measure secondary voltage with the secondary load disconnected. Record results.

3.5 ADJUSTING AND CLEANING

A. Upon completion of installation, inspect interiors and exteriors of accessible components. Remove paint splatters and other spots, dirt and construction debris. Touch up scratches and mars on finish to match original finish.

B. Adjust transformer taps to provide optimum voltage conditions at utilization equipment.

3.6 PROTECTION

A. Temporary Heating: Apply temporary heat in accordance with manufacturer's recommendations within enclosure of each transformer throughout periods during which equipment is not in a space that is continuously under normal control of temperature and humidity.

END OF SECTION

SECTION 26 24 15

SERVICE ENTRANCE SWITCHBOARD

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification sections, apply to work of this section.

B. Division 26 Basic Electrical Materials and Methods sections apply to work specified in this section.

1.2 SUMMARY

A. Provide all switchboard, and enclosure work, including cabinets and cutout boxes, as indicated by drawings and schedules, and as specified herein.

B. Wires/cables, busses, electrical boxes and fittings, and raceways required in conjunction with the installation of switchboard, and enclosures are specified in other Division 26 sections.

C. All switchboards, panelboards, switchgear, transformers, disconnect switches, starter, etc., shall be fabricated by same manufacturer throughout the entire project.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's data on switchboard and enclosures.

B. Wiring Diagrams: Submit wiring diagrams for switchboard showing connections to electrical power service and feeders.

C. Submit electrical room plan, view drawings at ¼" scale with all electrical equipment, end and front elevation views of switchboard showing circuit breakers and ratings, buss work, conduit areas, dimensions, recommended housekeeping pad sizes, mounting of equipment supplied.

D. The equipment product data, main electrical room layout and short-circuit and coordination studies shall be submitted together in order to provide proper evaluation.

1.4 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of switchboard and enclosures, of types, sizes, and ratings required, whose products have been in satisfactory use in similar service for no less than 5 years.

B. Installer's Qualifications: Firms with at least 5 years of successful installation experience on projects utilizing switchboard similar to those required for this project.

C. Codes and Standards:

1. Electrical Code Compliance: Comply with applicable local code requirements of the authority having jurisdiction and NEC as applicable to installation, and construction of switchboard and enclosures.
2. UL Compliance: Comply with applicable requirements of UL 50, 869, 486A, 486B, 891, 1053, and 1066 pertaining to switchboard accessories and enclosures. Provide switchboard unit which are UL-listed and labeled.

3. NEMA Compliance: Comply with NEMA Stds Pub/No. 250, “Enclosure for Electrical Equipment (1000 Volts Maximum),” and Pub/No. PB 1.1, “Instructions for Safe Installation, Operation and Maintenance of Equipment Rated 600 Volts or Less.”

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store switchboard in a clean dry space. Protect units from dirt, fumes, water, construction debris and traffic; where necessary to store outdoors, store electrical components above grade and enclose with watertight wrapping.

B. Handle switchboard carefully to prevent internal components damage, breakage, denting, and scoring enclosure finish. Do not install damaged components; replace and return damaged units to equipment manufacturer.

1.6 SEQUENCING AND SCHEDULING

A. Coordinate installation of switchboard, and enclosures with installation of wires/cables, electrical boxes and fittings, and raceway work.

PART 2 - PRODUCTS

2.1 SWITCHBOARD

A. The switchboard shall be designed, manufactured and tested in accordance with applicable standards of NEMA, ANSI, and IEEE. The enclosure shall be completely self-supporting, front and rear angle forming a single metal enclosed structure. The side, top and rear covers shall be code gauge steel and finished with medium gray (ANSI #61 or #49) paint applied over rust inhibiting phosphate primer. Frame structure members shall be die-formed, 11-gauge steel bolted together and reinforced at corners. Switchboard frames are to be suitable to be bolted to floor sills embedded in concrete. The equipment shall be totally adjusted and tested at the factory and sectionalized for shipment so that the largest section does not exceed 49 inches wide, 60 inches deep, and 90 inches high to enable installation at the job site.

B. The switchboard shall be provided with load and line side compression or mechanical lug terminations for incoming and outgoing cables.

C. All switchboard bussing, devices, and connections shall be braced to withstand the maximum short circuit current available from the utility transformer. The switchboard shall be labeled to indicate the maximum available fault current rating, taking into account the structure, bussing, switchboard main disconnect(s), and switchboard branch circuit devices. The short circuit current rating of the switchboard(s) shall exceed the available short circuit, and be not be less than 65,000 RMS symmetrical amperes. The switchboard branch circuit devices short circuit current rating shall be fully rated, and exceed the available short circuit..

D. The switchboard through-buss shall be silver-plated copper. The switchboard bussing shall be of sufficient cross sectional area to meet UL Standard 891 for temperature rise. The through-buss shall have an ampacity rating as indicated on one-line drawings and extended the full length of the switchboard. The through-buss shall be 100% rated. Provisions shall be provided for future splicing of additional sections. The neutral buss shall be 100% rated.

E. The switchboard distribution section buss shall be of the same material as the through-buss and shall be fully rated. The distribution section neutral plate shall be of copper provided with Cu/Al lugs for the devices installed and future specified devices.

F. A copper 1600A, (2) 0.25 x 3-inch ground buss shall be secured to each vertical section structure. Ground buss shall extend entire length of switchboard and shall be equipped with a terminal accommodating up to 250 Kcmil for connection to purchaser’s ground system. A lug strap shall be provided for each vertical feeder section.

G. Switchboard shall be separated into shipping blocks. Each switchboard section shall be capable of being handled individually with the use of removable lifting bars or rollers and be clearly labeled with proper handling procedures.

H. Switchboard shall be arranged for connection to the supply source by cable with UL service entrance label, incoming line isolation and shall have side barriers between sections.

I. Overcurrent compartment doors shall be secured with two captive hex head screws.

J. Provide cable supports for each vertical section.

K. Bolted covers that can be bolted closed shall be provided for each cable compartment. Utility CT sections shall not be provided with hinged doors.

L. Provide shutters in drawout breaker compartments to cover breaker primary line and load disconnects when the breaker is removed from the compartment.

M. Cable bending space shall meet National Electrical Code requirements. All switchboard sections shall have open bottoms and removable top plate(s) to install conduit.

N. A-B-C buss arrangement (left-to-right, top-to-bottom, front-to-rear) shall be used throughout to assure convenient and safe testing and maintenance. Where special circuitry precludes this arrangement, buss bars shall be labeled.

O. Breaker primary connections shall be copper-to-copper, silver-plated on drawout breakers, silver-plated on stationary breakers.

P. All feeder device line and load connections shall be rated to carry continuous current rating of device frame (not trip rating).

Q. A utility metering compartment shall be supplied to meet requirements of the Central Hudson Gas and Electric Company. No additional cost to the Owner will be allowed for coordinating and meeting the local utility company requirements.

R. Service Entrance shall comply with UL Service Entrance requirements: Service entrance label, incoming line isolation barriers, neutral connection to switchboard ground for solidly grounded wye systems. The switchboard shall be listed as suitable “For Use” as service entrance and not as “Only” for service entrance. The Neutral-Ground bond shall be capable of being isolated in the future.

S. Incoming Line Section shall be rated as indicated in drawings. Main cable connection as shown on drawing.

2.2 CIRCUIT BREAKERS

A. Main Breakers:

1. The circuit breaker shall be fixed mounted type with the frame and rating (100%) size as shown on the associated drawings. The breaker operating mechanism is to be of the two-step stored energy quick-make, quick-break type. First step operation of local “close” button is to close the breaker contacts. Closing of the breaker contact shall automatically charge the opening springs to insure quick-break operation. The trip unit shall be provided with adjustable long time, short time, instantaneous and ground fault trip functions. It shall also be provided with kirk-key interlocks.
2. Main protective devices shall be low voltage insulated case circuit breakers. All protective devices shall be UL 489 listed.
3. Provide Ground Fault sensing and tripping.
4. Moveable Element: Breakers shall have manual trip button and position indicator. “Push to Close” button shall be located on front of breaker for easy access. Breaker shall be able to have all 3 primary breaker

contacts padlocked in open position to prevent unauthorized breaker closing. In Test and connected positions, breaker element shall have positive ground to housing. Breakers with same frame sizes shall be interchangeable.

B. Feeder Circuit Breakers

1. Feeder circuit breakers shall be 100% rated, molded case circuit breakers with solid state (microprocessor) trip unit. The breaker shall be manually operated type frame and be stationary mounted. Line and load side circuit breaker connections are to be buss type. The trip unit shall be provided with adjustable long time, short time, instantaneous and ground fault trip functions. Provide metering capabilities per paragraph 2.3.
2. Provisions for all controls, future accessories and communications shall be factory wired.
3. Breakers shall be suitable for reverse feeding.

2.3 POWER MONITORING EQUIPMENT

A. Circuit Breaker Monitor: The feeder circuit breaker shall have a fully functioning microprocessor based circuit monitoring device (CMD) for measuring true RMS currents and voltages. The CMDs shall have a display meter with an easy to use, full-function, electronic meter. The metering values shall be phase selectable, include RMS current for each phase and neutral, Voltage (L-L and L-N), Watts, VARs, Volt-Amps, Power Factor, Watt-Hours, VAR Hours, Volt-Amp hours, Current Demand, Peak Current, Watt Demand, Peak Watts Demand, Peak VARs Demand, VARs Demand, Peak volt-amperes Demand, volt-amperes Demand, Q-Hours, Power Factor Average, Power Factor during last demand and interval and Frequency. The breaker-mounted solid-state device shall have a single-line LCD display visible front of switchboard. All monitoring devices in each switchboard shall be tied into central monitor located above the main breaker.

B. Central Monitor: The Monitor shall be provided on specified circuits. This panel mounted solid state device shall have an LCD display with 2 lines, 16 characters each. The device shall provide the functions listed below.

1. Metering values available for display at the monitor shall include RMS current for each phase, RMS voltage (L-L or L-N), Watts, VARs, Volt-Amps, Power Factor, Watt-hours, Watt demand, and frequency from each of the CMD devices.
2. Events shall be defined by the devices that are connected to the Central Monitor. Events shall include circuit breaker trips such as overvoltage, undervoltage and ground fault. When an event occurs, the event log shall be updated with the device alphanumeric name and type of event.
3. The New Event indicator light shall notify the user of the existence of a new event (if enabled during setup). A relay contact shall also operate (if enabled during setup) which shall allow the user to use other types of event notification, such as an audible alarm.
4. The device shall permit the user to define a password to provide security protection. The device setup and all user defined values/settings shall be accomplished by entering the information into the device via the four digit keypad on the front of the faceplate.
5. The device shall be capable of communicating on the FUTURE communication network.

2.4 TRANSIENT VOLTAGE SURGE SUPPRESSOR

A. Each switchboard shall be provided with a Transient Voltage Surge Suppresser (TVSS) exterior of enclosure, and shall be UL 1449 Listed and CSA Approved. The TVSS shall meet the requirements of Section 26 43 13 for service entrance.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine area and conditions under which switchboards, panelboards and enclosures are to be installed, and notify Engineer in writing of conditions detrimental to proper completion of work. Do not proceed with work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF SWITCHBOARD

A. Install switchboards, panelboards, and enclosures as indicated, in accordance with manufacturer's written instructions, applicable requirements of NEC standards and NECA's "Standards of Installation," and in compliance with recognized industry products fulfill requirements practices to ensure that.

B. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturers' published torque tightening values for equipment connectors. Where manufacturer's torque requirements are not indicated, tighten connectors and terminals to comply with torque tightening requirements specified in UL Std 486A and B.

C. Fasten enclosures firmly to walls and structural surfaces, ensuring that they are permanently and mechanically anchored.

D. Provide properly wired electrical connections for switchboard.

E. Provide engraved, plastic laminate labels for all switchboard indicating name, voltage, phase, wire and short circuit rating. In addition, each branch device on the switchboard shall be labeled (engraved). Refer to Section 26 05 53 for more information.

F. Provide typed panelboard's circuit directory card upon completion of installation work to match as-built conditions and nomenclature indicated on engineering drawings and submit directories to the Engineer for review prior to mounting in panelboard.

3.3 RISER DIAGRAMS PLACARD

A. Provide an electrical riser diagram for light and power, telephone, fire alarm and smoke detector, and emergency power framed, under glass, and mounted on the wall in the transformer room. Prints shall be of the diffusion transfer process to eliminate fading.

3.4 SWITCHBOARD BASES

A. Construct concrete equipment pads as follows:

1. Coordinate size of equipment bases with actual unit sizes provided. Construct base 4-inches high and 2-inches larger in all directions that the overall dimensions of the supported unit. The highest switch shall not exceed 6'-6" above the floor when installed on the pad.
2. Form concrete pads with framing lumber with form release compounds. Chamfer top edge and corners of pad.
3. Install reinforcing bars, channel sills embedded into concrete to tie to frame, and place anchor bolts and sleeves to facilitate securing units.
4. Place concrete and allow to cure before installation of units. Use cement conforming to ASTM C 150, 4000 psi compressive strength, and normal weight aggregate.

3.5 GROUNDING

A. Provide equipment grounding connections for switchboard enclosures as indicated herein. Tighten connection to comply with torque tightening requirements specified in UL 486A to assure permanent and effective grounds.

B. Refer to Section 26 05 26 for additional grounding requirements.

3.6 FIELD QUALITY CONTROL

Tests shall conform to International Electrical Testing Association (INETA) Standard ATS, "Acceptance Testing Specifications for Electrical Power Distribution Equipment."

A. Infrared Inspection (After Energized):

1. The scan is to include all electrical switchboard field connections to buss bars and loads.
2. All equipment should be energized at normal load levels for at least 1 to 2 hours prior to being scanned.
3. Access covers are to be removed and reinstalled by the electrical contractor for the Engineer to inspect and scan all electrical junctions, buss, and cable.
4. The IR Scan will be made using an AGEMA 720 camera. The camera shall provide infrared photos clearly indicating problem areas.
5. All problem areas will be noted as to location, description, and recommended solution by providing a typed report including infrared and Polaroid pictures of all problem areas.

B. Switchboard:

1. Visual and mechanical Inspection:
   a. Inspect for physical damage and code violations.
   b. Inspect for proper alignment, anchorage and grounding.
   c. Inspect for proper identification of protective devices and switches.
   d. Check tightness of accessible bolted buss joints.
   e. Physically test all electrical or mechanical interlocks to assure proper function.
   f. Clean interior and insulator surfaces.
   g. Inspect for proper operation of space heaters and thermostat settings (if they exist).
2. Electrical Tests:
   a. Measure insulation resistance of each buss section phase-to-phase and phase-to-ground.
   b. Check switchboard for electrical continuity of circuits and for short circuits.

C. Circuit Breakers:

1. Visual and Mechanical Inspection:
   a. Inspect for physical damage.
   b. Mechanical operational test will be made in accordance with manufacturer's instructions.
   c. Check tightness of all hardware connections.
   d. Check cell fit and element alignment.
2. Electrical Tests:
   a. Measure contact resistance.
   b. Check the following functions by primary current injection.
      1) Measure minimum long-time pickup when possible.
      2) Measure long-time delay at three (3) times long-time pickup current.
      3) Measure short-time pickup.
      4) Measure short-time delay at 1½ times short-time pickup current.
      5) Measure instantaneous pickup.
      6) Measure ground fault pickup.
      7) Measure ground fault delay at 1½ times ground fault pickup.
      8) Check trip unit reset operation.
   c. Perform insulation resistance test phase-to-ground, phase-to-phase and across open contacts.
   d. Metering and instrumentation
      1) Visual and mechanical inspection.
         a) Check all devices for physical damage and connection tightness.

b) Verify meter nameplate designation.

e. Electrical Tests
1) Check calibration of all panel meters at zero, mid-scale and full-scale deflections by transfer standard.
2) Check calibration of watt-hour meters for proper registration by use of rotating standard at light, heavy, and 50% power conditions.
3) Verify all instrument multipliers and scale factors.

3.7 ADJUSTING AND CLEANING

A. Adjust operating mechanisms for free mechanical movement.

B. Touch-up scratched or marred surfaces to match original finishes.

3.8 DEMONSTRATION

A. Subsequent to wire and cable hook-ups, energize switchboard and demonstrate functioning in accordance with requirements. Where necessary, correct malfunctioning units, and then retest to demonstrate compliance.

END OF SECTION

SECTION 26 27 26

WIRING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Requirements of the following Division 26 Sections apply to this section.

1.2 SUMMARY

A. This Section includes the following:

1. Receptacles
2. Ground Fault Circuit Interrupter Receptacles
3. Plugs
4. Plug Connectors
5. Snap Switches
6. Dimmer-Switches
7. Wall Plates

B. Related Sections: The following sections contain requirements that relate to this section:

1. Division 26 Section “Disconnects, Fuses and Enclosed Breakers” for devices other than snap switches and plug/receptacle sets used as disconnects for motors.

1.3 SUBMITTALS

A. Product data for each type of product specified. Include a color selection chart showing available color for each device type.

1.4 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with provisions of the following codes.

1. NFPA 70 “National Electrical Code.”

B. UL and NEMA Compliance: Provide wiring devices which are listed and labeled by UL and comply with applicable UL and NEMA standards.

1.5 SEQUENCE AND SCHEDULING

A. Schedule installation of finish plates after the surface upon which they are installed has received final finish.

PART 2 - PRODUCTS

2.1 WIRING DEVICES

A. General: Provide wiring devices, in types, characteristics, grades, colors, and electrical ratings for applications indicated which are UL listed and which comply with NEMA WD 1 and other applicable UL and NEMA standards.

B. Color of Devices: Color of all devices shall be coordinated with the Architect, except special purpose devices shall be black, emergency power system devices which shall be red, corrosion-resistant devices which shall be yellow, surge suppression devices shall be blue, or isolated ground devices which shall be orange.

C. Receptacles: As scheduled in Table 1 in Part 3 indicated herein. Comply with UL 498 and NEMA WD 1 and WD 5.

D. Receptacles, Industrial Heavy Duty: Provide pin and sleeve design receptacles conforming to UL 498. Comply with UL 1010 where installed in hazardous locations. Provide features indicated.

E. All receptacles fed from emergency generator power upon normal power failure, shall be "Hospital Grade" type. Cover shall be steel with red baked enamel. Receptacles connected to emergency power shall be colored red and durably marked to indicate panelboard and circuit number supplying them.

F. Ground-Fault Interrupter (GFI) Receptacles: As scheduled in Tables 1 and 2 in Part 3 indicated herein: Provide “terminal” or feed-through type ground-fault circuit interrupter, as indicated on drawings, with integral heavy-duty NEMA 5-20R duplex receptacles. Provide unit designed for installation in a 2-3/4-inch deep outlet box without adapter, grounding type, Class A, Group 1 per UL Standard 943.

G. All single receptacles or multi-outlet receptacle assemblies in lab areas shall be labeled with panel and circuit breaker.

H. All non-locking 125-volt, 15A and 20A receptacles in guest rooms and guest suites in hotels and motels shall be listed tamper-resistant type.

I. All 15A and 20A, 125V and 250V, non-locking receptacles located in damp or wet locations shall be listed weather-resistant type.

J. Provide Firestop putty pads on the backside of all boxes exceeding 16 sq. inches in area. Provide Firestop putty pads on the back side for all outlet boxes within 24 inches of each other, in opposite sides, and at same elevation, in the same wall. Provide Firestop putty pads on the back side for all boxes in a wall or ceiling where the aggregate surface area of the outlet boxes exceeds 100 sq. inches per 100 sf of surface of wall or ceiling area. Firestop putty pads shall be Hilti CP617XL (9” x 9”) for each box 16 sq inches or less.

K. Snap Switches: As scheduled in Table 3 in Part 3 indicated herein:

L. Wall Dimmer: As scheduled in Table 3 in Part 3 indicated herein.

1. Wall dimmers shall be solid state type with slide control handle, preset button and semi-flush mounting. Dimmers shall be sized to continuously carry the load they are connected to, the minimum size shall be 1000 watts, and shall be rated larger if indicated on the drawings or required to serve the load.
2. Dimmers shall be selected to match the specific load served.
3. All dimmers shall be of the same manufacturer. Faceplate shall be the same color as device plates specified.

M. Vacancy Sensors: See Section 26 51 01.

N. Floor Outlets: Floor boxes shall be concealed service, fully adjustable cast iron, watertight type for single or multi-gang installations. Floor box shall have space for both 120 volt and telecommunication wiring. Service fittings, covers, and accessories shall be brass. Service fittings shall be in floor flush type with outlet devices as indicated on the drawings. Provide covers, extensions, adapters and necessary components to provide the service type indicated on the drawings. Install carpet flange on all outlets in carpeted areas.

O. Floor Poke through Outlets: The device shall be a fire-rated poke-through with a flush service fitting shall be UL classified with a fire rating that is the same as the floor in which the outlet is installed. The units shall accommodate power, telephone and data services in a single unit, or multiple units as shown on the documents. The poke-through shall be pre-wired and install in a 4 inch diameter core drilled hole. The internal spur assembly is designed so that the pedestal is secure in place from above, while also allowing for easy removal or relocation data jacks and power. Receptacles shall be covered by lift cover flaps that lay flat against the cover when open. Modular jacks include dust covers. Poke-through shall be a Hubbell S1PT series or approved equal.

P. Surface Mounted Multi-outlet System:

1. Multi-outlet system shall consist of surface mounted all steel raceways for use with number and type of wiring devices installed as shown on the Drawings. System shall be complete with all fittings required for a complete installation.

    a. Wiremold 4000 Series - Raceway with buff finish shall be 4-3/4" high by 1-3/4" deep with dividers deep and snap on cover and shall contain brackets for mounting of grounding type wiring devices located 12" on centers and rated 20 amperes, 120 volts, unless otherwise indicated on drawings.
    b. Wiremold 3000 Series - Raceway with buff finish shall be 2-3/4" high by 1-15/32" deep with snap on cover and shall contain brackets for mounting of grounding type wiring devices located 12" on centers and rated 20 amperes, 120 volts, unless otherwise indicated on drawings by symbol, and having the capability of being installed wherever desired within the raceway. All branch circuit wiring shall be run within the raceway.
    c. Wiring devices shall be as specified under "Outlet Boxes and Wiring Devices" with plates having finish to match that of multi-outlet system raceway. Each receptacle cover shall be indent stamped with the voltage and ampere rating of that receptacle.
    d. All receptacles in multi-outlet assemblies shall be labeled with panel and branch circuit number.

Q. Wireways:

1. Wiring troughs shall be 4" x 4" or 6" x 6", brake-formed of code gauge steel, furnished in standard 10-foot sections with knock- outs, as required. Wiring troughs shall be of the screw cover type and shall have a high grade enamel finish baked on a chemically-cleaned and zinc-phosphatized surface providing maximum resistance to corrosion.
2. Wiring troughs shall be furnished with all the required components, such as square junction boxes, 90-degree elbows, T-shaped pull boxes, crossover pull boxes, box-connecting couplings, fittings and screw-on cover plates. Lengths of individual sections shall be provided in accordance with installation requirements.

R. All exterior weatherproof receptacles located on the roof, receptacles located in elevator pits and machine rooms shall be GFI type or GFI protected and have “in use” covers.

S. All devices shall be premium specification grade.

2.2 WIRING DEVICE ACCESSORIES

A. Wall Plates: Single and combination, of types, sizes, and with ganging and cutouts as indicated. Provide metal screws for securing plates to devices with screw heads colored to match finish of plates. Provide wall plates with engraved legend where indicated on drawings. Engraving shall be done by the device manufacturer. All lettering shall be 1/8-inch high and shall be black for normal power systems and red for emergency power systems. Provide

plates possessing the following additional construction features:

1. Material and Finish: 0.04 inch thick, type 302 satin finished stainless steel. Plate shall be Hubbell “S” Series or approved equal.
2. Surface mounted wiring devices and blank outlet plates shall be cadmium plated. Interior outlet plates shall be pressed steel. Outlets exposed to weather or corrosive conditions shall be of the cast-metal type.
3. Plates for weatherproof receptacles shall consist of cast- aluminum gasketed plate with spring-loaded lift covers providing access to the outlet. Lift cover to correspond to number of outlets to be gasketed. Plates for weatherproof switches shall consist of a cast plate with flexible bubble for activating a push type switch. Plates shall be for corrosion-resistant devices, as manufactured by Hubbell, Inc., or approved equal.

B. For all devices installed which are exposed to the weather, moisture or where indicated on the drawings, device plates shall be weatherproof. Device plates shall be cast type with gasketing to prevent entrance of moisture when closed.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine location where wiring devices and installation components are to be installed and determine space conditions and notify architect in writing of conditions detrimental to proper and timely completion of the work.

B. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF WIRING DEVICES AND ACCESSORIES

A. Install wiring devices and accessories as indicated, in accordance with manufacturer’s written instructions, applicable requirements of NEC and in accordance with recognized industry practices to fulfill project requirements.

B. Coordinate with other work, including painting, electrical boxes and wiring installations, as necessary to interface installation of wiring devices with other work.

C. The mounting height of devices is indicated in the legend on the drawings. Where finished walls are exposed concrete block, brick or tile, the height shall be adjusted to allow outlet box for device to be mounted at a joint.

D. Receptacles above countertops shall be installed with major axis horizontal above the backsplash.

E. Electrical outlets shall be installed vertically unless otherwise noted. Those located on interior columns shall be centered laterally.

F. Mount all devices within outlet boxes to allow device plates to be in contact with wall on all sides. Align devices with major axis of device parallel to adjacent predominant building feature, i.e., door frames or countertops.

G. Install wall switches on the strike side of doors.

H. Mount switches with the long dimension vertical and the operating handle in the upward position when in the "On" position.

I. Install wiring devices only in electrical boxes which are clean; free from building materials, dirt, and debris.

J. Provide a current carrying conductor, neutral, equipment grounding conductor and an insulated grounding conductor to each isolated ground “IG” receptacle.

K. Install galvanized steel wall plates in unfinished spaces.

L. Install wiring devices after wiring work is completed.

M. Install wall plates after painting work is completed.

N. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer’s published torque tightening values for wiring devices. Where manufacturer’s torque requirements are not indicated, tighten connectors and terminal to comply with tightening torque requirements specified in UL Standard 486A. Use properly scaled torque indicating hand tool.

O. At time of completion, replace items which have been damaged including those burned and scored by faulty plugs.

P. Where it is not possible to set the switch box flush with the wall, furnish raised edge plates.

Q. Where more than one switch is being installed, provide multiple gang switch plates for number of switches as required.

3.3 PROTECTION

A. Protect installed components from damage. Replace damaged items prior to final acceptance.

3.4 FIELD QUALITY CONTROL

A. Testing: Prior to energizing circuits, test wiring for electrical continuity, and for short-circuits. Ensure proper polarity of connections is maintained. Subsequent to energizing test wiring devices and demonstrating compliance with requirements, operate each operable device at least six times.

B. Test ground fault interrupter operation with both local and remote fault simulations in accordance with manufacturer recommendations.

C. TABLE 1

RECEPTACLES

Designation (1)	Current Rating Amps	Voltage Rating	Single/ Duplex	NEMA Config.	Hubbell Catalog #(3)	Notes
-	20	125	Duplex	5-20R	HBL2162	-
-	20	125	Single	5-20R	HBL5361	-
IG	20	125	Duplex	5-20R	IG5362	Isolated Ground
WP	20	125	Duplex	5-20R	HBL5362WR	Weather-proof (4)
GFI	20	125	Duplex	5-20R	GF20LA	Integral GFI (2)
SS	20	125	Duplex	5-20R	5362S	Surge Suppression
TP	20	125	Duplex	5-20R	DR20TR	Tamperproof
CH	15	125	Simplex	5-15R	HBL5235	Clock Hanger

NOTES

1. Letter designations are used where symbols alone do not clearly designate on plans locations where specific receptacle types are used.
2. Protecting downstream receptacles on same circuit is not acceptable.
3. Refer to Section 26 05 05 for additional acceptable manufacturers. Color of device shall be verified with Architect (ivory, gray, white, etc.). All emergency receptacles shall be red.
4. Where required per NEC or local code provide 'WP26M' in-use water-proof cover.

D. TABLE 2

NOT USED

E. TABLE 3

SNAP SWITCHES/WALL DIMMERS

Designation (1)	Typical Application	Load Rating	Voltage Rating (AC)	Poles	Hubbell Catalog #(4)	Notes
S	Control Lights	20A	120/277	1	DS120	-
S3	Control Lights	20A	120/277	3-way	DS320	-
S4	Control Lights	20A	120/277	4-way	DS420	
Sp	Switch & Pilot Light	20A	120/277	1	DS1201	(2)
D	Dimmer Switch	1000W	120	1	Vareo Series w/preset	(3)
Sk	Key Switch	20A	120/277	1	HBL1221L	
Swp	Wp Switch & Cover Plate	20A	120/277	1	1281/1750	

NOTES

1. For snap switches, designation is the same as the symbol used on plans for the device. Type of switch is determined from plan context including type of device or circuit being controlled.
2. Pilot light "on" when switch is "on."
3. Lutron dimmer (refer to 26 05 05 for additional manufacturers). Provide dimmer wattage size to handle load served. Derate dimmer switch per manufacturer's recommendations where dimmers are ganged together.
4. Refer to Section 26 05 05 for additional acceptable manufacturers. Color of device shall be verified with Architect (ivory, gray, white, etc.).

END OF SECTION

SECTION 26 28 16

DISCONNECTS, FUSES AND ENCLOSED BREAKERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification sections, apply to work of this section.

B. Division 26 Basic Electrical Materials and Methods sections, apply to work of this section.

1.2 SUMMARY

A. Provide all circuit and motor disconnect switch and circuit breaker work including fusing, electrical connections to motors, appliance and mechanical equipment as indicated on the drawings and schedules.

B. All disconnects serving smoke fans/motors shall have auxiliary contact wired to control circuit of upstream starter/VFD to monitor the position of the disconnect.

C. Types of circuit and motor disconnect switches in this section include the following:

1. Equipment disconnects.
2. Appliance disconnects.
3. Motor-circuit disconnects
4. Enclosed breakers.

D. Applications of electrical power connections specified in this section include the following:

1. To resistive heaters.
2. From electrical source to motor starters.
3. From motor starters to motors.
4. To lighting fixtures.
5. To converters, rectifiers, transformers, inverters, rheostats, and similar current adjustment features of equipment.
6. To grounds including earthing connections.
7. To panelboards, contactors, time clocks and similar equipment.

E. All switchboards, panelboards, transformers, disconnect switches, starters, etc., shall be fabricated by same manufacturer throughout the entire project.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's data on circuit and motor disconnect switches, fuses, equipment connectors.

B. Fuse Product Data: For each type of fuse indicated. Include construction details, material, dimensions, descriptions of individual components, and finishes for spare-fuse cabinets. Include the following for each fuse type indicated:

1. Ambient Temperature Adjustment Information: If ratings of fuses have been adjusted to accommodate ambient temperatures, provide list of fuses with adjusted ratings:

a. For each fuse having adjusted ratings, include location of fuse, original fuse rating, local ambient temperature, and adjusted fuse rating.

b. Provide manufacturer's technical data on which ambient temperature adjustment calculations are based.

2. Dimensions and manufacturer's technical data on features, performance, electrical characteristics, and ratings.
3. Current-limitation curves for fuses with current-limiting characteristics.
4. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse.
5. Fuse sizes for elevator feeders and elevator disconnect switches, and circuit breakers.

1.4 QUALITY ASSURANCE

A. All equipment shall be in compliance with codes and standards referenced in Section 26 05 02 titled "Electrical Requirements".

B. "Manufacturers" - Firms regularly engaged in manufacture of the type of equipment required for the application, whose products have been in satisfactory use in similar service for not less than 5 years.

C. UL Compliance: Comply with requirements of UL 98, "Enclosed and Dead-Front Switches." Provide circuit and motor disconnect switches which have been UL listed and labeled.

D. Comply with NEC (NFPA 70) for construction and installation of safety and disconnect switches.

E. Comply with UL Std 486A, "Wire Connectors and Soldering Lugs for Use with Copper Conductors," including, but not limited to, tightening of electrical connectors to torque values indicated.

F. NEMA Compliance: Comply with applicable requirements for NEMA Stds Pub/No. KS 1, "Enclosed Switches," and No. 250, "Enclosures for Electrical Equipment (1000 Volts Maximum)."

G. ANSI Compliance: Comply with applicable requirements of ANSI C97.1, "Low-Voltage Cartridge Fuses 600 Volts or Less."

H. NEMA Compliance: Comply with NEMA FU1 for cartridge fuses.

1.5 PROJECT CONDITIONS

A. Where ambient temperature to which fuses are directly exposed is less than 40 deg F (5 deg C)or more than 100 deg F (38 deg C), apply manufacturer's ambient temperature adjustment factors to fuse ratings.

B. Molded case circuit breakers and all components shall be designed, manufactured and tested in accordance with the latest applicable standards of the following:

1. UL 489 – Molded Case Circuit Breakers
2. NEMA AB1 – Molded Case Circuit Breakers
3. NEMA 250 – Enclosures for Electrical Equipment

PART 2 - PRODUCTS

2.1 CIRCUIT AND MOTOR DISCONNECT SWITCHES

A. Furnish and install safety switches as required for motor outlets or other equipment. Switches shall be of size, number of poles, and fused or non-fused, as required for job conditions and the National Electrical Code.

B. Switches shall be equipped with fuse contacts and jaws which ensure positive fuse and jaw contact by means of reinforcing spring clips of other approved means. All current carrying parts shall be silver-plated. Hinges shall be non-current carrying. Switches shall be so designed that they can be locked in either open or closed position.

C. All switches shall have switch blades which are fully visible in the OFF position when the door is open. Switches shall have removable arc suppressors, where necessary to permit easy access to line-side lugs. Lugs shall be UL listed for aluminum and/or copper cables and front removable. 30A thru 100A switches shall have provisions for field installed fuse pullers. Switches shall include solid neutral where required.

D. All safety switches shall be NEMA 1 enclosed Type “HD” (heavy duty) quick-make, quick-break, and have interlocking cover with handle that may either be front or side operating with padlocking provisions. Provide NEMA 3R weather proof enclosures where indicated on the drawings or exposed to exterior or damp locations. Incorporate rejection clips where used with Class “R” fuses.

E. Handle position shall indicate if switch is ON or OFF. Handle shall have provision for padlock.

F. Switches shall be rated for voltage, poles, amperes, and horsepower, as required or shown on Drawings. All switches shall be rated for maximum available fault current as required or shown on Drawings.

G. Fusible Switches: Heavy duty switches, with fuses of classes and current ratings indicated on drawings. See Section “2.3” for Fuse specifications. Where current limiting fuses are indicated, provide switches with non-interchangeable feature suitable only for current limiting type fuses.

H. Non-fusible Disconnects: Heavy duty switches of classes and current ratings as indicated on drawings.

I. Double-Throw Switches: Heavy duty switches of classes and current rating as indicated on drawings.

J. Bolted Pressure Switches: Bolted pressure switches conforming to and listed under UL Standard 977; single or double-throw arrangement as indicated. For fusible units provide fuses as indicated on drawings.

K. Accessories:

1. Electrical Interlocks: Provide number and arrangement of interlock contacts in switches as indicated on drawings or specified elsewhere in specifications.
2. Special Enclosure Material: Provide special enclosure material as follows for switches indicated on drawings to be NEMA 4X:
   a. Stainless Steel Type 316.
   b. Heavy case aluminum.
3. Captive Fuse Pullers: Provide built-in pullers arranged to facilitate fuse removal.

2.2 CONNECTIONS FOR EQUIPMENT

A. General: For each electrical connection indicated provide complete assembly of materials, including but not necessarily limited to, pressure connectors, terminals (lugs), electrical insulating tape, electrical solder, electrical soldering flux, heat-shrinkable insulating tubing, cable ties, solderless wirenuts. All other items and accessories as needed to complete splices and terminations of types indicated.

B. Metal Conduit, Tubing and Fittings:

1. General: Provide metal conduit, tubing and fitting of types, grades, sizes and weights (wall thicknesses) indicated for each type service. Where types and grades are not indicated, provide proper selection as determined by Installer to fulfill wiring requirements and comply with NEC requirements for raceways. Provide products complying with Section 26 05 06 titled “Basic Materials and Methods” and Section 26 05 33 titled “Raceways and Boxes” and in accordance with the following listing of metal conduit, tubing and fittings:

    a. Rigid steel conduit.
    b. Rigid metal conduit fittings.
    c. Electrical metallic tubing.
    d. EMT fittings.
    e. Flexible metal conduit.
    f. Flexible metal conduit fittings.
    g. Liquid-tight flexible metal conduit.
    h. Liquid tight flexible metal conduit fittings.

C. Wires, Cables, and Connectors:

1. General: Provide wires, cables and connectors complying with Division 26 05 06 titled “Basic Materials and Methods” and “Section 26 05 19” titled “Wires and Cables.”
2. Wires/Cables: Unless otherwise indicated, provide wires/cables (conductors) for electrical connections which match, including sizes and rating, of wires/cables which are supplying electrical power. Provide copper conductors with conductivity of not less than 98% at 20°C (68°F).
3. Connectors and Terminals: Provide electrical connectors and terminals which mate and match, including sizes and ratings, with equipment terminals and are recommended for use by equipment manufacturer for intended applications.
4. Electrical Connection Accessories: Provide electrical insulating tape, heat shrinkable insulating tubing and boots, electrical solder, electrical soldering flux, wirenuts and cable ties as recommended for use by accessories manufacturers for type services indicated.

2.3 FUSES

A. General: Except as otherwise indicated, provide fuses of types, sizes, ratings, and average time-current and peak let-through current characteristics, which comply with manufacturer’s standard design, materials, and constructed in accordance with published product information, and with industry standards and configurations.

B. Class RK1 dual element time-delay fuses: Provide UL Class RK1 current limiting time-delay fuses rated 600-volts, (250 volts where specified), 60 Hz, with 200,000 RMS symmetrical interrupting current rating for protecting circuit breakers, motors and panelboards.

C. Class RK5 dual element time-delay fuses: Provide UL Class RK5 current limiting time-delay fuses rated 600 volts, (250 volts where specified), 60 Hz, with 200,000 RMS symmetrical interrupting current rating for protecting circuit breakers, motors, and transformers.

D. Class L time-delay fuses: Provide UL Class L time-delay fuses rated 600 volts, 60 Hz, with 200,000 RMS symmetrical interrupting current rating.

2.4 SPARE-FUSE CABINET

A. Characteristics: Wall-mounted NEMA-1 steel unit with full-length, recessed piano-hinged door and key-coded cam lock and pull.

1. Size: Adequate for storage of spare fuses specified in Section 3.3 with 15 percent spare capacity minimum.
2. Finish: Gray, baked enamel.

3. Provide engraved, plastic laminate label “Spare Fuses” for cabinet. Refer to Section 26 05 53 for more information.
4. Fuse Pullers: For each size of fuse, where applicable and available, from fuse manufacturer.

B. A complete set of spare fuses shall be purchased at the same time the initial fuses are purchased. Spare fuses shall consist of a standard carton for 0 to 60 amperes rating, and for above 60 amperes rating provide 10% of each type and rating or a set of three, whichever is greater. Spare fuses shall be placed in one or more spare fuse cabinets as required. The spare fuse cabinet shall be 30” H x 24” W x 12” D with key lock door, center shelf and fuse index holder. Include one set of fuse bulletins in the fuse cabinet.

C. Fuses shall be U.L. Class L, time-delay and shall employ “O” rings as positive gas seals between the end bells and the glass melamine fuse barrel. Mounting terminals shall be opened. Fuses shall be time-delay and must hold 500% of rated current for a minimum of 4 seconds and clear 20 times rated current within .01 seconds. Fuse links shall consist of pure copper.

2.5 MOLDED CASE PROTECTIVE DEVICES

A. Protective devices shall be molded case circuit breakers with inverse time and instantaneous tripping characteristics.

B. Circuit breakers shall be operated by a toggle-type handle and shall have a quick-make, quick-break over-center switching mechanism that is mechanically trip-free. Automatic tripping of the breaker shall be clearly indicated by the handle position. Contacts shall be non-welding silver alloy and arc extinction shall be accomplished by means of DE-ION arc chutes. A push-to-trip button on the front of the circuit breaker shall provide a local manual means to exercise the trip mechanism.

C. Circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the drawings.

D. The Contractor shall perform field adjustments of the circuit breakers as required to place the equipment in final operating condition. The settings shall be in accordance with the approved protective device coordination study or as directed by the Engineer.

2.6 ENCLOSURES

A. Provide enclosures suitable for locations as indicated on the drawings and as described below:

1. NEMA 1 surface of flush-mounted general purpose enclosures intended for indoor use.

B. All enclosed circuit breakers shall have nameplates that contain a permanent record of catalog number and maximum rating.

C. Provide handle mechanisms that are pad-lockable in the “OFF” position.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine location where fuses and safety and disconnect switches and circuit breakers are to be installed and notify Architect/Engineer in writing of conditions detrimental to proper and timely/completion of the work.

B. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF CIRCUIT AND MOTOR DISCONNECT SWITCHES

A. Install circuit and motor disconnect switches as indicated, complying with manufacturer's written instructions, applicable requirements of NEC, NEMA, and NECA's "Standard of Installation," and in accordance with recognized industry practices.

B. Coordinate circuit and motor disconnect switch installation work with electrical raceway and cable work, as necessary for proper interface.

C. Install disconnect switches for use with motor-driven appliances, and motors and controllers within sight of controller position unless otherwise indicated. For all disconnecting means located remote from the motor controller (starter or variable frequency drive), contractor to provide disconnect with auxiliary contacts, contacts and control wiring back to motor controller.

D. Provide NEMA 3R disconnect switches for all exterior locations and any location subject to moisture.

E. Provide box with spare set of each size fuse used on job.

F. Provide nameplate on switch, indicating equipment served.

G. Provide line voltage wiring from starter/VFD control circuit to Aux contact in disconnect. Provide 2# 10, 3/4" C or run with power wire if same voltage.

3.3 INSTALLATION OF EQUIPMENT CONNECTIONS

A. Install electrical connections in accordance with equipment manufacturer's written instructions and with recognized industry practices, and complying with applicable requirements of UL, NEC and NECA's "Standard of installation" to ensure that products fulfill requirements.

B. Coordinate with other work, including wires/cables, raceway and equipment installation, as necessary to properly interface installation of electrical connections for equipment with other work.

C. Connect electrical power supply conductors to equipment conductors in accordance with equipment manufacturer's written instructions and wiring diagrams. Mate and match conductors of electrical connections for proper interface between electrical power supplies and installed equipment.

D. Cover splices with electrical insulating material equivalent to, or of greater insulation resistivity rating, than electrical insulation rating of those conductors being spliced.

E. Prepare cables and wires, by cutting and stripping covering armor, jacket, and insulation properly to ensure uniform and neat appearance where cables and wires are terminated. Exercise care to avoid cutting through tapes which will remain on conductors. Also avoid "nicking" copper conductors while skinning wire.

F. Trim cables and wires as short as practicable and arrange routing to facilitate inspection, testing and maintenance.

G. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturers published torque tightening values for equipment connectors. Accomplish tightening by utilizing proper torque tools, including torque screwdriver, beam-type torque wrench, and ratchet wrench with adjustable torque settings. Where manufacturer's torque requirements are not available, tighten connectors and terminals to comply with torque values contained in UL 486A.

H. Provide PVC-coated conduit and fittings for highly-corrosive atmospheres.

I. Provide flexible conduit for motor connections, and other electrical equipment connections, where subject to movement and vibration.

J. Provide liquid-tight flexible conduit for connection of motors and other electrical equipment where subject to movement and vibration, and also where connections are subjected to one or more of the following conditions:

1. Exterior location.
2. Moist or humid atmosphere where condensation can be expected to accumulate.
3. Corrosive atmosphere.
4. Water spray.
5. Dripping oil, grease, or water.

K. Fasten identification markers to each electrical power supply wire/cable conductor which indicates their voltage, phase and feeder number in accordance with Division 26 section titled “Electrical Identification.” Affix markers on each terminal conductor, as close as possible to the point of connection.

L. Provide flexible metal conduit or Type “S” rubber cords, pigtails, caps, etc., as required to constitute an operating system. All flexible cords shall have a grounding conductor. Ground all equipment. See Section 26 05 26 titled “Grounding” for additional requirements.

M. Prior to roughing-in, refer to all equipment manufacturer’s shop drawings for details of equipment connections. Provide receptacles as required to match the cord caps on the equipment furnished. Provide either direct wiring or receptacles for final connection to equipment as required for the particular equipment furnished regardless of the type of outlet shown on the plans.

3.4 INSTALLATION OF FUSES

A. Install fuses as indicated, in accordance with manufacturer’s written instructions and with recognized industry practices to ensure that protective devices comply with requirements. Comply with NEC, and NEMA standards for installation of fuses.

B. Coordinate work including electrical wiring, as necessary, to interface installation of fuses with other trades.

C. Install fuses in fused switches.

D. Provide spare fuse cabinet located in each main switchgear room. Provide spare fuse of size and type for every five (5) fuses installed. A minimum of three (3) spare fuses shall be provided for each size installed.

E. Contractor shall install Class R fuse rejection kits on all heavy duty safety switches not already fitted for Class R fuses.

3.5 INSTALLATION OF ENCLOSED CIRCUIT BREAKERS

A. Install enclosed circuit breakers as indicated, complying with manufacturer’s written instructions, applicable requirements of NEC, NEMA, and NECA’s “Standard of Installation,” and in accordance with recognized industry practices.

B. Coordinate enclosed circuit breakers installation work with electrical raceway and cable work, as necessary for proper interface.

3.6 GROUNDING

A. Provide equipment grounding connections, sufficiently tight to assure a permanent and effective ground for electrical disconnect switches.

3.7 FIELD QUALITY CONTROL

A. Testing: Subsequent to completion of installation of electrical disconnect switches and circuit breakers, energize circuits and demonstrate capability and compliance with requirements. Except as otherwise indicated, do not test switches by operating them under load. However, demonstrate switch operation through six opening/closing cycles with circuit unloaded. Open each switch enclosure for inspection of interior, mechanical and electrical connections, fuse installation, and for verification of type and rating of fuses installed. Correct deficiencies then retest to demonstrate compliance. Remove and replace defective units with new units and retest.

B. Upon completion of installation of fuses, test and inspect system to ensure compliance with requirements.

C. Final tests and inspections of fuses shall be made prior to energization of the equipment. This shall include a thorough cleaning, tightening and review of all electrical connections and inspection of all grounding conductors.

END OF SECTION

SECTION 26 29 13

MOTOR CONTROLLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification sections, apply to work of this section.

B. Division 26 Basic Electrical Materials and Methods sections apply to work specified in this section.

1.2 SUMMARY

A. Extent of motor controller work is indicated by drawings and schedules.

B. Types of motor controllers specified in this section include the following:

1. Combination.
2. Fractional HP manual.

C. Work of this section includes wires/cables, raceways, electrical boxes and fittings, as specified in Division 26 sections, and used in conjunction with motor controllers.

D. Refer to applicable Division 26 sections for wires/cables, electrical raceways, and boxes and fittings required in connection with motor controllers.

E. All motor controllers, switchboards, panelboards, transformers, disconnect switches, starters, etc., shall be fabricated by same manufacturer throughout the project.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's data and installation instructions or motor controllers.

B. Shop Drawings: Submit shop drawings of motor controllers showing accurately scaled equipment locations and spatial relationships to associated motors and equipment.

C. Wiring Diagrams: Submit power and control wiring diagrams for motor controllers showing connections to electrical power panels, feeders, and equipment. Differentiate between portions of wiring which are manufacturer-installed and portions which are field-installed.

1.4 QUALITY ASSURANCE

A. Manufacturer's Qualification: Firms regularly engaged in manufacture of motor controllers of types and sizes required, whose products have been in satisfactory use in similar service for no less than 5 years.

B. Installer's Qualifications: Firms with at least 5 years of successful installation experience with projects utilizing motor controller work similar to that required for this project.

C. Codes and Standards:

1. Electrical Code Compliance: Comply with applicable local electrical code requirements of the authority having jurisdiction and NEC Articles 220, 250, and 430, as applicable to installation, and construction of motor controllers.
2. NFPA Compliance: Comply with applicable requirements of NFPA 70E, "Standard for Electrical Safety Requirements for Employee Workplaces."
3. UL Compliance: Comply with applicable requirements of UL 486A and 486B, and components which are UL-listed and labeled.
4. IEEE Compliance: Comply with recommended practices contained in IEEE Standard 241, "Recommended Practice for Electric Power Systems in Commercial Buildings," pertaining to motor controllers.
5. NEMA Compliance: Comply with applicable requirements of NEMA Standard ICS 2, "Industrial Control Devices, Controllers and Assemblies," and Pub/No. 250, "Enclosures for Electrical Equipment (1000 Volts Maximum)," pertaining to motor controllers and enclosures.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver motor controllers and components properly packaged in factory-fabricated type containers.

B. Store motor controllers and components in original packaging and in a clean dry space; protect from weather and construction traffic.

C. Handle motor controllers and components carefully to avoid breakage's, impacts, denting and scoring finishes. Do not install damaged equipment; replace and return damaged units to equipment manufacturer.

1.6 SEQUENCING AND SCHEDULING

A. Coordinate with other electrical work including wires/cables, electrical boxes and fittings, and raceway, to properly interface installation of motor controllers with other work.

B. Sequence motor controller installation work with other work to minimize possibility of damage and soiling during remainder of construction period.

1.7 MAINTENANCE

A. Maintenance Data: Submit maintenance data and parts list for each motor controller and component; including "troubleshooting" maintenance guide. Include that data, product data and shop drawings in a maintenance manual; in accordance with requirements of Division 1.

B. Maintenance Stock, Fuses: For types and rating required, furnish additional fuses, amounting to one unit for every 10 installed units, but not less than 5 units each.

PART 2 - PRODUCTS

2.1 MOTOR CONTROLLERS

A. General: Except as otherwise indicated, provide motor controllers and ancillary components which comply with manufacturer's standard materials, design and construction in accordance with published product information, and as required for a complete installation.

B. Combination Controllers: Provide full-voltage alternating-current combination nonreversing controllers. Controllers shall consist of variable frequency drivers or motor circuit protector and disconnect switch mounted in common enclosure, of types, sizes, rating, and NEMA sizes shown on drawings. Each starter shall have a 120-volt, 60 Hz,

control power transformer, H-O-A selector switch, red run pilot light, single phase protection and (2) two sets of N.O. and N.C. contacts for the building automation system. Equip controllers with block type manual reset overload relays and with fusible disconnect switches. Provide operating handle for disconnect switch mechanism with indication and control of switch position, with enclosure door either opened or closed, and capable of being locked in OFF position with three padlocks. Construct and mount controllers and disconnect switches in single NEMA Type 1 enclosure; coat with manufacturer's standard color finish. Provide NEMA 3R where installed in an exterior or damp location.

C. Provide start time delay relay with range 0-300 seconds for all motors 10 HP and larger. Set each relay 4 seconds apart for sequenced start-up after loss and restoration of normal power.

D. Fractional HP Manual Controllers: Provide single-phase fractional HP manual motor controllers, of sizes and ratings shown on drawings. Equip with manually operated quick-make, quick-break toggle mechanisms; and with one-piece melting alloy type thermal units. Controller to become inoperative when thermal unit is removed. Provide controllers with double break silver-alloy contacts, visible from both sides of controller; green pilot lights, and switch capable of being padlocked OFF. Enclose controller unit in NEMA Type 1 general purpose enclosure; coat with manufacturer's standard color finish. Provide NEMA 3R where installed in an exterior or damp location.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which motor controllers are to be installed, and notify Engineer in writing of conditions detrimental to proper completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF MOTOR CONTROLLERS

A. Install motor controllers in accordance with equipment manufacturer's written instructions and with recognized industry practices; complying with applicable requirements of NEC, UL and NEMA standards, to ensure that products fulfill requirements.

B. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturers' published torque tightening values for equipment connectors. Where manufacturer's torque requirements are not indicated, tighten connectors and terminals to comply with torque requirements specified in UL Standards 486A and 486B, and the National Electrical Code.

3.3 FIELD QUALITY CONTROL

A. Prior to energization of motor controller equipment, check with ground resistance tester, phase-to-phase and phase-to-ground insulation resistance levels to ensure requirements are fulfilled.

B. Prior to energization, check circuitry for electrical continuity, and for short circuits.

C. Ensure that direction of rotation of each motor fulfills requirements.

3.4 GROUNDING

A. Provide equipment grounding connections for motor controller equipment. Tighten connections to comply with torque tightening requirements specified in UL Standard 486A to assure permanent and effective grounding.

3.5 ADJUSTING AND CLEANING

A. Adjust operating mechanisms, where necessary, for free mechanical movement.

B. Touch-up scratched or marred enclosure surfaces to match original finishes.

3.6 DEMONSTRATION

A. Upon completion of installation of motor controller equipment and electrical circuitry, energize controller circuitry and demonstrate functioning of equipment in accordance with requirements. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and retest to demonstrate compliance.

END OF SECTION

SECTION 26 31 00

PERFORMANCE SPECIFICATIONS

SOLAR PHOTOVOLTAIC SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provision of Contract, including General and Supplementary Conditions and Division-1 Specification sections, apply to work of this section.

B. Division-26 Basic Electrical Materials and Methods sections apply to work specified in this section.

1.2 SUMMARY

A. The provisions of this article apply to solar photovoltaic electrical energy systems, including the array circuit(s), inverter(s), and controller(s) for such systems. Solar photovoltaic systems are interactive with other electrical power production sources. These systems have AC output for utilization.

B. The following are parameters associated with the PV system that should be adhered to:

PV System Overall Wattage	50kW
PV System Output Voltage	480V, 3-phase (60 Hz)
PV Panel Output Wattage (W/sqft)	15W/sqft
DC/AC Conversion Efficiency	95%
PV Panel Efficiency	16%
PV Panel Mounting	Roof (Fixed)
PV Panel Tilt (deg)	36º
PV Panel Azimuth (deg)	202.5º
PV Panel Inverter	Integral

Approved list of manufacturers is as follows: SunPower, LG, REC Group, Panasonic, Solartech Universal

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's data on all photovoltaic modules and components. Include manufacturer's standard product warranty, for duration of not less than 25 years, for replacement of materials and equipment used in photovoltaic systems.

B. Shop Drawings: The Contractor shall submit copies of pertinent drawings and schematic diagrams for approval and shall include the following:

1. Photovoltaic system plans and elevations or riser views clearly indicating entrance points for each of the interconnections required.
2. Electrical schematic diagrams including all wiring, conductors, disconnects, switches, grounding, and utility inter-tie locations.
3. Diagrams including wire sizing with respect to DC and AC voltage, wattage and amperage.
4. Legends for all devices on all diagrams.
5. A complete ½" = 1'-0" scale drawing showing the exact photovoltaic system layout including all components and accessories being provided or required for operation as specified herein.
6. Main circuit breaker.

C. Wiring Diagrams: Submit wiring diagrams for photovoltaic showing connections to electrical power panels, feeders, automatic transfer switches, disconnects, and ancillary equipment. Differentiate between portions of wiring that are manufacturer installed and portions that are field installed.

D. Agreement to Maintain: Prior to time of final acceptance, the Installer shall submit 4 copies of an agreement for continued service and maintenance of photovoltaic systems, for Owner's possible acceptance. Offer terms and conditions for furnishing parts and providing continued testing and servicing, including replacement of materials and equipment, for one-year period with option for renewal of Agreement by Owner.

E. Provide photovoltaic system certified test record of the final production testing.

F. Provide certified test record prior to photovoltaic component set being shipped from factory to project location. This includes certified test record of photovoltaic modules, inverters and associated equipment.

1.4 QUALITY ASSURANCE

A. Manufacturer's qualifications: Firms regularly engaged in manufacture of photovoltaic modules and ancillary equipment, of types, ratings and characteristics required, whose products have been in satisfactory use in similar service for not less than 10 years.

B. Installer's Qualifications: Firms with at least 5 years of successful installation experience on projects with grid-tied photovoltaic systems similar to that required for this project.

1. Agreement to Maintain: Engage Installer who is willing to execute with the Owner, required agreement for continued maintenance of diesel engine-driven generator units.

C. Photovoltaic System Supplier Qualifications: Photovoltaic System supplier shall be factory-authorized distributor nearest to the project location for the system being provided. There shall be a distributor for the generator manufacturer within a driving distance of 50 miles. Supplier shall certify that they employ at least two technicians who have attended all factory service schools. Supplier shall certify that they offer 24-hour, 7-day field service and maintain the manufacturer's recommended parts inventory on all field service vehicles, as well as a complete recommended service parts stock at their location nearest the project.

D. Codes and Standards:

1. Electrical Codes Compliance: Comply with applicable local code requirements of the authority having jurisdiction and NEC Articles 690 and 705 pertaining to construction and installation of solar photovoltaic systems and interconnected electrical power production sources.
2. NFPA Compliance: Comply with applicable requirements of NFPA 37 and NFPA 101, "Code for Safety to Life from Fire in Buildings and Structures".
3. UL Compliance: Comply with applicable requirements of UL 1008, "Automatic Transfer Switches," UL 486A, "Wire Connectors and Soldering Lugs for Use with Copper Conductors," and UL 486B, "Wire Connectors for Use with Aluminum Conductors."
4. ANSI/NEMA Compliance: Comply with applicable requirements of ANSI/NEMA MG 1 "Motors and Generators," and MG 2, "Safety and Use of Electric Motors and Generators".

E. NEMA Compliance: Comply with applicable requirements of NEMA's Stds Pub No. 250, "Enclosures for Electrical Equipment (1000-Volts Maximum)."

F. IEEE Compliance: Comply with applicable portions of IEEE Std 1262, "Recommended Practices for Qualifications of Photovoltaic Modules."

1.5 DELIVERY, STORAGE AND HANDLING

A. Deliver photovoltaic equipment and components properly packaged and mounted on pallets, or skids to facilitate handling of heavy items. Utilize factory-fabricated type containers or wrappings for photovoltaic modules and components which protect equipment from damage.

B. Store photovoltaic equipment in original packaging and protect from weather and construction traffic. Wherever possible, store indoors; where necessary to store outdoors, store above grade and enclose with watertight wrapping.

C. Handle photovoltaic equipment carefully to prevent physical damage to equipment and components. Do not install damaged equipment; remove from site and replace damaged equipment with new.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Modules :

1. PV modules must be listed on the NYSERDA PTC list and must qualify for eligibility under the NYSERDA/NABCEP RE Program.
2. System must comply with IEEE 1262 “Recommended Practice for Qualifications of Photovoltaic Modules”.

B. Electric Power Requirements:

1. Power provided must be compatible with the onsite distribution system.
2. The System must include all hardware needed for the solar PV.
3. All systems must be installed in accordance with all applicable requirements of local electrical codes and the National Electrical Code (NEC), including but not limited to Article 690, “Solar Photovoltaic Systems” and Article 705 – “Interconnected Electrical Power Production Sources”.
4. Systems must be designed and installed using UL or ETL listed components, including mounting systems.
5. Modules must be certified to UL 1703 – “Flat-Plate Photovoltaic Modules and Panels”.
6. Inverters must comply with the following requirements
    a. IEEE 929-2000 –“Recommended Practice for Utility Interface of Photovoltaic Systems”.
    b. UL 1741 – “Standard for Static Inverters and Charge Controllers for use in Photovoltaic Systems”.
    c. Listed on the CEC list of eligible converters.
7. Other technical codes that will apply include:
    a. AMSE PTC 50 (solar PV performance)
    b. ANSI Z21.83 (solar PV performance and safety)
    c. NFPA 853 (solar PVs near buildings)
    d. NEPA 70 (electrical components)
    e. National Electrical Safety Code – ANSI C2 – 1999
    f. All applicable State Building Codes and requirements
8. All Balance of Systems (wiring, component, wiring, conduits, and connections) must be suited for conditions for which they are to be installed. When possible, inverters shall be located inside out of the weather in a minimum NEMA 12 enclosure. If inverters are in exterior locations, they shall be installed in all-weather NEMA 4X enclosures. An interval data meter must be installed to measure the AC output of the inverter. This meter should be located in a location accessible to University facilities personnel.
9. Interconnection must comply with Central Hudson Power and Light, Interconnection Standards for non-Utility Generation”. Prepare and submit appropriate interconnection agreements with CHP+L.

C. Meters:

1. Contractor shall provide connection to the Building’s Energy Management System (EMS) for the purposes of metering, monitoring and data collection of solar production.

2. Meters must connect to a monitoring/data collection recording solar production through Time of Use (TOU) increments applicable to the local utility standards, with a minimum 15 minute intervals.

D. Structural Requirements:

1. All structures and structural elements, including array structures, shall be designed in accordance with all applicable NY State Building Codes and standards pertaining to the erection of such structures.
2. The licensee shall provide structural calculations, stamped by a licensed professional structural engineer in good standing with the State of New York.
3. All structural components, including array structures, shall be designed in a manner commensurate with attaining a minimum of 30 year design life. Particular attention shall be given to the prevention of corrosion at the connections between dissimilar metals.
4. The structural design should provide for easy and cost effective repair or replacement of the roof. Contractor shall expect to remove and replace roof mounted solar systems no more than one time during the contract period at no expense to building management, to allow for major roofing maintenance, including installing a new roof.
5. Any roof penetrations must be designed and constructed in collaboration with the roofing professional or manufacturer responsible for the roof and roofing material warranty for the specific site, to ensure that the existing roof warranty is not invalidated by the installation of the PV system.

E. System Service Contract:

1. The supplier of the PV system must provide a copy and make available to the owner his standard service contract which, at the Owner's option, may be accepted or refused. This contract will accompany any documents, drawings, catalog cuts, specification sheets, wiring or outline drawings, etc. submitted for approval to the designing engineer. The Contract shall be for the complete services rendered over a period of one year.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which diesel engine-driven generator units are to be installed and notify Engineer in writing of conditions detrimental to proper completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF SOLAR PV SYSTEM SETS

A. Wherever the requirements of other articles of this Code and Article 690 differ, the requirements of Article 690 shall apply and, if the system is operated in parallel with a primary source(s) of electricity, the requirements in 705.14, 705.16, 705.32, and 705.43 shall apply

1. A solar photovoltaic system shall be permitted to supply a building or other structure in addition to any service(s) of another electricity.

B. Conductors of Different Systems: Photovoltaic source circuits and photovoltaic output circuits shall not be contained in the same raceway, cable tray, cable, outlet box, junction box, or similar fitting as feeders or branch circuits of other systems, unless the conductors of the different systems are separated by a partition or are connected together.

C. Module Connection Arrangement: The connections to a module or panel shall be arranged so that removal of a module or panel from a photovoltaic source circuit does not interrupt a grounded conductor to another photovoltaic source circuit. Sets of modules interconnected as systems rated at 50 volts or less, with or without blocking diodes and having a single overcurrent device shall be considered as a single-source circuit. Supplementary overcurrent devices used for the exclusive protection of the photovoltaic modules are not considered as overcurrent devices for the purpose of this section.

D. Equipment: Inverters or motor generator shall be identified for use in solar photovoltaic systems. Equipment listed for marine, mobile, telecommunications, or other applications may not be suitable for installation in permanent PV power systems complying with the Code.

3.3 GROUND FAULT PROTECTION

A. Roof –mounted dc photovoltaic arrays located on dwellings shall be provided with dc ground-fault protection to reduce fire hazards.

B. Ground-Fault Detection and Interruption: The ground-fault protection device or system shall be capable of detecting a ground fault, interrupting the flow of fault current, and providing an indication of the fault.

Typical ground-fault protection devices meeting the requirements of 690.5(A) operate by opening the main dc bonding jumper. They sense dc ground faults anywhere on the dc system and may be mounted anywhere in that system. They are installed inside the utility-interactive inverters.

C. Disconnection of Conductors: The ungrounded conductors of the faulted source circuit shall be automatically disconnected. If the grounded conductors of the faulted source circuit are disconnected to comply with the requirements of 690.5(A), all conductors of the faulted source circuit shall be opened automatically and simultaneously. Opening the grounded conductor of the array or opening the faulted sections of the array shall be permitted to interrupt the ground-fault current path.

D. Labels and Markings: Labels and marking shall be applied near the ground-fault indicator at a visible location, stating that, if a fault is indicated, the normally grounded conductors may be energized and ungrounded.

3.4 ALTERNATING-CURRENT (AC) MODULES

A. Photovoltaic Source Circuits: The requirements of Article 690 pertaining to photovoltaic source circuits shall not apply to ac modules. The photovoltaic source circuit, conductors and inverters shall be considered as internal wiring of an ac module.

B. Inverter Output Circuit: The output of an ac module shall be considered an inverter output circuit.

C. Disconnecting Means: A single disconnecting means, in accordance with 690.15 and 690.17, shall be permitted for the combined ac output of one or more ac modules. Additionally, each ac module in a multiple ac-module system shall be provided with a connector, bolted, or terminal-type disconnecting means.

D. Ground-Fault Detection: Alternating-current-module systems shall be permitted to use a single detection device to detect only ac ground faults and to disable the array by removing ac power to the ac module(s).

E. Overcurrent Protection: The output circuits of ac modules shall be permitted to have overcurrent protection and conductor sizing in accordance with 240.5(B)(2).

3.5 CIRCUIT REQUIREMENTS

A. Maximum Photovoltaic System Voltage: In a dc photovoltaic source circuit or output circuit, the maximum photovoltaic system voltage for that circuit shall be calculated as the sum of the rated open-circuit voltage of the series-connected photovoltaic modules corrected for the lowest expected ambient temperature. For crystalline and multicrystalline silicon modules, the rated open-circuit voltage shall be multiplied by the correction factor provide in Table 690.7. This voltage shall be used to determine the voltage rating of cables, disconnects, overcurrent devices, and other equipment. Where the lowest expected ambient temperature is below -40˚C (-40˚F), or where other than crystalline or multicrystalline silicon photovoltaic modules are used, the system voltage adjustment shall be made in accordance with the manufacturer's instructions.

B. Direct-Current Utilization Circuits: The voltage of dc utilization circuits shall conform with 210.6.

C. Photovoltaic Source and Output Circuits: In one- and two-family dwellings, photovoltaic source circuits and photovoltaic output circuits that do not include lampholders, fixtures, or receptacles shall be permitted tohave a maximum photovoltaic system voltage up to 600 volts. Other installations with a maximum photovoltaic system voltage over 600 volts shall comply with Article 690, Part I.

D. Circuits Over 150 Volts to Ground: In one- and two-family dwellings, live parts in photovoltaic source circuits and photovoltaic output circuits over 150 volts to ground shall not be accessible to other than qualified persons while energized.

E. Calculation of Maximum Circuit Current: The maximum current for the specific circuit shall be calculated in accordance with 690.8(A)(1) through (A)(4).

F. Photovoltaic Source Circuit Currents: The maximum current shall be the sum of parallel module rated short-circuit currents multiplied by 125 percent.

G. Photovoltaic Output Circuit Currents: The maximum current shall be the sum of parallel source circuit maximum currents as calculated in 690.8(A)(1).

H. Inverter Output Circuit Current: The maximum current shall be the inverter continuous output current rating.

Utility-interactive inverters are power-limited devices. Output circuits connected to these devices are sized on the continuous rated outputs of these devices and are not based on load calculations or reduced-size PV arrays, if any. Some inverters may have specifications listing sustained maximum output currents and the higher of this number or the rated output should be used.

I. Ampacity and Overcurrent Device Ratings: Photovoltaic system currents shall be considered to be continuous.

J. Sizing of Conductors and Overcurrent Devices: The circuit conductors and overcurrent devices shall be sized to carry not less than 125 percent of the maximum currents as calculated in 690.8(A). The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B) and (C).

K. Internal Current Limitation: Over current protection for photovoltaic output circuits with devices that internally limit the current from the photovoltaic output circuit shall be permitted to be rated at less than the value calculated in 690.8(B)(1). This reduced rating shall be at least 125 percent of the limited current value. Photovoltaic output circuit conductors shall be sized in accordance with 690.8(B)(1).

L. System with Multiple Direct-Current Voltages: For a photovoltaic power source that has multiple output circuit voltages and employs a common-return conductor, the ampacity of the common-return conductor shall not be less than the sum of the ampere ratings of the overcurrent devices of the individual output circuits.

M. Sizing of Module Interconnection Conductors: Where a single overcurrent device is used to protect a set of two or more parallel-connected module circuits, the ampacity of each of the module interconnection conductors shall not be less than the sum of the rating of the single fuse plus 125 percent of the short-circuit current from the other parallel-connected modules.

3.6 OVERCURRENT PROTECTION

A. Circuits and Equipment: Photovoltaic source circuit, photovoltaic output circuit, inverter output circuit, and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Circuits connected to more than one electrical source shall have overcurrent devices located so as to provide overcurrent protection from all sources.

B. Power Transformers: Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

C. Photovoltaic Source Circuits: Branch-circuit or supplementary-type overcurrent devices shall be permitted to provide overcurrent protection in photovoltaic source circuits. The overcurrent devices shall be accessible but shall not be required to be readily accessible.

Standard values of supplementary overcurrent devices allowed by this section shall be in one ampere size increments, starting at one ampere up to and including 15 amperes. Higher standard values above 15 amperes for supplementary overcurrent devices shall be based on the standard sizes provided in 240.6(A).

If the overcurrent protection of PV source circuits is considered supplementary overcurrent protection, use of overcurrent devices with ratings other than those suitable for branch-circuit protection is permitted. The use of such devices permits module protection closer to the specified ratings required on the labels attached to listed modules. It is anticipated that only qualified service personnel will replace or reset overcurrent devices in PV source circuits. Consequently, ready access to the user need not be provided. These supplementary overcurrent devices must be listed for dc operation and have appropriate voltage and current ratings.

D. Direct-Current Rating: Overcurrent devices, either fuses or circuit breakers, used in any dc portion of a photovoltaic power system shall be listed for use in dc circuits and shall have the appropriate voltage, current, and interrupt ratings.

E. Series Overcurrent Protection: In series-connected strings of two or more modules, a single overcurrent protection device shall be permitted.

The single overcurrent device (when required) may provide both the reverse-current protection required for the series-connected PV modules and the overcurrent protection required for the interconnecting conductors.

3.7 DISCONNECTING MEANS

A. All Conductors: Means shall be provided to disconnect all current-carrying conductors of a photovoltaic power source from all other conductors in a building or other structure. A switch or circuit breaker shall not be installed in a grounded conductor unless that switch or circuit breaker is part of a ground-fault detection system required by 690.5 and that switch or circuit breaker is automatically opened and indicated as a normal function of the device in responding to ground faults.

B. Additional Provisions: Photovoltaic disconnecting means shall comply with 690.14(A) through 690.14(D).

C. Disconnecting Means: The disconnecting means shall not be required to be suitable as service equipment and shall be rated in accordance with 690.17.

D. Equipment: Equipment such as photovoltaic source circuit isolating switches, overcurrent devices, and blocking diodes shall be permitted on the photovoltaic side of the photovoltaic disconnecting means.

E. Requirements for Disconnecting Means: Means shall be provided to disconnect all conductors in a building or other structure from the photovoltaic system conductors.

1. Location: The photovoltaic disconnecting means shall be installed at a readily accessible location either on the outside of a building or structure or inside nearest the point of entrance of the system conductors. The photovoltaic system disconnecting means shall not be installed in bathrooms.
2. Marking: Each photovoltaic system disconnecting means shall be permanently marked to identify it as a photovoltaic system disconnect.
3. Suitable for Use: Each photovoltaic system disconnecting means shall be suitable for the prevailing conditions. Equipment installed in hazardous (classified) locations shall comply with the requirements of Articles 500 through 517.
4. Maximum Number of Disconnects: The photovoltaic system disconnecting means shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, in a group of separate enclosures, or in or on a switchboard.

5. Grouping: The photovoltaic system disconnecting means shall be grouped with other disconnecting means for the system to comply with 690.14(C)(4). A photovoltaic disconnecting means shall not be required at the photovoltaic module or array location.

F. Utility-Interactive Inverters Mounted in Not-Readily-Accessible Locations: Utility-interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible. These installations shall comply with (1) through (4):
1. A direct-current photovoltaic disconnecting means shall be mounted within sight of or in the inverter.
2. An alternating-current disconnecting means shall be mounted within sight of or in the inverter.

The requirements in 690.14(D)(1) and 690.14(D)(2) provide for servicing disconnects at the inverter.

3. The alternating-current output conductors from the inverter and an additional alternating-current disconnecting means for the inverter shall comply with 690.14(C)(1).

The requirements in 690.14(C)(1) allows the inverter and the circuit to it to be de-energized from a readily accessible location.

4. A plaque shall be installed in accordance with 705.10.

G. Disconnection of Photovoltaic Equipment

1. Means shall be provided to disconnect equipment, such as inverters, batteries, charge controllers, and the like, from all ungrounded conductors of all sources. If the equipment is energized from more than one source, the disconnecting means shall be grouped and identified.
2. A single disconnecting means in accordance with 690.17 shall be permitted for the combined ac output of one or more inverters or ac modules in an interactive system.

H. Fuses

1. Disconnecting means shall be provided to disconnect at a fuse from all sources of supply if the fuse is energized from both directions and is accessible to other than qualified persons. Such a fuse in a photovoltaic source circuit shall be capable of being disconnected independently of fuses in other photovoltaic source circuits.
2. Switches, pullouts, or similar devices that have suitable ratings may serve as means to disconnect fuses from all sources of supply.

I. Switch or Circuit Breaker

1. The disconnecting means for ungrounded conductors shall consist of a manually operable switch(es) or circuit breaker(s) complying with all of the following requirements:
   a. Located where readily accessible.
   b. Externally operable without exposing the operator to contact with live parts.
   c. Plainly indicating whether in the open or closed position.
   d. Having an interrupting rating sufficient for the normal circuit voltage and the current that is available at the line terminals of the equipment.
2. Where all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and have the following words or equivalent:

WARNING
ELECTRIC SHOCK HAZARD
DO NOT TOUCH TERMINALS. TERMINALS ON BOTH THE LINE AND LOAD SIDES MAY BE ENERGIZED IN THE OPEN POSITION

J. Installation and Service of an Array

1. Open circuiting, short circuiting, or opaque covering shall be used to disable an array or portions of an array for installation and service:

FPN: Photovoltaic modules are energized while exposed to light. Installation, replacement, or servicing of array components while a module(s) is irradiated may expose persons to electric shock.

3.8 WIRING METHODS

A. Wiring Systems: All raceway and cable wiring methods included in Code and other wiring systems and fittings specifically intended and identified for use on photovoltaic arrays shall be permitted. Where wiring devices with integral enclosures are used, sufficient length of cable shall be provided to facilitate replacement.

B. Single-Conductor Cable: Types SE, UF, USE, and USE-2 single-conductor cable shall be permitted in photovoltaic source circuits where installed in the same manner as a Type UF multiconductor cable in accordance in accordance with Part II of Article 340. Where exposed to sunlight, Type UF cable identified as sunlight-resistant shall be used.

C. Small-Conductor Cables: Single-conductor cables listed for outdoor use that are sunlight resistant and moisture resistant in sizes 16 AWG and 18 AWG shall be permitted for module interconnections where such cables meet the ampacity requirements of 690.8. Section 310.15 shall be used to determine the cable ampacity and temperature derating factors.

D. Direct-Current Photovoltaic Source and Output Circuits Inside a Building: Where direct current photovoltaic source or output circuits of a utility-interactive inverter from a building-integrated or other photovoltaic system are run inside a building or structure, they shall be contained in metallic raceways or enclosures from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means. The disconnecting means shall comply with 690.14(A) through 690.14(D).

E. Component Interconnections: Fittings and connectors that are intended to be concealed at the time of on-site assembly, where listed for such use, shall be permitted for on-site interconnection of modules or other array components. Such fittings and connectors shall be equal to the wiring method employed in insulation, temperature rise, and fault-current withstand, and shall be capable of resisting the effects of the environment in which they are used.

F. Connectors: The connectors permitted by Article 690 shall comply with 690.33(A) through 690.33(E).

1. Configuration: The connectors shall be polarized and shall have a configuration that is noninterchangeable with receptacles in other electrical systems on the premises.
2. Guarding: The connectors shall be constructed and installed so as to guard against inadvertent contact with live parts by persons.
3. Type: The connectors shall be of the latching or locking type.
4. Grounding Member: The grounding member shall be the first to make and the last to break contact with the mating connector.
5. Interruption of Circuit: The connectors shall be capable of interrupting the circuit current without hazard to the operator.

G. Access to Boxes: Junction, pull, and outlet boxes located behind modules or panels shall be so installed that the wiring contained in them can be rendered accessible directly or by displacement of a module(s) or panel(s) secured by removable fasteners and connected by a flexible wiring system.

3.9 GROUNDING

A. System Grounding: For a photovoltaic power source, one conductor of a two-wire system with a photovoltaic system voltage over 50 volts and the reference (center tap) conductor of a bipolar system shall be solidly grounded or shall

use other methods that accomplish equivalent system protection in accordance with 250.4(A) and that utilize equipment listed and identified for the use.

B. Point of System Grounding Connection: The dc circuit grounding connection shall be made at any single point on the photovoltaic output circuit.

If other than solid grounding is utilized, as permitted by 690.41, the connections should be made in accordance with the markings found on the equipment or in the installation instructions.

C. Equipment Grounding: Exposed non-current-carrying metal parts of module frames, equipment, and conductor enclosures shall be grounded in accordance with 250.134 or 250.136(A) regardless of voltage.

D. Size of Equipment Grounding Conductor: Where not protected by the ground-fault protection equipment required by 690.5, the equipment-grounding conductor for photovoltaic source and photovoltaic output circuits shall be sized for 125 percent of the photovoltaic-originated short-circuit currents in that circuit. Where protected by the ground-fault protection equipment required by 690.5, the equipment-grounding conductors for photovoltaic source and photovoltaic output circuits shall be sized in accordance with 250.122.

E. Grounding Electrode System

1. Alternating-Current Systems: If installing an ac system, a grounding electrode system shall be provided in accordance with 250.50 through 250.60. The grounding electrode conductor shall be installed in accordance with 250.64.
2. Direct-Current Systems: If installing a dc system, a grounding electrode system shall be provided in accordance with 250.177 for grounded systems or 250.169 for un-grounded systems. The grounding electrode conductor shall be installed in accordance with 250.64.
3. Systems with Alternating-Current and Direct-Current Grounding Requirements: Photovoltaic power systems with both alternating-current and direct-current (dc) grounding requirements shall be permitted to be grounded as described in (1) or (2).
4. A grounding-electrode conductor shall be connected between the identified dc grounding point to a separate dc grounding electrode. The dc grounding-electrode conductor shall be sized according to 250.166. The dc grounding electrode shall be bonded to the ac grounding electrode to make a grounding electrode system according to 250.52 and 250.53. The bonding conductor shall be no smaller than the largest grounding electrode conductor, either ac or dc.
5. The dc grounding electrode conductor and ac grounding electrode conductor shall be connected to a single grounding electrode. The separate grounding electrode conductors shall be sized as required by 250.66 (ac) and 250.166 (dc).

F. Continuity of Equipment Grounding Systems: Where the removal of equipment disconnects the bonding connection between the grounding electrode conductor and exposed conducting surfaces in the photovoltaic source or output circuit equipment, a bonding jumper shall be installed while the equipment is removed.

G. Continuity of Photovoltaic Source and Output Circuit Grounded Conductors: Where the removal of the utility-interactive inverter or other equipment disconnects the bonding connection between the grounding electrode conductor and the photovoltaic source and/or photovoltaic output circuit grounded conductor, a bonding jumper shall be installed to maintain the system grounding while the inverter or other equipment is removed.

PART 4 – MISCELLANEOUS

4.1 MARKING

A. Modules: Modules shall be marked with identification of terminals or leads as to polarity, maximum overcurrent device rating for module protection, and with the following ratings:

1. Open-circuit voltage
2. Operating voltage
3. Maximum permissible system voltage

4. Operating current
5. Short-circuit current
6. Maximum power

B. Alternating-Current Photovoltaic Modules: Alternating-current modules shall be marked with identification of terminals or leads and with identification of the following ratings:
1. Nominal operating ac voltage
2. Nominal operating ac frequency
3. Maximum ac power
4. Maximum ac current
5. Maximum overcurrent device rating for ac module protection

C. Direct-Current Photovoltaic Power Source: A marking for the direct-current photovoltaic power source indicating terms (1) through (4) shall be provided by the installer at an accessible location at the disconnecting means for this power source:
1. Operating current
2. Operating voltage
3. Maximum system voltage
4. Short-circuiting current

D. Interactive System Point of Interconnection: All interactive system(s) points of interconnection with other sources shall be marked at an accessible location at the disconnecting means as a power source with the maximum ac output operating current and operating ac voltage.

4.2 CONNECTION TO OTHER SOURCES

A. Identified Interactive Equipment: Only inverters and ac modules listed and identified as interactive shall be permitted in interactive systems.

B. Loss of Interactive System Power: An inverter or an ac module in an interactive solar photovoltaic system shall automatically de-energize its output to the connected electrical production and distribution network upon loss of voltage in that system and shall remain in that state until the electrical production and distribution network voltage has been restored.

C. Ampacity of Neutral Conductor: If a single-phase, 2-wire inverter output is connected to the neutral and one ungrounded conductor (only) of a 3-wire system or of a 3-phase, 4-wire wye-connected system, the maximum load connected between the neutral and any one ungrounded conductor plus the inverter output rating shall not exceed the ampacity of the neutral conductor.

D. Unbalanced Interconnections:

1. Single Phase: Single-phase inverters for photovoltaic systems and ac modules in interactive solar photovoltaic systems shall not be connected to 3-phase power systems unless the interconnected system is designed so that significant unbalanced voltages cannot result.
2. Three Phase: Three-phase inverters and 3-phase ac modules in interactive systems shall have all phases automatically de-energized upon loss of, or unbalanced, voltage in one or more phases unless the interconnected system is designed so that significant unbalanced voltages will not result.

E. Point of Connection: The output of a photovoltaic power source shall be connected as specified in 690.64(A) or 690.64(B).

1. Supply Side: A photovoltaic power source shall be permitted to be connected to the supply side of the service disconnecting means as permitted in 230.82(6).
2. Load Side: A photovoltaic power source shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises, provided that all of the following conditions are met:

a. Each source interconnection shall be made at a dedicated circuit breaker or fusible disconnecting means.
b. The sum of the ampere ratings of overcurrent devices in circuits supplying power to a busbar or conductor shall not exceed the rating of the busbar or conductor.
c. The interconnection point shall be on the line side of all ground-fault protection equipment.
d. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor shall be marked to indicate the presence of all sources.
e. Circuit breakers, if backed, shall be identified for such operation. Dedicated circuit breakers backfed from listed utility-interactive inverters complying with 690.60 shall not be required to be individually clamped to the panelboard busbars. A front panel shall clamp all circuit breakers to the panelboard busbars. Main circuit breakers connected directly to energized feeders shall also be individually clamped.

4.3 SYSTEMS OVER 600 VOLTS

A. General: Solar photovoltaic systems with a maximum system voltage over 600 volts dc shall comply with Article 490 and other requirements applicable to installations rated over 600 volts.

B. Photovoltaic Circuits: In dc photovoltaic source circuits and photovoltaic output circuits, the maximum system voltage.

4.4 POINT OF CONNECTION

The outputs of electric power production systems shall be interconnected at the premises service disconnecting means.

A. Integrated Electric System: The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where the system qualifies as an integrated electric system and incorporates protective equipment in accordance with all applicable sections of Article 685.

B. General: The outputs shall be permitted to be interconnected at a point or points elsewhere on the premises where all of the following conditions are met:

1. The aggregate of non-utility sources of electricity has a capacity in excess of 100 kW, or the service is above 1000 volts.
2. The conditions of maintenance and supervision ensure that qualified persons service and operate the system.
3. Safeguards and protective equipment are established and maintained.

C. Output Characteristics: The output of a generator or other electric power production source operating in parallel with an electric supply system shall be compatible with the voltage, wave shape, and frequency of the system to which it is connected.

D. Interrupting and Short-Circuit Current Rating: Consideration shall be given to the contribution of fault currents from all interconnected power sources for the interrupting and short-circuit current ratings of equipment on interactive systems.

E. Disconnecting Mean, Sources: Means shall be provided to disconnect all ungrounded conductors of an electric power production source(s) from all other conductors.

F. Disconnecting Means, Sources: Means shall be provided to disconnect equipment, such as inverters or transformers associated with a power production source, from all ungrounded conductor of all sources of supply. Equipment intended to be operated and maintained as an integral part of a power production source exceeding 1000 volts shall not be required to have a disconnecting means.

G. Disconnect Device: The disconnecting means for ungrounded conductors shall consist of manually or power operable switch(es) or circuit breaker(s) with the following features:

1. Located where accessible.
2. Externally operable without exposing the operator to contact with live parts and, if power operable, of a type that can be opened by hand in the event of a power supply failure.

3. Plainly indicating whether in the open or closed position.
4. Having ratings not less than the load to be carried and the fault current to be interrupted.

For disconnect equipment energized from both sides, a marking shall be provided to indicated that all contacts of the disconnect equipment may be energized.

4.5 PERSONNEL TRAINING

A. Building Operating Personnel Training: Train Owner's building personnel in procedures for starting-up, testing and operating PV System sets. In addition, train Owner's personnel in periodic maintenance of equipment and components.

END OF SECTION

SECTION 26 32 13

DIESEL GENERATOR SETS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provision of Contract, including General and Supplementary Conditions and Division-1 Specification sections, apply to work of this section.

B. Division-26 Basic Electrical Materials and Methods sections apply to work specified in this section.

1.2 SUMMARY

A. Extent of diesel generator set work is indicated by drawings and is hereby defined to include, but not by way of limitation, diesel engine, electrical generator, engine starting system including batteries, instrument control panel, transfer switches, fuel tanks, annunciator panel, exhaust silencer, vibration isolation, wall thimble, accessories, load bank, and generator enclosure.

B. The generator and transfer switches shall be furnished by the same manufacturer.

C. Refer to Division-3 sections for concrete and grout work required in connection with pads for engine-driven generator set; work of this section.

D. Refer to Division-23 sections for fuel tank piping and associated accessories required for installation of diesel engine-generator unit.

E. All unit (skid) mounted fuel tank piping and accessories required are work of this section.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's data on diesel engine-driven generator sets and components. Include manufacturer's standard product warranty, for duration of not less than two-years, for replacement of materials and equipment used in diesel generator systems.

B. Shop Drawings: The Contractor shall submit a copy of this specification section with the words "comply" or "not comply" marked in the margins of each paragraph shall be submitted along with copies of pertinent drawings and schematic diagrams for approval which shall include the following:

1. Engine generator set including plans and elevations or riser views clearly indicating entrance points for each of the interconnections required.
2. Slip-over steel housing showing all pertinent dimensions and details. Exhaust silencer(s) will be supported above roof of the enclosure.
3. Engine generator/exciter control cubicle.
4. Fuel consumption rate curves at various loads, ventilation and combustion CFM requirements.
5. Exhaust muffler, critical silencer, and vibration isolators.
6. Battery charger, battery, and battery rack.
7. Fuel tank connection points.
8. Automatic load transfer switch.
9. Legends for all devices on all diagrams.
10. Load bank.

11. A complete ½" = 1'-0" scale drawing showing the exact generator and transfer switch system layout including all components and accessories being provided or required for operation as specified herein.
12. Main circuit breaker.
13. Spring isolators and Korfund parts.

C. Wiring Diagrams: Submit wiring diagrams for diesel engine-driven generator unit showing connections to electrical power panels, feeders, automatic transfer switches, and ancillary equipment. Differentiate between portions of wiring that are manufacturer installed and portions that are field-installed.

D. Agreement to Maintain: Prior to time of final acceptance, the Installer shall submit 4 copies of an agreement for continued service and maintenance of diesel engine-driven generator sets, for Owner's possible acceptance. Offer terms and conditions for furnishing parts and providing continued testing and servicing, including replacement of materials and equipment, for one-year period with option for renewal of Agreement by Owner. Refer to paragraph 26 32 13-2.10(M).

E. Certifications: Provide diesel engine-drive generator sets certified test record of the following final production testing:

1. Single-step load pickup.
2. Transient and steady-state governing.
3. Safety shutdown device testing.
4. Voltage regulation.
5. Rated power.
6. Maximum power.

F. Provide certified test record prior to engine-driven generator set being shipped from factory to project location.

1.4 QUALITY ASSURANCE

A. Manufacturer's qualifications: Firms regularly engaged in manufacture of diesel engine-driven generator units and ancillary equipment, of types, ratings and characteristics required, whose products have been in satisfactory use in similar service for not less than 10 years.

B. Installer's Qualifications: Firms with at least 5 years of successful installation experience on projects with diesel engine-driven generator units similar to that required for this project.

1. Agreement to Maintain: Engage Installer who is willing to execute with the Owner, required agreement for continued maintenance of diesel engine-driven generator units.

C. Generator Supplier Qualifications: Generator supplier shall be factory-authorized distributor nearest to the project location for the system being provided. There shall be a distributor for the generator manufacturer within a driving distance of 50 miles. Generator supplier shall certify that they employ at least two technicians who have attended all factory service schools. Supplier shall certify that they offer 24-hour, 7-day field service and maintain the manufacturer's recommended parts inventory on all field service vehicles, as well as a complete recommended service parts stock at their location nearest the project.

D. Codes and Standards:

1. Electrical Codes Compliance: Comply with applicable local code requirements of the authority having jurisdiction and NEC Articles 700, 701, and 702 pertaining to construction and installation of emergency and standby systems.
2. NFPA Compliance: Comply with applicable requirements of NFPA 37, "Installation and Use of Stationary Combustion Engines and Gas Turbines", and NFPA 101, "Code for Safety to Life from Fire in Buildings and Structures".

3. UL Compliance: Comply with applicable requirements of UL 1008, “Automatic Transfer Switches,” UL 486A, “Wire Connectors and Soldering Lugs for Use with Copper Conductors,” and UL 486B, “Wire Connectors for Use with Aluminum Conductors.”
4. ANSI/NEMA Compliance: Comply with applicable requirements of ANSI/NEMA MG 1 “Motors and Generators,” and MG 2, “Safety and Use of Electric Motors and Generators”.

E. NEMA Compliance: Comply with applicable requirements of NEMA’s Stds Pub No. 250, “Enclosures for Electrical Equipment (1000-Volts Maximum).”

F. IEEE Compliance: Comply with applicable portions of IEEE Std 446, “IEEE Recommended Practices for Emergency and Standby Power Systems for Industrial and Commercial Applications.”

1.5 DELIVERY, STORAGE AND HANDLING

A. Deliver diesel engine-driven generator properly packaged and mounted on pallets, or skids to facilitate handling of heavy items. Utilize factory-fabricated type containers or wrappings for engine-generator and components which protect equipment from damage.

B. Store diesel engine-driven generator equipment in original packaging and protect from weather and construction traffic. Wherever possible, store indoors; where necessary to store outdoors, store above grade and enclose with watertight wrapping.

C. Handle diesel engine-driven generator equipment carefully to prevent physical damage to equipment and components. Do not install damaged equipment; remove from site and replace damaged equipment with new.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Performance:

1. Standby kw: 600kW
2. Power factor: 0.8
3. Speed: 1,800 RPM
4. Generator output voltage: 480/277V
5. Units shall be certified by the manufacturer to provide the rated kw at altitude and 120 ambient temperature.
6. It is intended that all products specified herein be of standard ratings, therefore the kw and kVA ratings, ampere ratings, withstand and closing ratings, etc., shall be the manufacturer’s next larger size or rating when the specifications cannot be exactly met.
7. In a standby power capacity, the unit shall be capable of continuous service at rated output for the duration of any utility power failure. The engine and generator shall be the product of a single manufacturer; and that manufacturer and its authorized dealer shall have the responsibility to provide the diesel engine/generator set and its accessories which will meet the specified output at the required altitude and ambient temperature. It shall be a new factory assembled and tested set. It is the intent and purpose of these specifications to also secure for the Owner, the necessary controls and accessories to the extent that this equipment, in conjunction with the diesel/engine/generator set, will comprise a complete operating package unit.
8. Rating of the diesel engine/generator set shall be based on operation of the set when equipped with all necessary operating accessories, such as radiator fan, air cleaners, lubrication oil pump, fuel transfer pump, fuel injection pump, jacket water pump, governor, charging generator, alternating current generator, and exciter regulator. These ratings must be substantiated by manufacturer’s standard published curves and test data. Special ratings or maximum ratings are not acceptable.
9. Voltage regulation shall be +/-2.0 percent of rate voltage for any constant load between no load and rated load.

10. Frequency regulation shall be 5 percent from steady state no load to steady state rated load.
11. Total Harmonic distortion: The sum of AC voltage waveform harmonics, from non load to full linear load, shall not exceed 5% of rated voltage (L-N, L-L, L-L-L) and no single harmonic shall exceed 3% of rated voltage.
12. Telephone Influence Factor: TIF shall be less than 50 per NEMA MG1-22.43.
13. The diesel engine-generator set shall be capable of single step load pick up of 100% nameplate kw and power factor, less applicable derating factors, with the engine-generator set at operating temperature.
14. Motor starting capability shall after an initial instantaneous voltage dip not to exceed 15 percent, be capable of sustaining a minimum of 90% of rated no load voltage with the specified kVA at near zero power factor applied to the generator set.

B. Engine:

1. The engine shall be watercooled inline or Vee-type two or four stroke cycle compression ignition diesel. It shall meet specifications when operating on Number 2 domestic burner oil. The engine shall be equipped with fuel, lube oil, and intake air filters, lube oil cooler, fuel transfer pump fuel priming pump, service meter, gear driven water pump, and unit mounted instruments, including a fuel pressure gauge, water temperature gauge, and lubrication oil pressure gauge. All crankcase emissions will be directed through a demister unit, CRANK VENT from Diesel Research, Inc. or equivalent.
2. Governor - The engine governor shall maintain frequency regulation not to exceed +/-0.25% from no load to full rated load. Units shall be furnished with an electronic isochronous governor. Governor shall incorporate rack position limiter for start-up, field adjustable to minimize smoke during start-up and acceleration.
3. Mounting - The unit shall be mounted on a structural steel sub-base and shall be provided with suitable spring-type vibration isolators and korfund pads. Sub-base shall be sized to accommodate an under skid mounted double walled fuel tank (8 hours minimum size).
4. Safety Devices - Safety shut-offs for high water temperature, low oil pressure, low coolant level, low coolant temperature, low fuel, overspeed, and engine overcrank shall be provided.
5. Engine-mounted battery charging alternator, 45 ampere, and solid-state voltage regulator.
6. Accessories: Provide replaceable type oil filters, dry-type air cleaners, lubricating oils, greases, and coolant.
7. Install engine at sufficient height above base to permit dropping oil pan without removing unit.
8. All rotating parts shall be guarded against accidental contact.

C. Generator:

1. The generator shall be rated for continuous standby service at 0.8 power factor, 60 hertz, 1800 RPM. The unit shall be capable of 100% block load per NFPA 110.
2. NFPA 110 required full load test at rated power factor shall be done in factory.
3. The A.C. generator shall be; synchronous, four-pole, revolving field, drip-proof construction, single prelubricated sealed bearing, air cooled by a direct drive centrifugal blower fan, and directly connected to the engine with flexible drive disc(s). The starter shall have skewed laminations of insulated electrical grade seal, two thirds pitch windings. The rotor shall have amortissuer (damper) windings. The rotor shall be dynamically balanced. The exciter shall be brushless, three-phase, with full wave silicon diodes mounted on the rotating shaft and a surge suppressor connected in parallel with the field winding.
4. All insulation system components shall meet NEMA (MGI0221.40 and 16.40) standard temperature limits for Class H insulation system. Actual temperature rise measured by resistance method at full load shall not exceed 105ºC.
5. The generator shall be broad range, 12 lead reconnectable. The generator shall be capable of delivering rated output (kVA) at rated frequency and power factor, at any voltage within the broad range.
6. The main generator and exciter insulation systems must be suitably impregnated for operation in severe environments for resistance to sand, salt, and sea spray.
7. A shunt excitation system shall derive excitation power from the main generator output. The automatic voltage regulator shall be temperature compensated, half wave phase controlled solid-state design and include an underspeed protection function. The regulator design shall include a torque-matching characteristic to allow the engine to use its fullest power producing capability (without exceeding it or

overcompensating) as speed lower than rated, to optimize motor starting capability and to provide the fastest possible recovery from the transient speed dips.

8. Regulator - A generator-mounted, volts-per-hertz-type exciter/regulator shall be provided to match the characteristics of the generator and engine. Voltage regulation shall be plus or minus 0.5% from no load to full rated load. Readily accessible voltage drop, voltage level, and voltage gain controls shall be provided. Voltage level adjustment shall be a minimum of plus or minus 5%. The solid-state regulator module shall be shock-mounted and epoxy-encapsulated for protection against vibration and atmospheric deterioration. Provide terminal box for generator and exciter leads. The regulator must be sealed from the environment and isolated from the load to prevent tracking when connected to SCR loads.

D. Cooling System:

1. Radiator - A radiator with blower type fan shall be sized to maintain safe operation at 130º F ambient temperature. The fan shall be capable of accommodating air flow restrictions external to the radiator/generator package of at least 0.5" H_20 ESP at 54,000 CFM. If a greater air is required, the fan shall accommodate an ESP={(required CFM)/54,000 CFM}^{2*}0.5.
2. The engine cooling system shall be pre-treated by the engine supplier for the inhibition of internal corrosion.

E. Fuel System:

1. Skid and double walled tank shall be built below the structural base of the generator set and shall have a 1200 gallon capacity. No fuel piping shall be required. Engine shall be complete and ready to run when delivered to the site. Contractor shall provide all fuel required for site set-up and testing. After installation has been accepted, Contractor shall "top-off": base tank with No. 2 fuel oil.
2. An engine driven, mechanical, positive displacement fuel pump; fuel/water separator; fuel filter with replaceable spin-on canister element; fuel pressure gauge and fuel priming pump; flexible supply and return fuel lines.

F. Exhaust System:

1. Exhaust Silencer - A critical type silencer, muffler companion flanges, and two minimum 3'-0" long flexible stainless steel exhaust connectors properly sized shall be furnished and installed according to the manufacturer's recommendation. Mounting shall be provided by the Contractor. The silencer shall be mounted so that its weight is not supported by the engine, nor will the exhaust system growth, due to thermal expansion, be imposed on the engine. The exhaust back pressure capability of the engine shall accommodate a minimum of 35" ESP including muffler and flex connectors. Maximum pressure drop of the muffler and flex connectors at full load shall be 10" w.c.
2. Insulation - The muffler and all indoor exhaust piping shall be lagged by the Contractor to maintain a surface temperature not to exceed 150º F. The insulation shall be installed so that it does not cover or interfere with the functioning of the flexible exhaust fitting.
3. Contractor shall install exhaust pipe and insulation required.

G. Automatic Starting System:

1. Starting Motor - A 24 volt DC electric starting system with positive engagement shall be furnished. The motor voltage shall be as recommended by the engine manufacturer.
2. Automatic Control - Fully automatic generator set start-stop controls in the generator control panel shall be provided. Controls shall provide shutdowns for low oil pressure, high water temperature, overspeed, overcrank and one auxiliary contact for activating accessory items. Controls shall include 3 complete cranking attempts without overheating before cranking cycle is lockout.
3. Jacket Water Heater - A unit mounted thermal circulation type water heater incorporating a thermostatic switch shall be furnished to maintain engine jacket water to 90º F. The heater shall be 277 volts, single phase, 60 hertz. Vee-type engines of 12 cylinders or more shall have one heater per each bank of cylinders.

4. Batteries - A lead acid battery set of the heavy duty diesel starting type shall be provided. Battery voltage shall be compatible with the starting system. The cold cranking amps as recommended by the engine manufacture necessary cables and clamps shall be provided.
5. Battery Trays - Battery trays shall be provided for each battery and shall conform to NEC 480.8(b). They shall be constructed of wood and so treated as to be resistant to deterioration by battery electrolyte. Further, construction shall be such that any spillage or boil over battery electrolyte shall be contained within the tray to prevent a direct path to the ground.
6. Battery Charger - A current limiting battery charger shall be furnished to automatically recharge batteries. Charger shall float at 2.17 volts per cell and equalize at 2.33 volts per cell. It shall include overload protection, silicon diode full wave rectifiers, voltage surge suppressor, DC ammeter, DC voltmeter, and fused AC input. AC input voltage shall be 120 volts, single phase. Amperage output shall be not less than 5 amperes. Alarm contacts shall be provided for low voltage and battery charger failure. Charger shall be adjacent to generator. Status for generator shall be tied into building automation system. Provide wiring as required with conduit.
7. Provide remote on/off/status controls. Provide control wire and conduit back to generator. Assure controls are located 500 feet from generator.

H. Weatherproof Generator Enclosure

1. Reinforced steel housing allowing access to engine, generator, radiator, day tank and all other ancillary components. Housing shall have clearance width adequate to service the engine while it is running, but not less than 48 inches on both sides. Length will be adequate to accommodate the radiator, engine, generator, day tank, battery charger. Inside height will not be less than two feet above top of radiator filling cap.
2. Roof of enclosure shall be reinforced to accommodate mounting of engine silencer(s). Both sides will have louvers sized for cooling and combustion air intake, and be power activated to open with starting of engine. Both sides of housing will have full height, double hinged access doors. Doors will have not less than four latching points, operable from the inside and outside, and equipped with keyed alike locks. All enclosure wall shall have sound attenuation to reduce Db level.

I. Main Line Circuit Breaker:

1. Type - A main line, molded case circuit breaker mounted upon and sized to the output of the generator shall be installed as a load circuit interrupting and protection device. It shall operate both manually for normal switching functions and automatically during overload and short circuit conditions. Manufacturer of breaker shall be the same as electrical equipment on this project.
2. The trip unit for each pole shall have elements providing inverse time delay during overload conditions and instantaneous magnetic tripping for short circuit protection provide with adjustments for long-term, short-term and instantaneous tripping. The circuit breaker shall meet standards established by Underwriters Laboratories, National Electrical Manufacturers Association, and National Electrical Code.
3. Generator exciter field circuit breakers do not meet the above electrical standards and are unacceptable for line protection.
4. Circuit breaker shall have battery voltage operated shunt trip wired to safety shutdowns to open the breaker in the event of engine failure.

J. Generator Control Panel:

1. Generator mounted NEMA 1 enclosed solid state module for engine control and AC metering. Panel shall contain, but not be limited to the following equipment:
   a. Auto/Manual start-stop with LED indicators for low oil pressure, high coolant temperature, prealarm low coolant pressure, pre-alarm high coolant temperature, low fuel, battery charger fault, low battery volts, low coolant temperature, not on auto, low coolant level, AC output fail over speed, over cranks and emergency stop. Safety shut-downs shall be automatic.
   b. Cyclic-cranking as specified by NFPA 110. (1-60 seconds crank/rest).
   c. Adjustable cool down timer (0-30 minutes).

d. LCD readout for: engine oil pressure, coolant temperature, engine RPM, system DC volts, engine running hours, generator AC volts, generator AC amps and generator frequency.
e. Engine control switch.
f. Ammeter - Voltmeter phase selector switch.
g. Emergency stop pushbotton.
h. Indicator/display test switch.
i. Voltage adjustment potentiometer.
j. Auxiliary relay, 3PDT.
k. Padlocking provisions.

2. Generator control panel shall be unit mounted and installed not more than 7'0" above the finished floor adjacent to the engine/generator set. Where control panel may be above the specified 7'0", the Electrical Subcontractor shall provide a working platform adjacent to the engine/generator set which will allow proper access to maintenance personnel (control panel within 7'0" of platform).

K. NFPA Requirements:

1. Annunciator Panel - Two panels shall be provided for remote mounting to give audible and visual warning of fault or alarm conditions in the generator set. The panel(s) shall conform with requirements of the National Electrical Code, and the National Fire Protection Association publication NFPA-110A. The panels shall be located in the building operation office and Fire Command Center..

L. Schedules:

1. In order to forecast and minimize engine failure, the supplier of the equipment must provide an oil sampling analysis kit which operating personnel shall utilize for scheduled oil sampling.
2. Scheduled oil sampling shall be accurate within a fraction of one part per million for the following elements:
   a. Iron
   b. Chromium
   c. Copper
   d. Aluminum
   e. Silicon
   f. Lead
3. The sample shall be tested for the presence of water, fuel dilution, and anti-freeze.
4. All equipment needed to take oil samples shall be provided in a kit at the time of acceptance and shall include the following:
   a. Sample extraction gun (1)
   b. Bottles (10)
   c. Postage paid mailers (10)
   d. Written instruction (1)

M. System Service Contract:

1. The supplier of the standby power system must provide a copy and make available to the owner his standard service contract which, at the Owner's option, may be accepted or refused. This contract will accompany any documents, drawings, catalog cuts, specification sheets, wiring or outline drawings, etc. submitted for approval to the designing engineer. The Contract shall be for the complete services rendered over a period of one year.

N. Load Bank (Outdoor)

1. Description: Automatically-controlled multiple stage resistor integrally forced-air cooled load bank in a stationary free-standing NEMA 3R weatherproof enclosure. Load bank is to be used for periodic exercising of the emergency generator(s) under load. The unit shall include provisions for manual control from a remote location.

2. Characteristics: Unit shall be made up of not less than (4) continuously rated 480 volt 3-phase resistance stages designed and connected so as to provide a load of up to 200 KW.

   Steps shall be applied and removed as follows:
   a. Manually from the integral control panel.
   b. Manually from a remotely located panel, furnished with the load bank and installed complete with circuitry at a location as directed in the field.
   c. Automatically to maintain – in conjunction with building lighting and equipment connected to the generator – a nearly constant load.

3. Construction: The load bank shall be completely self-contained, incorporating all of the following, integrally mounted in a single enclosure except as otherwise noted:
   a. Load steps: Independent resistance stages, made up of chrome alloy wire, connected so as to provide load steps up to the total rating of the load bank. No stage shall exceed 50 KW.
   b. Each resistance stage shall be independently protected by means of factory installed current limiting fuses and shall be provided with a magnetic contactor. Fuses and magnetic contactor shall be factory wired so as to provide a self-protected, individually controllable unit for each stage.
   c. Main terminals arranged to accommodate a single power connection, sized for the full load rating of the load bank, complete with power circuit extensions to the protective devices for each branch circuit (i.e., stage).
   d. Main disconnect switch. If switch cannot be integrally mounted, provide with separate NEMA 3R enclosure mounted adjacent to load bank.
   e. Fused control transformer with 120 volt output.
   f. Integral control system incorporating the following features and functions:
      1) Local or remote manual application in stages of the load bank resistors, from a factory installed integrally mounted local control panel and/or a remotely located controlled panel furnished by the load bank supplier, and installed (complete with circuitry) as part of the work of this section at a location as directed in field.
      2) Automatic control of the load bank so as to disconnect the load bank (and initiate the cool-down sequence) on disturbances of normal power as sensed by a control circuitry extension to each automatic transfer switch.
      3) Automatic control of the load bank so as to maintain a nearby constant manually adjustable generator output throughout fluctuations in the “base loads” applied to the generator during either outages or scheduled “exercising under load”. Include circuitry connections to the generator panel.
      4) Generator voltages sensing to delay the applications of load until generator voltage and frequency have stabilized.
      5) Automatic protection against regenerative power from elevators. Include reverse power and overfrequency sensing and control logic.
      6) Selection at the local control panel of “Local-Manual,” “Local-Automatic” or “Remote” operation.
      7) Selection at the remote control panel of the “Remote-Manual,” “Remote-Automatic” or “Off.”
      8) Both control panels shall include step-by-step manual control as well as status lights.
   g. Integral forced air cooling system including TEFC motor driven direct connected fan, combination motor starter and temperature sensor.
   h. Malfunction detection system incorporating sensors, alarms and wiring for intake and exhaust air overtemperature and loss of cooling airflow; so arranged as to shut down load bank to avoid overheating.
   i. Complete set of factory installed power and control wiring. Cooling fan and control power shall be derived from a protected tap on the load side of the nearest transfer switch.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which diesel engine-driven generator units are to be installed and notify Engineer in writing of conditions detrimental to proper completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF DIESEL ENGINE-DRIVEN GENERATOR SETS

A. Install diesel engine-driven generator units in accordance with the equipment manufacturer's written instructions, and with recognized industry practices, to ensure that engine-generator units fulfill requirements. Comply with NFPA and NEMA standards pertaining to installation of engine-generator sets and accessories.

B. Coordinate with other work, including raceways, electrical boxes and fittings, fuel tanks, piping and accessories, as necessary to interface installation of engine-generator equipment work with other work.

C. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturers' published torque tightening valves for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified in UL Stds 486A, 486B, and the National Electrical Code.

D. Install units on vibration isolators in accordance with Division-23 section; and comply with manufacturer's indicated method of installation.

E. Connect fuel oil piping to alternative generator equipment as indicated, and comply with manufacturer's installation instructions.

F. Align shafts of engine and generator within tolerances recommended by engine-generator unit manufacturer.

G. Generator set shall be capable of start-up and accepting rated load within ten (10) seconds.

H. Provide appropriate conduit and wiring from building normal panelboard, of appropriate voltage, to feed miscellaneous equipment such as jacket heaters, battery charger, etc. Coordinate power supplies with engine manufacturer. Provide separate conduits and wiring for each miscellaneous equipment.

3.3 GROUNDING

A. Provide equipment grounding connections for diesel engine-driven generator units. Tighten connections to comply with tightening torques specified in UL Std 486A to assure permanent and effective grounding.

3.4 FIELD QUALITY CONTROL

A. Start-up Testing:

1. Engage local equipment manufacturer's representative to perform start-up and building load tests upon completion of installation, with the Architect/Engineer in attendance; provide certified test record. Tests are to include the following:
    a. Check fuel, lubricating oil, and antifreeze in liquid cooled models for conformity to the manufacturer's recommendations under environmental conditions present.

b. Test prior to cranking engine for proper operation, accessories that normally function while the set is in a standby mode. Accessories include: engine heaters, battery charger, generator strip heater, remote annunciator.
c. Check, during start-up test mode, for exhaust leaks, path of exhaust gases outside the building, cooling air flow, movement during starting and stopping, vibration during running, normal and emergency line-to line voltage and phase rotation.
d. Test, by means of simulated power outage, automatic start-up, remote-automatic starting, transfer of load, and automatic shut-down. Prior to this test adjust for proper system coordination, transfer switch timers. Monitor throughout the test, engine temperature, oil pressure, battery charge level, generator voltage, amperes, and frequency

2. Perform an eight-hour load bank test with the following sequence:
   a. Two hours start-up 50% load.
   b. Four hours 100% load.
   c. Two hour 50% load.
   (Test results shall be documented and given to the engineer for review and approval.)
3. Upon completion of installation demonstrate capability and compliance of system with requirements. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed with retesting. Initial testing and retesting to be at no cost to Owner.
4. Verify remote start/stop controls are operational.

3.5 PERSONNEL TRAINING

A. Building Operating Personnel Training: Provide 4 hours to train Owner's building personnel in procedures for starting-up, testing and operating diesel engine-driven generator sets. In addition, train Owner's personnel in periodic maintenance of batteries.

END OF SECTION

SECTION 26 36 00

TRANSFER SWITCHES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provision of Contract, including General and Supplementary Conditions and Division-1 Specification sections, apply to work of this section.

B. Division-26 Basic Electrical Materials and Methods sections apply to work specified in this section.

1.2 SUMMARY

A. Extent of transfer switch work, including associated control devices, is indicated by drawings and schedules and as specified herein.

B. The generator and transfer switches shall be furnished by the same manufacturer.

C. Types of transfer switches required for the project include the following:

1. Automatic transfer.

D. Refer to other Division-26 sections for wires/cables, electrical raceways, boxes and fittings, which are required in conjunction with transfer switch work; not work of this section.

E. Refer to Division-3 sections for concrete and grout work required in connection with transfer switch work; not work of this section.

F. Refer to Division-23 section for vibration control and isolation required in connection with transfer switches; not work of this section.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's data and installation instructions for electrical power transfer switches.

B. Shop Drawings: Submit ½"=1'-0" scale layout drawings of electrical generator and transfer switches showing accurately scaled equipment locations, housekeeping pad size, location and spatial relationships to associated electrical equipment in proximity.

C. Wiring Diagrams: Submit wiring diagrams for electrical transfer switches, and associated control devices showing connections to prime and alternate power sources, electrical load, and equipment components. Differentiate between portions of wiring that are manufacturer-installed and portions that are field-installed.

1.4 QUALITY ASSURANCE

A. Manufacturer's Qualification: Firms regularly engaged in manufacture of electrical power transfer switches, of types, rating, and capacities required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Provide automatic transfer switches produced by a manufacturer listed as an Approved Manufacturer in this section.

C. Provide automatic transfer switch whose performance under specified conditions is certified by the manufacturer.

D. Service: The manufacturer must have a factory warehouse, at which spare parts are stocked and where a field service engineer permanently resides, located within 50 miles of the job site. The field service engineer shall be a full-time employee of the manufacturer, factory trained and qualified individual whose primary duty is field service.

E. Upon request, the manufacturer shall provide a notarized letter certifying compliance with all the requirements of this Specification. The certifications shall identify, by serial number(s), the equipment involved.

F. Each transfer switch shall be furnished with an operator's manual providing installation and operating instructions.

G. Installer's Qualifications: Firm with at least 5 years of successful installation experience on projects utilizing electrical power transfer switches similar to that required for this project.

H. Codes and Standards:

1. Electrical Code Compliance: Comply with applicable local electrical code requirements of the authority having jurisdiction and NEC as applicable to construction and installation of electrical power transfer switches.
2. UL Compliance: Comply with applicable requirements of UL 1008, "Automatic Transfer Switches", and UL 486A, "Wire Connectors and Soldering Lugs for Use with Copper Conductors." Provide transfer switches and components which are UL-listed and labeled.
3. NEMA Compliance: Comply with applicable requirements of NEMA Stds Pub/No.'s ICS 2, "Industrial Control Devices, Controllers and Assemblies", ICS 6 and 250, pertaining to transfer switches.
4. NFPA Compliance: Comply with applicable requirements of NFPA 99; "Standard for Health Care Facilities", and NFPA 101; "Code for Safety to Life from Fire in Buildings and Structures", pertaining to transfer switches. NFPA 110, NEC (NFPA 70) for construction and installation.

1.5 DELIVERY, STORAGE AND HANDLING

A. Deliver transfer switches and associated devices in factory-fabricated type containers or wrappings, which properly protect equipment from damage.

B. Store transfer switches and associated devices in original packaging and protect from weather and construction traffic. Wherever possible, store indoors; where necessary to store outdoors, store above grade and enclose with watertight wrapping.

C. Handle transfer switches and associated devices carefully to prevent physical damage to equipment. Do not install damaged equipment; remove from site and replace damaged equipment with new equipment.

PART 2 - PRODUCTS

2.1 TRANSFER SWITCHES

A. General: Except as otherwise indicated, provide manufacturer's standard design, materials and components as indicated by published product information, designed and constructed as recommended by manufacturer for duty indicated, and as required for a complete installation.

B. Automatic Transfer Switches shall be provided with 4 poles, current ratings as indicated on the drawings, for a normal and emergency source of 3 phase, 4 wire, 60Hz with neutral bus. The transfer switch shall be braced to have a short circuit rating of a minimum of 65,000 RMS symmetrical amperes, and larger than the available fault current indicated on the one line diagram. The transfer switches shall be listed per UL Standard 1008 as a recognized

component for emergency systems and rated for total system load. The pickup voltage shall be adjustable from 85% to 98% of nominal and the dropout voltage shall be adjustable from 75% to 98% of the pickup value. The switch is to be enclosed in a NEMA 1 type non-ventilated enclosure suitable for all mountings without derating. The neutral bus shall be fully rated for switch ampere rating unless otherwise noted

C. The automatic transfer switches shall be mechanically held, electrically operated type and suitable for continuous duty in an unventilated sheet metal enclosure without derating (NEMA Type A IEC Type PC). The transfer switches shall be inherently double throw so both sets of contacts move simultaneously when the switch is transferring. The transfer switches shall be mechanically interlocked to ensure only three possible positions-normal neutral and emergency.

D. All main contacts shall be silver alloy wiping action type. They shall be protected by arcing contacts in sizes above 400 amperes. Main contacts shall transfer in 1/6th of a second or less.

E. All switch and relay contacts, coils, springs and control elements shall be removable from the front of the transfer switch without removal of the switch panels from the enclosure and without disconnection of drive linkages or power conductors. Sensing and control relays shall be continuous duty industrial control type with minimum contact rating of 10 amperes.

F. All relays, control wiring and accessories shall be front accessible. The voltage sensing relays and all adjustable timers shall be capable of being adjusted, while energized, through calibrated dials. Sensing relays shall operate without contact chatter or false response when voltage is slowly varied to drop out and pick up level. The switch shall be capable of handling all classes of loads as required for the application.

G. Automatic transfer switches utilizing components of molded case circuit breakers, circuit interrupters, disconnect switches, or parts thereof which had not been intended for repetitive switching are not acceptable. An overload or short-circuit shall not cause the transfer switch to go into neutral position.

H. A time delay to override momentary normal source outages to delay all transfer switch and engine starting signals. The time delay shall be field adjustable from 0.5 to 15 seconds and factory set at 3 seconds.

I. The switch shall transfer the load to the emergency power system after the generator set reaches proper voltage and frequency. Time delay transfer to emergency power adjustable from 0 to 120 seconds (set at 5 seconds) shall allow the engine-generator set to stabilize before application of load.

J. A time delay on retransfer to normal source. The time delay shall be automatically bypassed if the emergency source fails and normal source is available. The time delay shall be field adjustable from 0 to 30 minutes and factory set at 15 minutes.

K. Independent single phase voltage and frequency sensing of the emergency source. The pickup voltage shall be adjustable from 85% to 98% of nominal. Transfer to emergency upon normal source failure when emergency source voltage is 90% or more of nominal.

L. Each individual transfer contact switch shall be arranged to close a pilot contact to initiate remote starting of standby plant after specified time delay upon normal source failure or after drop in voltage on any phase to 80% or less. Upon signal from automatic transfer switch, engine shall crank, start, obtain operating speed and be ready to accept load within ten seconds. When the standby plant is delivering not less than 90% of rated voltage and frequency, the load shall be transferred. This operation shall take place within 10 seconds of the loss of normal power. Upon restoration of the normal source to not less than 90% of rated voltage on all phases, the load shall be transferred to the normal source after specified time delay. Upon retransfer to normal source, engine shall remain running for a predetermined time for "cool-out" and/or protection against additional failure of normal source.

M. Transfer switch shall be factory equipped with a means to prevent large inrush currents due to transfer between energized sources. This feature shall provide a field adjustable time delay during switching in both directions, during

which time the load is isolated from both power sources, to allow residual voltage of motors or other inductive loads (such as transformers) to decay before completing the switching cycle. The programmed transition feature shall have an adjustable time range of 0 to 7.5 seconds. All transfer switched specified to be supplied without programmed transition shall be capable of addition of the programmed transition feature in the field without transfer switch replacement. Transfer methods that use the phase relationships between the two power sources to control a transfer initiation time are not acceptable.

N. The automatic transfer switch shall be UL listed as complete transfer switch in accordance with UL 1008, latest edition. UL listing on the individual power switch devices above is not sufficient. Transfer switches utilizing components of molded case circuit breakers, circuit interrupters, disconnect switches etc., will not be acceptable. The automatic transfer switch shall be warranted for a period of two years from date of acceptance.

O. A contact that closes when normal source fails for initiating engine starting, rated 10 amps, 32 volt D.D. Contacts to be gold plated for low voltage service.

P. Pilot lights to show switch position.

Q. One set of normally open and one set of normally closed auxiliary contacts.

R. A test switch to momentarily simulate normal source failure.

S. Harnessing between transfer switch and control panel shall have built-in disconnect for routine maintenance.

T. Transfer switch shall be furnished with an operator's manual providing installation and operating instructions.

U. Transfer switch shall be supplied in a NEMA 1 enclosure.

V. Transfer switch shall be furnished with an adjustable exerciser circuit. Selectable exercise time of the day of month, time of day, and duration shall be provided.

W. The control module shall direct the operation of the transfer switch. The module's sensing and logic shall be a built-in microprocessor-based system for maximum reliability, minimum maintenance, and inherent digital communications capability. The control settings shall be stored in nonvolatile EEPROM. The module shall contain an integral programmable clock and calendar. The control module shall have a keyed disconnect plug to enable the control module to be disconnected from the transfer mechanism for routine maintenance. The control module shall be mounted separately from the transfer mechanism unit for safety and ease of maintenance. Interfacing relays shall be industrial control grade plug-in type with dust cover.

X. The control module shall include programming keypad, alpha-numeric display for monitoring settings and diagnostic values, key-lockable program selector switch, light-emitting diode status indications, and user instructions. These features shall be user accessible when the enclosure door is closed.

Y. The control module shall be capable of storing the following records in memory for access either locally (at the control module) or remotely (at a computer):

1. Number of hours transfer switch is in the emergency position (total and since record reset).
2. Number of hours the emergency is available (total and since record reset).
3. Total transfers in either direction (total and since record reset).
4. Date of record reset.
5. Date of last exercise period.
6. Date, time, and description of the last four source failures.
7. Elapsed time during the most recent source outage.

Z. The following additional accessories shall be provided:

1. Adjustable time delay to override momentary outage for six (6) seconds.
2. Adjustable time delay 2-25 minutes on retransfer to normal source with 5 minute unloaded running time of standby plant. In the event of a general failure transfer switch will nullify the time delay and return to normal.
3. Momentary test switch with the following positions:
   a. Test
   b. Automatic
4. Engine starting contact.
5. Indicating lights - mount in cover of enclosure to indicate switch in either normal or emergency position.
6. Auxiliary contacts, one closed on normal position, the second closed on emergency position.
7. All time delay and sensing functions shall be readily field adjustable over the ranges indicated and operate without drift over a temperature range of minus 4˚F. to 158˚F.
8. Time delay on transfer to emergency for controlled loading of generator 0-1 minutes, set at 0 minutes.
9. Return to normal switch - mount in cover of enclosure to initiate manual transfer from alternate to normal power source.

AA. During the withstand tests, there shall be no contact welding or damage. The circuit breaker coordination tests shall be performed without the use of current limiting fuses, and oscillograph traces across the main contacts shall be furnished to verify that contact separation has not occurred. Test procedures shall be in accordance with UL 1008, and testing shall be certified by Underwriters' Laboratories, Inc. or a nationally recognized Independent Electrical Testing Laboratory. When conducting temperature rise test to Paragraph 17 of UL-1008, the manufacturer shall include post- endurance temperature rise tests to verify the ability of the transfer switch to carry full rated current after completing the overload and endurance tests.

BB. An operational test shall be conducted after installation to indicate that each switch will operate satisfactorily under all conditions required by the Specifications. This shall be done in the presence of the Architect's representative.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which transfer switches are to be installed and notify Engineer in writing of conditions detrimental to proper completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF TRANSFER SWITCHES

A. Install transfer switches, including associated control devices as indicated, in accordance with equipment manufacturer’s written instructions, and with recognized industry practices, to ensure that transfer switches comply with requirements. Comply with applicable requirements of NEC and NFPA pertaining to wiring practices and installation of electrical power transfer switches.

B. Coordinate with other electrical work, including raceway, and electrical boxes and fittings, as necessary to interface installation of transfer switch work with other work.

C. Tighten electrical connectors and terminals, including screws and bolts, in accordance with equipment manufacturer’s published torque tightening values for equipment connectors. Where manufacturer’s torquing requirements are no indicated, tighten connectors and terminals to comply with tightening torques specified in UL Stds 486A and B.

D. Anchor mounting hardware firmly to walls, floors, or ceilings, to ensure enclosures are permanently and mechanically secured. Provide all hardware and accessories for proper mounting.

E. Provide in conjunction with each and every automatic transfer switch the following:

1. 2# 12-1/2"C from auxiliary contact (closed when switch in emergency position) on transfer switch to each elevator machine room which is served via that transfer switch. Terminate as and where required by the elevator vendor.
2. 2# 12-1/2"C from auxiliary contact (closed before switch returns to normal power) on transfer switch serving elevators to each elevator machine room which is served via that transfer switch. Terminate as and where required by the elevator vendor.
3. 2# 12-1/2"C from engine start contact on transfer switch to respective emergency generator control panel.
4. 2# 12-1/2"C from auxiliary contacts on fire pump controller for generator start.
5. Wiring as necessary from transfer switch to remote annunciator panels and engine control panel for transfer switch position indicator lights.

F. Provide all necessary wiring and conduit to each remote alarm panel locate at the building command center.

3.3 GROUNDING

A. Provide equipment grounding connections for transfer switch units as indicated. Tighten connectors to comply with tightening torques specified in UL Std 486A to assure permanent and effective grounding.

3.4 FIELD QUALITY CONTROL

A. Test transfer switches, by means of simulated power outage; automatic start-up by remote-automatic starting, transfer of load and automatic shutdown. Prior to these tests, adjust transfer switch timers for proper system coordination.

B. Upon completion of installation and after circuitry has been energized, demonstrate capability and compliance of transfer switches with requirements. Where possible, correct malfunctioning units at site then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed with retesting. Initial testing and retesting, where necessary, at no cost to Owner.

3.5 PERSONNEL TRAINING

A. Building Operating Personnel Training: Train Owner's building personnel in procedures for starting-up, testing and operating transfer switches an auxiliary equipment.

END OF SECTION

SECTION 26 41 15

LIGHTNING PROTECTION SYSTEM (MULTI-POINT)

PART 1 - GENERAL

1.1 GENERAL REQUIREMENTS

A. This Section is coordinated with and complementary to the General Conditions and Supplementary General Conditions of the Work, wherever applicable to mechanical and Electrical Work.

B. Section 23 05 01 - Mechanical and Electrical Coordination shall apply.

C. Section 26 05 02 – Electrical Requirements.

1.2 DESCRIPTION OF WORK

A. The work includes the providing of all labor, materials, equipment, accessories, services and tests necessary to complete and make ready for operation by the Owner, a lightning protection system in accordance with specifications. The lightning protection system shall include, but not be limited to air terminals, loops, ground rods, connections, and wiring.

B. Any such work included in any other section of these specifications that is not specifically described therein shall comply with the requirements of this section.

C. The following items of work are specifically included in, but not limited to the generality implied by these specifications.

1. Lightning protection terminals.
2. Complete Terminal, Base and Supports.
3. Down Conductors.
4. Grounding Termination.
5. Transient Voltage surge suppression.

1.3 QUALITY ASSURANCE

A. "Manufacturers" - Firms regularly engaged in the manufacturer of the type of equipment required for the application, whose products have been in satisfactory use in similar service for not less then 10 years and are members of the Lightning Protection Institute.

B. A system of lightning protection shall be provided and installed in compliance with the provisions of NFPA 78, NEC and the latest "Code for Protection Against Lightning" for buildings as adopted by the National Fire Protection Association and the Underwriters Laboratories, Inc. to produce a Master Label System.

C. The lightning protection system shall be installed by a lightning protection contractor who specializes in this field.

1.4 SUBMITTALS

A. Refer to Section 23 05 01 - Mechanical and Electrical Coordination and submit shop drawings. Shop drawings shall include a dimensioned drawing of lightning protection system layout with conductor routings, descriptive data on all equipment, air terminals, air terminal bases, cable fasteners, splicer fittings, ground clamps, and cables.

B. Submit detailed product data sheets showing application, dimensions, and material of each component utilized in the lightning protection system installation.

C. Submit manufacturer's installation instructions under the other provisions.

D. Submit proof of installer's approval or certification by the system manufacturer.

E. A sample of all parts to be used in the lightning protection systems shall be submitted for review and approval.

F. Submit copy of manufacturer's warranty.

G. Submit copy of lightning protection insurance policy for a minimum of $6,000,000 coverage.

H. Submit list of ten (10) verifiable installations with names, addresses, and phone numbers.

1.5 GUARANTEE

A. Refer to Section 23 05 01 - Mechanical and Electrical Coordination.

PART 2 - PRODUCTS

2.1 MATERIALS

A. All material shall comply in weight, size and composition with the requirements of Underwriters Laboratories, Inc. and the National Fire Protection Association Code relating to this type of structure.

2.2 AIR TERMINALS

A. Air terminals shall be 1/2" x 18" solid copper and shall extend at least 18 inches above the object to be protected. All air terminal bases shall be cast bronze with stainless steel bolted-pressure cable connectors. The air terminals should be spaced so as not to exceed 20' apart around the outside perimeter of the roof or the ridge and not over 50 square feet apart through the center of flat roof areas. The air terminals in the center roof area shall be 1/2" x 48" solid copper with a proper brace. All air terminal bases for flat roof areas shall be of the adhesive type.

2.3 CONDUCTORS

A. Conductors shall consist of U.L. listed 28 strands of 14 gauge copper wire weighing 375 lbs. per 1,000 feet and installed in accordance with the U.L. Code. A perimeter cable shall be installed around the entire main roof, and all penthouses and cooling towers. Each perimeter cable shall be connected to at least (2) down leads, providing a two-way path to ground from each air terminal. All center roof air terminals shall be interconnected with conductors to the outside perimeter cable. Conductors on the flat roof areas may be run exposed. Ground connections shall be made around the perimeters of each roof and to the main down conductor at a maximum of 100'-0" on centers.

2.4 CONCEALED CONDUCTORS

A. All concealed conductors shall be installed in Schedule 40 1" P.V.C. Conduit. Conduit to be furnished and installed by the Electrical Contractor.

2.5 FASTENERS

A. Conductor fasteners shall be an approved type of non-corrosive metal, have ample strength to support conductors and shall be spaced not to exceed 3'-0" centers. Masonry type cable fasteners spaced every 3'-9" on masonry. Adhesive type cable fasteners spaced every 3'-0" on flat roofs.

2.6 ROOF PENETRATION

A. Wherever the conduit penetrates the roof, copper pitch pans shall be furnished by the Lightning Protection Contractor and installed by the Roofing Contractor. Wood nailing blocks shall be furnished and installed by the General Contractor. All patching and masonry work shall be furnished and installed by the General Contractor.

2.7 DOWN CONDUCTORS

A. Buildings that are of reinforced concrete or wall bearing structures, the concealed down conductors shall be installed in Schedule 40 1" P.V.C. Conduit. Each perimeter roof cable shall be connected to at least 2 down leads. The average distance between down leads shall not exceed 100', from upper roof to lower roof, or from roof to ground terminals. Irregularly shaped structures may require extra down conductors to provide a two-way path to ground from each air terminal.

2.8 CABLE CONNECTORS

A. All cable connectors shall be cast bronze with screw pressure type stainless steel bolts and nuts.

2.9 INTERCONNECTION OF METALS

A. All metal bodies within 6' of the conductor shall be bonded to the system with approved fittings and conductor. Connections between dissimilar metals shall be made with approved bimetallic connections.

1. Bonding of all metallic objects and systems at roof levels and elsewhere on the structure shall be complete. Primary bonds for metal bodies of conductance shall be bonded with appropriate fittings and full-size conductor; and shall consist of, but not be limited to the following: Roof exhaust fans, HVAC unit with related piping ductwork, exhaust vents and any other roof piping systems, cooling towers, and rails systems, window washing tracks, antenna mast for T.V., radio or microwave, flag poles, roof handrails and/or decorative screens, roof ladders, skylights, metal plumbing stacks, etc. Exterior architectural metal fascia and/or curtain walls or mullions, which extend the full height of the structure shall also be bonded, if not inherently bonded thru the building frame.
2. Metal bodies of inductance located within six feet of a conductor or object with secondary bonds, shall be bonded with secondary cable and fittings. Typical of these are: Roof flashings, parapet coping caps, gravel guards, isolated metal building panels or siding, roof drains, down spouts, roof insulation vents and any other sizeable miscellaneous metals, etc.

2.10 GROUNDING

A. Ground terminals shall be located at the base of the structure. Ground connections shall be made around the perimeter of the structure and in no case shall average over 100'-0" apart. Ground terminals shall be 3/4" in diameter and shall be driven to a minimum depth of 10' and more if necessary to reach permanent moisture. One ground shall have connection to the water system where the water supply enters the building in addition to artificial ground. In case of rock ledge or other conditions making it impossible to comply with the above, trenching or a copper ground plate will be permitted, providing it will meet with the Underwriters Laboratories, Inc. requirements.

2.11 COMMON GROUNDING

A. Provide necessary common grounds between the lightning protection system and the electric and telephone service entrance wires, TV and radio antenna grounds.

2.12 SURGE SUPPRESSION (Refer to Section 26 43 13 “Transient Voltage Surge Suppression)

A. Provide surge protection on the electrical, telephone, and antenna and TV lead wires.

B. The surge suppressor for the main electrical service entrance switches shall be 150 grade, rated for (160) KA capability, reaction time of less than five (5) nanoseconds, with redundant replaceable MOV modules, independently fused module, status indicator lights, UL 1449 listed. The electrical surge suppression equipment shall be installed at the main entrance of the electrical system with a UL listed disconnecting mechanism. The surge suppressor shall have the capability of being disconnected without shutting down the electrical system.

C. Electrical surge suppressers shall comply with requirements outline in the transient voltage surge suppression specification section.

D. Telephone surge suppression shall be to the standards of the telephone system carrier. The suppressor shall be industrial grade, with replaceable modules, and a reaction time of less than one (1) nanosecond. This surge equipment shall be installed at the main entrance of the telephone system.

E. Antenna and TV lead wire suppressor shall be industrial grade suitable for the conductor, coax or hard wire. The suppressor shall have a reaction time of less than one (1) nanosecond and shall be installed as close to the antenna or TV camera as possible.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine locations where grounding is to be installed and notify Architect/Engineer in writing of conditions detrimental to proper and timely completion of work.

B. Do not proceed with work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Excavating: All services involving excavating, trenching, backfilling, tamping of ground for ground rods, test wells, and ground loops shall be furnished and completed by the Contractor and meet the Architect's and Engineer's requirements.

B. Install lightning protection system in accordance with manufacturer's written instructions, and with recognized industry practices, to ensure that equipment complies with requirements and serves intended purpose.

C. Coordinate with other work including electrical wiring, excavating, and roofing work, as necessary to interface installation of lightning protection system with other equipment.

D. Installation shall comply with the requirements of the NEC, NFPA No. 78, applicable UL installation requirements, UL Master Label requirements, and the applicable portions of NECA's "Standard of Installation".

E. Install conductors with direct paths from air terminals to ground connections avoiding sharp bends and narrow loops. All conductor drops to earth shall be concealed in building structure.

3.3 FIELD QUALITY CONTROL

A. Upon completion of lightning protection system, test system to demonstrate compliance with requirements. When possible, field-correct defective equipment, then retest to demonstrate compliance. Replace equipment which cannot be satisfactorily corrected.

B. Inspect all connections prior to concealing same.

C. Check continuity of entire system.

D. Provide Master Label inspection verification.

E. Underwriters Laboratories, Inc. Master Label shall be furnished as evidence that the installation has met with UL 96A code requirements.

F. Upon completion of installation of lightning protection system, test ground resistance with a megger ground tester. Where tests show resistance to ground is over 5 ohms, take appropriate action to reduce resistance to 5 ohms or less by driving additional ground rods and/or treating soil around ground rod with sodium chloride (salt), calcium chloride, copper sulphate, or magnesium; then retest to demonstrate compliance.

END OF SECTION

SECTION 26 43 13

SURGE PROTECTION DEVICES

PART 1 - GENERAL

1.1 SUMMARY

This specification includes requirements for a high energy surge protection devices and electronic filtering system used to protect AC electrical distribution from the effects of lightning, utility switching events, and impulses generated internally within a facility.

1.2 RELATED DOCUMENTS

The specified unit shall be designed, manufactured, tested and installed in compliance with the following standards:

ANSI/IEEE C62.41-1991 and C62.45-1992
ANSI/IEEE C62.1 and C62.11
Canadian Standards (CUL)
Federal Information Processing Standards Publication 94 (FIPS PUB 94)
National Electrical Manufacturers Association (NEMA LS1-1992 Guidelines)
National Fire Protection Association (NFPA 70 [NEC], 75 and 78)
Underwriters Laboratories (UL 198, 248-1, 489, 1283 and 1449-latest Edition)

1.3 SUBMITTALS

A. Product Data: Provide complete product data detailing manufacturer's model number, specifications, features and options. Substitute/alternate products shall only be considered if the Attachment 1 Surge Protection Devices Submittal Compliance Form is fully completed and included in the submittal.

B. Test Data: Certified documentation shall be provided of the product's UL 1449 Latest Edition listing, clamping values (to include ratings with internal disconnects, if applicable), surge current fuse testing, independent test lab single pulse surge current capacity testing, and minimum repetitive surge current capacity testing.

C. Shop Drawings: Provide electrical and mechanical drawings that include detail on unit dimensions, weights, field connections and mounting provisions.

D. Installation, Operation and Maintenance Manuals: Provide one copy of the installation, start-up, operation and maintenance data for each unit supplied.

1.4 SUBSTITUTION PRE-APPROVAL PROCEDURES

Manufacturers requesting approval of their products shall identify the full model number and submit product data, specifications and complete the Attachment 1 Surge Protection Devices Submittal Compliance Form at least fourteen (14) days prior to the bid date.

1.5 WARRANTY

The manufacturer shall provide a ten year limited warranty from the date of shipment against failure when installed in compliance with applicable national/local electrical codes and the manufacturer's installation, operation and maintenance instructions.

1.6 LOCAL SERVICE SUPPORT

A dedicated support organization shall be located within 150 miles of the project location, and shall have experience supporting at least twenty other projects of similar complexity within the last three years. Personnel shall perform a start-up service to verify correct installation of the filters, perform transient voltage tests for reliability and performance using appropriate surge generating test equipment, and respond on-site to investigate user concerns.

PART 2 - PRODUCTS

2.1 HIGH PERFORMANCE SUPPRESSION SYSTEM

The suppression system shall incorporate metal oxide varistor (MOV) arrays and filtering capacitors. The system shall not utilize gas tubes, spark gaps, silicon avalanche diodes, or other components that might short or crowbar the line, thus leading to power interruption.

2.2 UL 1449 LATEST EDITION

The system shall be UL 1449 Latest Edition listed and UL approved as a surge protection device.

2.3 UNIT OPERATING VOLTAGE

The operating voltage and configuration shall be 277/480 grounded wye for unit substation location and 120/208 Volt grounded wye for panelboard locations or as noted on the drawings.

2.4 MAXIMUM CONTINUOUS OPERATING VOLTAGE (MCOV)

The MCOV shall be greater than 115 percent (%) of nominal voltage. Test and evaluation shall be as outlined in NEMA LS1-1992, paragraphs 2.2.6 and 3.6.

2.5 PROTECTION MODES

Per the definitions in NEMA LS 1-1992, paragraph 2.2.7, all modes shall be protected (e.g., line-to-line, line-to-neutral, line-to-ground and neutral-to-ground).

2.6 RATED SINGLE PULSE SURGE CURRENT CAPACITY

Calculations for single pulse surge current capacity shall use the component manufacturer's individual component rating multiplied by the respective number of per mode components. Documentation shall be provided with submittals on the Attachment 1 Surge Protection Devices Submittal Compliance Form. Component manufacturer's ratings shall be derived using the ANSI/IEEE C62.41-1991 Category C1 8 X 20/sec, 3000A current waveform. The per mode single pulse surge current rating shall be calculated based upon the component manufacturer's catalog rating for each device. The minimum rated single pulse surge current capacity per mode shall be as follows:

Rated Single Pulse Surge Current Capacity				
Location	L-N	L-G	N-G	L-L
Unit Substations	150,000 A	150,000 A	150,000 A	150,000 A
Panelboards	100,000 A	100,000 A	100,000 A	100,000 A

2.7 TESTED SINGLE PULSE SURGE CURRENT CAPACITY

The suppression filter system shall be single pulse surge current tested in all modes at rated surge currents by an industry-recognized independent test laboratory. Units with surge current capacities of 200,000 amps or less shall be tested as a unit, not individual modules. Due to industry test equipment limitations, units with surge current capacities greater than 200,000 amps shall be tested as a unit to 200,000 amps; and certified for surge current ratings above 200,000 amps by testing individual components or sub- assemblies within a mode. Units that sustain any component or overcurrent device failure are unacceptable.

2.8 MINIMUM REPETITIVE SURGE CURRENT CAPACITY

Per ANSI/IEEE C62.41 and ANSI/IEEE C62.45-1992, every mode of the suppression filter system shall be designed to survive multiple Category C3, 20 KV, 10 KA impulses. Test documentation shall detail the unit's ability to survive the following number of events (at one minute intervals) without any performance degradation.

Repetitive Surge Current Capacity - Number of Impulses				
Locations	L-L	L-N	L-G	N-G
Unit Substation	>12,000	>12,000	>12,000	>12,000
Panelboards	>4500	>4500	>4500	>4500

2.9 SWELL VOLTAGE RATING

For unit substation locations only, suppression components shall be capable of withstanding continuous overvoltage events (swells). Based on a source impedance of 0.7 Ohms, the unit shall withstand an overvoltage of 200 percent (above RMS nominal voltage) for at least 60 cycles, without component failure (including fuses).

2.10 HIGH FREQUENCY EXTENDED RANGE FILTER

EMI-RFI noise rejection/attenuation (per NEMA LS-1-1992 and MIL-STD-E220A 50 ohm insertion loss methodology) shall be as follows:

Attenuation Frequency	50 KHz	100 KHz	1 MHZ	10 MHZ	100 MHZ
Insertion Loss (dB)	50	41	31	35	53

For installations that install multiple downstream filters, the filters shall be coordinated to provide minimum noise rejection/attenuation as follows:

Attenuation Frequency	50 KHz	100 KHz	1 MHZ	10 MHZ	100 MHZ
Insertion Loss (dB)	85	83	68	67	84

NOTE: Insertion loss data shall be based on a minimum of 100 feet of #4 AWG conductor between filters.

2.11 SUPPRESSION VOLTAGE RATING

In compliance with procedures outlined in NEMA LS 1-1992, paragraphs 2.2.10 and 3.10, the maximum suppression voltage rating (with integral fused disconnect) shall be as follows:

System Voltage	Mode	6KV/500A Comb Wave	B3 Ringwave	B3/C1 Comb. Wave	C3 Comb. Wave
120/208	L-N L-G N-G L-L	325 325 325 625	350 425 375 475	425 500 475 825	725 800 750 1200
277/480	L-N L-G N-G L-L	725 750 700 1375	575 875 700 750	850 850 900 1675	1150 1175 1200 2100

2.12 REDUNDANT OVERCURRENT PROTECTION

Each suppression element shall utilize individual UL 248-1 recognized, 200 KAIC tested fuses to ensure that the operation of any single fuse does not isolate the filter from the distribution. At service entrance locations only, in the event a catastrophic or swell voltage occurrence causes the failure of all the MOV elements, the fusing for the selenium cells shall be independent to provide redundancy. The filter shall be capable of withstanding the rated single pulse surge current capacity without fuse failure.

2.13 INTERNAL CONNECTIONS

Internal surge current paths shall utilize low-impedance copper bus bar. No plug-in modules or quick-disconnect terminals shall be used in the surge current-carrying paths.

2.14 BUILT-IN FIELD TEST CAPABILITY

The unit shall incorporate an integral test point for off-line diagnostic testing to verify operational integrity of the suppression filter system. Testing shall include injection of an impulse at least two times the nominal system voltage, and provide metering to indicate the resultant clamping voltage.

2.15 ADDITIONAL FEATURES/EQUIPMENT

Advanced Monitoring Feature. A battery-powered audible alarm with event counter displays and two sets of form C dry contacts (N.O. or N.C.) shall be provided. The alarm shall indicate single or multiple phase failure of the filter.

PART 3 – EXECUTION

3.1 INSTALLATION

The Surge Protection Devices filters shall be installed within the switchgear as close as possible to the connection point following the manufacturer's recommendations for conductor size and minimal bends.

3.2 EQUIPMENT MANUAL

An equipment manual shall be provided that details installation, operation, and maintenance instructions for the filter. Information shall include unit dimensions, weights, mounting provisions, connection details and a layout diagram.

ATTACHMENT 1 – SURGE PROTECTION DEVICES SUBMITTAL COMPLIANCE FORM
(SERVICE ENTRANCE)

Performance/Feature	Specification Requirement	Proposed
Single Pulse Surge Rating Per Mode	150 KA L-N 150 KA L-G 150 KA N-G	_____ L-N _____ L-G _____ N-G

END OF SECTION

SECTION 265100 - ARCHITECTURAL LIGHTING

PART 1 – GENERAL

1.1 GENERAL REQUIREMENTS

A. WORK OF THIS SECTION SHALL BE GOVERNED BY THE CONTRACT DOCUMENTS. PROVIDE MATERIALS, LABOR, EQUIPMENT, AND SERVICES NECESSARY TO FURNISH, DELIVER, AND INSTALL ALL WORK OF THIS SECTION AS SHOWN ON THE DRAWINGS, AS SPECIFIED HEREIN, AND/OR AS REQUIRED BY JOB CONDITIONS.

B. THE WORK SHALL INCLUDE BUT NOT BE LIMITED TO THE FOLLOWING:

1. COMPLETE SHOP FABRICATION
2. DELIVERY TO JOB SITE
3. INSTALLATION AT DESIGNATED LOCATIONS, AND CONTROLS AS NOTED
4. LAMPING AND LAMPS
5. LAMP FOCUSING
6. CLEANING AND PROTECTION

1.2 DESCRIPTION OF WORK

A. FURNISH AND INSTALL A LIGHTING FIXTURE OF THE TYPE INDICATED BY LETTER AT EACH LOCATION SHOWN ON THE DRAWINGS.

B. ALL MATERIALS, ACCESSORIES, AND ANY OTHER EQUIPMENT NECESSARY FOR THE COMPLETE AND PROPER INSTALLATION OF ALL LIGHTING FIXTURES INCLUDED IN THIS CONTRACT SHALL BE FURNISHED BY THE CONTRACTOR.

C. CONFORMANCE: FIXTURES SHALL BE MANUFACTURED IN STRICT ACCORDANCE WITH THE CONTRACT DRAWINGS AND SPECIFICATIONS.

D. CODES: MATERIALS AND INSTALLATION SHALL BE IN ACCORDANCE WITH THE LATEST REVISION OF THE NATIONAL ELECTRICAL CODE AND ANY APPLICABLE FEDERAL, STATE, AND LOCAL CODES AND REGULATIONS.

E. ALL FIXTURES AND COMPONENTS OF SHALL BE MANUFACTURED IN ACCORDANCE WITH THE APPROPRIATE AND CURRENT REQUIREMENTS OF A NATIONALLY RECOGNIZED TESTING LABORATORY (UL, CUL, ETL, OR OTHERS) –OR– AN EUROPEAN ECONOMIC AREA APPROVED CE TESTING LABORATORY AND HAVE APPROPRIATE LABELING AFFIXED TO EACH FIXTURE IN A POSITION THAT IS CONCEALED FROM NORMAL VIEW.

F. SPECIFICATIONS AND SCALE DRAWINGS ARE INTENDED TO CONVEY THE SALIENT FEATURES, FUNCTION AND CHARACTER OF THE FIXTURES ONLY, AND DO NOT UNDERTAKE TO ILLUSTRATE OR SET FORTH EVERY ITEM OR DETAIL NECESSARY FOR THE WORK.

G. MINOR DETAILS, NOT USUALLY INDICATED ON THE DRAWINGS NOR SPECIFIED, BUT THAT ARE NECESSARY FOR THE PROPER EXECUTION AND COMPLETION OF THE FIXTURES, SHALL BE INCLUDED, THE SAME AS IF THEY WERE HEREIN SPECIFIED OR INDICATED ON THE DRAWINGS.

H. OMISSIONS: THE OWNER SHALL NOT BE HELD RESPONSIBLE FOR THE OMISSION OR ABSENCE OF ANY DETAIL, CONSTRUCTION FEATURE, ETC. WHICH MAY BE REQUIRED IN THE PRODUCTION OF THE FIXTURES. THE RESPONSIBILITY OF ACCURATELY FABRICATING THE FIXTURES TO THE FULFILLMENT OF THIS SPECIFICATION RESTS WITH THE CONTRACTOR.

1.3 RELATED DOCUMENTS

A. The Specifications and Drawings are intended to be complementary.

1. A particular section, paragraph or heading in a Division may not describe each and every detail concerning work to be done and materials to be furnished.

2. Drawings are diagrammatic and may not show all of the work required or all construction details. All dimensions and actual placements are to be verified in the field.

B. Refer to Section 265101 - appendix (a) for lighting fixture schedule

1. Any discrepancies between the catalog numbers, fixture description, remarks, lamp and supply voltage should be brought to the attention of the Project Arhitect prior to the release of a purchase order.

C. Refer to Section 265101 - appendix (b) for lighting fixture cut sheets

1. Catalog cuts or "series" numbers are intended to provide assistance in establishing general type or category of lighting fixtures only. Contractor shall provide a fixture that meets the written performance and description.

1.4 REFERENCE STANDARDS

A. National Electrical Code

B. National Electrical Manufacturers Association (NEMA)

C. National Fire Protection Association (NFPA section 70)

D. American National Standards Institute (ANSI)

E. Illuminating Engineering Society (IES):

F. Aluminum Association (AA)

G. American Iron and Steel Institute (AISI)

H. Restriction of Hazardous Substances in LED (RoHS)

I. Certified Ballast Manufacturers Association (CBM)

PART 2 – PRODUCT DATA

2.1 FIXTURE CONSTRUCTION (GENERAL)

A. All materials, accessories, and other related fixture parts shall be new and free from defects which in any manner may impair their character, appearance, strength, durability and function, and be effectively protected from any damage or injury from the time of fabrication to the time of delivery and until final acceptance of the work.

B. Sheet Metal Work: All sheet metal work shall be free from tool marks and dents, and shall have accurate angles bent as sharp as compatible with the gauges of the required metal. All intersections and joints shall be formed true of adequate strength and structural rigidity to prevent any distortion after assembly.

C. Housings shall be so constructed that all electrical components, including power supply units (ballasts / drivers) are easily accessible and replaceable without removing fixtures from their mountings, or disassembly of adjacent construction.

D. Castings: All castings shall be exact replicas of the approved patterns and shall be free of sand pits, blemishes, scales and rust, and shall be smoothly finished. Tolerance shall be provided for any shrinkage of the metal castings in order that the finished castings will accurately fit in their designated locations.

E. All lamp sockets in lighting fixtures shall be suitable for the indicated lamps and shall be set so that lamps are positioned in optically correct relation to all lighting fixture components. If adjustable socket positions are provided, socket should be preset in factory for lamp specified. If different socket positions are specified for same fixture, sockets shall be preset for each type, and cartons marked accordingly.

F. All fixtures shall be completely wired at the factory.

G. All fixtures supplied for recessing in suspended ceilings shall be supplied with prewired junction boxes.

H. Mounting Frames and Rings: If ceiling system requires, each recessed and semi-recessed fixture shall be furnished with a mounting frame or ring compatible with the ceiling in which they are to be installed. The frames and rings shall be one piece or constructed with electrically-welded butt joints, and of sufficient size and strength to sustain the weight of the fixture.

I. There shall be no light leaks between ceiling trims of recessed lighting equipment and the ceiling. Fixture is used in partially transparent ceilings shall have no light leaks above the ceiling line.

J. Yokes, brackets and supplementary supporting members needed to mount lighting fixtures to carrier channels or other suitable ceiling members shall be furnished and installed by the Contractor.

K. Hardware:

1. Steel and aluminum fixtures: all screws, bolts, nuts and other fastening and latching hardware shall be cadmium or equivalent plated.
2. Stainless steel fixtures: all hardware shall be stainless steel.
3. Bronze fixtures: all hardware shall be stainless steel or bronze.

L. Temperature: All fixtures must operate within the temperature limits of their design and in the applications and mounting conditions herein specified.

M. Adjustable Angle Fixtures: Each lighting fixture which has a beam angle adjustment shall have reliable angle locking devices.

N. Spread Lens Fixtures: Each light fixture which has a spread lens shall contain lens orientation locking devices to insure that lens orientation is not disturbed during future lamp replacement or cleaning.

2.2 REFLECTORS

A. Installation: Reflectors, reflector cones and visible trim of all lighting fixtures shall not be installed until completion of plastering, ceiling tile work, painting and general clean-up. They shall be carefully handled to avoid scratching or finger-printing and shall be, at the time of acceptance by the Owner, completely clean.

B. All Alzak parabolic cones shall be guaranteed against discoloration for a minimum of ten years, and, in the event of premature discoloration, shall be replaced by the Manufacturer, including materials and the cost of labor. Reflectors for fluorescent fixtures using tri-phosphor lamp technology shall not produce a visible "rainbow" of light.

C. Aluminum reflectors shall be finished specular, semi-specular, or diffuse as required and shall meet or exceed Alzak specifications. Minimum requirements of reflector finishes for interior and exterior service shall be as follows:

Minimum·weight·of·coating·per·description·of·service.¤	Minimum·reflectance·per·square·inch.¤	Specular¤	Diffuse¤
Normal·interior·commercial·service.¤	5.0¤	83.0¤	75.0¤
General·interior·industrial·and·exterior·work·reflector·protected·by·glass·covering.¤	7.5¤	82.0¤	73.0¤
Exterior·industrial·and·commercial·reflector·not·protected.¤	10.0¤	78.0¤	75.0¤
Exterior·marine·service·reflector·not·protected.¤	13.0¤	78.0¤	65.0¤

2.3 LENSES

A. Plastic for lenses and diffusers shall be formed of colorless 100% virgin acrylic as manufactured by Evonik Industries or as acceptable. The quality of the raw material must exceed IES, SPI, and NEMA Specifications by at least 100% which, as a minimum standard, shall not exceed a yellowness factor of 3 after 2,000 hours of exposure in the Fade-meter or as tested by an independent test laboratory. Acrylic plastic lenses and diffusers shall be properly cast, molded or extruded as specified, and shall remain free of any dimensional instability, discoloration, embrittlement, or loss of light transmittance for at least 15 years.

B. Glass used for lenses, refractors, and diffusers in incandescent lighting fixtures shall be tempered for high impact and heat resistance. The glass shall be crystal clear in quality with a transmittance of not less than 88%. For exterior fixtures use tempered Borosilicate glass tempered Corning #7740 or as acceptable. For fixtures directly exposed to the elements and aimed above the horizontal with a radiant energy of 4.16 watts per square inch or greater, use Vycor glass or as acceptable.

C. Where optical lenses are used, they shall be free from spherical and chromatic aberrations and other imperfections which may hinder the functional performance of the lenses.

D. All lenses, louvers, or other light diffusing elements shall be removable, but positively held so that hinging or other normal motion will not cause them to drop out.

E. All lenses shall be turned over to the Owner clean and free of dust.

2.4 LAMPS:

A. Manufacturer: Lamps shall be manufactured by General Electric, Philips, or Osram/Sylvania unless different manufacturer is specified. All lamps of a given fixture designation and lamp type shall be supplied by the same manufacturer unless otherwise noted,.

B. If a specific manufacturer is noted in the schedule, only that manufacturer shall be acceptable.

C. Provide lamps for all lighting fixtures (furnished as part of the electric work).

D. Incandescent and tungsten halogen lamps shall not be operated, other than for initial testing, prior to final inspection, lighting control programming and/or turnover of finished space to owner. If incandescent or tungsten halogen lamps are operated by the contractor during construction, all lamps must be replaced by the contractor prior to owner turn over.

E. Compact fluorescent, linear fluorescent, and LED lamps shall not be operated, during construction, other than for initial testing, inspections, or control system programming, for a period of more than two (2) months prior to turn over of the finished space to the owner. If lamps are operated longer than two (2) months prior to owner turn over, all lamps must be replaced by the contractor.

2.5 LAMP HOLDERS:

A. Incandescent:

1. Body: porcelain;

2. Screw Shell: nickel plated brass, pre-lubricated with silicone compound.

B. Outdoor lampholders, when directly exposed to the elements, shall be neoprene gasketed and compression type.

C. Lampholders with open-circuit voltage over 300 volts shall be “safety” type, designed to open supply circuit on lamp removal.

2.6 FINISHES

A. Painted Surfaces: Synthetic enamel, with acrylic, alkyd, epoxy, polyester, or polyurethane base, light stabilized, baked on at 350° Fahrenheit minimum, catalytically or photo-chemically polymerized after application.

B. White finishes: minimum of 85 percent reflectance.

C. Ceiling opening frames shall either be manufactured of non-ferrous metal, or be suitably rustproofed after fabrication.

D. Selection: Unless otherwise noted, finishes shall be as selected by the Architect.

E. Undercoat: Except for stainless steel give ferrous metal surfaces a five stage phosphate treatment or other acceptable base bonding treatment before final painting and after fabrication.

F. Unpainted non-reflecting surfaces shall be satin finished and coated with a baked-on clear lacquer to preserve the surface. Where aluminum surfaces are treated with an anodic process, the clear lacquer coating may be omitted.

G. Unpainted Aluminum Surfaces: Finish interior aluminum trims with an anodized coating of not less than 7 mg. per square inch, of a color and surface finish as selected by the Architect. Finish exterior aluminum and aluminum trims with an anodized coating of not less than 35 mg. per square inch, of a color and surface finish as selected by the Architect.

2.7 INCANDESCENT LIGHTING FIXTURES:

A. Fixtures utilizing tungsten halogen sources shall:

1. Be designed and constructed so that lamp seal temperatures do not exceed 350°C at an ambient of 25°c when tested in accordance with UL Standard #57, and shall maintain an operating bulb wall temperature of approximately 600°C, and not less than 250°C.

2. Utilize lead wires be rated for not less than 200°C operation, but rated for 250°C if temperature warrants.

B. Temperature on reflectors shall not exceed 205°C at any point.

2.8 LED LIGHTING

A. Luminaire manufacturers shall only utilize LEDs that have been tested and comply with the relevant standards.

B. Testing shall be in accordance with

1. ASTME methods

2. IESNA current LM-79 standards by an independent DOE approved participating lab

C. LED chip manufacturers' recommended specifications shall be adhered to:

1. Power to the LEDs shall not be overdriven

2. Thermal characteristics of the luminaire coupled with the specified current shall not exceed acceptable temperature.

3. The fixture shall be designed to maintain LED junction temperatures below the specified maximum temperature.

D. All LED fixtures (100% of each lot) shall undergo a minimum eight-hour burn-in test during manufacturing.

E. LED color

1. Consistency for static white LEDs shall not exceed 3 SDCM (3 stem MacAdam binning)

2. CRI shall be at least 80 with an R9 value greater than (80) - unless otherwise specified on the fixture schedule.

3. The average color shift shall be less than 0.0026du'v' after 10,000 hours; 0.007du'v' after 60,000 hours (based on LM80)

F. Luminaire shall exhibit 50,000 hours of life to 70% lumen output (based on LM-80 and extrapolated via the TM-21 calculation from 9000 hours of data at the testing temperature - unless otherwise specified on the fixture schedule.)

2.9 INSTRUCTIONS:

A. Each lighting fixture shall be packaged with complete instructions and illustrations showing how to install.

2.10 BASE BID MANUFACTURERS (ALTERNATES)

A. Alternate manufacturers:

1. Subject to compliance with requirements, other manufacturer's products may be found acceptable

B. Base bid shall be for lighting fixtures of manufacturers listed in the Fixture Schedule

1. Identification by means of manufacturers' names and catalog numbers is to establish basic features and performance standards. Any substitutions must meet or exceed the base bid standards.

C. Products specified to be by a designated manufacturer with "or equal by" an alternate manufacturer:

1. The alternate manufacturer's product must meet the specifications given for the designated product. If the alternate manufacturer listed does not have a product that will meet the specification, then his product will not be acceptable.
2. For any fixture offered in substitution for a specified fixture, provide complete photometric data

D. It is the contractor's responsibility to verify that the alternate manufacturer's equipment is complete with the same features, options, and photometric performance, as the designated manufacturer's equipment, and that it will fit in the available space (wall, plenum, cove, etc.)

E. Substitutions:

1. Within sixty days of placement of order, Contractor must furnish independent photometric tests and samples for all alternative fixtures.
2. If fixture fails to comply with specification requirements at that time, Contractor will furnish acceptable fixture at no additional cost to the Owner, and with no delay to the project.

2.11 ATTIC STOCK

CONTRACTOR MUST PROVIDE ATTIC STOCK OF ALL FIXTURES AND COMPONENTS AS DESCRIBED IN THE FIXTURE SCHEDULE.

A. Submittals must note the quantities of attic stock provided by the Contractor for each fixture type for approval.

B. Contactor to keep fixtures in original packaging and label all boxes with fixture type, manufacturer, catalog number, beam spread, color temperature and wattage. Attic stock fixtures must be stored in a temperature controlled location between 55° and 85° Fahrenheit. Owner to advise contractor of attic stock storage location.

2.12 SUBMITTALS:

A. The Contractor shall coordinate all aspects of the lighting fixture package and installation with the drawings and details of the Architectural, Structural, Electrical, Mechanical, and all other related trades.

B. No variation from the general arrangement and details indicated on the drawings shall be made in the submittal unless required to suit the actual conditions on the premises, and then only with the written approval of the Architect.

C. Submittal document(s) for all lighting fixtures shall be received no later than sixty days after award of Contract.

D. Review of shop drawings or samples does not waive contract requirements.

E. Provide manufacturer’s product data sheets for each type of lamp specified, including and highlighting the following product data:

2.13 SHOP DRAWINGS:

A. Provide for each fixture type submitted clearly indicated and complete “fixture type specific” ordering code.

B. Narrative descriptions, TDA cut sheets and verbatim copies of TDA catalogue numbers, and submittals that do not include manufacturer’s current submittal sheets are not acceptable for review.

C. Catalogue cuts lacking sufficient detail to indicate compliance with contract documents will not be acceptable.

D. Manufacturer's shop drawings:

1. Must be provided for all fixture components. Include detailed information on the fixture housing / mounting tray, mounting accessories, power supplies, and any other significant component of the fixture assembly and installation
2. Shop drawings should include:
    a. Details and cut sheets of each fixture type
    b. Clearly indicated fixture tag (Type designation)
    c. Lamping / source details
    d. Power requirements (input voltage and wattage)
    e. Power Supply Unit (PSU) details (when relevant)
    f. Graphic diagrams of all major fixture components, with overall fixture dimensions, and all other relevant technical details (ex: housing construction, optics, lenses, accessories, baffles, method of support, power feed locations, gasketing, fixture and housing finish, and others.)
    g. Contractor's field verified overall run lengths, layouts, and details that have been fully coordinated (with site conditions, construction by "others", etc.), when relevant.
        1) All non-standard layouts must be clearly documented, coordinated, and verified with field conditions, and any architectural integration as appropriate.
        2) Submit reflected ceiling plans, sections and/or details clearly identifying and locating each iteration of the fixture in the shop drawing
    h. Any modified fixtures must be so noted, and include Manufacturer's fabrication drawings and/or Manufacturer's statement demonstrating a clear understanding of the requirements and documentation of the product as it will be provided.
    i. Photometric data;
        1) For all optical fixtures supply complete photometric data for the fixture, including optical performance rendered by independent testing laboratory, developed according to methods of U.S.A. Illuminating Engineering Society
        2) Fixtures used for general illumination, photometric data shall include:
            a) Coefficients of utilization.
            b) Candlepower data:
                - Presented graphically and numerically in 5 degree increments.
                - For all "up/down light" fixtures and fixture with asymmetrical light distribution, present additional values at normal, parallel, and at 22-1/2°, 45°, 167-1/2° to the fixture
            c) Zonal lumens stated numerically in 10 degree increments
        3) Area and roadway luminaires, photometric data shall include:
            a) Isocandela charts
            b) Coefficients of utilization
            c) IES Roadway distribution classification

j. Custom fabrications shall clearly indicate the contract drawing number of fixture details used as reference in the development of the fixture, the name of the job, and of the Architect.

k. Indicate work to be provided by other trades

l. Indicate wiring and control circuits.

m. Indicate supplementary support when required to meet seismic code requirements.

2.14 SAMPLES:

A. For final approval after initial qualifying shop drawing review, and prior to release for manufacturing, the Contractor shall furnish one sample of each fixture on the fixture schedule and contract drawings for which sample requirement is noted.

B. Shipping: The samples shall be complete with specified lamp(s), ready for hanging, energizing, and examining, and shall be shipped, prepaid by Contractor, to the Architect, or as otherwise advised.

C. Sufficient time shall be allowed for thorough examination of the samples by the Architect.

D. Samples are not returnable, nor included in quantities listed for a project.

E. Samples must be actual working unit of materials to be supplied.

2.15 QUALIFICATIONS

A. The Manufacturer shall be a specialty lighting firm who has been in the business of designing and manufacturing specialty lighting fixtures for not less than ten (10) years.

B. Ballast manufacturers shall have been producing electronic ballasts in the U.S. for more than 10 years with a low failure rate.

C. Ballast shall carry three-year warranty, including labor allowance.

2.16 DELIVERY, STORAGE AND HANDLING

A. Deliver materials to the site ready for use in the manufacturer's original and unopened containers and packaging, bearing labels as to type of material, brand name, and manufacturer's name. Delivered material shall be identical to the reviewed submittals.

B. Store materials under cover in a dry and clean location, off the ground. Remove materials which are damaged, or otherwise not suitable for installation from the job site and replace with acceptable materials.

C. The fixtures shall be delivered to the job site fully fabricated and assembled and ready for installation. Lamps shall be shipped separately.

D. For luminaires incorporating Alzak cones or reflector/cones for protection pending completion of the installation: these components shall be supplied bulk packed in cartons separate from the luminaires. Unit packaging of cones or reflector/cones with luminaires is not acceptable.

2.17 WARRANTY

A. Warranties shall be provided in an acceptable form and shall be signed and notarized by a person or persons authorized to execute such a document on behalf of the company.

1. The Manufacturer shall guarantee all lighting fixtures and major components (except replaceable incandescent, halogen, fluorescent, and discharge lamps) for a period of three (3) year after acceptance of the project and final payment is made.

2. Ballast shall carry three (3) year warranty, including labor allowance.
3. Drivers (for LED fixtures) shall carry five (5) year warranty, including labor allowance

2.18 CLOSE OUT SUBMITTALS

A. The Contractor shall be responsible for obtaining from his supplying lighting manufacturers, for each type of lighting fixture, a recommended maintenance manual including:
1. Tools required.
2. Types of cleaners to be used.
3. Replacement parts identification lists.
4. Final, as-built shop drawings.

PART 3 – EXECUTION

3.1 QUALIFICATIONS

A. The Installer, if not the manufacturer, shall be a firm having trained personnel who have been in the business of installing specialty lighting for not less than seven (7) years and shall provide a full time field superintendent who shall be a representative of the installer during the installation and testing.

3.2 INSTALLATION

A. Do not scale electrical drawings for exact location of the lighting fixtures. In general, the architectural reflected ceiling plans indicate the proper locations of lighting fixtures.

B. Install each fixture properly and safely, fixtures in strict conformance with manufacturer's recommendations and instructions.

C. Appurtenances:
1. Furnish and erect hangers, rods, mounting brackets, supports, frames, and other equipment required.
2. Furnish lighting fixtures complete with appurtenances required for the proper, safe and distortion-free installation in the various surfaces in which they appear. Determine surface types from the Architectural drawings.

D. Concealment: Whenever a fixture or its hanger canopy is applied to a surface mounted outlet box, a finishing ring shall be utilized to conceal the outlet box.

E. Secondary voltages shall be tested at the power supply unit, the connection to the fixture, and such other locations on the distribution system as necessary. The inductance at the point of connection to the fixtures must be within the manufacturer’s allowable range.

F. Install reflector cones, baffles, aperture plates, light controlling element for air handling fixtures, and decorative elements after completion of ceiling tiles, painting and general cleanup.

G. Replace blemished, damaged or unsatisfactory fixtures as directed.

H. Mechanical Rooms: Lighting fixture locations in mechanical and electrical equipment rooms are approximate. Coordinate mounting height and location of lighting fixtures to clear mechanical, electrical and plumbing equipment and to illuminate adequately meters, gauges and equipment.

3.3 AIMING AND ADJUSTMENT:

A. All adjustable lighting units shall be aimed, focused, locked, etc., by the Subcontractor under the supervision of the Architect. The Architect shall indicate the number of crews (foreman and apprentice) required. All aiming and adjusting shall be carried out after the entire installation is complete. All ladders, scaffolds, etc. required shall be furnished by the Contractor at the direction of the Architect. As aiming and adjusting is completed, locking set-screws and bolts and nuts shall be tightened securely.

B. Night Work: Where possible, units shall be focused during the normal working day. However, where daylight interferes with seeing, aiming shall be accomplished at night.

3.4 CLEANUP:

A. At the time of final acceptance by the Owner, all lighting fixtures shall have been thoroughly cleaned with materials and methods recommended by the manufacturers, all broken parts shall have been replaced, and all lamps shall be operative.

3.5 INSTALLATION CHECKOUT:

A. Upon completion of initial installation and fixture cleaning, the Contractor shall notify the Architect that the installation has been completed. At this time, the Contractor shall verify that the installation has been done in full accordance with the design and specification and is in full and complete working order.

3.6 WARRANTY:

A. The Contractor shall warrant the fixture, its finishes, and all of its component parts, except ballasts, to be free from defects for a period of one year from date of acceptance if operated within rated voltage range. Replacement of faulty materials and the cost of labor required to make the replacement shall be the responsibility of the Contractor.

END OF SECTION 265000

SECTION 26 51 00

LIGHTING FIXTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including general and supplementary conditions and Division-1 Specification sections, apply to work of this section.

B. Division-26 Basic Electrical Materials and Methods sections apply to work specified in this section.

C. Refer to Drawings for light fixture cutsheets.

1.2 SUMMARY

A. Extent, location, and details of lighting fixture work are indicated on drawings and in schedules.

B. Types of lighting fixtures in this section include the following:

1. Light Emitting Diode, LED
2. Other lamps as noted on fixture schedule.

C. Fixture: A complete lighting unit, including lamps, wiring, controls and parts required to securely support fixture.

D. Exact ceiling construction shall be verified prior to ordering. Minor changes in ceiling construction shall not be an extra cost to the project.

1. All materials, accessories, and any other equipment necessary for the complete and proper installation of all lighting fixtures included in this Contract shall be furnished by the Contractor.
2. Fixtures shall be manufactured in strict conformance with the Contract Drawings and Specifications.
3. Specifications and scale drawings are intended to convey the salient features, function and character of the fixtures only, and do not undertake to illustrate or set forth every item or detail necessary of the work.
4. Minor details, not usually indicated on the drawings nor specified, but that are necessary for the proper execution and completion of the fixtures, shall be included, the same as if they were herein specified or indicated on the drawings.
5. The Owner shall not be held responsible for the omission or absence of any detail, construction feature, etc., which may be required in the production of the fixtures. The responsibility of accurately fabricating the fixtures to the fulfillment of this specification rests with the Contractor.

E. Where a catalog number and a narrative or pictorial description is provided, the written description shall take precedence and prevail.

F. General Contractor shall provide electrical subcontractor with entire lighting specification (including fixture illustrations and sketches); electrical subcontractor shall provide each specified manufacturer with complete information about the fixtures they will supply.

G. The contractor shall include the installation of an additional (20) exit signs with back boxes and conduit (with batteries if no generator) circuited and operational, in the base price for future request for exit signs by the Fire Department or Building Official. Place in field as directed.

H. Fixture details shown may be modified by the manufacturer provided all of the following conditions have been met:

1. Fixture performance is equal or improved.
2. Structural, mechanical, electrical, safety, and maintenance characteristics are equal or improved.
3. Cost to the Owner is reduced or equal.
4. Modifications have been reviewed by the Architect and have been approved by the Architect in writing.

1.3 SUBMITTALS

Submit shop drawings, samples, and prototypes as specifically instructed below.

A. Shop drawings shall include but not be limited to:

1. For standard catalog items with no modifications, submit catalog cut sheets prepared by the manufacturer which clearly show all elements to be supplied and all corresponding product data (including lamping; ballast manufacturer and model number; voltage; accessories or options and any miscellaneous items detailed in the written description of the specification). If cut sheet shows more than one (1) fixture type, all non-applicable information shall be crossed out.
2. For lamps, submit catalog cut sheets prepared by the manufacturer which clearly shows, manufacturer, CRI, CT, wattage, base type, lumen output, lamp life, and any other pertinent information.
3. For custom fixtures, modified fixtures or linear fluorescent fixtures mounted in continuous rows, submit a reproducible drawing prepared by the manufacturer showing all details of construction, lengths of runs, lamp layout, pendant locations, power locations, finishes and list of materials. Drawings must be to scale. Contractor shall provide manufacturer with field dimensions where required.
4. For all submittals under paragraphs 1 through 3 above, manufacturer shall provide submittals within two weeks of receipt of order. All submittals shall have project name and fixture type clearly shown.
5. The Architect/Engineer shall make the final determination as to whether or not the submittal contains sufficient information and reserves the right to request a shop drawing if the fixture cut is insufficient.
6. Maintenance Data: Submit maintenance data and parts list for each lighting fixture, accessory and also include “trouble-shooting” maintenance guide. In addition to the product data and shop drawings, a maintenance manual in accordance with general requirements of Division 1 shall be provided.

B. Samples:

1. It shall be the responsibility of the Contractor to provide a sample(s) fixture as indicated in LIGHTING FIXTURE SCHEDULES or as stated herein. When samples are called for the manufacturer shall provide two working samples, unless otherwise noted, complete with lamp, ballast (rated for 120 volt operation) and 6’ pig-tail 3-prong Edison plug.
2. The sample(s) shall be shipped to a location that is determined by the Architect. Shipping and return shipping costs shall be provided as part of the contract.
3. The purpose of the sample is to review manufacturing techniques, detailing, lamping and scale. Sample fixtures must be approved prior to fabrication of fixtures for the project. Minor modifications, if any, shall be considered part of these Specifications and shall be accomplished with no additional cost to the Owner.
4. Sample fixtures may not be used on the project.
5. In the event the submissions are disapproved, the fixtures will be returned to the contractor to immediately make a new submission of fixture or fixtures meeting the contract requirements.
6. All costs associated for samples are to be paid by the Contractor. No additional costs to the Owner for samples or mockups will be allowed.

C. Shop drawings and samples requested shall be submitted for approval before fabrication. Any material produced prior to the approval of shop drawings or samples, and not in conformance with the Contract Documents, shall be disapproved with the Contractor bearing full responsibility and cost.

D. No variation from the general arrangement and details indicated on the drawings shall be made on the shop drawings unless required to suit the actual conditions on the premises, and then only with the written acceptance of the Architect. All variations must be clearly marked as such on the drawings submitted for approval.

E. Mock-ups:

1. It shall be the responsibility of the Contractor to provide a mock-up of the lighting fixture or lighting systems as indicated in the fixture descriptions. The mock-up shall be erected within a time period and in a location that is acceptable to the Architect. A minimum of five (5) mock ups are anticipated.
2. The mock-up installation shall closely conform to the conditions of the actual installation as to: height, distance from ceiling, number and type of lamps, material, color and etc. The Contractor shall submit a written description of each proposed mock-up with drawings in order to obtain the Architect's approval prior to commencement of each mock-up.
3. The purpose of the mock-up will be to study the general appearance and performance of the intended lighting systems. At that time, certain minimal test variations may be requested as to lamp location, lamp type, reflector shape, color and etc. Final modifications, if any, shall be considered a part of these Specifications and shall be accomplished with no additional cost to the Owner.

F. Substitutions: Manufacturers or light fixtures not listed on fixture schedule must be prequalified prior to bid. For approval of all manufacturer/fixture substitutions, the bidders shall comply to specifications herein and as outlined below for submitting alternate fixtures:

1. No substitutions shall be accepted when the LIGHT FIXTURE SCHEDULE includes a three name manufacturer specification.
2. Should only one manufacturer be listed, with no "Approved alternate" statement, no substitutions are allowed. It is accompanied by a dollar allowance to allow for budgeting by other providers.
3. Light fixture bids must be priced separately and shall not be bundled with any other material or product bids, including but not limited to lighting control devices and lighting control systems.
4. Manufacturer shall have not less than five years experience in design and manufacture of lighting fixtures of the type and quality shown. Prequalification submissions must include a list of completed projects and data catalogue pages and drawings indicating length of experience.
5. Bidders wishing to obtain approval on brands other than those specified by name and catalog number or as an approved alternate in LIGHTING FIXTURE SCHEDULE shall submit their requests not later than fifteen (15) business days before the bid opening. Approval will be in the form of an addendum to the specifications issued to all prospective bidders indicating that the additional brand or brands are approved, as equal to those specified as far as the requirements of the project are concerned.
6. If the bidders do not elect to obtain prior approval during the time so specified above, the Owner/Architect/Engineer or Lighting Designer has no obligation to review or consider any such article after the contract award.
7. Contractor shall pay professional fees at current standard hourly rates and reimburse expenses directly to all designers (Architect, Engineer and Lighting Designer) for time spent reviewing substitutions proposed by the Contractor after the bid has been awarded. If payment by the Contractor is not made within 60 days of invoice date, the Owner shall deduct the amount due from subsequent payments to the Contractor in order to reimburse designers.
8. Request for approval shall be accompanied by working fixture samples (with an appropriate lamp, complete photometric, mechanical and electrical data, list of materials and finishes and unit cost to the Owner) of both the specified brand and the proposed substitutes as required to make complete comparison and evaluation. These samples shall be in addition to those required by Lighting Fixture Specification. The above data shall be delivered separately to the Architect and the Engineer. The fixture samples shall be furnished and installed at the bidder's expense, at a location selected by the Architect. In addition, the bidder shall furnish the Architect and the Engineer with the name and location of at least one completed project where each proposed substitute has been in operation for a period of at least six (6) months, as well as the names and addresses of the Owner, the Architect and the Engineer.

9. Point by point lighting calculations of areas affected by proposed substitution will be done by the bidder for review.
10. The Architect and Engineer shall determine whether the prototype sample complies with the specifications and shall reserve the right to disqualify any bidders.
11. When required and requested by the Architect, or Engineer, samples submitted as per above shall be subjected to photometric, thermal, mechanical, electrical or water testing at an independent test laboratory at no expense to the Owner.

1.4 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of lighting fixtures of sizes, types and ratings required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Installer's Qualifications: Firms with at least 5 years of successful installation experience on projects with lighting fixture work similar to that required for this project.

C. Codes and Standards:

1. Electrical Code Compliance: Comply with applicable local code requirements of the authority having jurisdiction and NEC Articles 220, 225, 250, 410, and 500 as applicable to installation and construction of building lighting fixtures.
2. NEMA Compliance: Comply with applicable requirements of NEMA Stds Pub/No's LE 1 and LE 2 pertaining to lighting equipment.
3. IES Compliance: Comply with IES RP-1 pertaining to office lighting practices and RP-15, regarding selection of illuminance values for interior office lighting. Comply with IES RP-8, 19, 20, and PB-15 pertaining to exterior, parking, and roadway lighting practices and fixtures.
4. UL Compliance: Comply with UL standards, including UL 486A and 486B, pertaining to lighting fixtures. Provide lighting fixtures and components which are UL-listed and labeled.
5. CBM Labels: Provide fluorescent lamp ballasts which comply with Certified Ballast Manufacturer's Association standards and carry the CBM label.

D. Special Listing and Labeling: Provide fixture for damp locations, wet locations, recessed in rated ceilings and walls, hazardous that are UL listed and labeled for specific use. Fixtures mounted with air plenum spaces shall be rated for such conditions.

E. Materials and Equipment:

1. Materials, equipment, and appurtenances as well as workmanship provided under this Section shall conform to the highest commercial standards, and as specified and as indicated on drawings. Fixture parts and components not specifically identified or indicated shall be made of materials most appropriate to their use or function and as such resistant to corrosion and thermal and mechanical stresses encountered in the normal application and function of the fixtures.
2. All fixtures shall be manufactured to a consistent level of quality. Size, color, and component parts shall be identical for all fixtures of the same type.
3. Provide lighting fixtures whose performance under specified conditions is certified by the manufacturer.
4. Provide lighting fixtures, ballasts, and lamps produced by a manufacturer listed as an Approved Manufacturer in this section, or noted on the drawings.

1.5 DELIVERY, STORAGE, HANDLING, AND WARRANTY

A. Deliver lighting fixtures in factory-fabricated containers or wrappings, which properly protect fixtures from damage.

B. Store lighting fixtures in original packaging. Store inside well-ventilated area protected from weather, moisture, soiling, extreme temperature, humidity, laid flat and blocking off ground.

C. Handle lighting fixtures carefully to prevent damage, breaking, and scoring of finishes. Do not install damaged units or components; replace with new.

D. Provide a 5-year warranty of failure in materials, workmanship, ballast, etc., in addition to and not limited to other rights the Owner may have under the contract documents. A full warranty shall apply for the first year, and a prorated warranty for the last four years.

1.6 SEQUENCING AND SCHEDULING

A. Coordinate with other work including wires/cables, electrical boxes and fittings, and raceways to properly interface installation of lighting fixtures with ceiling requirements.

B. Sequence lighting installation with other work to minimize possibility of damage and soiling during remainder of construction.

PART 2 - PRODUCTS

2.1 GENERAL

A. Unless otherwise specified or indicated on the Drawings, all incandescent fixture spinnings and stampings shall be (22) U.S. gauge. All spinnings and stampings shall be perfect and of even bore and gauge, shall be free from dents, scabs, fold or other defects. Incandescent lamp sockets shall have porcelain housings over copper screw base shells, with medium base sockets rated 660 watts at 250 volts. Wiring channels shall be in accordance with the National Electrical Code. All parts of the fixtures shall be accurately and firmly fitted in an approved manner. Where screws are necessary for adjustment, they shall be concealed as far as possible and finished to match the fixtures.

B. Set screws shall be heavy and of exact bore to fit the stems. Canopy and other set screws shall be large with a bearing of not less than four (4) full threads. All screws in all parts of fixtures shall be brass and of ample and approved size and strength for the purpose intended.

C. All glassware called for on the Drawings shall be furnished and put in place under this Division. Contractor shall be solely responsible for all glassware furnished by him, until the work has been accepted, and he shall leave the work with all glassware in perfect condition and thoroughly clean. Glassware shall be Opal, Carrara, Alba, Corning, Holophane.

2.2 MANUFACTURERS

A. The Contractor shall base bid for lighting fixtures on the manufacturers listed on the fixture schedule only.

B. Alternate manufacturer’s identification by means of manufacturer’s names is to establish basic features and performance standards. Alternate manufacturer’s or substitutions must meet or exceed the standards of the primary manufacturer listed.

C. Qualifications: The contractor is allowed 60 days after the contract has been awarded to submit independent photometric tests and samples for all alternate fixtures. If these fixtures fail to comply with the specification requirements at that time, the Contractor will furnish acceptable fixtures at no additional cost to the Owner and with

no delay to the project.

D. Any submittals for cost reduction alternates or value engineering shall include unit prices for the specified manufacturer, the specified equal manufacturer, and the proposed alternates. Refer to Part 1.3 for approval process.

2.3 CUSTOM FIXTURES MATERIAL, FABRICATION AND FINISHES (IF REQUIRED)

A. Provide materials as specified with the following characteristics:

1. Stainless Steel:
   a. AISI Type 302 or UNS Type S30200 18-8 grade: 18 percent chromium and 8 percent nickel. Austentic grain structure with excellent corrosion resisters and high strength.
   b. AISI Type 316: Most resistant to salt spray and industrial fumes for use in these applications.
   c. AISI Type 430: Most economical Ferritic Chromium Steel, very good corrosion resistance, for use only where specified.
2. Galvanized Steel: Coated steel with zinc by a method of hot dipping on electroplating.
3. Aluminum: A pure metal. Aluminum and aluminum alloys meeting the national standard ANSI H35.1-1982.
4. Bronze: Copper alloy, principal alloying elements are phosphor, aluminum, silicon, and tin.
5. Brass: Copper alloy, principal alloying element is zinc. Wrought brass is of UNS designation C20000, C30000, C40000, C66400 to C69800. Cast brass includes leaded red brass (C83600), leaded semi-red brass (C84400), and yellow and leaded yellow brass (C85200 to C85700).
6. Copper: A pure metal. Copper or high copper alloy containing less than 6 percent alloying elements. Wrought copper has UNS designation C10000. Cast copper has UNS designation C80100 to C82800.
7. Zinc: A pure metal. May be specified as an alloying element in copper and aluminum.
8. Glass: All glass shall be heat strengthened (tempered) clear float glass should conform to the requirements of Federal Specification DD-G-1403B, transmittance not less than 88 percent or laminated safety glass. For exterior fixtures, use Borosilicate glass, tempered, Corning #7740. For fixtures directly exposed to the elements and aimed above horizontal with radiant energy of 4.16 watts per square inch or greater, use Vycor glass.
9. Acrylic: 100 percent virgin acrylic polymer, colorless.
10. Neoprene: All neoprene rubber should be heat resistant to withstand heat generated by lamp operation.
11. Silicone: A plastic based on silicon which is not an organic compound. Suitable for use in a wide temperature range (-80 to +500ºF). Used as an additive to plastic to improve adhesion, increase strength, and improve water resistance.

B. Provide thickness of metal required or as specified so that all fixture are rigid, stable and will resist deflection, twisting, warping or bending under normal installation procedures, loading, relamping, etc.:

1. All steel luminaire housings minimum (22) gauge cold rolled steel.
2. All aluminum extrusion housings minimum 0.125” thick.
3. All spun, hydroformed, or sheet aluminum reflectors fabricated from #12 aluminum sheets, minimum 15 gauge, 0.57” or heavier.
4. All cast aluminum or bronze housings minimum of 0.375” thick.
5. All sheet bronze, steel, aluminum or other metal plate minimum of (22) gauge.
6. Flexible leads shall enter all fixtures at sides only, unless otherwise noted. Ballast compartments shall be well ventilated and ballast shall be firmly secured to conducting metal surface. Ballast screws shall be welded securely to fixture body.

C. Fasteners shall be manufactured of non-magnetic stainless steel, except in indoor applications where galvanized steel is acceptable in non-visible locations. Provide tamperproof screws in all fixtures mounted below 8’ above finished floor.

D. Refer to other parts of this section for additional material and fabrication requirements.

E. Fixture finishes shall be applied in a manner that will assure a durable, wear resistant surface.

1. Prior to finishing, all surfaces shall be free from foreign materials such as dirt, rust, oil, polishing compounds and mold release agents.
2. Where necessary, surfaces shall be hot cleaned by accepted chemical means and shall receive corrosion inhibiting (phosphating) treatment assuring positive paint adhesion.
3. Exposed metal surfaces used in interior areas, except chromium plated parts, shall be given an even coat of high grade methacrylate lacquer, or transparent epoxy with a satin finish.
4. All castings, extrusions, and spinnings shall be machined, sanded or similarly treated, and given minimum one coat of baked-on clear methacrylate lacquer, unless a painted finish is specified, to provide a consistent texture, color, and finish throughout all exposed surfaces.
5. Exterior metal surfaces such as extruded parts or castings which do not otherwise receive a finishing coating, shall be machined, sanded or similarly treated. All such finished components shall be given a minimum of one coat of baked-on clear methacrylate lacquer, satin finish, unless an alternate finish is specified.
6. Aluminum surfaces exposed to the weather shall receive a duronodic or polyester powder paint or clear methacrylate lacquer finish as specified for corrosion resistance. When in contact with concrete, aluminum shall be coated with bituminous paint, zinc chromate primer, or separated by a layer of plastic or other gasketing material. Creosote and tar coatings should not be used because of their acid contents.
7. For weatherproof and vaportight fixtures, painted finishes and accessories shall be weatherproof enamel using proper primers or galvanized and bonderized epoxy in accordance with the manufacturer's requirements. Unless otherwise specified, all painted surfaces shall have an outdoor life expectancy of not less than 20 years.
8. Sheet steel fixture housings, iron and steel parts, which have not received phosphating treatment ("Bonderizing" or similar process) or are to be utilized in exterior applications shall be made corrosion resistant by zinc or cadmium plating, or hot-dip zinc galvanizing after completion of all forming, welding, or drilling operations. Where aluminum parts come in contact with steel (or other metals), the steel shall be zinc plated or cadmium plated. Minimum thickness of above protective coatings shall be:
   a. Hot galvanized zinc coating - 0.0005".
   b. Cadmium plating - 0.00015".
9. Parts operated under temperatures injurious to hot-dipped galvanizing shall be electroplated.
10. Where aluminum parts come in contact with bronze parts, apply to both surfaces a coating of Corogard No. 1706 as manufactured by Minnesota Mining & Manufacturing Company.

F. Completely form painted reflectors before application of primer and enamel color coats. Reflectors and reflector bodies for fluorescent lamp fixtures having baked-on white enamel finish, shall be made of steel of the thickness specified and given a suitable primer and white color coats properly applied to meet all applicable requirements and tests.

G. When requested by the Architect and Engineer, the Contractor shall submit a sufficient quantity of flat metal panels having the identical primer and color coats applied in the same manner as proposed for the Contract items, for subjection to any one or all of the tests listed herein by an approved independent testing laboratory. Provide panels of suitable size and drilled as necessary for a particular test procedure. The Contractor shall bear the cost of all required tests.

H. Wire leads to the receptacle or connector of any side-prong incandescent lamp or any "cool-beam" lamp utilizing a dichroic reflector shall be SF-2 (silicone rubber insulated) stranded wire (minimum No. of 18 AWG). Wire within housing shall be entirely covered with a flexible woven fiberglass sleeve.

I. All reflectors shall be finished according to the minimum requirements outlined below.

CLASS	MIN. WEIGHT OF COATING (mg/sq.in.)	SERVICE	% MINIMUM REFLECTIVITY	
MI	0.5	Normal interior service.	83	75
SI	7.5	Medium service, interior industrial, exterior when operated within glass.	82	73
SE	10.0	Exterior industrial or commercial service, exposed to atmosphere. Marine service enclosure.	78	65

J. All reflector and baffles of modified elliptical contour cross section shall have with no apparent brightness from above 40º above the nadir, and with no lamp image or any part of the lamp visible from above 40º above the nadir.

K. Cone flange shall be formed as an integral part of the cone and with an identical color and finish. Width of the flange covers all ceiling openings without light leaks or hardware visible.

L. Samples of colored aluminum finishes (black, brass, bronze, etc.) shall be submitted for approval before fabrication.

M. All glass lenses shall be heat treated (tempered) or sealed with a clear acrylic laminate layer to provide a “safety glass” rating. All lenses which require removal for relamping or normal maintenance shall be attached to the fixture housing by a minimal length of safety chain to prohibit the lens from falling and striking surrounding surfaces. Glass edges exposed during the relamping process gasketed to prevent chipping or cracking. Glass lenses shall be a minimum 0.375” thick.

N. Glass lenses specified as translucent or “opal” shall be treated as follows:

1. Sand blasted.
2. Acid etched.
3. White flashed.

O. Actual location of fixtures shall be as shown on the architectural reflected ceiling plans, or as directed by the Architect. Spaces for fixture insertion will be provided under the Division that installs the ceiling. Plaster and other frames shall be turned over to the Division for General Construction for setting and installation, under another Division of these Specifications. Contractor shall be responsible for obtaining fixtures designed to fit properly into these ceilings. The Contractor's attention is directed to the requirements of the acoustical ceiling, particularly to the need for close coordination between the ceiling construction details and lighting fixture design. The electrical contractor is responsible for coordinating mounted hardware to match ceiling type.

P. All methods of construction and details of workmanship, where not specifically described or shown on the Drawings, shall be satisfactory to the Architect and shall be subject to his approval. All joints between fixture wiring shall be made with Buchanan #2008S or equivalent solderless connectors by Thomas and Betts.

Q. All lighting fixtures on emergency generators or battery circuits shall be provided with a red dot or approved marker. Fixtures with internal batteries shall be provided with test switch and pilot light.

2.4 MATERIALS AND FABRICATION

A. Provide thickness of metal required or as specified so that all fixture are rigid, stable and will resist deflection, twisting, warping or bending under normal installation procedures, loading, relamping, etc.

B. Provide neoprene or silicone gasketing, stops, and barriers where required to prevent light leak or water and water vapor (penetration).

C. Provide finished product with ground metal edges, tight fitting connections, hinges and closures; clean, neat edges, trims, and frames; continuous welds, ground smooth with sharp corners; all exposed screws countersunk flush.

D. Provide positive, durable means of connection at all joints as required.

E. All cast parts, including die-cast members, shall be of uniform quality, free from blow holes, pores, hard spots, shrinkage defects, cracks or other imperfections that affect strength and appearance or are indicative of inferior metals or alloys.

F. Provide sufficient ventilation for lamps, ballasts and transformers including vent holes where required. Outdoor fixtures shall have corrosion resistant wire mesh screens in the vent holes.

G. All adjustable fixtures shall be provided with reliable locking device to secure aiming angles of the fixture housing or lamp yoke as well as lamp and lens orientation devices to secure oval beam pattern lamps and/or spread lenses.

2.5 FINISHES

A. Fixture finishes shall be applied in a manner that will assure a durable, wear resistant surface.

1. Prior to finishing, all surfaces shall be free from foreign materials such as dirt, rust, oil, polishing compounds and mold release agents.
2. Where necessary, surfaces shall be hot cleaned by accepted chemical means and shall receive corrosion inhibiting (phosphating) treatment assuring positive paint adhesion.
3. Provide all ferrous metal surfaces with a protective finish having rest-inhibiting properties. Painted finishes shall be a minimum of 1.5 mils thick and shall have a balance between hardness and bending properties suitable for application. White finishes shall have 87 percent minimum reflectance. Application and cleaning shall be performed so as to prevent any loss of reflectance capability.
4. Finish shall be porcelain or baked enamel, matte white on interiors with minimum tested reflectance of 86%. Manufacturer's standard finish or as specified on plans, on visible exteriors. Base metal shall be thoroughly cleaned and given bonderizing or other approved highly adhesive prime coating. All reflectors shall be of 20 gauge sheet steel with polymerized baked white coating with a reflectance ranging form 85% to 88%.

2.6 WIRING

A. All wiring shall comply with the following:

1. All wiring devices within lighting fixtures or from the fixture to the splice with the project branch circuit wiring shall be as specified below.
2. Wiring between fluorescent lampholders and associated operating and starting equipment shall be of similar or heavier gauge than the leads furnished with the approved types of ballasts with equal or better insulating and heat resisting characteristics.
3. Wiring shall be protected with tape or tubing at all points where abrasion may occur.
4. Wiring shall be concealed within the fixture construction except where design or mounting dictates otherwise.
5. Connections of wires to terminals of lampholders and other accessories shall be made in a neat and workmanlike manner and electrically and mechanically secure with no protruding or loose strands. The number of wires extending to or from the terminals of a lampholder or other accessory shall not exceed the number which the accessory is designed to accommodate.
6. Individual fixture wiring shall be not less than #16 gauge and shall be limited to insulations with rated maximum operating temperature of 150°C or higher.
7. Where branch circuit wiring calls for two-level lighting, three-and- four-lamp fixtures shall be circuited in a manner so that outer lamps can be switched separately from inner lamp(s), unless otherwise indicated on Drawings.

8. Joints in wiring within lighting fixtures and connections of the fixture wiring to the wiring of the building shall be specified in Division 26.
9. Wiring channels and wireways shall be free from projections and rough or sharp edges throughout, and all points or edges over which conductors must pass and may be subject to injury or wear shall be rounded and bushed.
10. Insulated bushings shall be installed at points of entrance and exit of flexible wiring.
11. Junction boxes attached to lighting fixtures shall be manufactured in accordance with the National Electrical Code and approved for the number of conductors indicated on the drawings. Supplementary junction boxes shall be installed where required to comply with Code.
12. When exposed, all junction boxes and conduit to be painted as per the Architects' direction at no additional cost to the Owner.
13. Cord types shall be suitable for application and be fitted with proper strain relief and watertight entries where required by application.
14. Furnish code approved wiring in ceiling cavities forming air plenums.

2.7 MARKING OF FIXTURES

A. Fixtures designed for voltages other than 110-125 volts shall be marked with operating voltage.

B. Fixtures equipped for operation of rapid start lamps shall be clearly marked "USE RAPID START LAMPS ONLY."

C. Fixtures designed for operation of lamps below the rated enclosure maximum shall be clearly marked "Lamp Watts Not to Exceed _____" to maintain the design energy load.

D. Where catalog numbers are listed, they shall be considered only as a guide. Contractor is cautioned to take care that where fixtures are ordered by catalog numbers these fixtures must incorporate all the general and particular requirements mentioned in the specification, even though it may be necessary to modify the manufacturer's standard fixture corresponding to the designated type or catalog number.

2.8 SOUND TRANSMISSION

Sound transmission through the light fixture units, when spaced as indicated on drawings, shall be sufficiently attenuated to maintain speech privacy between adjoining spaces. Contractor to provide insulating battens around the fixtures where voice and sound transmission levels are unacceptable.

2.9 THERMAL PROTECTORS

A. Provide thermal protectors as required by the N.E.C., or as required by local Code, to prevent operation of lighting fixtures in enclosed spaces or adjacent to combustible materials at temperatures at or above 90ºC (194ºF).

B. Fixtures approved for operation in fire-resistant material at temperatures up to 150ºC (302ºF) shall be plainly marked.

C. All incandescent fixtures shall be provided with thermal protectors except where otherwise indicated or where approved for operation without such protectors by the N.E.C. and by the local building authority.

2.10 LAMPS

A. Provide lamps as shown in the fixture schedule or as modified in reviewed shop drawings.

B. Lamps as specified for the individual luminaries or lighting equipment shall be delivered and installed in fixtures and lighting equipment leaving these completely lamped and in normal operating condition.

C. Hot cathode fluorescent lamps, unless otherwise designated, shall be of the rapid start type and deliver not less than 2,900 initial lumens for straight lamps. Fluorescent lamps are triphosphor, color temperature 3500˚K, with a color rendering index of not less than 85, unless noted otherwise. Refer to light fixture schedule for details.

D. Provide all incandescent lamps inside frosted, unless noted otherwise. Refer to light fixture schedule for details.

E. High intensity discharge lamps, unless noted otherwise, shall be color corrected, phosphor coated, mogul base metal halide lamps. The mogul base color rendering index (CRI) shall not be less than 80 and a color shift not exceeding ± 400ºK, unless otherwise specified. All medium base metal halide lamps to have a CRI of not less than 80 and color shift not exceeding ± 200ºK. Refer to light fixture schedule for details.

F. LED lamp sources shall conform with the IESNA LM-79 and LM-80 published standards. They shall have a color temperature binning that does not exceed +/-200K. LED Lamp life shall be rated at 70% of initial lumens remaining. LED drivers shall be used @ 100% output for lumen output rating and not be underdriven or overdriven.

G. A complete set of new lamps shall be installed in each fixture at the completion of the work. Fluorescent lamps shall be of the energy savings type, cool white or warm white, unless otherwise noted in Schedule, or directed. All fluorescent lamps shall be T-8, 1" dia., SP35, 3500°K unless otherwise noted.

H. Lamps shall be by the same manufacturer and produced by the following acceptable manufacturers:

1. General Electric Lighting
2. Osram Sylvania, Inc.
3. North American Philips Lighting
4. Venture Lighting International, Inc.
5. Others only where specified.

I. LED Lamps

1. All LED light fixtures shall conform with the IESNA LM-79 and LM-80 published standards.
2. Initial delivered lumens – thermal losses should be less than 10% when operated at a steady state at an average ambient operating temperature of 25°C, and optical losses should be less than 15%.
3. Average Delivered Lumens – Average delivered lumens over 50,000 hours should be minimum of 85% of initial delivered lumens.
4. LED boards, drivers and associated components shall have a Warranty of 5 years on the LEDs, 5 years on the driver, 10 years on the paint finish.
5. Driver Specification shall include:
    a. Electronic
        Voltage range of (120-277) +/- 10%
        1) Current .35 Add (+/- 5%)
        2) Frequency 50/60 Hz
        3) Power Factor >90% at full load
        4) THD <20% at full load
        5) Load regulation: +/- 1% from no load to full load
        6) Output ripple <10%
        7) Output should be isolated
        8) Case temperature: rated for -40º through +80 º
        9) Overheat protection, self-limited short circuit protection and overload protected
        10) Primary fused
        11) Life rating not less than 50,000 hours

2.11 LAMPHOLDERS

A. Lamp sockets shall be rigidly attached to fixture enclosure or husk.

B. Incandescent and high intensity discharge lamp sockets shall be made of heavy duty heat-resistant porcelain.

C. Plastic or metal sheet sockets are not to be used.

D. Fluorescent lamp sockets operated with an open circuit voltage in excess of 300 volts shall be of the safety type, and open the supply circuit when the lamp is removed from the sockets.

E. Provide nickel plated brass or nickel and silver plated contacts in all lampholders for tungsten halogen lamps, lamps in outdoor fixtures, and mogul base incandescent, metal halide or mercury vapor lamps.

F. All lamp sockets shall be suitable for the indicated lamps and shall be set so that lamps are positioned in optically correct relation to all lighting fixture components. All adjustable sockets shall be preset at the factory for lamp specified.

2.12 FLUORESCENT AND HIGH INTENSITY DISCHARGE LAMP BALLASTS

A. All fluorescent and high intensity discharge lamp ballasts shall conform to the following:

1. All ballasts for a particular lamp type shall be of the same manufacturer and where possible all ballasts on the projects be of the same manufacturer.
2. All ballasts shall be “Class P” indicating approved integral ballast protection. Fuses in the primary leads shall be provided in addition to the “Class P” ballast.
3. All ballasts shall be of the electronic high power factor type, energy saving, “super low heat” as manufactured by Universal, Motorola or approved equal.
4. All fluorescent ballasts shall be electronic, capable of maintaining a constant light output on all rapid start fluorescent lamps over operating range of 90V to 145V (120V ballast) and 200V to 320V (277 ballast). The total harmonic distortion (THD) of the ballast shall be less than 10 percent of the full light output current level. The ballast shall have a sequenced start progression which first heats cathode filaments and then ignites the lamp. The ballast shall withstand line transients as defined in ANSI/IEEE C62.41, category A; crest factor less than 1.4; power factor greater than 95% and operating frequency of 20KHZ or greater without a visible flicker. The case temperature shall not exceed 25ºC temperature rise over 40ºC ambient. Ballasts shall comply with FCC regulations Part 18, Class A.
5. All HID ballasts to be encapsulated and have maximum crest factor 1.6.
6. All HID ballasts shall meet U.L. standards for “Class H” operations (180ºC).
7. U.L. and ANSI specifications with labels and/or symbols of approval by the U.L. and of certification by the Certified Ballast Manufacturers (C.B.M.) as tested by the E.T.L.
8. The component parts shall be designed, fabricated, and assembled in accordance with the latest requirements of the N.E.C.
9. Ballasts shall provide safe and reliable operation of the specified lamps.
10. Whenever possible, provide two-lamp ballasts for fixtures with two fluorescent lamps or multiples of two lamps.
11. Approved Lamp/Ballast combinations should be used to allow for maximum energy efficiency, unless otherwise specified,
12. Identical ballasts shall be installed within each fixture type.
13. For HID fixtures specified with remote ballasts, the contractor shall verify and coordinate the maximum distance from lamp to ballast allowed.
14. Fixture design, fabrication, and assembly shall be such as to prevent overheating or cycling of lamps and ballasts under normal operating temperature variations.

15. Provide the lowest sound rating available for the lamps specified and clearly show their respective sound ratings. Ballasts found by the Architect or Engineer to be unduly noisy shall be replaced without charge prior to acceptance of the work.
16. Dimming ballasts shall be provided where dimming controls are required per the drawings, notes and schedules. Dimmer type ballasts shall be of a design recognized and approved under the U.L. component program. These ballasts must coordinate with the dimming control devices specified for the particular application. Unless specified in the Lighting Fixture Schedule, all dimming ballasts shall dim to 10%.
17. Ballasts intended for outdoor use shall have a minimum lamp starting temperature of 0ºF, except as noted otherwise.
18. Where ballasts are remote from fixture housing, provide suitable enclosure for installation with the conduit and wire from the ballast to the lamp socket clearly marked “Caution,” “High Voltage.” All remote ballasts to be installed within the recommended distance from the lamp socket as per the manufacturer with access plates for maintenance and on neoprene pads for sound absorption.
19. All ballasts shall be high power factor (over 95%) of the "Watt Reducer" type and shall have ETL-CBM certification. All ballasts shall be sound-rated and shall have manufacturer's lowest sound level rating. Ballasts shall be 120V or 277 volt 60 Hz, depending on the voltage applied in individual branch circuiting. The ordering of fixtures with the appropriate ballast voltage shall remain the Contractor's responsibility.
20. At conclusion of the work, deliver to Owner a written certificate guaranteeing all fluorescent and HID lamp ballasts for a full two years after job acceptance date. Guarantee shall also cover the cost of replacing the defective ballast and installing new ballast, as well as the purchase cost of the ballast.
21. Ballast for T5 HO lamps or smaller shall have end of live sensing circuits.
22. All fixtures controlled by occupancy sensors shall be provided with program start ballasts.
23. Provide internal disconnecting means for ballast maintenance. Disconnecting means shall disconnect all conductors, including grounded conductor.
24. Contractor to coordinate ballast line side voltage with branch circuit voltage as shown on Contract Drawings.
25. Provide multitap ballasts (Mvolt) whenever offered by manufacturer.

B. Ballasts manufactured by the following are acceptable:

1. Motorola/GE
2. Advance
3. Universal
4. Osram Sylvaria
5. Lutron (for dimming ballasts)
6. Approved Equal

C. Contractor to coordinate ballast line side voltage with branch circuit voltage as shown on Contract Drawings.

2.13 TRANSFORMERS (COLD CATHODE, NEON)

A. All transformers shall be sized to accommodate the intended load and utilized to operate lamps in a method approved by Underwriter’s Laboratory and acceptable by code and shall not exceed the following:

1. Neon: 9,000 volts, 30 ma.
2. Cold Cathode: 150 ma.

B. Transformers for non-dimming installations shall be high power factor type, voltage as specified in LIGHTING FIXTURE SCHEDULE. Transformers for dimming installations shall be 120 Volt, 60 hertz, low (normal) power factor type. Fixture manufacturer shall confirm compatibility of transformer with dimming system manufacturer. Secondary voltage shall be as required by lamp footage, cold weather usage and dimming. Transformers shall be UL listed, self-contained steel enclosure equipped with a disconnect switch which shall automatically disconnect the primary when the wiring compartment cover is removed. Transformers shall be installed in accessible and ventilated area (100°F maximum ambient temperature) with air circulation on all sides to dissipate full wattage rating of the transformer. Each transformer shall be installed as close to the lamp as possible in order to keep the secondary

feeds as short and equal in length as possible. Wiring compartments shall be accessible if mounted above ceilings, in partitions, or in any location other than electrical closets.

C. Provide self contained, U.L. listed transformers in 16 gauge steel housing with secondary and primary wiring compartments, mount all transformers securely to the fixture housings (if integral) or to the building structure (if remote) with neoprene pads to isolate vibration and noise.

D. Provide all transformers with secondary overcurrent protection and a primary disconnect switch, which will automatically disconnect the primary switch when the wiring compartment cover is removed.

E. All transformers shall be installed in an accessible and ventilated location with a maximum 100ºF, ambient temperature with air circulation on all sides.

F. All winding type transformers will be high power with a maximum crest factor of 1.6.

G. All regulating transformers shall be tested to have an output regulated to +/-3 percent for input variations of 15 percent to 25 percent, less than 3 percent distortion with a minimum load efficiency of 85 percent, and operating temperature of -20ºC to 70ºC.

2.14 REFLECTORS

A. All reflectors shall be of glass or metal of the type required by the drawings and of the size recommended by the manufacturer for the lamp rating indicated. In all cases, holders shall be made so as to support the reflector in proper relation to the lamp filament

B. Reflectors and reflecting cones or baffles shall be as follows:

1. Absolutely free of any tooling marks including spinning lines, indentations caused by riveting or other assembly techniques.
2. No rivets, springs, or other hardware visible after installation.
3. First quality polished, buffed and anodized finish, “Alzak” or approved equal.
4. Specular finish color as selected by the Architect or as specified in the fixture schedule.

C. Other aluminum reflectors shall be as follows:

1. Formed and finished as noted on the Drawings and elsewhere in the Specification.
2. Reflectors free from blemishes, scratches, or indentations which would distort their reflective function.
3. Finished by means of the “Alzak” process or approved equal unless otherwise noted.

D. Reflector and housing shall comply completely enclose the fixture’s fluorescent lamp in downlights in a plenum ceiling and provide the full rated output of the lamp. Fixtures that vent through the downlight reflector into the plenum are not acceptable.

2.15 LENSES AND DIFFUSERS

A. All lenses secured by positive means with neoprene or silicone gasketing or washers as required to hold the lens tight within a frame or attach to a housing.

B. All glass lenses shall be heat treated (tempered) or sealed with a clear acrylic laminate layer to provide a “safety glass” rating. All lenses which require removal for relamping or normal maintenance shall be attached to the fixture housing by a minimal length of safety chain to prohibit the lens from falling and striking surrounding surfaces.

C. Acrylic lenses shall be 100 percent virgin acrylic polymer and colorless and shall be guaranteed for 15 years against crazing or warping. Lens shall be (.156”) thick.

D. The quality of the raw acrylic material must exceed IES, SPI, and NEMA Specifications by at least 100 percent which, as a minimum standard, shall not exceed yellowness factor of 3 after 2,000 hours of exposure in the Fade-o-meter or as tested by an independent test laboratory. Acrylic plastic lenses and diffusers shall be properly cast, molded or extruded as specified, and shall remain free of any dimensional instability, discoloration, embrittlement, or loss of light transmittance for at least 15 years.

E. All plastic diffusers shall be given an approved destaticizing treatment prior to installation, and instructions shall be left with Owner for similar destaticizing after cleaning. Diffusers must be put up with no finger or dirt-marks. Use white gloves, if necessary.

2.16 LOUVERS

A. All louvers shall be fabricated of the specified material.

B. All fluorescent light fixture louvers shall be parabolic and shall be rated at 90 percent or over on the VCP index.

C. Louver finishes shall be provided as specified.

D. All plastic parabolic louvers shall be destaticized before and after fabrication to insure minimum maintenance.

E. All metal louvers shall be coated with anti-rust material and electrostatically painted.

F. All louvers shall be heat tested to withstand lamp operating temperatures with no deformation of shape, paint blistering or discoloration.

2.17 FIXTURE TRIMS

A. Fixtures shall have finish trim designed for the following types of ceiling systems: Ceiling Type Trim Type

1. Recessed Incandescent, Fluorescent, or Metal Halide Fixtures
    a. Plaster - Overlap Trim.
    b. Concrete - Overlap Trim.
    c. Tile - Overlap Trim.
    d. Gypsum - Overlap Trim.
    e. Metal Pan, Concealed M - Modular, Fit-in Support.
    f. Lay-in - Modular, Tile with Flush Fit-in.

B. Provide trim details as shown on the Drawings or as specified, which are indicative of appearance and dimensional requirements. The trim finish and dimensions subject to the approval of the Architect.

C. Trimless fixtures shall be installed per manufacturer's guidelines and shall be installed and coordinated with other trades as required.

D. Mitered corners shall be continuously welded and smoothed before shop finish is applied. No lapping of trim metal for all flush mounted ceiling trims for rectangular or square recessed fixtures.

E. Provide a mounting frame or ring with lock recessed or semi-recessed light fixture to secure the mounting frame to the ceiling and support any reflectors, trims, or lenses. Ring shall be compatible with the ceiling and of sufficient strength to rigidly support the fixture and any stress applied in relamping.

F. Catalog numbers are included for reference. Provide all accessories and design features described herein regardless of whether such features are included in catalog reference including, mounting hardware, louvers, lenses, filters, transformers, etc.

2.18 LIGHTING FIXTURE TYPES AND CATALOG NUMBERS

A. General: Various fixtures types required are indicated on drawings fixture schedule. Fixtures must comply with minimum requirements as stated herein. Review architectural drawings and specifications to verify ceiling types, modules, suspension systems appropriate to installation.

2.19 SUPPORTS FOR SUSPENDED FIXTURES

A. Provide separate and isolated suspension for all fixtures required by the Local Building Department and seismic requirements. This may include rod hangers, hook hangers, or single stem hangers.

2.20 EMERGENCY LIGHTING UNITS

A. Provide 90-minute battery pack emergency lighting fixtures with two lamp heads for all mechanical equipment rooms, electrical equipment room, generator area, etc. Battery units shall be self-contained, self diagnostic, sealed, maintenance free, lead-acid type with 10-year normal life warranty.

B. Provide in sufficient quantity that light produced by these emergency fixtures shall provide one foot-candle maintained throughout the space have chargers and wire guards.

C. Where battery back-up is required for linear LED or fluorescent sources, provide 1400 lumen output battery packs, for a 4ft. lamp length and equivalent efficiency on shorter lamp lengths and compact fluorescent. Operation shall be for a continuous 90 minutes. Provide battery unit with automatic switching to battery upon loss of power to sensing circuit. Battery unit shall be designed and connected such that the lighting fixtures with these battery units can be switched off while maintaining automatic battery function when sensing circuit looses power.

D. All metal halide fixtures connected to an emergency circuit shall have a quartz restrike and a time delay relay to illuminate the space for emergency purposes. Quartz lamps shall remain on until 50% of metal halide lamp output is achieved. Quartz wattage shall be equivalent to the metal halide lamp.

E. All Exit signs shall be provided with 90 minute battery backup, and come complete with mounting hardware directional chevrons, mirrored backing and graphics. Single face exit signs shall be constructed to they can read from either side.

F. Exit signs shall be edge-lit with faces and directional arrows per plans.

G. All single-face edge-lit exit lights shall have a mirrored backing.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which lighting fixtures are to be installed, and substrate for supporting lighting fixtures. Notify Contractor in writing of conditions detrimental to proper completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to installer.

3.2 INSTALLATION OF LIGHTING FIXTURES

A. Contractor to coordinate exact quantities and critical dimension with field conditions.

B. Contractor to verify and coordinate that appropriate framing, support structures, mounting brackets, and other required structural connections are provided by the General Contractor or other trades to insure a timely, neat installation of all luminaries.

C. Contractor to coordinate and provide any associated mounting hardware, conduit connections, or associated appurtenances to effectively install the luminaries. Provide each light fixture with complete installation instructions. All light fixtures to be installed in strict conformance with manufacturer's recommendations and instructions.

D. Coordinate space conditions with other trades.

E. In Mechanical Equipment Room modify locations and mounting to suit conditions as directed. Electrical contractor must coordinate fixture location with mechanical equipment room layout or wait until mechanical equipment is installed

F. Install lighting fixtures in accordance with fixture manufacturer's written instructions, applicable requirements of NEC, NECA's "Standard of Installation," NEMA standards, and with recognized industry practices to ensure that lighting fixtures fulfill requirements.

G. Exact locations of all lighting fixtures including mounting heights and plan dimensions are as per the Architectural Drawings. Any ambiguities or conflicts in this dimensional information to be identified to the Architect prior to installation.

H. Provide fixtures and/or fixture outlet boxes with hangers to properly support fixture weight. Submit design of hangers, method of fastening, other than specified herein, for review by Architect.

I. Install flush mounted fixtures properly to eliminate light leakage between fixture frame and finished surface.

J. Provide plaster frames for recessed fixtures installed in other than suspended grid type acoustical ceiling systems. Brace frames temporarily to prevent distortion during handling.

K. Fasten fixtures securely to structural supports, and ensure that pendant fixtures are plumb and level. Provide individually mounted pendant fixtures longer than 2 feet with twin stem hangers. Provide stem hanger with ball aligners and provisions for minimum on inch vertical adjustment. Mount continuous rows of fixtures with an additional stem hanger greater than number of fixtures in the row.

L. Tighten connectors and terminals, including screws and bolts, in accordance with equipment manufacturer's published torque tightening values for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals to comply with tightening torques specified on UL Stds. 486A and 486B and the National Electrical Code.

M. Support pendant mounted fixtures greater than an overall 2 feet in length at a point in addition to the outlet box fixtures stud with an appropriate safety cable. Certain decorative pendant fixtures may not require a safety cable, verify with Architect, Engineer or Lighting Designer.

N. Fasten electrical lighting fixtures and brackets securely to indicate structural supports, including poles/standards, and ensure that installed fixtures are plum and level.

O. Rigidly align all continuous rows of fixtures for true in-line appearance.

P. Do not install exposed fixtures, reflectors or trims until all plastering and painting that may mar fixture finish is completed. Replace blemished, dented, damaged or unsatisfactory fixtures as directed.

Q. Support all fixtures independent of ductwork or piping.

R. Install rows of fixtures in straight lines, except as noted. Install fixtures so that fixture doors open from same side.

S. Pendant mount fixtures where indicated nd provide all mounting hardware.

T. Mount fixtures in accordance with manufacturer's installation details and applicable codes. Provide all required accessories.

U. Install reflector cones, baffles, aperture plates, and decorative elements after completion of ceiling tiles, painting and general clean-up.

3.3 FIELD QUALITY CONTROL

A. Replace defective and burned out lamps for 3 months following the Date of Substantial Completion.

B. At Date of Substantial Completion, replace lamps in lighting fixtures which have been operational over 400 hours and have a lamp life of less than 4,000 hours.

1. Refer to Division-1 sections for the replacement/restoration of lamps in lighting fixtures, where used for temporary lighting prior to Date of Substantial Completion.

C. Furnish stock or replacement lamps amounting to 5%, but not less than 4 lamps in each case, of each type and size lamp used in each type fixture. Deliver replacement stock as directed to Owner’s storage space.

D. Upon completion of installation of lighting fixtures, and after building circuitry has been energized, apply electrical energy to demonstrate capability and compliance with requirements. When possible, correct malfunctioning units at the site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed with retesting.

E. Certify that the equipment has been properly installed, adjusted, and tested.

F. For sloped ceilings:

1. Provide sloped ceiling adapters for all fixtures in sloped ceilings.

2. Contractor shall coordinate with architectural details for degrees of slopes, mounting details, etc.

3.4 AIMING AND ADJUSTMENT

A. All adjustable lighting units shall be aimed, focused, locked, etc., by the Contractor under observation of the Architect and Engineer. All aiming and adjusting shall be carried out after the entire installation is complete. All ladders, scaffolds, etc., required shall be furnished by the Contractor. As aiming and adjusting is completed, locking setscrews and bolts and nuts shall be tightened securely. The aiming and adjustment of luminaires must take place after the projects amenities have been completely installed. These amenities shall include but are not limited to plantings, furniture, artwork, graphics and signage.

B. Where possible, units shall be focused during the normal working day. However, where daylight interferes with seeing, aiming shall be accomplished at night.

C. Provide positive locking devices to preclude mis-focus during relamping.

3.5 CLEANUP

A. Clean lighting fixtures of dirt and construction debris upon completion of installation. Clean fingerprints and smudges from lenses. Two weeks prior to substantial completion, re-clean all fixtures for dust, fingerprints, smudges from all visible parts of the fixture.

B. Protect installed fixtures from damage during remainder of construction period.

C. At the time of final acceptance by the Owner, all lighting fixtures shall have been thoroughly cleaned with materials and methods recommended by the manufacturers, all broken parts shall have been replaced, and al lamps shall be operative.

3.6 GROUNDING

A. Provide equipment grounding connections for lighting fixtures as indicated by branch circuitry. Tighten connections to comply with tightening torques specified in UL Std 486A to assure permanent and effective grounds.

3.7 DEMONSTRATION

A. Upon completion of installation of lighting fixtures, and after building circuitry has been energized, apply electrical energy to demonstrate capability and compliance with requirements. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed with retesting.

END OF SECTION

SECTION 26 51 01

OCCUPANT SENSORS AND INSTALLATION COMPONENTS

PART 1 - GENERAL

1.1 GENERAL REQUIREMENTS

A. This Section is coordinated with and complementary to the General Conditions and Supplementary General Conditions of the Work, wherever applicable to Mechanical Work.

B. Section 23 05 01 - Mechanical and Electrical Coordination shall apply.

1.2 DESCRIPTION OF WORK

A. The work includes the providing of all labor, materials, equipment, accessories, services and tests necessary to complete and made ready for operation by the Owner, all vacancy sensors in accordance with drawings and specifications.

1.3 QUALITY ASSURANCE

A. "Manufacturers" - Firms regularly engaged in manufacture of vacancy sensors and installation components, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Provide vacancy sensors and installation components produced by a manufacturer listed as an Approved Manufacturer in this Section.

C. Provide equipment whose performance under specified conditions is certified by the manufacturer.

D. All equipment shall be U.L. listed.

1.4 SUBMITTALS

A. Refer to Section 23 05 01 - Mechanical and Electrical Coordination shall apply and submit shop drawings. Shop drawings shall include vacancy sensors, control units, relays, etc.

1.5 GUARANTEE

A. Refer to Section 23 05 01 - Mechanical and Electrical Coordination.

PART 2 - PRODUCTS

2.1 MATERIAL

A. Ceiling and Wall Dual Technology Sensors

1. Sensors shall be ceiling or wall mounted as indicated on plans.
2. Sensor shall have a microprocessor and utilize adaptive technology to optimize the sensor behavior to fit occupant usage patterns and adjust sensitivity and time delay to changing conditions.
3. Sensor shall not require any manual adjustment at the time of installation or during operation.
4. Sensor shall adapt automatically to changing room conditions.

5. Sensor shall utilize either passive infrared and ultrasonic technology to detect motion. Sensor shall not react to noise or ambient sound.
6. The sensor shall be capable of detecting presence in the control area by detecting doppler shifts in transmitted ultrasound and passive infrared heat changes.
7. Sensor's microprocessor shall monitor PIR background levels and automatically make corresponding adjustments.
8. Sensor shall incorporate a dual element pyrometer and 12-element cylindrical Fresnel lens.
9. Sensor shall be provided with a variety of masking inserts for PIR rejection to prevent false tripping.
10. Sensor's microprocessor shall monitor ultrasonic frequency changes and automatically make corresponding adjustments.
11. Sensor's microprocessor shall automatically adapt to a continuous airflow situation.
12. Sensors shall feature a walk-through mode, where lights turn off 3 minutes after the area is initially occupied if no motion is detected after the first 30 seconds.
13. Sensor shall have an ultrasonic frequency of 32kHz or 40kHz.
14. Sensor coverage shall range from 0 to 2000 sq. ft. depending on model.
15. Sensor shall be available with either a 110 degree, 180 degree, or 360 degree field of view, as specified on drawing.
16. Sensor shall recognize, as a false on, the failure to detect motion 6 seconds after motion is detected initially (turning on the lighting). The sensor shall decrease the sensitivity in response to the false on.
17. Sensor shall feature an 8-second time out install test mode, which will automatically revert to standard time out one hour after being put into test mode.
18. Sensor shall have manual controls and override switches to force manual adjustments.
19. Sensor shall have controls behind a cover to resist tampering. All controls shall be accessible from the front of the sensor.
20. Sensor shall have timer that can be adjusted manually from 8 to 30 minutes.
21. Sensor sensitivity shall be adjustable from 0% to 100%
22. Sensor shall have a control knob that sets the minimum setting for the timer in automatic mode.
23. Sensor shall have control knobs for setting the initial automatic sensitivity adjustments.
24. Sensor shall have a switch to restore factory settings.
25. Sensor shall have real time motion indicator LED's visible from the front of the unit. Red = Infrared, Green = Ultrasonic.
26. Sensor shall operate at universal voltages 100 - 277VAC; 50/60Hz, with each relay able to operate on a different voltage.
27. Sensor shall accept Class 2 wiring.
28. To ensure quality and reliability, sensor shall be manufactured by an ISO 9002 certified manufacturing facility and shall have a defect rate of less than 1/3 of 1%.
29. Sensor shall be ETL listed (Conforms to UL STD 508 Certified to CAN/CSA STD C22.2 NO.14).
30. Sensor shall have a standard 5-year warranty.
31. Sensor shall be available in White.
32. Sensors located within Inn Guestrooms shall be battery powered.

B. Wall Switch, Dual Technology Vacancy Sensor

1. Sensor shall be two self-contained, dual technology motion sensing type. Unit can be mounted to any standard single or two gang outlet box.
2. Sensors shall require manual turn on and automatic and manual turn off.
3. Sensor shall be capable of detecting presence in the control area by detecting Doppler shifts in transmitted ultrasound and passive infrared heat changes.
4. Sensor shall not react to acoustic noise or ambient sound.
5. Sensor shall adapt automatically to changing room conditions.
6. Sensor's microprocessor shall monitor PIR background levels and/or ultrasonic frequency changes and automatically make corresponding adjustments.
7. Sensors utilizing passive infrared detection technology shall incorporate a dual element pyrometer and 12-element cylindrical impact resistant Fresnel lens.

8. Sensors utilizing ultrasonic detection technology shall have an ultrasonic frequency of 32 to 40 kHz.
9. Sensor shall operate at universal voltages 100 - 277VAC; 50/60Hz, with each relay able to operate on a different voltage.
10. Sensor shall have no minimum load requirement and shall be capable of switching 0 to 1000W Ballast or 1/6HP @ 100/120VAC, 50/60 Hz; 0 to 1800W Ballast or 1/6 HP @ 230/277VAC, 50/60 Hz.
11. Sensor shall have line and load control wires plus a ground wire for safety. Sensor shall not require a neutral.
12. Sensor shall have automatic-ON or manual-ON operation adjustable with DIP switch.
13. Sensor shall have a user accessible ON/OFF control for each circuit.
14. When the sensor is in the 5-sec test time out mode, depressing the push button reverts the unit to standard time out mode.
15. Sensor shall retain all learned adjustments and programmed modes of operation even after power loss.
16. Sensor shall close the relay at zero crossing to protect the contacts.
17. Sensor shall recognize the lighting turning off exactly 1 timeout period as a false on. In response to the second false on, sensitivity settings are automatically adjusted accordingly.
18. Sensor shall automatically determine and calibrate the ambient light level set point (10 -500 fc) when put into daylight mode.
19. Sensor shall have a mode which turns lights off during periods of vacancy if ambient light levels increase sufficiently to illuminate the area.
20. Sensor shall have a hallway algorithm, that when enabled reduces false tripping of the lights associated with hallway traffic outside the room where the sensor is controlling the lights.
21. Sensor shall have an adaptive reset switch, that when enabled resets the sensor's adaptive timer and sensitivity settings.
22. Sensor shall have configuration switches that are only accessible with fascia cover removed.
23. Sensor shall have a safety air gap disconnect switch.
24. Sensor shall have an automatic timer mode of 4-30 minutes which self adjusts based on vacancy.
25. Sensor shall have a fixed timer mode of 4, 8, 15 and 30 minutes.
26. Sensor shall have a 5-sec time out test mode, which reverts to standard timeout after pressing any button or automatically after one hour.
27. Sensor shall have a minimum 4-min time out (standard).
28. Sensor shall feature a walk-through mode, where lights turn off three minutes after the area is initially occupied if no motion is detected after the first 30 seconds, set by DIP switch.
29. To avoid false on activations and to provide immunity to RFI and EMI, Detection Signature Analysis shall be used to examine the frequency, duration, and amplitude of a signal, to respond only to those signals caused by human motion.
30. Sensor shall cover up to 1,000 sq. ft. for walking motion, with a field view of 180 degree.
31. Each sensing technology shall have a LED indicator that remains active at all times in order to verify detection within the area to be controlled.
32. Sensor shall be able to control incandescent, magnetic low voltage, electronic low voltage, and fluorescent loads.
33. The Dual Technology wall switch sensor shall be a completely self contained control system that replaces a standard toggle switch.
34. To ensure quality and reliability, sensor shall be manufactured by an ISO 9002 certified manufacturing facility and shall have a defect rate of less than 1/3 of 1%.
35. Sensor shall have standard 5-year warranty.
36. Sensor shall be ETL listed (Conforms to UL STD 508 Certified to CAN/CSA STD C22.2 NO.14).
37. Sensors located within Inn Guestrooms shall be battery powered.

C. Power Packs and Relays
1. Power pack shall be a self-contained transformer and relay module.
2. Power pack shall have primary universal voltage inputs of 100-277VAC, 50/60Hz.
3. Power pack shall have dry contacts capable of switching 20 amp ballast and incandescent load @ 120 VAC, 60Hz; 20 amp ballast @ 277 VAC, 60Hz; 1HP @ 120-277 VAC, 60Hz.
4. Power pack shall provide a 24 VDC, 150mA output.

5. Power pack shall provide overload protection. A momentary or continuous short of any of the control wires will not damage the device.
6. Power pack shall provide Zero Arc Point Switching to protect from the effects of inrush current and increase product life.
7. Power pack shall be capable of parallel wiring without regard to AC phases on primary.
8. Power pack can be used as a stand alone, low voltage switch, or can be wired to sensor for auto control.
9. Power and auxiliary relay packs shall be suitable for use in plenum applications.
10. For ease and speed of installation, power and auxiliary relay pack shall have 1/2" snap-in nipple for 1/2" knockouts and shall mount on the outside or inside of enclosure.
11. Power and auxiliary relay packs shall have a 5 year warranty.
12. Power and auxiliary relay packs shall be UL and CUL listed.
13. Power and auxiliary relay packs controlling emergency circuits shall be UL 924 listed.

PART 3 - EXECUTION

3.1 INSPECTION

A. Contractor shall examine locations where wiring devices and installation components are to be installed and determine space conditions and notify architect in writing of conditions detrimental to proper and timely completion of the work.

B. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install vacancy sensors and installation components where shown, in accordance with manufacturer's written instructions, and with recognized industry practices, to ensure that installation complies with requirements and serves intended purposes.

1. Locate switches near doors at the strike side of doors as finally hung.
2. Install devices only after wiring is completed.

B. Provide tape masking of sensors as required to prevent unintentional sensor activation by walking past an office with an open door.

C. Set dip switches on all sensors as specified.

D. Coordinate with other work as necessary to interface installation of vacancy sensors and installation components.

E. Installation shall comply with the requirements of NEC and NECA, "Standard of Installation".

F. At time of completion, replace items which have been damaged.

3.3 FIELD QUALITY CONTROL

A. Upon completion of installation of vacancy sensors and installation components, and after connection to power source, test devices and installation components to demonstrate compliance with requirements. When possible, field correct malfunctioning units, and then retest to demonstrate compliance. Replace units which cannot be satisfactory corrected.

B. Test devices and installation components to ensure electrical continuity of grounding connections.

END OF SECTION

DIVISION 27
COMMUNICATIONS

SECTION 27 05 00 - COMMON WORK RESULTS FOR COMMUNICATIONS

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. All work of Section 270526 - Grounding and Bonding for Communications Systems
2. All work of Section 270529 – Hangers and Supports for Communications Systems
3. All work of Section 270536 – Cable Trays for Communications System
4. All work of Section 270553 - Identification for Communications Systems
5. All work of Section 270800 - Commissioning of Communications
6. All work of Section 271116 - Communications Cabinets, Racks Frames and Enclosures
7. All work of Section 271119 - Communications Termination Blocks and Patch Panels
8. All work of Section 271123 - Communications Cable Management and Ladder Rack
9. All work of Section 271313 - Communication Copper Backbone Cabling
10. All work of Section 271323 - Communication Optical Fiber Backbone Cabling
11. All work of Section 271323.13 - Communications Optical Fiber Splicing and Terminations
12. All work of Section 271513 - Communications Copper Horizontal Cabling
13. All work of Section 271543 - Communications Faceplates and Connectors
14. All work of Section 271619 – Communications Patch Cords, Station Cords & X-Connects

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Not Applicable.

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Not Applicable

1.3 SPECIAL CONDITIONS

A. The general conditions for contracts of construction, referred to in the contract documents as the General Conditions, together with the following articles of the Communications Structured Cabling Specifications, which amend, modify and supplement various articles and provisions of the General Conditions, are made part of the Contract and shall apply to all work under the Contract.

B. The Contractor represents that he/she is familiar with, and has expertise in the Work of this nature and scope. The Contractor further agrees that he/she shall provide all Work as may be required to make a complete job of that which may not be fully defined in the Contract documents.

C. These specifications are material, equipment, and performance specifications. Actual installation requirements shall be as indicated on the TN-series drawings. Installation details indicated on the drawings shall govern if they differ from the specifications. Contractor is obligated to identify such differences at the time of bid submission.

D. Contractor shall comply with all applicable governmental regulations and with all Federal, State, City, and other applicable codes and ordinances. If the contractor performs any work which is contrary to such regulations, codes, and ordinances, contractor shall make all changes to comply therewith and bear all costs arising there from.

E. It is the intent of this Specification that all items under these Sections be engineered, assembled, installed and maintained by, and under the full responsibility of a single Contractor, whether these processes are actually performed by the Contractor or not. Deviations from this intent are to be fully described in the proposal, with reasons for the same, and the coordination methods required facilitating the least effect of the deviation on the project's implementation.

1.4 WORK INCLUDED

A. The Owner seeks to identify a qualified telecommunications cabling contractor capable of performing the scope of work as identified in the Contract Documents.

B. It is the intent of these Specifications to create an ANSI/TIA-942-A compliant cabling system to support high-speed data applications up to 100 Gbps including IEEE standards based on 1G, 10G, 40G, and 100 Gigabit Ethernet. System acceptance shall be judged on its ability to perform as such, the successful adherence to the installation instructions of this Specification, and compliance with parts and workmanship warranties.

C. The work covered by this specification includes the installation of a complete cabling system, including all labor necessary to perform and complete such installation, all materials and equipment incorporated or to be incorporated in such installation, and all services, supervision, consumable items, fees, licenses, facilities, tools, and equipment necessary or used to perform and complete such installation.

D. The Work Included is defined by the following and further defined in the drawings and Sections of Division 270500.

1. Provide project management and oversight for the installation of a complete structured cabling system.
2. Prepare and submit component documentation shop drawings, outlet labeling drawings, cable pull/termination schedules, cable test results and as-built drawings as described within this Specification and per the General Conditions.
3. Preparation of shop drawings, record or as-built drawings, manufacturer cut sheets, and other documentation described herein.

41.	TCIM:	Telecommunication Cabling Installation Manual
42.	TDMM:	Telecommunications Distribution Methods Manual
43.	TDR:	Time Domain Reflectometer
44.	TGB:	Telecommunications Grounding Busbar
45.	TIA:	Telecommunications Industry Association
46.	TMGB:	Telecommunications Main Grounding Busbar
47.	TR:	Telecommunications Room
48.	TSER:	Telecommunications Service Entry Room
49.	UL:	Underwriters Laboratory
50.	UTP:	Unshielded Twisted Pair
51.	WAP:	Wireless Access Point

B. "PROVIDE" or "FURNISH" means to supply, purchase, transport, place, erect, connect, label, test and turn over to Owner, complete and ready for regular operation, all materials, labor, equipment, testing apparatus, controls, tests, accessories and all other items customarily required for a telecommunications cabling system.

C. "SUPPLY" means to purchase, procure, acquire, and deliver complete with related accessories.

D. "INSTALL" means to move from property line, set in place, join, unite, fasten, link, attach, set up or otherwise connect together before testing and turning over to Owner of equipment and/or components. It means the installation is to be complete and ready for regular operation, except as otherwise noted.

E. "WIRING" or "CABLING" includes furnishing, unless otherwise noted, of all fittings, hangers, supports, sleeves, etc.

F. "CONDUIT" and CABLE TRAY" includes furnishing, unless otherwise noted, of all fittings, hangers, supports, sleeves, etc.

G. AS DIRECTED" means as instructed by the IT Project Manager or his representative.

H. "CONCEALED" means embedded in masonry or other construction, installed behind wall furring or within double partitions, or installed within hung ceilings.

I. "EXPOSED" means not installed underground or "CONCEALED" as defined above.

J. “PERMANENT LINK” means the end-to-end test configuration for a link excluding test cords and patch cords, but including the mated connection with the link.

1.6 CODES, REGULATIONS, AND STANDARDS

A. All equipment shall be equal to or exceed the minimum requirements of OSHA, NEMA, IEEE, ASME, ANSI, NEC and Underwriters Laboratories.

B. The installation shall comply fully with all applicable local, county and state laws and ordinances, regulations and codes.

C. Local electrical and building codes in New York may be more stringent than national codes, recommendations or practice. Follow the most restrictive code or recommendations.

D. All products, services and materials provided and performed under the scope of this specification shall conform to the following codes and standards. Refer to the most recent version, update or addenda.

1. Building Industry Consulting Service International (BICSI) Telecommunications Distribution Methods Manual - latest edition
2. Building Industry Consulting Service International (BICSI) Information Transport Systems Installation Manual (ITSIM) – latest edition
3. ANSI/TIA-568-C.1, Commercial Building Telecommunications Cabling Standard
4. ANSI/TIA-568-C.3, Optical Fiber Cabling Components Standard
5. ANSI/TIA-569-C, Telecommunications Pathways and Spaces
6. ANSI/TIA-606-B, Administration Standard for Telecommunications Infrastructure
7. ANSI/TIA-607-B, Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
8. ANSI/TIA-942-A, Telecommunications Infrastructure Standard for Data Centers
9. ANSI/TIA-455-57-B, FOTP-57, Preparation and Examination of Optical Fiber End Face for Testing Purposes
10. ANSI/TIA-455-78-B FOTP-78, Measurement Methods and Test Procedures – Attenuation
11. ANSI/TIA-455-95-A FOTP-95, Absolute Optical Power Testing for Optical Fiber and Cables
12. ANSI/TIA-455-133-A FOTP-133, Measurement Methods and Test Procedures – Length Measurement
13. ANSI/TIA-492AAAC-A, Detail specification for 850 nm Laser-Optimized, 50-μm Core Diameter/125-μm Cladding Diameter Class 1a Graded-Index Multimode Optical Fibers
14. ANSI/TIA-492CAAB, Detail Specification for Class IVa Dispersion-Unshifted Single-Mode Optical Fibers with Low Water Peak
15. ANSI/TIA-526-7, OFSTP-7, Measurement of Optical Power Loss of Installed Single-Mode Fiber Cable Plant

16. ANSI/TIA-526-14-B, Optical Power Loss Measurement of Installed Multimode Fiber Cable Plant
17. ANSI/TIA-758-B Customer Owned Outside Plant Telecommunications Infrastructure Standard
18. FCC Part 15
19. FCC Part 68
20. IEEE 802.3-2012
21. IEEE 802.11, Wireless Ethernet Specifications, including 802.11a, 802.11b, 802.11g and 802.11n.
22. NEC Article 392.5, Construction Specifications for Tray Modification
23. NEC Article 770, Optical Fiber Cables
24. NEC Article 800, Communications Circuits
25. NFPA 70, National Electrical Code
26. NFPA 75, Protection of Electronic Computer / Data Processing Equipment

1.7 QUALITY ASSURANCE

A. All materials furnished shall be new, unused, clean and free from damage, defects or corrosion.

B. Equipment and materials of the same type shall be a product of the same manufacturer throughout unless specifically exempted in advance. A specific example is all products comprising the Permanent Link (station cable, patch panels, jacks, faceplates, etc.…)

C. Component manufacturer shall be ISO 9001:2008 and offer products that are RoHS compliant.

1.8 SUBMITTALS

A. Certificates:

1. Submit management and installation team reference documentation verifying that:
   a. The project manager is a RCDD in good standing with BICSI and is qualified to manage the scope of work described in the contract documents and has five (5) years of experience managing similar projects in size and scope. The documentation shall include the RCDD registration number.
   b. The field supervisor is a BICSI trained technician that is qualified to perform and oversee the work described in the contract documents.

B. Qualification Statements

1. The contractor shall submit documentation that within the past 12 months, a minimum of 75% of all installation personnel have been trained or certified by the manufacturer of the products they are installing.

C. Shop Drawings

1. Refer to requirements listed in Division 01.

1.9 COORDINATION OF WORK

1. Refer to requirements listed in Division 01.

1.10 PROJECT CLOSEOUT

A. Subsequent to the installation and prior to acceptance of the work, the contractor shall prepare and issue record (as-built) drawings, in AutoCAD 2010 format, that reflect the lengths of cables installed, the actual manner and conditions

of installation, including all deletions from, additions to or departures from the contract documents. These documents are to include all specified labeling and pathway routing detail. Pathway routing detail shall be provided in excel format for importation into Owner database. Identifiers used to label cables and components as specified in Section 270553 shall be used in identifying cables and components in record drawings.

B. Provide revised cable termination schedules for all cables installed under the Work. Format to comply with owner system requirements. Schedules shall be in printed form and on either CD, DVD, USB in Microsoft Excel format. Identifiers used to label cables as specified in Section 270553 shall be used in identifying cables in cable termination schedules.

C. Provide two (2) sets of Operation and Maintenance Manuals including wiring diagrams, parts list, shop drawings and manufacturers' information on all equipment and cables provided under this Work. Provide manuals in a high quality, 3-ring binder, completely indexed. Provide manuals within fifteen days of systems acceptance

D. Provide two (2) sets of all cable test results in the native format of the test equipment vendor and in excel format on CD, DVD or USB. Identifiers used to label cables as specified in Section 270553 shall be used in identifying cables in cable test results

1.11 MANUFACTURER'S EXTENDED WARRANTIES

A. All manufacturer extended product warranties shall be afforded to The Owner. A copy of certification by the manufacturer for all products listed in this specification is to be provided.

B. Prior to commencement of the work, the successful bidder shall contact an authorized manufacturer’s representative to inform them that this job is being registered under the warranty program. Bidder shall provide an additional copy of all warranty notifications to owner.

C. Upon completion of the work, the contractor shall coordinate with the manufacturer the issuance of a full warranty on the entire copper and fiber optic cable plant for both parts and labor. The cabling contractor at his sole expense will correct any deficiencies determined by the manufacturer

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 STAFFING

A. Craft personnel shall be certified personnel qualified to perform the work and be knowledgeable of the following activities included but not limited to:

1. Color coding of standard American telephone/ data telecommunications cables.
2. Bonding and grounding of telecommunications systems
3. Testing conductors for transmission impairments.
4. Testing conductor insulation.
5. Installation and termination of optical fiber cabling.
6. Testing and verification of optical fiber transmission characteristics with a power meter.
7. Telephone and data industry cable installation standards and manufacturer's instructions will be used for in-process quality control and final acceptance of the work installation.
8. Cable tray and ladder rack installation.

B. Craft personnel will be required to provide and use the proper tools and test equipment in the performance of each activity. The tools must be in good working order, and the test equipment must have current calibration certificates, as applicable. The Owner reserves the right to review the tool and test equipment lists and maintenance procedures of the contractor.

C. Use of Site – Refer to the Division 01 Requirements.

D. Follow manufacturer's instructions for installing, connecting, and adjusting all telecommunications cabling and associated supporting, termination and splicing equipment, conduits, poke through, and cable tray. Provide a copy of such instructions at the equipment during any work on the equipment.

E. Keep all items protected before and after installation. Provide protection for exposed cables roughed onto the floor prior to their installation into the furniture systems. Clean up and remove all debris.

F. If products and materials are specified herein for a specific item or system, use those products or materials. If products and materials are not listed, use first-class products and materials, subject to acceptance of shop drawings.

G. Examine and compare the telecommunications cabling drawings and specifications with the drawings and specifications of other trades; report any discrepancies between them to the IT Project Manager; and obtain from him written instructions for changes necessary in the work.

H. The locations of structural and architectural features, sleeves, floor slots, termination and cross connect fields, panels, racks and other equipment indicated on the drawings are approximate. The contractor shall verify the existence, locations, and suitability of all such items, and shall present, with bid response, required modifications to contract documents necessary to complete this work.

3.2 SPECIAL CONDITIONS

A. Furnish, install, terminate and test all riser & tie cabling shown in the attached and associated drawings and described below.

1. The contractor shall route all copper and fiber cabling, unless otherwise identified, via overhead cable tray, ladder rack, conduits, raised floors, and poke-through unless otherwise noted
2. Cables with the same origin and destination shall take diverse paths. Diverse path is defined as paths that do not intersect and remain at least 3 feet apart along the entire route
3. All cables shall be dressed in a neat manner, observing cable bend radius limit at each rack, frame and cabinet, and on ladder racks and cable trays.
4. Overhead cabling shall follow tiered cable tray system. Utilize cable waterfall for exiting ladder rack at frames and cabinets.
5. Provide Velcro cable ties at five-foot intervals for each cable bundle.
6. Provide pedestal mount J hooks for supporting cables from under floor cable tray to cabinet or frame
7. Cables must be securely bundled, but may not display insulation/sheath damage or pair distortion from over-tightening of Velcro cable ties
8. Cabling at racks and frames must be neatly dressed and Velcro tie wrapped.
9. Fiber cabling at fiber distribution frame must be secured to frame with cable clamps.

3.3 INSTALLATION

A. General

1. Subcontractor will provide paired copper, coaxial, and optical fiber backbone and horizontal cabling as noted on Drawings and Schedules.

B. Contractor shall take all necessary precautions to assure that the maximum tensile load and minimum bend radius of all cables (fiber and copper) are not exceeded. When terminating UTP cable, the contractor must maintain pair twists up to the termination point and the cable sheath shall not be removed more than 0.5" from the termination point. Velcro tie wraps are to be hand tightened on cables to prevent crimping cable sheath. Plastic tie wraps are not to be used on lateral cables. All tie wraps need to be cut so that no edges are visible that can cause potential damage to the cable bundle. The contractor is responsible for protecting all connectorized cables from damage by other contractors at the information outlet before and after installation of the outlet faceplates

C. Termination Hardware.

1. All copper and fiber cabling will be terminated on rack and cabinet mounted patch panels. The fiber optic tie cabling shall be terminated on fiber distribution coupler panels with LC connectors. All termination hardware shall be grounded and bonded according to applicable codes, TIA standards, and Section 270526.

D. Fire Stop - Penetration Sealant: Refer to work of other sections

3.4 REPLACEMENT

A. Any fiber strand, connector, block, or module installed by the contractor, which fails to meet the loss budget or tests below the manufacturer's standards, shall be replaced at no additional cost to the Owner. The replacement cable, connector, or part shall be tested after repairs have been made to verify compliance. Only equipment that meets the installation requirements stated herein shall meet The Owner's acceptance requirements.

3.5 SOURCE MANUFACTURING AND QUALITY CONTROL

A. Cables that are supplied by the contractor, and test outside of the factory test data by a margin of 10 percent on loss, may, at The Owner's option, be deemed non-usable and returned to the manufacturer for replacement.

3.6 POST IMPLEMENTATION TESTING

A. Following the physical installation of the cabling, the contractor will conduct pre-checkout tests as described below, "Physical Inspection", prior to the formal acceptance tests with The Owner.

3.7 PHYSICAL INSPECTION

A. Prior to conducting any transmission testing, the following visual inspections will be performed:

1. Verify that all cable has been installed to full compliance with the proposal specifications.
2. Check for physical damage to the optical fiber distribution panels and termination hardware.
3. Check that all cabling is properly jacketed, installation properly labeled at both ends of the cable, innerduct and termination hardware is completed.
4. Verify that all cable bends are within the manufacturer's specified bend radius
5. Verify that all cabinets and racks (which require grounding) are properly grounded and comply with the National and Local Electrical Codes for grounding
6. Verify that the cables are properly approved and structurally supported for termination
7. Verify that the requirements of all authorities having jurisdiction have been satisfied.

END OF SECTION 27 05 00

SECTION 27 05 26 - GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. Busbar
2. Ground Conductors
3. Ground Lugs

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Not Applicable.

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 271116 – Communications Cabinets, Racks, Frames, and Enclosures
2. Section 271119 – Communications Termination Blocks and Patch Panels
3. Section 271123 – Communications Cable Management and Ladder Rack

1.3 SUMMARY

A. This section includes the minimum requirements for grounding, Earthing, and bonding of equipment and cable installations installed under or referred to in Division 27 Contract Documents.

1.4 RELATED DOCUMENTS

A. Architectural, mechanical, electrical, and all technology drawings.

1.5 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

PART 2 - PRODUCTS

2.1 WALL-MOUNT BUSBARS

A. Manufacturer's List:

1. Chatsworth Products
2. Or approved equivalent

B. Telecommunications Main Grounding Busbar (TMGB)

1. Telecommunications Main Grounding Busbar (TMGB) shall be constructed of .25" (6.4 mm) thick solid copper bar.
2. The busbar shall be 4" (100 mm) high and 20" (510 mm) long and shall have 30 attachment points (two rows of 15 each) for two-hole grounding lugs.
3. The hole pattern for attaching grounding lugs shall meet the requirements of ANSI/TIA – 607-B and shall accept 27 lugs with 5/8" (15.8 mm) hole centers and 3 lugs with 1" (25.4) mm) hole centers.
4. The busbar shall include wall-mount stand-off brackets, assembly screws and insulators creating a 4" (100 mm) standoff from the wall.
5. The busbar shall be UL Listed as grounding and bonding equipment

C. Telecommunications Grounding Busbar (TGB)

1. Telecommunications Grounding Busbar (TGB) shall be constructed of .25" (6.4 mm) thick solid copper bar.
2. The busbar shall be 4" (100 mm) high and 20" (510 mm) long and shall have 30 attachment points (two rows of 15 each) for two-hole grounding lugs.
3. The hole pattern for attaching grounding lugs shall meet the requirements of ANSI/TIA – 607-B and shall accept 27 lugs with 5/8" (15.8 mm) hole centers and 3 lugs with 1" (25.4) mm) hole centers.
4. The busbar shall include wall-mount stand-off brackets, assembly screws and insulators creating a 4" (100 mm) standoff from the wall.
5. The busbar shall be UL Listed as grounding and bonding equipment.

2.2 BONDING ACCESSORIES

A. Two Mounting Hole Ground Terminal Block

1. Ground terminal block shall be made of electroplated tin aluminum extrusion.
2. Ground terminal block shall accept conductors ranging from #14 AWG through 2/0.
3. The conductors shall be held in place by two stainless steel set screws.
4. Ground terminal block shall have two 1/4" (6.4 mm) holes spaced on 5/8" (15.8 mm) centers to allow secure two-bolt attachment to the rack or cabinet.
5. Ground terminal block shall be UL Listed as a wire connector.

B. Compression Lugs

1. Compression lugs shall be manufactured from electroplated tinned copper.
2. Compression lugs shall have two holes spaced on 5/8" (15.8 mm) or 1" (25.4 mm) centers, as stated below, to allow secure two bolt connections to busbar.
3. Compression lugs shall be sized to fit a specific size conductor, sizes #6 to 4/0, as stated below.
4. Compression lugs shall be UL Listed as wire connectors.

C. Antioxidant Joint Compound

1. Oxide inhibiting joint compound for copper-to-copper, aluminum-to-aluminum or aluminum-to-copper connections.

D. Equipment Ground Jumper Kit

1. Kit includes one 610 mm L insulated ground jumper with a straight two-hole compression lug on one end and an L-shaped two-hole compression lug on the other end, two plated installation screws, an abrasive pad and a tube of antioxidant joint compound.
2. Ground conductor is an insulated green/yellow stripe #6 AWG wire
3. Lugs are made from electroplated tinned copper and have two mounting holes spaces 12 mm to 16 mm apart that accept 6 mm screws.
4. Jumper will be made with UL Listed components

E. Accessory Products:

1. Provide any accessory products related to the copper connectors required to provide a complete and functional infrastructure system.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section.

B. Confirm all housings including back boxes, floor boxes and poke-through provided for the telecommunications connectivity system will support the installation of project approved manufacturer components prior to purchase of the components described in this specification.

3.2 INSTALLATION

A. General Installation Practices

1. Installation and testing of the telecommunications bonding and grounding infrastructure shall follow the specifications and recommendations of ANSI/TIA-607-B Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises and ANSI/NECA/BICSI-607 Standard for Telecommunications Bonding and Grounding Planning and Installation Methods for Commercial Buildings

B. Grounding Hardware

1. The grounding and bonding infrastructure system shall not make use of the building plumbing system, unless required to do so by the NEC.
2. Coordinate the installation of the grounding and bonding system with the electrical power distribution system grounding infrastructure
3. TGB: Provide TGBs as shown in the Contract Documents including the ER, MDF, IDF, TRs, POE rooms, and additional technology rooms as specified in ANSI/TIA-607-B. Directly bond each TGB to its associated TBB and to the nearest building structural steel or other permanent metallic system. Group protector, busbar bonding, and approved building grounding conductors toward the left end and leave space for equipment grounding conductors to the right end.
4. TBB(s) and Grounding Conductors: Provide TBB(s) and grounding conductors as shown on the Contract Documents and as required to bond all non-current carrying metal telecommunications equipment and materials to the nearest TGB. Use TBB(s) to connect the TMGB to each TGB. Route along the shortest and

straightest path possible with minimal bends. Bends shall be sweeping. Insulate TBB(s) and conductors from their support. TBB(s) and grounding conductors shall be continuous (without splices).

5. Ensure that bonding breaks through paint to bare metallic surface of all painted metallic hardware.
6. Labeling:
   a. Label the TMGB, TGB, TBBs, and bonding conductors as specified in ANSI/TIA-606-B
   b. Label TBB(s) and bonding conductors “WARNING! TELECOMMUNICATIONS BONDING CONDUCTOR. DO NOT REMOVE OR DISCONNECT!”

C. Wall-Mount Busbar

1. Process
   a. Conductor connections to the TMGB or TGB shall be made with 2-Hole Bolt-On Compression Lugs sized to fit the busbar and the conductors.
   b. Each lug shall be attached with stainless steel hardware after preparing the bond according to manufacturer recommendations and treating the bonding surface on the busbar with antioxidant to help prevent corrosion at the bond.
   c. The wall-mount busbar shall be bonded to ground as part of the overall Telecommunications Bonding and Grounding System.

D. Cable Tray and Ladder Rack (cable runway)

1. Process:
   a. Follow manufacturer’s instructions for grounding, use wherever possible use grounding hardware and accessories from same manufacturer as cable tray and cable runway systems

E. Frames & Cabinets

1. Process:

   a. Contractor to follow frame/cabinet manufacturer’s instructions specific to grounding. Use grounding hardware and accessories from same manufacturer.

3.3 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time and/or end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning the work.

3.4 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.

B. Contractor to submit all as-built drawings and any test documentation required prior to acceptance by the Owner.

END OF SECTION 27 05 26

SECTION 27 05 29 - HANGERS AND SUPPORTS FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. Non-continuous cable supports.

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Not Applicable.

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 270536 – Cable Trays for Communications Systems
2. Section 271116 – Communications Cabinets, Racks, Frames, and Enclosures
3. Section 271123 – Communications Cable Management and Ladder Rack
4. Section 271513 – Communications Copper Horizontal Cabling

1.3 SUMMARY

A. Provides specifications for non-continuous cable support components utilized to provide pathways support to telecommunications cables traveling outside cable trays, conduits, or other continuous cable supports.

1.4 RELATED DOCUMENTS

A. Architectural, mechanical, electrical, and all technology drawings.

1.5 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

PART 2 - PRODUCTS

2.1 NON-CONTINUOUS CABLE SUPPORTS

A. Manufacturer's List:

1. Erico – Caddy CableCat Support System
2. Cooper B-Line – Spring Steel Fasteners
3. Panduit – J Mod Cable Support System
4. Or Approved Equivalent

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each component selected shall address the particular infrastructure requirements.
2. Select support system components capable of supporting the telecommunications cable quantities required for each location. Options are as follows:
   a. Support slings/cable straps
   b. Four (4) inch wide J-hook supports wide base cable support J-hooks equivalent.

C. Description:

1. Non-continuous cable supports shall be available in multiple sizes, styles and materials. Rigid supports shall be equipped with flared edges and pre-configured bend radius controls.
2. Provide drop wire supports and threaded rod assemblies in areas where structural mounting surfaces are non-functional or inaccessible.
3. Sling assemblies'/cable straps shall provide a bearing surface of sufficient width to comply with required bend radii of high-performance UTP cables. Support slings shall have a static load limit of 100 lbs.
4. Non-continuous cable supports sized 1 5/16" and larger shall have a cable retainer strap to provide containment of cables within the hanger. The cable retainer strap shall be removable and reusable.
5. Select approved non-continuous cable supports suitable for specific installation environments and/or air handling (plenum) spaces.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section.

3.2 NON-CONTINUOUS CABLE SUPPORT INSTALLATION

A. Process:

1. Follow manufacturer's instructions and recommended industry standards and guidelines.
2. The installed non-continuous support system must be an independent support structure for the voice/data communication system.
3. Draping cables over other structures in the ceiling is unacceptable. Water pipes, ceiling grid, sprinkler system, electrical supports, air ducts or any other in-ceiling structure may not be used for cable support.

4. Contractor installed supports shall be used to supplement the main cable support system when any cabling leaves the main support system or is unsupported for more than three and one half feet (3'-6").
5. Supports shall be installed at a maximum distance of 5'-0"apart.
6. Non-continuous supports shall be installed with ceiling wire or threaded rod secured to the slab above to support the telecommunications cable infrastructure parallel to the slab throughout the cable plant, unless site conditions dictate a non-parallel installation.
7. Cable must be routed to follow existing corridors and parallel or 90 degree angles from all walls and the cable tray whenever possible.

3.3 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time, and end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning any re-installation work.

3.4 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.

B. Contractor to submit all as-built drawings and any test documentation required prior to acceptance by the Owner.

END OF SECTION 27 05 29

SECTION 27 05 53 – IDENTIFICATION FOR COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. Labeling and identification products

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable

D. Items to Be Furnished Only: Not Applicable.

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 271116 – Communications Cabinets, Racks, Frames, and Enclosures
2. Section 271119 – Communications Termination Blocks and Patch Panels
3. Section 271123 – Communications Cable Management & Ladder Rack
4. Section 271313 – Communications Copper Backbone/Tie Cabling
5. Section 271323 – Communications Optical Fiber Backbone/Tie Cabling

1.3 SUMMARY

A. Provides specifications information for identification of the various components of the telecommunications infrastructure and pathway system.

1.4 RELATED DOCUMENTS

A. Architectural, Mechanical, Electrical, and all Technology Drawings.

1.5 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

2.1 LABELING AND IDENTIFICATION PRODUCTS

A. Manufacturer's List:

1. Brady USA Inc.
2. Panduit Corporation
3. Rhino
4. Hubbell
5. Or approved equivalent

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each component selected shall address the particular requirements for each situation.

C. Description:

1. Machine-generated, printed self-adhesive, smudge resistant labels for cables, faceplates, patch panels, and termination blocks. Labels shall be appropriately sized for cable diameter. Labels shall be appropriately colored for faceplate color contrast
2. The intention of the labeling scheme is to be ANSI/TIA-606-B compliant.
3. It is the responsibility of the contractor to acquire, understand, and utilize the owner's labeling scheme for all components of the communications system.
4. Submit sample labels for approval.
5. Labels shall have industrial adhesives that resist dirt and oil.
6. Shall have a split backing for easy removal
7. Design Make
    a. Flexible Nylon
        i. For curved surfaces (wire and cable) and rough surfaces for indoor applications flexible nylon memory resistant material shall be used.
    b. Permanent Polyester Labels
        i. For flat surfaces permanent polyester shall be used.
    c. Vinyl
        ii. For outdoor applications in direct sunlight and where color coding is required vinyl shall be used.
    d. Heat Shrink Tube
        iii. Shall be polyolefin tube with a 3:1 heat-shrink ratio
    e. Non – Adhesive labels
        iv. Shall be rigid and durable polypropylene material.
8. Labeling shall meet the visibility and durability requirements of ANSI/TIA – 606-B standard.
9. Labels shall be pre-printed or laser-printed. Hand written labels are not acceptable.
10. Labels shall have white printing area and black print. If cable jacket is white, provide cable label with printing area that is any color other than white, preferably orange or yellow – so that labels are easily distinguishable

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section.

3.2 LABELING

A. Process:

1. The Owner-approved labeling scheme is intended to comply with the ANSI/TIA-606-B standard for labeling and administration of a cable plant. It is the responsibility of the contractor to acquire, understand, and utilize the owner's labeling scheme for all component of the Voice, Data Communications system including, but not limited to:
   a. Tie cables (both ends and on each floor of an exposed cable run, such as within an Equipment Room or MDF Room)
   b. Termination panels, blocks, trays
   c. MDF entry and exit pathways
   d. Racks, Cabinets and Equipment
   e. Telecommunication cable tray, conduit pathways, & pullboxes
   f. Telecommunications grounding & bonding system

2. Contractor to provide labels as described herein for all conduits, manholes, and pullboxes at all interconnecting points as well as conduit ends as shown on the drawings.
   a. All labels shall include 'FROM-TO' information clearly stated according to owner provided information.

3. Label each component with a machine-generated label where it is accessible for administration.
4. Provide on all termination blocks installed under this Work, machine-generated designation strips with the cable ID clearly printed and pair number, in uppercase lettering.
5. Provide on all patch panels installed under this Work, machine-generated label with the cable ID and port number clearly printed in uppercase lettering. Each panel shall have a unique identification label as well.
6. Provide on all cables installed under this work, machine-generated labels with the cable ID clearly printed, in black uppercase lettering on a permanent adhesive, white label stock, covered with a permanent water resistant sealer. Labels shall be placed on both ends of each cable at no more than 6" from the point at which the cable is broken out into individual copper pairs or strands from the connector or termination block or patch panel
7. Provide all labels in accordance with Owner's labeling standards and in accordance with the approved cable termination schedule.
8. Hand lettered label stock will not be accepted for final installation. Hand lettered stock is acceptable only for temporary labeling required during construction phases.
9. All cable IDs shall be both physically and visually accessible upon completion of the project. Label locations shall be such that all labels can be easily seen and read without disassembling cable bundles or stressing cable connections in order to gain visual access.
10. If at any time during the project, any label becomes illegible, is removed, or is found to be positioned so that it will not be easily readable when cable termination and dressing are completed, the Contractor shall immediately replace it with a duplicate preprinted label.

3.3 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time and/or end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning the work.

3.4 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.

B. Contractor to submit all as-built drawings required prior to acceptance by the Owner.

END OF SECTION 27 05 53

SECTION 27 08 00 - COMMISSIONING OF COMMUNICATIONS

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. Copper cable test device
2. Optical fiber cable test device
3. Cable Test Results
4. As-built drawings

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Not Applicable.

E. Related Sections include the following:

1. 271119 – Communications Termination Blocks and Patch Panels
2. 271313 – Communications Copper Backbone Cabling
3. 271323 – Communications Optical Fiber Backbone Cabling
4. 271513 – Communications Copper Horizontal Cabling
5. 271543 – Communications Faceplates and Connectors
6. 271619 – Communications Patch Cords, Station Cords, and Cross Connect Wire

1.3 SUMMARY

A. Provides specifications for a certification tester used for end to end testing, certification, and documentation of all test results to confirm the installed connectivity system complies with industry standards and specific category and performance ratings.

B. Contractor to notify owner three (3) days prior to testing any cabling.

1.4 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

PART 2 - PRODUCTS

2.1 COPPER CABLE TEST DEVICE

A. Manufacturer's List:

1. Fluke Networks

B. Product Options

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.
2. Select analyzer to comprehensively certify each category rated connection and record results verifying compliance with TIA/EIA performance specifications to meet the category rating of the system.
3. Versiv ProjX Management System.

C. Description:

1. Must meet or exceed TIA Level IV compliant network cable-testing device certification by an independent laboratory, such as Intertek, for verification of high speed, TIA/EIA T568 compliant cables.
2. Copper test equipment must be capable of certifying Category-3, Category-5e, and Category-6A UTP or F/UTP links or channels independent of termination hardware configuration (RJ45 port or 110-style) for each level of performance.
3. Provide full 2-way Auto test of Category-3, 5e, 6 and 6A twisted pair links.
4. All test equipment shall be capable of storing full frequency sweep data for all tests and printing color graphical reports for all swept measurements.

D. Accessory Products:

1. Interface Adapters

a. TIA Category-3, 5e, 6 and 6A: 100 ohm
b. Category/Class E permanent link adapters for TIA Cat 3, 5e, 6 and 6A unshielded and shielded cables.
c. Fluke Networks DTX ten (10) Gigabit Kit - DTX 10 Gig over Copper Test solution, Model No. DTX-10GKIT or approved equivalent.

2.2 OPTICAL FIBER CABLE TEST DEVICE

A. Manufacturer List:

1. Fluke Networks

B. Product Options:

1. Select analyzer to comprehensively certify each optical fiber connection and record results verifying compliance with TIA/EIA performance standards and manufacturer specifications.
   a. Versiv ProjX management system

C. Description:

1. The optical fiber source shall permit full end to end testing of Multimode, Single-mode and LOMMF optical fiber cabling fully compliant with industry standards and manufacturer recommendations.
2. Available source types and wavelengths shall be as follows:
   a. Multimode - 850nm LED and 1300nm LED.Versiv
   b. Single-mode – 1310nm FP Laser and 1550nm FP Laser.
   c. LOMMF – 850nm VCSEL and 1310nm FP Laser.

3. The power meter shall be calibrated to read 850, 1300, 1310 and 1550nm wavelengths.

D. Accessory Products:

1. Interface Adapters
   a. DTX Fiber Module for Multimode cable @ 850 and 1300 nm – Model No. DTX-MFM2
   b. DTX Fiber Module for Gigabit LOMMF cable @ 850 and 1310 nm – Model No. DTX-GFM2
   c. DTX Fiber Module for Single mode cable @ 1310 and 1500 nm – Model No. DTX-SFM2
   d. Optical Fiber Mandrels.

2. Fiber Microscope
   a. Magnification of 200X or 400X for end face inspection
   b. Optional requirements
      i. Video camera systems are preferred.
      ii. Camera probe tips that permit inspection through adapters are preferred.
      iii. It is preferable to use test equipment capable of saving and reporting the end face image.

   c. FiberInspector Mini Video Microscope – Model No. FT500.

PART 3 - EXECUTION

3.1 EXAMINATIONS

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section.

B. Verify telecommunications cabling is installed and supported, terminated, mounted in an appropriate housing or terminated on the applicable component and labeled prior to certification testing and documentation.

C. Verify certification tester universal interface adapters and manufacturer patch cords that enable permanent link verification are in new condition not indicating any twisting or kinking resulting from incorrect storage of the tester interface adapters.

D. Optical fiber patch cords shall be inspected to ensure connector surfaces are clean and free of defects that may affect testing results.

3.2 COPPER CABLE TESTING GENERAL REQUIREMENTS

A. Process:

1. Certification test 100% of the installed cabling plant including all backbone and horizontal four (4) pair UTP/ or F/UTP copper connections.
2. Follow manufacturers' instructions and recommended industry standards and guidelines to complete all TIA testing procedures to verify performance levels.
3. Follow manufacturer requirements for self-calibration procedures.
4. Perform all tests required by local authorities in addition to tests specified herein.
5. Update tester software to show specific project information including but not limited to:

    a. Date and time of testing
    b. Project name
    c. Field technicians name
    d. Cable identification number
    e. Cable manufacturer, type and part number

3.3 CATEGORY 6A COPPER CABLE TESTING REQUIREMENTS

A. General Requirements

1. Every cabling link in the installation shall be tested for:

    a. Wire Map
    b. Length
    c. Insertion Loss
    d. NEXT Loss
    e. PS NEXT Loss
    f. ACR-F Loss
    g. PS ACR-F Loss
    h. Return Loss
    i. Propagation Delay
    j. Delay Skew

in accordance with the field test specifications defined in ANSI/TIA-568-C.2 "Commercial Balanced Twisted-Pair Telecommunications Cabling and Components Standard". This document will be referred to as the "TIA Cat 6 Standard."

2. The installed twisted-pair horizontal links shall be tested from the IDF in the telecommunications room to the telecommunication wall outlet in the work area for compliance with the "Permanent Link" performance specification as defined in the Category 6A Standard.
3. One hundred percent of the installed cabling links must pass the requirements of the Category 6A Standard mentioned in A.1 above and as further detailed in Section B. Any failing link must be diagnosed and corrected. The corrective action shall be followed with a new test to prove that the corrected link meets the performance requirements. The final and passing result of the tests for all links shall be provided in the test results documentation in accordance with Section C below.
4. Trained technicians who have successfully attended an appropriate training program and have obtained a certificate as proof thereof shall execute the tests. Appropriate training programs include but are not limited to installation certification programs provided by BICSI or the ACP (Association of Cabling Professionals).
5. The test equipment (tester) shall comply with the accuracy requirements for level IIIe field testers as defined in ANSI/TIA-1152. The tester including the appropriate interface adapter must meet the specified accuracy requirements. The accuracy requirements for the permanent link test configuration (baseline accuracy plus adapter contribution) are specified in Table 3 of ANSI/TIA-1152 (Table 3 in this TIA document also specifies the accuracy requirements for the Channel configuration).

6. The RJ45 test plug shall fall within the values specified in ANSI/TIA-568-C Annex C for NEXT, FEXT and Return Loss.
7. The tester shall be within the calibration period recommended by the vendor in order to achieve the vendor-specified measurement accuracy.
8. The tester interface adapters must be of high quality and the cable shall not show any twisting or kinking resulting from coiling and storing of the tester interface adapters. In order to deliver optimum accuracy, preference is given to a permanent link interface adapter for the tester that can be calibrated to extend the reference plane of the Return Loss measurement to the permanent link interface. The contractor shall provide proof that the interface has been calibrated within the period recommended by the vendor. To ensure that normal handling on the job does not cause measurable Return Loss change, the adapter cord cable shall not be of twisted-pair construction.
9. The Pass or Fail condition for the link-under-test is determined by the results of the required individual tests (detailed in Section 4.2.2 of ANSI/TIA-1152). Any Fail or Fail* result yields a Fail for the link-under-test. In order to achieve an overall Pass condition, the results for each individual test parameter must Pass or Pass*.
10. A Pass or Fail result for each parameter is determined by comparing the measured values with the specified test limits for that parameter. The test result of a parameter shall be marked with an asterisk (*) when the result is closer to the test limit than the accuracy of the field tester. The field tester manufacturer must provide documentation as an aid to interpret results marked with asterisks. To which extent '*' results shall determine approval or disapproval of the element under test shall be defined in the relevant detail specification, or agreed on as a part of a contractual specification.
11. A representative of the end-user shall be invited to witness field testing. The representative shall be notified of the start date of the testing phase five business days before testing commences.
12. A representative of the end-user has the right (at their discretion) to select a random sample of 5% of the installed links. The representative (or his authorized delegate) shall test these randomly selected links and the results are to be stored in accordance with the prescriptions in Section C.1. The results obtained shall be compared to the data provided by the installation contractor. If more than 2% of the sample results differ in terms of the pass/fail determination, the installation contractor under supervision of the end-user representative shall repeat 100% testing and the cost shall be borne by the installation contractor.

B. Performance Test Parameters

The test parameters for Category 6A cabling are defined in the ANSI/TIA-568-C.2 and are all tested automatically using the Category 6A Auto test with the Fluke DTX-1800 or Fluke DSX-5000 Cable Analyzer.

C. Test Result Documentation

1. The test results/measurements shall be transferred into a Windows™-Excel and in the Fluke LinkWare Cable Test Management Software format. A guarantee must be made that the measurement results are transferred to the PC unaltered, i.e., “as saved in the tester” at the end of each test and that these results cannot be modified at a later time.
2. The database for the completed job shall be stored and delivered on CD-ROM or DVD including the software tools required to view, inspect, and print any selection of test reports.
3. General Information to be provided in the electronic database with the test results information for each link:

    a. The identification of the customer site as specified by the end-user
    b. The identification of the link in accordance with the naming convention defined in the overall system documentation
    c. The overall Pass/Fail evaluation of the link-under-test
    d. The name of the test limit selected to execute the stored test results
    e. The cable type and the value of NVP used for length calculations
    f. The date and time the test results were saved in the memory of the tester
    g. The brand name, model and serial number of the tester
    h. The identification of the tester interface
    i. The revision of the tester software and the revision of the test standards database in the tester

j. The test results information must contain information on each of the required test parameters that are listed in Section B and as further detailed below under paragraph C5.

4. The detailed test results data to be provided in the electronic database for must contain the following information:
For each of the frequency-dependent test parameters, the value measured at every frequency during the test is stored. The PC-resident database program must be able to process the stored results to display and print a color graph of the measured parameters. The PC-resident software must also provide a summary numeric format in which some critical information is provided numerically as defined by the summary results (minimum numeric test results documentation) as outlined above for each of the test parameters.

a. Length: Identify the wire-pair with the shortest electrical length, the value of the length rounded to the nearest 0.1 m (1) and the test limit value
b. Propagation delay: Identify the pair with the shortest propagation delay, the value measured in nanoseconds (ns) and the test limit value
c. Delay Skew: Identify the pair with the largest value for delay skew, the value calculated in nanoseconds (ns) and the test limit value
d. Insertion Loss (Attenuation): Minimum test results documentation as explained in Section B for the worst pair
e. Return Loss: Minimum test results documentation as explained in Section B for the worst pair as measured from each end of the link
f. NEXT, ACR-F: Minimum test results documentation as explained in Section B for the worst pair combination as measured from each end of the link
g. PS NEXT and PS ACR-F: Minimum test results documentation as explained in Section B for the worst pair as measured from each end of the link

(1): Nominal Velocity of Propagation (NVP) expresses the speed of the electrical signals along the cabling link in relation to the speed of light in vacuum ($3x10^8$ m/second). Insulation characteristics and twist rate of the wire pair influence NVP in minor ways. Typically, an 'average' value for NVP is published for all four wire-pairs in a data cable.

(2): 'Margin' designates the difference between the measured value and the corresponding test limit value. For passing links, 'worst case margin' identifies the smallest margin over the entire frequency range; the point at which the measured performance is "closest" to the test limit.

3.4 FIBER OPTIC CABLE TESTING REQUIREMENTS

A. GENERAL

1. All tests performed on optical fiber cabling that use a laser or LED in a test set shall be carried out with safety precautions in accordance with ANSI Z136.2.
2. All outlets, cables, patch panels and associated components shall be fully assembled and labeled prior to field-testing. Any testing performed on incomplete systems shall be redone on completion of the work.

B. OPTICAL FIBER CABLE TESTING

1. Field-test instruments shall have the latest software and firmware installed.
2. Link and channel test results from the OLTS shall be recorded in the test instrument upon completion of each test for subsequent uploading to a PC in which the administrative documentation (reports) may be generated.
3. Fiber end faces shall be inspected at 200X or 400X magnification. 200X magnification is suitable for inspecting multimode and single mode fibers. 400X magnification may be used for detailed examination of single mode fibers. Scratched, pitted or dirty connectors shall be diagnosed and corrected.

a. It is preferable that the end face images be recorded in the memory of the test instrument for subsequent uploading to a PC and reporting.

4. Testing shall be performed on each cabling segment (connector to connector).
5. Testing shall be performed on each cabling channel (equipment to equipment) that is planned for use per the owner's instructions.
6. Testing of the cabling shall be performed using high-quality test cords of the same fiber type as the cabling under test. The test cords for OLTS testing shall be between 1 m and 5 m in length.
7. Optical loss testing
   a. Backbone link
      iv. Multimode (OM4) backbone links shall be tested at 850 nm and 1300 nm in accordance with ANSI /TIA-526-14-B, One-cord reference method (Annex A)
      v. Single mode (OS2) backbone links shall be tested at 1310 nm and 1550 nm in accordance with ANSI /TIA-526-7, Method A.1, Insertion Loss Using an Optical Power Meter – One Jumper Cable Measurement.
      vi. Link attenuation does not include any active devices or passive devices other than cable, connectors, and splices, i.e. link attenuation does not include such devices as optical bypass switches, couplers, repeaters, or optical amplifiers.
      vii. Use the One Reference Jumper Method specified by ANSI/TIA -526-14-B, Annex A and ANSI/TIA -526-7, Method A.1. The user shall follow the procedures established by these standards or application notes to accurately conduct performance testing.

8. Magnified End Face Inspection
   a. Fibers shall be inspected at 250X or 400X magnification. 250X magnification is suitable for inspecting multimode and single mode fibers.

9. Length Measurement
   a. The length of each fiber shall be recorded.
   b. It is preferable that the optical length be measured using an OLTS.

10. Polarity Testing
    a. Paired duplex fibers in multi-fiber cables shall be tested to verify polarity in accordance with Clause E.5.3 of ANSI/TIA 568 C.0. The polarity of the paired duplex fibers shall be verified using an OLTS.

C. ADMINISTRATION

1. Test results documentation
   a. Test results saved within the field-test instrument shall be transferred into a Windows™-Excel and in the Fluke LinkWare Cable Test Management Software format. These test records shall be uploaded to the PC unaltered, i.e., "as saved in the field-test instrument". The file format, CSV (comma separated value), does not provide adequate protection of these records and shall not be used.
   b. The test results documentation shall be available for inspection by the Owner or the Owner's representative during the installation period and shall be passed to the Owner's representative within 5 working days of completion of tests on cabling served by a telecommunications room or of backbone cabling. The installer shall retain a copy to aid preparation of as built information.
   c. The database for the complete project, including twisted-pair copper cabling links, if applicable, shall be stored and delivered on CD-ROM, DVD or USB prior to Owner acceptance of the building. CD-ROM, DVD or USB shall include the software tools required to view, inspect, and print any selection of the test reports.
   d. Circuit IDs reported by the test instrument should match the specified label ID.
   e. The detailed test results documentation data is to be provided in an electronic database for each tested optical fiber and shall contain the following information
      i. The identification of the customer site as specified by the end-user
      ii. The name of the test limit selected to execute the stored test results
      iii. The name of the personnel performing the test

iv. The date and time the test results were saved in the memory of the tester
v. The manufacturer, model and serial number of the field-test instrument
vi. The version of the test software and the version of the test limit database held within the test instrument
vii. The fiber identification number
viii. The length for each optical fiber (Optionally the index of refraction used for length calculation when using a length capable OLTS)
ix. Test results to include OLTS attenuation link and channel measurements at the appropriate wavelength(s) and the margin (difference between the measured attenuation and the test limit value).
x. The overall Pass/Fail evaluation of the link-under-test for OLTS measurements
xi. A picture or image of each fiber end-face and a pass/fail status of the end-face based upon visual inspection.

3.5 ACCEPTANCE OF TEST RESULTS

A. Unless otherwise specified by the Owner or the Owners representative, each cabling link shall be in compliance with the following test limits:

1. Optical loss testing
   a. Multimode and Single mode links
      i. The link attenuation shall be calculated by the following formulas as specified in ANSI/TIA-568-C.0.
         a) Link Attenuation (dB) = Cable_Attn (dB) + Connector_Attn (dB) + Splice_Attn (dB)
         b) Cable_Attn (dB) = Attenuation_Coefficient (dB/km) * Length (Km)
         c) Connector_Attn (dB) = number_of_connector_pairs * connector_loss (dB)
         d) Maximum allowable connector_loss = 0.50 dB
         e) Splice_Attn (dB) = number_of_splices * splice_loss (dB)
         f) Maximum allowable splice_loss = 0.3 dB
         g) The values for the Attenuation_Coefficient (dB/km) are listed in the table below:

Type of Optical Fiber	Wavelength (nm)	Attenuation coefficient (dB/km)	Wavelength (nm)	Attenuation coefficient (dB/km)
Multimode 50/125 µm	850	3.5	1300	1.5
Single-mode (Inside plant)	1310	1.0	1550	1.0
Single-mode (Outside plant)	1310	0.5	1550	0.5

2. Magnified end face inspection
   a. Fiber connections shall be visually inspected for end face quality.
   b. Scratched, pitted or dirty connectors shall be diagnosed and corrected.

B. All installed cabling links and channels shall be field-tested and pass the test requirements and analysis as described in Section 3.4. Any link or channel that fails these requirements shall be diagnosed and corrected. Any corrective action that must take place shall be documented and followed with a new test to prove that the corrected link or channel meets performance requirements. The final and passing result of the tests for all links and channels shall be provided in the test results documentation in accordance with Section 3.4.

C. Acceptance of the test results shall be given in writing after the project is fully completed and tested in accordance with Contract Documents and to the satisfaction of the Owner.

Note: High Bandwidth applications such as 1000BASE-SX, 10GBASE-SR, and 40GBASE-SR4 impose stringent channel loss limits. Where practical, certification should consider loss length limits that meet maximum channel (transmitter to receiver) loss.

Performance specification for MM fiber at 850 nm

Fiber Type		Bandwidth	1000BASE-SX		10GBASE-SR		40GBASE-SR4	
	µm	(MHz• Km)	Length (m)	Loss (dB)	Length (m)	Loss (dB)	Length (m)	Loss (dB)
OM1	62.5	200	275	2.38	33	2.5		2.4
OM2	50	500	550	3.56	82	2.3		2.2
OM3	50	1500		3.56	300	2.6	100	1.9
OM4	50	3500			400	2.9	150	1.5

3.6 REPAIR

A. Any connections failing to meet referenced standards or more stringent performance requirements stated above, must be removed and replaced with connections that prove, in additional testing, to meet or exceed the performance standards set forth.

3.7 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time and/or end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning the work.

3.8 CLOSEOUT ACTIVITIES

A. Contractor to submit all test results and any test documentation required prior to acceptance by the Owner.

B. Record copy and as-built drawings

C. Provide record copy drawings periodically throughout the project as requested by the Construction Manager or Owner, and at end of the project on CD-ROM, DVD or USB. Record copy drawings at the end of the project shall be in CAD format and include notations reflecting the as built conditions of any additions to or variation from the drawings provided such as, but not limited to cable paths and termination point. CAD drawings are to incorporate test data imported from the test instruments.

D. The as-built drawings shall include, but are not limited to block diagrams, frame and cable labeling, cable termination points, equipment room layouts and frame installation details. The as-built shall include all field changes made up to construction completion:

1. Field directed changes to pull schedule.
2. Field directed changes to cross connect and patching schedule.
3. Backbone cable routing or location changes.
4. Associated detail drawings.

END OF SECTION 27 08 00

SECTION 27 11 16 - COMMUNICATIONS CABINETS, RACKS, FRAMES AND ENCLOSURES

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. Equipment Racks

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable

D. Items to Be Furnished Only: Not Applicable.

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 270526 – Grounding and Bonding for Communications Systems
2. Section 270553 – Identification for Communications Systems
3. Section 271119 – Communications Termination Blocks and Patch Panels

1.3 SUMMARY

A. Provides specifications for network cabinets, racks, and telecommunications enclosure components utilized to house various telecommunications infrastructure components within technology distribution spaces.

1.4 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

PART 2 - PRODUCTS

2.1 EQUIPMENT RACKS (4-POST)

A. Manufacturer’s List:

1. Chatsworth Products Inc. (CPI)

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each infrastructure component selected shall address the particular requirements.
2. Select relay racks and components capable of supporting the telecommunications cable and equipment quantities required for each location.

C. Description:

1. Racks shall be used for mounting of patch panels, wire management, and network equipment in the MDF Rooms.
2. Racks shall be of high strength aluminum construction.
3. Minimum weight capacity of 1500 lbs. (680 kg).
4. Racks shall be supplied with (2) top angles.
5. Racks shall be 84 inch (2134 mm) high
6. Racks shall contain mounting dimension of a minimum of forty-five (45) rack units marked in a contrasting color.
7. Racks shall be bolted to slab at front and rear flanges and tied to overhead ladder rack for additional stability with threaded rod and Kindorf or the appropriate ladder rack mounting hardware.
8. Racks shall be provided with equipment mounting screws (50 per rack minimum).
9. Rack finish shall be Black.
10. Chatsworth Products Inc. QuadraRack 4-Post Frame Part No. 50120-703

D. Accessory Products:

1. Accessory mounting brackets to accept mounting of two (2) vertical plug strips, Chatsworth PN. TS1012713

2. Provide (2) APC Horizontal PDU (Nema L5-20P) at IDF

3. Provide Total (4) APC Vertical PDU (Nema L5-20P) at MDF

4. Grounding accessories as required to bond all removable rack parts to grounding system. Racks shall be equipped with a vertical Rack Grounding Busbar (RGB) bonded with a #6 AWG wire with green insulation to the nearest Telecom Grounding Busbar (TGB). Use lug type connectors at each end

2.2 HEAVY DUTY WALL MOUNTED RACK

A. Manufacturer's List:

1. Chatsworth Products Inc. (CPI)

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each infrastructure component selected shall address the particular requirements.
2. Select relay racks and components capable of supporting the telecommunications cable and equipment quantities required for each location.

C. Description:

1. Racks shall be used for mounting of patch panels, wire management, and network equipment in the IDF Rooms.
2. Racks shall be of high strength aluminum construction.
3. Rack shall be 40RU
4. Rack shall be Black

5. Chatsworth Products Inc. Heavy Duty Equipment Rack Part No. 15321-724

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section. Examples of work which must be checked include, but are not limited to:

1. Electrical requirements (conduit installation and capacity)
2. Adequate clearances of doors, riser spaces and ceilings for all component of the telecommunications system.
3. Examine and compare the telecommunications drawings and specifications with the drawings and specifications of other trades. Report any discrepancies between them to the A/E and obtain written instructions for changes or revisions.

3.2 EQUIPMENT RACKS & CABINETS

A. Process:

1. Install all racks per the manufacturer's recommended instructions.
2. Furnish and install equipment racks in each location as shown on the drawings, for the mounting of cable and Owner provided equipment. Bond the racks and cabinets to the mesh bonding network/signal reference grid or telecommunications grounding bus bar in the room or below the raised floor with # 6 AWG wire as specified in ANSI/TIA-607-B.
3. Anchor all racks and frames to the raised floor and cross brace to structure above.
4. Seismically brace the products indicated in this specification adhering to construction regulations relative to the buildings seismic zone.
5. Contractor shall request written authorization prior to drilling into any surface more than one and one half inch (1.5") in depth
6. Existing Cabinets to be relocated shall include as part of the contractor's preparation and staging work a visual inspection for missing or damaged material including accessories and power strips. Any irregularities shall be documented and submitted for verification to the Owner and A/E team

3.3 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time and/or end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning the work.

3.4 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.

B. Contractor to submit all as-built drawings and any test documentation required prior to acceptance by the Owner.

END OF SECTION 27 11 16

SECTION 27 11 19 - COMMUNICATIONS TERMINATION BLOCKS AND PATCH PANELS

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. Optical Fiber Termination Shelves
2. Copper Patch Panels

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Not Applicable.

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 270553 – Identification for Communications Systems
2. Section 271116 – Communications Cabinets, Racks, Frames, and Enclosures
3. Section 271313 – Communications Copper Backbone/Tie Cabling
4. Section 271323 – Communications Optical Fiber Backbone/Tie Cabling

1.3 SUMMARY

A. Provides specifications for wall and rack/cabinet-mounted blocks, patch bays, and patch panel components utilized to terminate various telecommunications infrastructure cabling and connectivity.

1.4 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

PART 2 - PRODUCTS

2.1 OPTICAL FIBER TERMINATION SHELVES

A. Manufacturer List:

1. Corning

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. Suitable for mounting in standard EIA 19-inch racks. Each patch panel with quick release hinged front door, hinged rear door, slide out shelf, front facing label panel. Complete with coupler panels and couplers.
2. Each panel shall offer one or more of the following strain relief options: compression glands, or internal clips and entrapment of yarn based impact resistance
3. Each patch panel shall be able to handle a minimum (48) terminated elements in a (1) RMS footprint, including a 24-inch service loop in each fiber element inside the enclosure. The bulkhead adapters are to be segregated in such a way that it will be clear which coupler belongs to each fiber type.
4. Cable Management rings or guides shall be provided to allow individual elements to be stored in the panel without crushing, bending or straining each element.
5. Each panel shall be able to store fiber reserve within the parameter/requirement of the fiber cable manufacturer for minimum bending radius.
6. There shall be sufficient finger space around bulkhead adapters to allow connectors to be mounted and demounted readily.
7. Each patch panel shall be fitted with bulkhead adapters with ceramic alignment sleeves for all styles of connectors. Bulkhead adapters to be sourced from the same manufacturer as the connectors provided as a part of this project, or they are to be recommended by the manufacturer for use with the connector.
8. Panels shall accommodate Plug & Play MPO modules in addition to bulkhead adapters.
9. Panels shall accommodate splice trays as required.
10. Panels shall be sized as indicated on drawings.
11. Used for housing fiber optic backbone cables in all the IDFs and MDF
12. Corning 2RU Fiber Optic Enclosure Part No. CCH-02U

D. Accessory Products:

1. Provide any accessory products related to the optical fiber termination shelves to provide a complete and functional infrastructure system.
2. Coupler panels:
   a. 24-Fiber Multimode LC-LC OM4 MM Connector Panel – CCH-CP24-E4-P03SH
   b. 12-Fiber Single mode LC-LC OS2 SM Connector Panel – CCH-CP12-A9-PO3RH

2.2 COPPER PATCH PANELS – HORIZONTAL CABLES

A. Manufacturer's List:

1. Hubbell

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. Modular RJ45 jack panels.
2. Flat style panels.
3. Panel finish shall be black.
4. Able to meet or exceed the channel specifications of the ANSI/TIA/EIA-568-C.2-10 standard for a Category 6A system up to 500 MHz
5. EIA/TIA T568B wiring scheme.
6. Suitable for mounting in standard EIA 19-inch racks.
7. Strain relief for each cable terminated on the connector. Provide strain relief bars on the rear of all panels.
8. Store cable reserve with no bends sharper than a 2-inch (50 mm) bend radius.
9. Provide sufficient finger space to allow connectors to be mounted and demounted readily.
10. Space for labeling of each individual connector.
11. Shall allow any individual cable to be terminated or otherwise handled without disturbing other cables.
12. Complete with designation strips
13. Used for Workstation and WAP cabling terminations as indicated on drawings.
14. Hubbell 24 Port Cat 6A Angled Patch Panel Part No. HP6A24A
15. Hubbell 48 Port Cat 6A Angled Patch Panel Part No. HP6A48A

D. Accessory Products:

1. Provide any accessory products related to the patch panels to provide a complete and functional infrastructure system

2.3 COPPER PATCH PANELS – BACKBONE CABLES

A. Manufacturer's List

1. Hubbell

B. Product Options

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. 110 to RJ45 patch panels.
2. Angled style panels.
3. Panel finish shall be black.
4. Able to meet or exceed the channel specifications of the ANSI/TIA/EIA-568-C.2 standard for a Category 5e system up to 100 MHz.
5. EIA/TIA T568B wiring scheme.
6. Suitable for mounting in standard EIA 19-inch racks.
7. Provided with a minimum of 24 connectors, as defined in this specification, housed in 1 RMU of usable rack height.
8. Strain relief for each cable terminated on the connector. Provide strain relief bars on the rear of all panels.
9. Store cable reserve with no bends sharper than a 2-inch (50 mm) bend radius.
10. Provide sufficient finger space to allow connectors to be mounted and demounted readily.

11. Space for labeling of each individual connector.
12. Shall allow any individual cable to be terminated or otherwise handled without disturbing other cables.
13. Complete with designation strips
14. Used for backbone cabling terminations as indicated on drawings.
15. Hubbell Cat 5E 24-Port Angeled Patch Panel Part No. HP5E24A

D. Accessory Products:

1. Provide any accessory products related to the patch panels to provide a complete and functional infrastructure system

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section. Examples of work which must be checked include, but are not limited to:

1. Electrical requirements (conduit installation and capacity)
2. Adequate clearances of doors, riser spaces and ceilings for all component of the telecommunications system.
3. Examine and compare the telecommunications drawings and specifications with the drawings and specifications of other trades. Report any discrepancies between them to the A/E and obtain written instructions for changes or revisions.

3.2 COPPER PATCH PANELS

A. Process:

1. Install patch panels for the termination of all copper cables installed under this work. Mount the patch panels into the equipment racks as shown in the drawings. Provide patch panels complete with designation strips.
2. Provide optical fiber patch panels as shown on the drawings for the termination of optical fiber cables installed under this work. Provide patch panels complete with coupler panels, coupler modules, and cable designation strips.
3. Provide horizontal wire management panels between flat patch panels installed in each equipment rack and cabinets; angled patch panels do not require horizontal wire management panels.
4. Install all optical fiber and UTP components under the guidelines of the manufacturer's recommended instructions and per all TIA 568C standards and manufacturer-approved industry practices as shown in the T-series drawings.
5. The installation and performance parameters of all installed cable termination panels shall be verified by the contractor through TIA 568C testing procedures.
6. Label all cable termination panels to identify each port and each specific panel in accordance with the TIA-606-B labeling scheme approved by the Owner.

3.3 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time and/or end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning the work.

3.4 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.

B. Contractor to submit all as-built drawings and any test documentation required prior to acceptance by the Owner.

END OF SECTION 27 11 19

SECTION 27 11 23 - COMMUNICATIONS CABLE MANAGEMENT AND LADDER RACK

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. Horizontal Cable Management Panels
2. Vertical Cable Management Troughs
3. Ladder Rack
4. Innerduct

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Not Applicable.

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 271116 – Communications Cabinets, Racks, Frames, and Enclosures
2. Section 271119 – Communications Termination Blocks and Patch Panels

1.3 SUMMARY

A. Provides specifications for cable management components utilized inside each telecommunications distribution space to support the management of horizontal workstation cabling, backbone cabling, and patch cords.

1.4 RELATED DOCUMENTS

A. Architectural, Mechanical, Electrical, and all Technology drawings.

1.5 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results
2. Results for Communications

PART 2 - PRODUCTS

2.1 HORIZONTAL CABLE MANAGEMENT PANELS

A. Manufacturer's List:

1. Chatsworth Products Inc. (CPI)

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. All horizontal cable management shall be provided in rack unit dimensions as noted in the drawings. Typical heights are 4 RMU
2. All 19" horizontal managers must have sufficient depth and surfaces to allow for Category 6A copper cables bend radii. Typically, (5) 4-inch (101 mm) deep horizontal distribution rings should be provided.
3. Horizontal cable managers shall be single sided and shall provide sufficient depth to allow for Category 6A copper and optical fiber bend radii internally and when entering and/or leaving the wire management frame.
4. All components of the cable management system shall be full metal or high-strength rigid plastic construction and black in color
5. Chatsworth Products Inc. Evolution Cable Management Panel, 4 RMU, Part No. 35441-704

D. Accessory Products:

1. Provide any accessory products related to the wire management components to provide a complete and functional infrastructure system.

2.2 VERTICAL CABLE MANAGEMENT TROUGHS

A. Manufacturer's List:

1. Chatsworth Products Inc. (CPI)

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. Used for organizing patch cords on front and incoming cables at rear of freestanding equipment racks.
2. Aluminum construction with grommet holes for cable pass through, protective edge guards, cable retaining latches, and solid cover.
3. Include plastic T-shaped cable guides with opening that align with each rack-mount unit space on the rack.
4. All vertical cable management on 2-post & 4-post equipment racks shall be 10-inches or 12-inches (254 mm) in width between racks unless otherwise noted on the drawings
5. All vertical cable management on 2-post & 4-post equipment racks shall be 6-inches (203 mm) in width at end of row unless otherwise noted on the drawings.

6. All vertical cable management on 2-post & 4-post equipment racks shall be 7-feet (2.1m) in height unless otherwise noted on the drawings.
7. All vertical cable management on 2-post & 4-post equipment racks shall be 24.5-inches (622 mm) in depth unless otherwise noted on the drawings.
8. Dual hinged, removable, full-length doors shall be provided on the front of the management.
9. Mounted directly to equipment racks between adjacent racks and at any open rack ends as shown on equipment elevation drawings.
10. Color: Black.
11. Chatsworth Products Inc. Evolution g2 Double Sided Vert Cable Man 10":
Part No. 35523-703
12. Chatsworth Products Inc. Evolution g2 Double Sided Vert Cable Man 6":
Part No. 35521-703

D. Accessory Products:

1. Velcro cable ties - Velcro strips ¾" wide, releasable and reusable 15'roll. Panduit Velcro cable ties or approved equivalent.
2. Provide any accessory products related to the wire management components to provide a complete and functional infrastructure system.

2.3 LADDER RACK

A. Manufacturer's List:

1. Chatsworth Product Inc. (CPI)

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. Open rung TELCO-style ladder type cable tray with runway dropouts, complete with splice hardware, runway termination hardware, and ceiling support hardware. Constructed of steel tubing with 12-inch (305 mm) rung spacing.
2. Size: As indicated on drawings.
3. Cross-members welded at 12-inch (305 mm) intervals.
4. Color: Black
5. Chatsworth Universal cable runway or approved equal.

D. Accessory Products:

1. Radius drop-cross member, radius drop-stringer, junction splice kit, butt splice kit, wall angle support kit, end closing kit, protective end caps, "L" bracket for ground wire support, 6" cable runway elevation kit.

2.4 INNERDUCT

A. Manufacturer's List

1. Tyton (or approved equivalent)

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements

C. Description:

1. 1 ¼" corrugated innerduct to be installed in conduit per direction shown on drawings. Innerduct to be labeled with tags indicating A, B, C

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section. Examples of work which must be checked include, but are not limited to:

1. Electrical requirements (conduit installation and capacity)
2. Adequate clearances of doors, riser spaces, and ceilings for all component of the telecommunications system.
3. Examine and compare the telecommunications drawings and specifications with the drawings and specifications of other trades. Report any discrepancies between them to the A/E and obtain written instructions for changes or revisions.

3.2 HORIZONTAL CABLE MANAGEMENT PANELS

A. Process:

1. Install all horizontal cable management per the manufacturer's recommended installation instructions, as indicated in the T-series drawings.
2. All cable bundles inside the telecommunications rooms shall be secured with Velcro™ cable wraps; plastic wire ties are not acceptable.
3. Velcro™ wraps shall not be pulled tight enough to kink the cable jacket.

3.3 VERTICAL CABLE MANAGEMENT TROUGHS

A. Process:

1. Install all vertical cable management troughs per the manufacturer's recommended installation instructions, as indicated in the project drawings. Follow all mounting and support guidelines

3.4 LADDER RACK

A. Process:

1. Install all ladder rack per the manufacturer's recommended installation instructions, as indicated in the project drawings. Follow all mounting and support guidelines.

3.5 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time and/or end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning the work.

3.6 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review by the Owner and A/E team.

B. Contractor to submit all as-built drawings and any test documentation required prior to acceptance by the Owner.

END OF SECTION 27 11 23

SECTION 27 13 13 - COMMUNICATIONS COPPER BACKBONE CABLING

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. 25-Pair Category 5E Cable
2. RG6 Coaxial Cable

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Not Applicable

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 270553 – Identification for Communications Systems
2. Section 270800 – Commissioning of Communications
3. Section 271116 – Communications Cabinets, Racks, Frames and Enclosures
4. Section 271119 – Communications Termination Blocks and Patch Panels

1.3 SUMMARY

A. Provides specifications for UTP copper tie cabling to distribute network signals between telecommunications distribution spaces.

1.4 RELATED DOCUMENTS

A. Architectural, mechanical, electrical, and all technology drawings.

1.5 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

PART 2 - PRODUCTS

2.1 BACKBONE MULTI-PAIR UTP CABLE

A. Manufacturer's List:

1. Hubbell

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. 25-Pair Binder Unshielded Twisted Pair Cable
2. Physical Specifications: 24 AWG, solid copper conductors, 100 Ohm nominal impedance +/ 15%
3. Electrical characteristics: Superior to the individual characteristics established in ANSI/TIA/EIA-568-C.2 for Category 5e cable performance.
4. Supports 10BASE-T, 100BASE-T, TP-PMD, Voice, Multimedia, and 155 Mb/s ATM.
5. Mechanical requirements:
   a. Conductors: 24 AWG - solid bare copper
   b. Outer Jacket: PVC
   c. Conductor Insulation: Polyethylene
   d. UL listed, Type CMP (plenum rated)
6. Cable color shall be Gray
7. Used for building backbone cabling distribution as indicated on the drawings.
8. Hubbell Category 5E Backbone 25-Pair UTP cable, Part No. C5ELPPGY

2.2 RG6 COAXIAL CABLE

A. Manufacturer's List:

1. Belden

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. RG 6 Coaxial cable indoor rated
2. 75 ohms
3. Minimum 60% Aluminum braid
4. 18 AWG
5. SCBA Compliant
6. Contractor shall provide 20' slack at both ends of cable run connecting MDF to IDF
7. Belden RG 6 18 AWG BCCS, Foil + Braid, CMR Part No. 1829R

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section. Examples of work which must be checked include, but are not limited to:

1. Electrical requirements (conduit installation and capacity)
2. Adequate clearances of doors, riser spaces and ceilings for all component of the telecommunications system.
3. Examine and compare the telecommunications drawings and specifications with the drawings and specifications of other trades. Report any discrepancies between them to the A/E and obtain written instructions for changes or revisions.

3.2 COPPER CABLING

A. Process:

1. Install all copper tie cable per the manufacturer’s recommended installation instructions, under the guidelines of TIA 568-C and BICSI, and in quantities indicated in the T-series drawings.
2. Install all cables with proper attention paid to bend radii, pulling method, attachment method, and pulling forces. The cable manufacturer's specifications for each particular cable type shall be followed exactly.
3. Tie cable shall be visually inspected for insufficient bend radius during and after pulling. Damaged cables, or those installed under questionable methods and/or circumstances shall be replaced at no additional cost to the owner.
4. All cable shall be pulled using an appropriate measuring device to ensure that the specified force is not exceeded as noted in BICSI guidelines.
5. Install tie cables “end-to-end” without splicing between the intended termination points within each telecommunications room with attention paid to aesthetic means and methods when routing cabling within IT spaces.
6. No tie cable shall be left unsupported for more than three (3) feet vertically or horizontally at any time.
7. All tie cables shall be clearly labeled on both ends and in an accessible location no more than one (1) foot from each cable end.

3.3 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time and/or end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning the work.

3.4 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.

B. Contractor to submit all as-built drawings and any test documentation required prior to acceptance by the Owner.

END OF SECTION 27 13 13

SECTION 27 13 23 - COMMUNICATIONS OPTICAL FIBER BACKBONE CABLING

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. Multimode Fiber Optic Cable
2. Single mode Fiber Optic Backbone Cable

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Not Applicable.

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 270553 – Identification for Communications Systems
2. Section 270800 – Commissioning of Communications
3. Section 271116 – Communications Cabinets, Racks, Frames, and Enclosures
4. Section 271119 – Communications Termination Blocks and Patch Panels
5. Section 271323.13 – Communications Optical Fiber Splicing and Terminations

1.3 SUMMARY

A. Provides specifications for optical fiber tie cabling to distribute optical network signals between telecommunications distribution spaces.

1.4 RELATED DOCUMENTS

A. Architectural, Mechanical, Electrical, and all technology drawings.

1.5 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

PART 2 - PRODUCTS

2.1 BACKBONE MULTIMODE FIBER OPTIC CABLE

A. Manufacturer's List:

1. Corning

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. Tight-buffered Multimode fiber optic cable with a plenum-rated outer jacket.
2. Total strand count as noted in drawings.
3. ISO/IEC 11801 – OM4 grade fiber optic cable.
4. Multimode Distribution Cable Elements. The Multimode Optical Fiber Cable shall as a minimum conform to the following specifications.
    1) 50/125-micron multimode optical fiber cable (tolerances 50 +/-2 micron, 125 +/-2 micron) with glass core and cladding
    2) Graded refractive index profile
    3) Attenuation coefficient at 850 nm of 0.7 dB/km or less
    4) Attenuation coefficient at 1300 nm of 0.7 dB/km or less
    5) Serial 1 Gigabit Ethernet distance of 1000m at the 850 nm wavelength.
    6) Serial 10 Gigabit Ethernet distance of 550m at the 1300 nm wavelength
    7) Core non-circularity +/- 6% maximum
    8) Core/ cladding offset 3.0-micron maximum
    9) Numerical aperture 0.275 (+/- 0.015)
    10) Individual optical elements distinguishable at ends by color-coded buffered coatings conforming to ANSI/TIA 598-C - Color Coding of Fiber Optic Cables.
    11) Individual glass elements proof tested at 100 Kpsi (100,000 lbs. per square inch)

5. UL listed, Type OFNP, used for:
    a. Intrabuilding IDF, MDF data backbone cabling distribution
    b. Corning 24 Strand Multimode Fiber Optic Cable Part No. 024T81-33190-24
    c. Cable shall meet the specification for fiber optical cable detailed in the ANSI/TIA-568-C.3 Optical Fiber Cabling Components Standard

2.2 SINGLEMODE FIBER OPTIC CABLE – BACKBONE

A. Manufacturer's List:

1. Corning

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. Singlemode fiber optic cable with a riser-rated outer jacket.
2. Total strand count as noted in drawings.
3. ISO/IEC 11801 – OS2 grade fiber optic cable.
4. Multimode Distribution Cable Elements. The Multimode Optical Fiber Cable shall as a minimum conform to the following specifications.
    1) 50/125-micron multimode optical fiber cable (tolerances 50 +/-2 micron, 125 +/-2 micron) with glass core and cladding
    2) Graded refractive index profile
    3) Attenuation coefficient at 850 nm of 0.7 dB/km or less
    4) Attenuation coefficient at 1300 nm of 0.7 dB/km or less
    5) Serial 1 Gigabit Ethernet distance of 1000m at the 850 nm wavelength.
    6) Serial 10 Gigabit Ethernet distance of 550m at the 1300 nm wavelength
    7) Core non-circularity +/- 6% maximum
    8) Core/ cladding offset 3.0-micron maximum
    9) Numerical aperture 0.275 (+/- 0.015)
    10) Individual optical elements distinguishable at ends by color-coded buffered coatings conforming to ANSI/TIA 598-C - Color Coding of Fiber Optic Cables.
    11) Individual glass elements proof tested at 100 Kpsi (100,000 lbs. per square inch)
5. UL listed, Type OFNP, OFNR used for:
    a. Intra building data backbone cabling distribution
6. Corning 12-Strand OS2 Distribution fiber cable Part No. 012E81-33131-24

D. Cable shall meet the specification for fiber optical cable detailed in the ANSI/TIA-568-C.3 Optical Fiber Cabling Components Standard

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section. Examples of work which must be checked include, but are not limited to:

1. Electrical requirements (conduit installation and capacity)
2. Adequate clearances of doors, riser spaces and ceilings for all component of the telecommunications system.
3. Examine and compare the telecommunications drawings and specifications with the drawings and specifications of other trades. Report any discrepancies between them to the A/E and obtain written instructions for changes or revisions.

3.2 OPTICAL FIBER CABLE

A. Process:

1. Install all cable per the manufacturer’s recommended installation instructions, under the guidelines of TIA 568-C and BICSI, and in quantities indicated in the series drawings.
2. Install all cables with proper attention paid to bend radii, pulling method, attachment method, and pulling forces. The cable manufacturer's specifications for each particular cable type shall be followed exactly.
3. Cable shall be visually inspected for insufficient bend radius during and after pulling. Damaged cables, or those installed under questionable methods and/or circumstances shall be replaced at no additional cost to the owner.

4. All cable shall be pulled using an appropriate measuring device to ensure that the specified force is not exceeded as noted in BICSI guidelines.
5. Install cables with attention paid to aesthetic means and methods when routing cabling within IT spaces. No cable shall be left unsupported for more than three (3) feet vertically or horizontally at any time.
6. All cable shall be securely fastened to the termination shelf in a way that does not damage the optical fiber strands or impede the performance of the media. This secure fastening method shall also serve to insure a secure termination environment.
7. A minimum of three feet (3'-0") of each optical fiber strand shall be left protected within the termination shelf for any future re-termination of a particular optical fiber strand.
8. All cables shall be clearly labeled on both ends and in an accessible location no more than one (1) foot from each cable end.

3.3 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time and/or end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning the work.

3.4 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.

B. Contractor to submit all as-built drawings and any test documentation required prior to acceptance by the Owner.

END OF SECTION 27 13 23

SECTION 27 13 23.13 - COMMUNICATIONS OPTICAL FIBER SPLICING AND TERMINATIONS

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. Fusion Splicing Device

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Not Applicable.

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 270800 – Commissioning of Communications
2. Section 271116 – Communications Cabinets, Racks, Frames, and Enclosures
3. Section 271119 – Communications Termination Blocks and Patch Panels
4. Section 271323 – Communications Optical Fiber Backbone Cabling

1.3 SUMMARY

A. Provides specifications for optical fiber cable termination and splicing for each strand of optical fiber inside termination shelves.

1.4 RELATED DOCUMENTS

A. Architectural, mechanical, electrical, and all technology drawings.

1.5 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

PART 2 - PRODUCTS

2.1 FUSION SPLICING DEVICE

A. Manufacturer's List:

1. Fujikura
2. Sumitomo Electric Lightwave

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. The fusion device shall be portable, fully automatic and compact.
2. Splicer electrodes shall contain an arc-stabilizing feature to prevent spontaneous position shift of the arc emission zone to reduce the average splice loss by up to 50% and also the standard deviation compared to standard electrodes. The splicer shall require minimal maintenance, allowing up to 7000 splices between cleanings.
3. Procedures such as pre-alignment, cleaning, gap-setting, cleave angle monitoring, core-to-core alignment and glass fusion shall be microprocessor-controlled. Multiple splice programs with individual parameter settings shall be selectable, with seven pre-set single-mode and two multimode programs.
4. Course pre-alignment shall be performed automatically; therefore, accurate manual pre-alignment of the fibers shall not be necessary. Precise pre-alignment in z-axis shall be automatically performed with two-step motors. Fine positioning and final alignment of the fibers in three (x, y and z) directions shall be automatically performed with piezo-ceramic actuators, which have a positioning resolution better than 0.1 μm.
5. Upon completion of the splice, the splice loss shall be evaluated automatically. The splice loss value shall be displayed on the LCD display in decibels (dB).
6. The splicer shall be compliant with FCC CISPR 22 EMI and with the "Electromagnetic Compatibility" directive 89/336/EEC and the low voltage directive 73/23/EEC (applicable to only the battery charger).

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section.

3.2 FUSION SPLICER DEVICE

A. Process:

1. Follow manufacturer's instructions at all times when operating the optical fiber fusion splicing device. Pay particular attention to cleanliness and axis alignment.
2. The technician shall utilize the integrated tensile testing function of the splicing device after each splice to analyze the strength of the fiber joint. The tensile testing load shall be 1.5 N (0.34 lbf) and shall be applied for approximately one second. Any splice failing the tensile test shall be re-spliced immediately.

3.3 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time and/or end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning the work.

3.4 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.

B. Contractor to submit all as-built drawings and any test documentation required prior to acceptance by the Owner.

END OF SECTION 27 13 23.13

SECTION 27 15 13 - COMMUNICATIONS COPPER HORIZONTAL CABLING

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. 4-pair UTP cable – Category 6A

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Not Applicable.

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 270553 – Identification for Communications Systems
2. Section 270800 – Commissioning of Communications
3. Section 271116 – Communications Cabinets, Racks, Frames, and Enclosures
4. Section 271119 – Communications Termination Blocks and Patch Panels
5. Section 271543 – Communications Faceplates and Connectors

1.3 SUMMARY

A. Provides specifications for 4-pair copper horizontal workstation cabling to distribute network signals from telecommunications distribution spaces to workstation outlet locations.

1.4 RELATED DOCUMENTS

A. Architectural, mechanical, electrical, and all technology drawings.

1.5 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

PART 2 - PRODUCTS

2.1 4-PAIR UTP CABLING

A. Manufacturer's List:

1. Hubbell

B. Product Options:

1. The manufacturers noted above shall be the only manufacturers acceptable to the Owner and Design-Builder.

C. Description

1. One (1) 4-pair UTP Category 6A cable with a plenum rated outer jacket.
2. Physical specifications: 4 twisted pair – 23 AWG, solid copper conductors, 100-Ohm nominal impedance +/ 15%.
3. Electrical characteristics: Able to meet or exceed the channel specifications of ANSI/EIA/TIA-568-C-2.10 standard, "Transmission Performance Specifications for 4-Pair 100 Ohm Augmented Category 6A Cabling", with available bandwidth up to 500 MHz
4. Mechanical requirements:
   a. Conductors: 23 AWG - solid bare copper
   b. Outer Jacket: Flame retardant PVC
   c. Conductor Insulation: FEP
   d. Break Strength: Minimum 90 lbs.
5. Color Code:
   a. Jacket: Blue for all Data locations
   b. Jacket: Yellow for Security Camera locations only
6. Insulation:
   a. Pair 1: White/Blue - Blue/White
   b. Pair 2: White/Orange - Orange/White
   c. Pair 3: White/Green - Green/White
   d. Pair 4: White/Brown - Brown/White
7. UL listed, Type CMP.
8. Hubbell Category 6A Part No. C6ASPB (Blue)
9. Hubbell Category 6A Part No. C6ASPY (Yellow)

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section. Examples of work which must be checked include, but are not limited to:

1. Electrical requirements (conduit installation and capacity)
2. The TRs are the size shown on the project drawings.

3. Adequate clearances of doors, riser spaces and ceilings for all component of the telecommunications system.
4. Examine and compare the telecommunications drawings and specifications with the drawings and specifications of other trades. Report any discrepancies between them to the A/E and obtain written instructions for changes or revisions.

3.2 4-PAIR CABLING INSTALLATION

A. Process:

1. Install all horizontal station cabling per the manufacturer's recommended installation instructions, under the guidelines of TIA/EIA-568C and BICSI standards, and in quantities indicated in the drawings.
2. Install all cables with proper attention paid to bend radii, pulling method, attachment method, and pulling forces. All cable shall be pulled using an appropriate measuring device to ensure that the specified force is not exceeded as noted in TIA/EIA 568C and BICSI guidelines. Also refer to the cable manufacturer's specifications for exact cable requirements per the particular cable type.
3. All cables shall be visually inspected for insufficient bend radius during and after pulling. Damaged cables, or those installed under questionable methods and/or circumstances shall be replaced at no additional cost to the owner.
4. Contractor shall ensure that all TIA/EIA and industry standards are met with special regards to maximum stripping length of cable jackets. No four (4) pair F/UTP cables shall have more than ½ inch (12.7 mm) of cable jacket removed beyond the termination points.
5. Install the horizontal cabling with attention paid to aesthetic means and methods when routing cabling within IT spaces.
6. All cabling distributed horizontally through metal stud framing shall have plastic protective bushings inserted to protect cables prior to installation.
7. All cables shall be clearly labeled on both ends and in an accessible location no more than 6-inches (152 mm) from the cable ends.
8. The owner reserves the right to specify a new location for any outlet or equipment without increasing contractor unit cost – providing that the new location is specified prior to roughing-in of technology cable and is not farther than 10-feet (3m) away from the original location specified.
9. When conduits, sleeves and cable trays (provided under the electrical work) are not present, support all cables with J-hooks and/or cable straps mounted to the ceiling above. Provide supports at maximum 5-foot intervals. Do not install more than 24 cables in any single J-hook for support. When more than 24 cables must be installed, provide additional J-hooks or cable straps.
10. Install workstation cable in accordance with this Specification, the approved Cable Termination Schedule, the manufacturer's recommendations, and the Telecommunications Distribution Drawings.
11. After dressing each cable to its final location, remove only enough jacketing to allow the conductors to be splayed and terminated in a neat and uniform fashion. Every effort shall be made to maintain jacketing integrity by removing only as much jacketing as is practical to accomplish termination. For twisted pair cables, maintain the manufacturers' twisting of the wire pairs through to the point of termination.
12. Install all U/UTP cable according to manufacturer's installation standards.
13. Terminate all cables neatly, with enough slack to pull off, test, re-cut and re-terminate each cable as needed.
14. When pulling cables through conduits, leave in-place all draglines for future use.
15. Provide a 12-inch (305 mm) service loop at all workstation locations unless otherwise noted. The workstation loops shall be stored at the top of each conduit stub-up in the accessible ceiling area, or wherever it is possible to be concealed and supported.
16. Provide Velcro tie wraps to organize and bundle all category rated cabling installed under this Work. Install the approved Velcro strips long enough to overlap at least 1.5 inches (38 mm) around the installed cables. Plastic tie wraps shall not be used.
17. Do not allow telecommunication cables to run parallel with electrical cables/conduits, unless they are separated by a minimum of 12-inches (305 mm).
18. Any telecommunications cable that must cross over electrical cables/conduits shall do so only at 90-degree angles.

19. Do not lay telecommunications cables unprotected on the floor at any time. If cables must be left on any floor, protect the cables so that they may not be walked on or have any material or equipment placed or rolled on top.
20. Maintain manufacturer's recommended minimum bend radius of the cables. Do not stretch, stress, tightly coil, bend or crimp the workstation cables during the installation or when leaving them out of the way of other trades during the staging of the work. The Contractor, at the Contractors sole expense, shall replace all abused or stressed cables.

3.3 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time and/or end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning the work.

3.4 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.

B. Contractor to submit all as-built drawings and any test documentation required prior to acceptance by the Owner.

END OF SECTION 27 15 13

SECTION 27 15 43 - COMMUNICATIONS FACEPLATES AND CONNECTORS

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. UTP Connectors
2. Coax Connectors
3. Outlet Housing Components (faceplates etc.…)

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Not Applicable.

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 270553 – Identification for Communications Systems
2. Section 270800 – Commissioning of Communications
3. Section 271513 – Communications Copper Horizontal Cabling

1.3 SUMMARY

A. Provides specifications for fiber optic backbone, horizontal workstation cable termination components, and outlet housing components. Includes wall-mount, floor-mount, and ceiling-mount components to support the various workstation outlets throughout the cabling plant.

1.4 RELATED DOCUMENTS

A. Architectural, mechanical, electrical, and all technology drawings.

1.5 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

PART 2 - PRODUCTS

2.1 UTP CONNECTORS

A. Manufacturer's List:

1. Hubbell

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. Non-keyed 8 pin modular connectors, suitable to terminate UTP 4-pair cables. Suitable to be mounted in corresponding faceplate, mounting plate or surface mount box.
2. Provide Category 6A rated eight-conductor RJ45 connector.
3. EIA/TIA T568B wiring scheme.
4. Performance criteria: Able to meet or exceed the channel specifications of the ANSI/TIA/EIA-568-C.2-10 standard for Augmented Category 6A system performance up to 500 MHz
5. Color: Multiple Different Colors, to be confirmed before ordering
6. Colors to be coordinated with Architect during submittal phase
7. Hubbell Category 6A Connector Part No. HJU6AW

D. Accessory Products:

1. Color-coded Icons – furnish and install (1) color-coded icon for each UTP connector installed in this project. Exact colors and styles shall be determined during product submittal review.
2. Provide any accessory products related to the UTP connectors required to provide a complete and functional infrastructure system.

2.2 COAX CONNECTORS

1. Belden

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. Exact connector type shall be provided prior to ordering. For bidding purpose please price Direct TV approved Compression connectors

2.3 OUTLET HOUSING COMPONENTS

A. Manufacturer's List:

1. Hubbell

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description:

1. All outlet housings at the various technology outlet locations shall provide the designated number modular insert ports as indicated in the drawings.
2. All flush-mounted faceplates shall be available in one (1), two (2), three (3), & four (4) port configurations of the same single gang style outlet Faceplates for wall-mounted phones shall be one (1) port stainless-steel single gang faceplates that have wall-mount lugs allowing vertical phone mounting.
3. Faceplates for flush floor mounted outlets shall be coordinated with the floor box that will be selected and installed outside the scope of this section.
4. System furniture faceplates shall be capable of fitting in the furniture system selected by the Owner. Quantity of furniture faceplates shall satisfy outlet jack requirements. Furniture faceplate extenders shall be used (if required) to maintain proper bend radii within the furniture raceway/pathway.
5. Surface mounted boxes shall be capable of the quantity of outlet jack requirements at each outlet locations indicated in the drawings. Provision (1) surface mount outlet box at all furniture-mounted outlet locations and Wireless Access point locations in the ceiling
6. All surface mounted boxes installed above ceiling in plenum air spaces shall be plenum rated.
7. Surface-raceway mounted outlets shall be capable of being installed within surface-raceway provided and installed by others. Contractor to provide appropriate mounting bezels and keystone jacks (as necessary) for proper mounting within surface raceway.
8. All outlet-housings shall provide a clear TIA/EIA 606-B labeling location for both the individual outlet port and the entire outlet housing location, unless otherwise indicated in the project drawings.
9. All faceplates shall be provided in a color that matches the electrical trim color unless otherwise noted in the drawings. Colors to be coordinated with Architect during submittal phase.

D. Accessory Products:

1. Provide any accessory products related to the workstation outlet housing components required to provide a complete and functional infrastructure system.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section.

B. Confirm all housings including back boxes, floor boxes and poke-through provided for the telecommunications connectivity system will support the installation of project approved manufacturer components prior to purchase of the components described in this specification.

3.2 UTP CONNECTORS

A. Process:

1. Install all connectors under the guidelines of the manufacturers' recommended instructions and per all TIA-568-C standards, BICSI guidelines, and manufacturer approved industry practices.
2. The installation and performance parameters of all installed couplers and connectors shall be verified by the trade contractor through TIA-568-C testing procedures.
3. Color of all connectors shall be coordinated with the Architect and/or Owner before purchase and installation.

3.3 OUTLET HOUSINGS

A. Process:

1. Color of all outlet housing components shall be coordinated with the Architect and/or Owner before purchase and installation.
2. All technology outlets located on walls shall be flush mounted, level and plumb.
3. All technology outlets shall be mounted at right angles and parallel to the floor, unless installation requirements or design dictate otherwise.
4. Install blank inserts in outlet housing spaces that are not being filled with cable termination modules. Blank inserts shall match the workstation housing color, unless otherwise indicated in the drawings.
5. All outlets located in systems furniture may be served from a wall adjacent to the furniture cluster or a floor box/floor-feed. If the cable is exposed prior to entering furniture raceway, install spiral wrap tubing to protect the cable per the manufacturer's recommendations.
6. All outlet housings as well as each individual utilized port must be labeled in accordance with the Owner-approved labeling scheme.

3.4 RE-INSTALLATION

A. No additional burden to the owner regarding costs, network down-time and/or end user interruption shall result from the re-installation of specified components. Scheduling for re-installation work shall be coordinated, in writing, with the owner prior to beginning the work.

3.5 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.

B. Contractor to submit all as-built drawings and any test documentation required prior to acceptance by the Owner.

END OF SECTION 27 15 43

SECTION 27 16 19 - COMMUNICATIONS PATCH CORDS AND STATION CORDS

PART 1 - GENERAL

1.1 GENERAL PROVISIONS

A. Attention is directed to the CONTRACT AND GENERAL CONDITIONS and all Sections within DIVISION 01 - GENERAL REQUIREMENTS which are hereby made a part of this Section of the Specifications.

1.2 DESCRIPTION OF WORK

A. Work Included: Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

1. 4-pair UTP Patch cords
2. Coax Patch Cords
3. Fiber Optic Patch Cords

B. Alternates: Not Applicable.

C. Items to Be Installed Only: Not Applicable.

D. Items to Be Furnished Only: Furnish the following items for installation by the designated Sections

1. Section 271619 - Communications Patch Cords, Station Cords, And Cross Connect Wire
   a. 4-pair UTP patch cords

E. Related Work: The following items are not included in this Section and will be performed under the designated Sections:

1. Section 270553 – Identification for Communications Systems
2. Section 270800 – Commissioning of Communications
3. Section 271119 – Communications Termination Blocks and Patch Panels
4. Section 271543 – Communications Faceplates and Connectors

1.3 SUMMARY

A. Provides specifications for 4-pair copper horizontal workstation cabling to distribute network signals from telecommunications distribution spaces to workstation outlet locations.

1.4 RELATED DOCUMENTS

A. Architectural, mechanical, electrical, and all technology drawings.

1.5 REFERENCES

A. Codes and Regulations: (Note: Reference Division 01 for specific code versions governing the work in addition to the information noted below).

1. Refer to Section 270500 – Common Work Results for Communications

PART 2 - PRODUCTS

2.1 COPPER PATCH CORDS

A. Manufacturer's List:

1. Hubbell

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements.

C. Description

1. Physical Specifications: 4-pair, 24 AWG stranded copper UTP cable, with male 8-pin modular RJ45 plugs with insert-molded strain relief on both ends.
2. Performance Characteristics: Able to meet or exceed the channel specifications of the ANSI/TIA/EIA-568-C.2-10 standard for Category 6A cable up to 500 MHz
3. All patch cords supplied must comply with ANSI/TIA/EIA-568-C.2-1, Production Modular Cord NEXT Loss Test Method, and Requirements for UTP Cabling.
4. Wiring: T568B.
5. Contractor shall provide and include into the bid sum the price for the patch cords shown in the following quantities:
   a. @ IDF/MDF Closet:
      1) Contractor shall furnish and install (1) Category 6A copper patch cord per cable installed. Patch cords shall be multi-length with minimal slack.

   b. @ Workstation/Outlet End:
      1) Contractor shall furnish and turn over (1) Category 6A copper patch cord per faceplate installed.
      2) Exact patch cord lengths shall be provided prior to ordering.

6. Hubbell Category 6A Patch Cord Part No. HC6ABxx "xx"-Length

2.2 COAX PATCH CORDS

A. Manufacturer's List:

1. Belden

B. Product Options:

1. The indicated manufacturers shall be the basis of the design and each assembly selected shall address the particular infrastructure requirements

C. Description

1. @ Workstation/Outlet End:
   a. Contractor shall provide (1) coax patch cord per cable installed.
   b. Exact patch cord lengths shall be provided prior to ordering.

2.3 FIBER PATCH CORDS

1. Contractor shall provide and include into the bid sum the price for the patch cords shown in the following quantities:

   a. Corning SM & MM Fiber Patch Cords @ xxx Feet, connectors to be determined as per client direction
   b. For pricing purposes, include twenty (25) patch cords to furnish & install

PART 3 - EXECUTION

3.1 EXAMINATION

A. Check actual site conditions prior to start of any work. Ensure all preceding trade work associated with the telecommunications system is accurate and complete before proceeding with installation or use of products specified in this section. Examples of work which must be checked include, but are not limited to:

1. Electrical requirements (conduit installation and capacity)
2. The MDF is the size shown on the project drawings.
3. Adequate clearances of doors, riser spaces and ceilings for all component of the telecommunications system.
4. Examine and compare the telecommunications drawings and specifications with the drawings and specifications of other trades. Report any discrepancies between them to the A/E and obtain written instructions for changes or revisions

3.2 CLOSEOUT ACTIVITIES

A. Contractor shall provide documentation of all telecommunications system components under this section utilized throughout the site for review and reference by the Owner and A/E team.

B. Contractor to submit all as-built drawings and any test documentation required prior to acceptance by the Owner.

END OF SECTION 27 16 19

SECTION 27 41 16 - AUDIOVISUAL SYSTEMS

PART 1 GENERAL

1.1 SUMMARY

A. Section includes the following:

1. Audiovisual equipment/systems and related control systems & programming.

B. Related Work

1. Audiovisual Contractor shall coordinate with the Structured Cabling Contractor for connection of all network enabled AV equipment to the structured cabling system (twisted pair and coaxial cabling).
2. Audiovisual Contractor shall coordinate with the Owner for connection of all network enabled AV equipment to Owner provided network switches, PoE power, wireless access points, VoIP interfaces as indicated on the drawings and equipment lists.
3. Audiovisual Contractor shall coordinate with the General Contractor and Electrical Contractor for final locations and routing of all audiovisual infrastructure including power, empty low voltage backboxes/conduit, required fire rated penetrations supporting all audiovisual equipment.
4. Audiovisual Contractor shall coordinate with the General Contractor and Miscellaneous Metals Contractor for location and attachment method of all structure/support systems provided under this scope of work for displays, video walls, speakers, cameras, racks and all other audiovisual equipment that is secured to the building.
5. Audiovisual Contractor shall coordinate with General Contractor for site logistics, schedule and access.

1.2 GENERAL CONDITIONS

A. The General Conditions, Requirements, and Special Provisions, of the larger body of specifications, of which this specification is a part, are hereby made a part of this specification. In the event that any clauses or provisions of the larger body of specification conflict with the letter or intent of this specification, the Contractor shall immediately notify the Consultant for clarification and direction.

1.3 THE SPECIFICATION

A. The “Specification” is defined as the body of documentation provided to the Contractor with the Request for Quotation, as well as all addenda to said documentation. Throughout this document, words such as “herein” refer to the entire Specification, and not just this written document.

1. The Specification includes, but is not limited to:

a. This written specification document.

b. The attached Audiovisual Systems Equipment List

c. All drawings, as listed in the List of Drawings or indicated on the drawing package cover page.

d. Additions and/or modifications as detailed in written addenda.

e. Additions and/or modifications as detailed in drawing additions or reissues.

B. Definition of Terms

1. Within this section of the specification, the following definitions shall apply:

2. The term “Owner” is used to indicate: Vassar College

3. The term “Architect” is used to indicate: Frederick Fisher and Partners

4. The term "General Contactor" or "Construction Manager" is the entity responsible for fit out of the interior spaces and coordination of all subcontractors

5. The term “Consultant” is used to indicate: Cerami & Associates

6. The term “Bidder” is used to indicate that entity generating the bid response.

7. The term “Contractor” is used to indicate the successful Bidder to whom the Owner has awarded the contract.

8. The term “Furnish” is used to indicate the responsibility to procure and ship or deliver the item to the job site, freight prepaid, for receipt, staging and installation by others.

9. The term “Install” or “Installation” is used to indicate the responsibility of receiving the item at the job site, assuring adequate storage, unpacking or uncrating the item, physically securing the item or otherwise making ready the item for its intended use by following the instructions and approved methods of the manufacturer and those contained herein.

10. The term “Provide” is used to indicate the responsibility to both “Furnish” and “Install”.

11. The term “Provided by Others” shall refer to material and work, which is related to this contract, but has been provided by parties other than the AV Contractor. An example might be in reference to a projection screen installed during building construction but requiring interface to the AV control system.

12. The terms “NIC” and “Not in Contract” are equivalent to “Provided by Others”.

13. The term “OFCI” (Owner Furnished Contractor Installed) shall refer to equipment that will be furnished by the Owner for installation by the Contractor. The Contractor shall be responsible for installing and integrating this equipment as detailed herein.

14. The term “Installation Materials” shall reference installed cable, loose cable, terminations, cable management, voice/data/video patch cords, adapters, I/O panels, cable dressing, lacing bars, copper bus bars, labels, rack shelves, rack mounts, power strips/distribution and other materials as needed to install the systems defined herein.

15. The term “shall” is mandatory; the term “will” is informative; and the term “should” is advisory.

1.4 BIDDER QUALIFICATIONS

A. Unless superseded by the General Conditions or Owner’s Representative request for proposal documents the following qualifications are required for any bidder of this scope of work.

B. Contractor Qualification Requirements: Bidder shall submit on or before the date of the Pre-Bid Meeting evidence of his/her qualifications to perform the work specified. Contractor qualifications shall be the most current information available but not more than one year old. Submit one copy of documentation to both Owner and Consultant for review and approval. Transmit documentation to be received no later than the scheduled time of Pre-Bid Meeting. Materials shall include:

1. Corporate Profile
2. Location of Corporate Headquarters
3. Number of offices and locations
4. Location of office assigned to this project
5. Corporate History
6. How Many years in this business?
7. Under what former names have your organization operated
8. Date(s) of incorporation
9. State of incorporation
10. Officers names and addresses

C. Litigation Experiences within the Last 5 Years

1. Project Related:

    a. Nature of Litigation
    b. Plaintiff or Defendant
    c. Outcome

2. Non-Project Related

    a. Nature of Litigation
    b. Plaintiff or Defendant
    c. Outcome

D. Number and Type of Full-Time Staff

1. Total number of employees
2. Number of design staff
3. Number of installation staff
4. Number of project management staff
5. Number of software programming staff

E. Identify key personnel that will be assigned to this project including:

1. Project Executive
2. Project Manager
3. Systems Designer
4. Crew Chief/Superintendent/Lead Technician

5. Systems Programmer

6. Commissioning Agent

7. Trainer

F. For each Individual listed above provide a resume that includes:

1. Office Location

2. Percentage of individual's time that will be allocated to this project

3. Work History

4. Previous Project Experience

5. Length of Employment

6. Certifications: CTS, CTS-D, CTS-I, RCDD, PMP, Certified Control System Programmer, Certified DSP Programmer, video projection manufacturer specific certification, other.

7. The contractor's lead installer shall hold a current CTS-I (Certified Technology Specialist – Installation) certification from InfoComm International, and/or a current EST-L2 (Electronic Systems Technician) certification from NSCA. The Contractor shall submit the name of the lead installer and certification expiration dates.

8. Due to the potential complexity of the control system, a manufacturer certified software programmer shall be required to author the programming components of this project. The Contractor shall include in the bid response, the name of the manufacturer certified person or entity that will provide programming for the remote control system. The resume shall include a listing of years of experience and include a statement of manufacturer authorization, certification type, date of certification and the certificate number.

9. The project will utilize Digital Media Systems from one of several approved manufacturers. The Contractor shall provide documentation listing project team member(s), named in Section 1.4.D above, who will work on the project and who are manufacturer certified for all systems included in these Specifications with active certification. The documentation shall include a listing of years of experience and include a statement of manufacturer authorization, certification type, date of certification and the certificate number.

10. The project will utilize Digital Signage and Video Distribution System products from one of several approved manufacturers. The Contractor shall provide documentation listing project team member(s), named in Section 1.4.E above, who will work on the project and who are manufacturer certified for all systems included in these specifications with active certification. The documentation shall include a listing of years of experience and include a statement of manufacturer authorization, certification type, date of certification and the certificate number.

11. This project will utilize union installation labor. The Contractor shall provide documentation indicating if union labor will be provided by the Contractor or a Contractor designated and managed sub-contractor. The Contractor shall indicate the company name, address and contact information for the intended union sub-contractor included in the audiovisual bid.

G. Resources

1. A manufacturers' line card for products in which the Contractor is an authorized Distributor or Dealer. Include date initially authorized.

2. A list of any manufacturers' specialized technical certifications or designations held by the Contractor.

3. A list of manufacturers for whom the Contractor is an authorized service center.

4. A list of computer software and/or systems owned by the Contractor, which will be used to communicate, measure, draw, and/or document the project.

5. A list of system test equipment owned and used by the Contractor, including manufacturer, model number and, where applicable, latest software revision.

H. References

1. Include three projects of:

   a. Similar scope and scale.

   b. Similar technology applications

   c. Provide project cost for each

2. Include three project references, including:

   a. Contact name

   b. Institution name

   c. Phone number

   d. E-mail address

3. List any past projects where Contractor has worked with the Owner, Consultant, Architects, or Construction Manager who are part of this project team.

I. Subcontractors

1. A list of all subcontractors proposed for use on the Project.

2. For each subcontractor proposed:

   a. Subcontractor firm name

   b. Name(s) of subcontractor firm principal(s)

   c. Description of subcontractor firm sub-specialty

   d. Subcontractor firm qualifications and justification for subcontracting

   e. Acceptability of subcontractors shall be at the sole discretion of the Owner.

1.5 SITE CONDITIONS

A. Labor and Physical Access

1. The Bidder shall be responsible for investigating any potential conflicts with site-related or union-related issues regarding use of personnel, scheduling, access to the site, storage of tools and equipment on-site, and other areas of potential conflict. If these issues impact the Bidder's bid response, the impacts on cost and schedule should be clearly noted in the bid response.

B. Equipment Delivery and Storage

1. Costs of all shipping to the site, and of all storage requirements, shall be borne by the Contractor. It shall be the responsibility of the Contractor to make appropriate arrangements, and to coordinate with the authorized personnel at the site, for the proper acceptance, handling, protections, and storage of equipment so delivered.

C. Refuse

1. The Contractor shall keep the site and building free of all debris and clutter, to the satisfaction of the Owner or Construction Manager. On a daily basis, the Contractor shall remove refuse and rubbish related to the specified work from the site and building and shall leave the relevant areas and equipment clean and in an operational state. The Contractor shall be responsible for repairing any damage caused to the site and building by the Contractor's installation activities, at no cost to the Owner.

1.6 SCOPE OF WORK

A. General: Provide audio visual systems design, engineering, and installation within all phases and spaces of the project, as defined by the related documents. Systems shall include all devices, equipment, installation, programming and commissioning in accordance with requirements of the contract documents and drawings.

B. The work detailed within the contract documents has been specified to meet certain requirements for performance, appearance, and costs. It shall be the responsibility of the Contractor to implement the guidelines and requirements contained in the contract documents and translate them into a complete design package containing all elements necessary for a complete, operational, and functionally integrated Audio Visual System(s).

C. The Contractor shall provide complete, turnkey multimedia systems performing all of the services and functions as described herein, together with all other apparatus, cable, materials, labor, tools, transportation, and any other resources necessary to provide a complete and working system.

1. The included Audiovisual Systems Equipment List is NOT a complete bill of materials and includes major components that the Owner has identified as required or preferred.

D. Specifically, the work shall include, but is not limited to:

1. Communicating and coordinating with the Owner, Consultant, Architect, and other trades complying with all requirements as defined under this Scope of Work and elsewhere, to fulfill all requirements of this specification.

2. Generating and submitting Shop Drawings as required for approvals and As-Built drawings as specified herein.

3. Providing all cable and pull strings in conduits for the specified systems.

4. Furnishing and/or installing all equipment as specified.

5. Installing Owner supplied equipment as specified.

6. Take delivery of all Owner supplied components and equipment, excluding Room PCs, at Contractor's staging facility for integration into AV equipment racks.

a. No Owner furnished equipment has been identified at this time as previously used in existing facilities.

7. From the initial point of delivery Contractor shall be responsible for storing, integrating and maintaining as part of the system warranty all Owner supplied components.

8. Prior to installation Contractor shall test and verify all functions of Owner supplied components and equipment previously used in existing Owner's facility. Contractor shall provide a summary report of existing Owner supplied equipment and document any defects or service issues that would prevent existing equipment from reuse as part of this work.

9. Coordinate with Owner's content provider to determine optimal resolution and format for any Owner provided content. Stand up the content playback system prior to installation and load initial content samples for validation of playback system final configuration and settings. Demonstrate content playback operation and configuration to Owner's content provider for approval prior to final implementation of the content/playback systems.

10. Take delivery of initial graphic content and audio (including licenses, accounts or other means for accessing pre-packaged or streaming content). Load/enable all content and prepare initial templates or configuration files in all content management/playback systems configured for the display and audio systems provided under this scope of work.

11. Coordinate video conference endpoint provisioning with the Owner's network and the Owner's existing video conference bridge system or outsourced video conference bridging service.

12. Furnishing all lifts, ladders, scaffolding or other resources as needed for proper safe installation. Coordinating with other trades as needed.

13. Interconnecting all components, both internal and external to rack cabinets.

14. Providing patch cables for connection of all IP-enabled audiovisual equipment to associated data network outlets, including but not limited to Owner supplied Room computers, production computers, laptop connections, control system processors, codecs, IP cameras, and projectors. This applies to all equipment installed by the Contractor, including Owner-Furnished (OFCI) items. Coordinate patch cable requirements with the greater building-wide structured cabling system.

15. Contractor shall coordinate and secure, from the Owner, the IP configuration parameters such as DHCP, IP addresses, subnet information, VLAN setup & authorization, and the like for use by Ethernet equipped system components. As part of this coordination, Contractor shall create a device tracking document sortable by room, floor or equipment type and including mac address, serial number, network plate and patch number and network configuration parameters. The Contractor shall coordinate the installation and configuration of these devices with the Owner's IT department and/or designated representative.

16. Secure, from the Owner, private IP addresses for use by Ethernet equipped control system processors.

17. Ensuring that all cabling, equipment, and terminations are installed in accordance with accepted industry standards, approved shop drawings, manufacturer's recommendations and as stipulated herein.

18. Verify that all audiovisual equipment rack locations are provided with adequate clearance, ventilation and cable management systems to ensure all equipment is operating within manufacturer published tolerances.

19. Coordinating and providing cable labels as stipulated by the owner and/or specified herein.

20. Providing cable management hardware as required including in areas audiovisual rack cabinets; between pieces of equipment not housed in rack cabinets; and as required to extend cabling from rack cabinets and equipment to the greater facility cabling infrastructure.

21. Providing custom cover plates, wall plates, I/O connection plates, floor box insert plates as required for a complete and working system. Final selection of finishes shall be coordinated with the Architect and/or Owner.

22. Coordinating with the Consultant, Architect and Owner on the final selection of all technical furniture including design details (make/model), available options, dimensions, cable management needs, color, finish, and the like.

23. Provide all furniture and lectern hatch connector plates using industry standard AAP style or similar connectors or pass-thru openings. Provide mating or pull-out cabling for all furniture and lecterns to mate with user portable devices.

24. Coordinating with furniture manufacturer or others who are providing all necessary furniture/millwork modifications ("cut-outs" or other) as required allowing for a neat and professional installation of integrated technology system components. This includes, but is not limited to: integrated table/lectern "cubbies", table-top microphones, cable management grommets, etc.

25. Coordinating with the furniture manufacturer, Owner, and Architect on cable management needs and equipment installation requirements in all spaces so equipped and as outlined in 'Installation Practices'.

26. Conduct a wireless site survey within 30 days prior to substantial completion to determine available wireless frequencies for audiovisual equipment. Coordinate with local entities as necessary (manufacturer, Owner, SBE, FCC, etc.) to determine final channel selection for all wireless devices and resolve conflicts where they may occur.

27. Insuring that all equipment, with the exception of portable equipment, is firmly fastened or attached in place. A safety factor of at least Five shall be utilized for all brackets, fasteners and attachments. Provide safety retention cables for overhead equipment such as loudspeakers, projectors, etc.

28. Verifying and providing all projector lenses where required.

29. Providing all projector mounts, including guy wires, clamps, or support assemblies back to structural members. Obstructions vary from room to room; Contractor must pay close attention to this issue on a room-by-room basis.

30. Mounting / aligning the projectors so that digital keystone correction is not required. Optical lens shift shall be employed, only if necessary, to align the image with the image area. Where possible all projectors mounted below the ceiling shall be mounted and adjusted to be perpendicular to the screen surface.

31. Ensure that all systems have HDCP, EDID and resolution management profiles which are maintained from input through output/encode/display. Provide EDID management profiles to Owner's content provider 90 days prior to loading of initial content.

32. Coordinating with the Construction Manager on the audiovisual control system connection to the projection screens and lifts, as required.

33. Adjusting motorized projection screen limits as required optimizing the amount of black drop in conjunction with the projection system and field conditions. Refer to the drawings for specified dimensions.

34. Providing speakers as complete assemblies with back boxes, grilles, tile bridges, wall mounts, hanging hardware and other installation hardware as required.

35. Coordinating with the Architect and Owner on final color selection, and/or the painting of any exposed loudspeakers and any/all exposed system components to match the room's aesthetics and finishes.

36. Providing control system design submittals and up to two control system design revisions.

37. Developing and installing all custom control programming code as required and/or as specified herein.

38. Providing control system interfaces to motorized screens, as specified.

39. Providing low voltage control system interfaces to facility lighting and share systems where specified.

40. Coordinating and providing low voltage interfaces to the life safety platform for audio muting in all event and public assembly spaces.

41. Providing the executable (uncompiled) programming control code as defined herein.

42. Developing and installing all custom software for DSP devices as required to optimize system performance.

43. Generating and Submitting "Progress Reports" as defined herein.

44. Ensuring that all individual components function as intended by this Specification.

45. Ensuring that the entire multimedia systems function as intended by this Specification.

46. Providing any/all patching, caulking, fire stopping, and painting required to restore damaged finishes during installation.

47. Providing to the Owner, upon completion, all accessories and ancillary items included with the manufacturer's equipment but not used for the physical installation of the device. This shall include all user manuals, remote controls, batteries, tools, installation hardware, carrying cases, protective covers, etc.

48. Testing, adjusting, and fine-tuning the completed systems and components.

49. Coordinating and conducting acceptance walk-through and sign-off sessions with the Owner and Consultant.

50. Coordinating and conducting an acceptance walk-through and sign-off session with the Owner and Consultant.

51. Documenting the completed installed systems as defined herein.

52. Conducting training in systems operation for the Owner's designated representative(s).

53. Providing "sign-off" documents for each space and/or space type as defined in Section 3.6 "System Setup and Tuning" of this specification.

54. Verifying required cable lengths for all bulk cable or manufactured cable assemblies prior to ordering as outlined in 'Installation Practices.'

55. Verify AV related infrastructure requirements including conduit, power and data as shown on design drawings is sufficient to meet all AV systems requirements. A written report confirming infrastructure requirements is required from the Contractor within 30 days of award of bid.

56. Verifying all display mounting conditions including width, height and depth of all recesses or architectural cutouts required for displays and other flush mounted equipment.

57. Verifying the accuracy of the manufacturer master quotes where indicated on the audiovisual equipment list or other manufacturer quotation numbers prior to ordering. Where given, master quote numbers or other quotation numbers have been provided for bidding purposes only.

58. For all LED Video Wall systems

    a. Validate all power, cooling, weight, mounting, lead time, delivery and installation sequencing requirements within 30 days of award and communicating in a timely fashion any system parameters not in conformance with the current space design or project schedule.

    b. All video wall systems shall be HDMI 2.0 & HDCP 2.2 compliant. Contractor shall demonstrate the ability to show protected content in current formats as part of acceptance testing.

    c. Review the video processor and signal distribution requirements with the Owner's content provider to confirm conformance to the overall content package.

    d. For all LED Video Wall systems, provide a minimum of 5% spare panels onsite (measured after completion of burn-in, installation, commissioning and final-sign off). Provide an additional 5% spare panels housed at the manufacturer's site for use with break/fix repairs.

    e. Provide an extended warrantee of a minimum of 3 years for all parts and replacement hardware.

    f. Provide onsite manufacturer installation support services including during initial installation, calibration, acceptance testing and training.

59. Providing a minimum one (1)-year warranty service contract for all parts and labor. Where available from individual manufacturers, provide the consultant or preferred client extended warrantees.

60. Provide pricing for years two and three extended warrantees

61. Provide monthly preventative maintenance services for a minimum of (1) year.

62. Providing onsite support staffing as outlined in this Specification.

63. The Contractor shall act as the primary point of responsibility and contact in resolving all audiovisual system defects including those involving Owner Furnished Contractor Installed (OF/CI) equipment.

1.7 ALTERNATES

A. Provide pricing for alternates listed in the audiovisual systems equipment List accompanying this specification.

1.8 RELATED DOCUMENTS

A. Drawings and general provisions of the contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this Section.

B. Refer to AV Design Drawings as listed on drawing TA-000

C. Refer to AV Equipment list provided as part of this specification

1.9 RELATED WORK

A. Audiovisual Contractor shall coordinate with Electrical Contractor on raceway/junction box locations for audio visual equipment and routing of audio, video, control, and power cables/raceway from equipment, terminal and pull boxes to system equipment racks.

B. Coordinate work of this section with installation of wall and ceiling finishes.

1.10 WORK EXCLUDED

A. Work not included under this contract shall be:

1. Providing conduit, power receptacles, junction boxes, cable raceways, electrical back-boxes, floor boxes, lighting fixtures, lighting dimming systems, or millwork except where otherwise specified herein.

2. Installation of wall or ceiling mounted projection screens.

3. With the exception of audiovisual network switches and interconnections as indicated in the audiovisual systems equipment list and system drawings the data and voice network is Provided by Others under separate contract for this building.

1.11 SCHEDULE

A. Project Milestones

1. The Contractor shall obtain from the Owner, Architect, Construction Manager or Consultant a project master timeline schedule showing projected dates when the relevant areas will be available to the Contractor for the on-site installation.

2. Within 15 days of notification of contract award, the Contractor shall provide a schedule of major project milestones to the Owner, Architect, and Consultant. The schedule shall show the following milestones, but may include others as required for overall site-work coordination:

a. Lead time schedule for all equipment

b. Shop Drawings and Submittals.

c. AV infrastructure validation

d. Required date for Owner meeting to review content

e. Required date for receipt of Owner furnished content

f. Delivery of materials to the work site for installation by Others.

g. Delivery of major system components to the work site.

h. Initial Touch Panel layouts

i. Completion of AV Equipment IP list for Owner coordination

j. Required date for receipt of Owner furnished equipment and PCs

k. Required network turn-on date for Audiovisual Connectivity

l. 50% completion of work by floor and by floor area.

m. 95% completion of work by floor and by floor area.

n. Completion of room run sheets (required prior to move-in).

o. Final punch list.

p. Training Sessions.

q. Submittal of Final Documentation / As-Builts.

3. The Contractor provided schedule shall outline a phased installation approach allowing time for installation, testing, issue remediation and sign-off on representative systems, spaces and programming prior to full scope deployment of systems.

4. If the Contractor feels that he/she will not be able to meet the scheduled project milestone deadlines, he must inform the Owner, Architect, and Consultant at the earliest possible opportunity and include in the notification a schedule catch-up or remediation plan.

1.12 JOB CONDITIONS

A. Coordination

1. In the interest of a coordinated and professional project, the Contractor shall:

a. Coordinate his/her work with that of other trades. The Contractor should anticipate attending weekly project coordination meetings with the Owner, Architect, Construction Manager, Consultant or other trades as required. These meetings shall be separate from weekly construction coordination meetings required by the General Contractor.

b. Afford other trades reasonable opportunity for installation work and for storage of materials.

c. Staff the job to keep pace with other trades.

d. Submit a brief progress report via e-mail to the Consultant, listing the following information in four sections: Schedule, Progress, Work Planned and Issues. The "Schedule" section shall list the status of all project milestones and track impacts to approved milestone dates. The “Progress” section shall list the tasks accomplished since the previous report; this is to include both completed tasks and work-in-progress. The “Work Planned” section shall list the tasks scheduled for the time period extending until the next report; this section should also include both completed tasks and work-in-progress. The “Issues” section shall list any factors that are delaying progress or have the potential to delay progress that involve the Owner, Architect and/or Consultant. The Progress Reports should be concise, utilizing bullet points or other efficient format. The Progress Reports should be submitted at the following intervals:

1). After contract award, while working off-site: every two weeks

2). While working on-site: every week.

e. After on-site work has started the Progress Report shall list the status of each room or space with audiovisual equipment and indicate the current status of items:

1). Cable Pull

2). Mount/Speaker/Backbox Installation

3). Room Ready

4). Display Installation

5). Furniture Installation

6). Rack Installation

7). Field Equipment Installation

8). Programming

9). Commissioning

10). Ready for Consultant Testing

11). Punch List Completion

1.13 SITE CONDITIONS

1. Reference drawings provided to the Contractor for bidding purposes may not reflect construction site as-built conditions. It shall be the responsibility of the Contractor to field-verify all site conditions relevant to his work.

2. The Contractor shall verify dimensions of equipment, equipment arrangements, space availability (including any millwork or cabinetry provided by others) and provide systems that work within the constraints of the space available. The Contractor shall notify the Consultant of any situation where space constraints are a problem, prior to the ordering or purchase of equipment. The Contractor shall bear the expense of providing alternate equipment, which will work within the available space, if space availability problems are discovered after equipment is ordered.

3. Drawings indicate locations of equipment and components. Changes in the location, and offsets of same to accommodate building conditions, and coordination with the work of other trades shall be made prior to initial installation, without additional cost to the Owner.

4. The Contractor shall insure during installation that access is provided to equipment and components requiring operation, service or maintenance within the life of the system.

5. It shall be the responsibility of the Contractor to identify any condition where the recommended environmental and/or electrical operating parameters for specified equipment/products cannot be assured. Should such condition exist, it shall further be the responsibility of the Contractor to notify the Architect and Consultant of any such condition.

1.14 LAWS AND REGULATIONS

A. All equipment, cabling, materials, and installation methodology shall conform to the requirements of the National Board of Fire Underwriters, the current published edition of the National Electrical Code, and all other applicable laws and regulations. The Contractor shall obtain and pay for any additional permits and inspections required by all legal authorities and agencies having jurisdiction over the Contractor’s work.

B. The Contractor shall comply with all of the legal regulations, including OSHA safety regulations and regulations of municipal, city, local, and other government agencies having jurisdiction concerning the work of the Contractor. The Contractor shall give all notices and comply with all laws, ordinances, codes, rules, and regulations bearing on the conduct of the work. If the Contractor performs any work which is contrary to such laws, ordinances, codes, rules and regulations, it shall make all changes to comply therewith and bear all costs arising therefrom.

C. The Contractor shall warrant that it and its subcontractors are licensed by the State and as required by local ordinances.

1.15 QUALITY ASSURANCE

A. All equipment for this installation will be new, less than one year from the date of manufacture, and without blemish or defect.

B. The Contractor shall maintain the same project manager and field supervisor throughout the installation, and where practical, maintain the same installers.

C. The Contractor shall supply and install any incidental equipment needed in order to result in a complete and operable system without claim for additional payment, even if such equipment is not listed in this Specification.

D. All work related to this Specification shall be completed in a professional manner by fully qualified workers.

1.16 RELIABILITY

A. General

1. The systems are designed to provide professional quality operation over a period of several years without the need for continual maintenance. Equipment that has a high failure rate is not acceptable for installation as part of these systems.

B. Warranty & Maintenance

1. The Contractor shall act as the primary point of responsibility and contact in resolving all audiovisual system defects including those involving Owner Furnished Contractor Installed (OF/CI) equipment.

2. The Bidder shall make known, in writing, at time of bid any exceptions that might exist between conditions described herein and Bidder's policy of warranty. After acceptance of bid, all conditions and requirements of warranty described herein shall apply.

a. The Contractor shall guarantee all equipment, materials, and labor for a period of 1 year from the date of final acceptance.

b. During the warranty period, within 4 hours of notification, the Contractor shall answer all service calls and requests for information.

c. During the warranty period, within 24 hours of original notification, the Contractor shall provide emergency service to restore operation of the system, replacing defective materials, repairing faulty workmanship, making temporary repairs, and providing loaner equipment as necessary, all at no charge.

d. The Contractor shall notify the Owner before any service call whether such call is or is not covered under warranty. The Owner may be billed for non-warranty calls. The Contractor shall notify the Owner of any service call or work to be performed for which charges may be incurred before such work commences.

e. Improper functioning, for warranty purposes, means failure of the system to meet the intentions of the specification because of internal defects. It does not include Owner caused malfunctions such as re-adjustment of the controls, re-tuning of the system, or injury to the system beyond normal wear. Nor does the warranty cover paint, exterior finishes, fuses, lamps (including projection lamps) or associated labor, unless the damage or failure results from defective materials or workmanship covered by the warranty.

f. The Contractor shall take such actions at the time of installation to insure that all equipment is installed in accordance with the manufacturer recommended environmental and electrical operating conditions and requirements. After installation, the Contractor shall be responsible for the repair or replacement of said equipment that the Contractor installs which fails due to environmental or electrical conditions, even if not covered by the manufacturer's warranty. The Contractor shall not be held responsible for damages due to changes in environmental conditions, which occur after system acceptance.

g. Unless otherwise directed, the Contractor shall activate all manufacturer warranties in the Owner's name. The start date of the warranties shall be the date of final acceptance.

h. If the Contractor has modified certain components, the manufacturer warranty may be void. In this case, the Contractor is responsible for providing warranty coverage equal to that of the manufacturer.

i. The Contractor shall perform (12) system maintenance sessions, one per month after substantial completion. Maintenance shall include a visual inspection, typical operation demonstration and addressing any issues noted on all systems. Contractor shall assume maintenance will be spread over multiple sessions to allow for scheduling around occupied spaces.

j. Certain subsystems and system components may require installation by authorized representatives in order for the complete manufacturer warranty to apply. If this pertains to any subsystem or component for this project, it is the Contractor's responsibility to make arrangements for the complete manufacturer warranty to apply. These arrangements are to be at no additional cost to the Owner.

k. As part of the bid response, the Contractor shall provide the Owner with a proposal to extend the Warranty to cover Year 2 and Year 3 of operation. These offerings are to include all parts and all labor; all conditions and restrictions listed above apply.

1.17 ALTERNATE EQUIPMENT

A. All bids shall be submitted based on the specified equipment. The Bidder may propose alternate equipment. However, all such proposals shall be submitted separately and will be identified as "alternates" with equipment costs shown separate and apart from the costs of the equipment "as specified".

B. Proposals for alternate equipment will receive careful and equitable consideration if the differences do not depart from the overall intent of the design and operation of the system, and are in the best interests of the Owner. All proposed alternate equipment shall work with the existing infrastructure.

C. All such proposals for alternate equipment shall be accompanied by full technical information, "cuts" and specifications for the equipment so proposed. The Bidder shall identify the substantive differences between the alternate and the specified equipment.

D. Owner and Consultant approval in writing is required before an alternate can be considered approved for use. It is at the discretion of the Owner and Consultant to determine if proposed alternates are considered acceptable and approved for this scope of work.

1.18 EXCEPTIONS AND PROPOSED MODIFICATIONS

A. Should the Bidder have recommendations, which will enhance the performance of the system, or reduce costs without loss of performance, reliability and durability, such recommendations shall be included with the bid submission. All suggestions that are of value to the Owner will be taken into consideration in the evaluation of the bid returns. All such proposals shall be made as "alternates", with the appropriate cost modifications shown separate and apart from the costs of the system "as specified". Pricing shall be on a line-item basis.

B. Any and all exceptions to these Specifications and related drawings must be made with the bid submission. In the absence of exceptions, these Specifications and related drawings shall be binding in letter and intent on the successful Bidder. It will further be assumed that the Bidder has examined the design and Specifications in detail, and is prepared to take full responsibility for the performance of the complete installation as designed and specified.

1.19 DEVIATIONS

A. For deviations in equipment or hardware after contract award, the Bidder shall provide a written statement describing why such deviations are requested. The Bidder shall also provide the manufacturer's specifications and warranty information on proposed substitutions. The Contractor shall be responsible for repaying any additional expenses incurred by other trades, the Consultant, the Architect, and/or the Owner, as a result of instituting such deviations without prior approval.

1.20 REVIEW AND INTERPRETATION DURING BIDDING

A. Notify the Architect and Consultant of any omissions, discrepancies or ambiguities in the documents so a clarification may be issued. Notify Architect, Owner and Consultant if exception is taken to any statement, indication or criterion in the contract documents.

B. Obtain all other contract documents, including architectural, structural, mechanical and electrical, and check to ensure there are no conflicts with work of this section. Notify the Architect and Consultant of all such conflicts, with any suggested alteration to resolve conflicts.

C. Submit all above notification in writing to the Architect and Consultant no less than 14 days prior to bid opening date. Lack of notification shall be understood to indicate acceptance of all requirements of the contract documents, and any future clams shall be rejected.

D. Interpretations or correction to the contract documents shall be issued by Addendum. Interpretations or corrections given by any other method shall not be binding.

PART 2 PRODUCTS

2.1 SYSTEM FUNCTIONAL DESCRIPTIONS

A. Guest Room

1. Shown for infrastructure coordination only, AV equipment supply and install by owner

B. Suite

1. Shown for infrastructure coordination only, AV equipment supply and install by owner

C. Main Lobby

1. AV Sources
    a. Background music (BGM) endpoint (by others)
2. Audio System
    a. Recessed ceiling speakers for program audio
    b. Amplifier with direct input form BGM system
3. Control
    a. All selection and volume controls will be within the BGM system
4. Mounting & Equipment Racks

a. Rack equipment will be mounted in AV/IT Rack Room 258

D. Fitness Center

1. Displays

a. Noted for infrastructure coordination only, display, mount, and CATV endpoint supply and install by owner

2. AV Sources

a. CATV endpoint (by others)

b. Background music (BGM) endpoint (by others)

3. Video System

a. Feed from CATV system (by others)

4. Audio System

a. Surface wall mounted speakers for program audio

b. Amplifier with direct input form BGM system

5. Control

a. TV control through manufacturer’s IR remote

b. Speaker volume controlled through a 70V wall volume controller

6. Mounting & Equipment Racks

a. Rack equipment will be mounted in AV/IT Rack Room 258

E. Private Dining

1. Displays

a. Utilizes one 86” LCD display

b. Pull out wall mount with integrated wall box

2. AV Sources

a. CATV endpoint (by others)

b. Background music (BGM) endpoint (by others)

c. Wired HDMI laptop input at wall location next to display

d. Wireless presentation gateway

3. Video System

a. AV source switcher

b. Digital AV extender for laptop input

c. Scaled digital AV extender for display output

4. Audio System

a. Recessed ceiling speakers for program audio

b. Amplifier sourced from the AV switcher

5. Conferencing

a. Audio conferencing support through a portable tabletop phone

6. Control

a. Control processor built into the AV switcher

b. Wall mounted control system touch panel

c. Touch panel layout, graphics, and function will meet Vassar standards

1). Touch panels should present users with an intuitive interface that guides its operation and leverages presets to automate functions

2). Touch panel example page layouts are to be submitted for approval

d. Control functions will include:

1). System power state

2). Source selection

3). Display power state based on source type

4). Volume up/down/mute

5). CATV tuner channel control

6). BGM channel control

7. Mounting & Equipment Racks

a. Rack equipment will be mounted in AV/IT Rack Room 258

F. Dining, Outdoor Dining & Bar

1. Displays

a. Noted for infrastructure coordination only, display, mount, and CATV endpoint supply and install by owner

2. AV Sources

a. CATV endpoint (by others)

b. Background music (BGM) endpoint (by others)

3. Video System

a. Feed from CATV system (by others)

4. Audio System

a. Recessed ceiling speakers for program audio in bar and dining areas

b. Surface ceiling mounted weatherized speakers for program audio in the outdoor dining area

c. Amplifiers sourced from the audio matrix

d. Audio from display is routed back to the audio matrix to allow its CATV source audio to be selected in the bar area

5. Control

a. Control processor built into the AV switcher in Private Dining system

b. Wall mounted control system button panel

c. Button panel layout, labels, and function will meet Vassar standards

1). Button panel example page layouts are to be submitted for approval

d. Control functions will include:

1). Display power state

2). Audio source selection for bar

3). Volume up/down/mute for each output zone

e. CATV tuner channel selection by manufacturer's IT remote

6. Mounting & Equipment Racks

a. Rack equipment will be mounted in AV/IT Rack Room 258

G. Pre-Function

1. AV Sources

a. Background music (BGM) endpoint (by others)

b. Audio announcements and overflow from Large Conference Room and Flexible Event Space

2. Video System

a. Ethernet cable pulled from AV rack to wall location for future use in NVX system

3. Audio System

a. Recessed ceiling speakers for program audio

b. Utilizes shared conferencing center audio DSP

4. Control

a. Utilizes shared conferencing center control processor

b. Wall mounted control system touch panel located in Director's Office

c. Touch panel layout, graphics, and function will meet Vassar standards

1). Touch panels should present users with an intuitive interface that guides its operation and leverages presets to automate functions

2). Touch panel example page layouts are to be submitted for approval

d. Control functions will include:

1). Audio source selection for bar

2). BGM channel control

3). Volume up/down/mute

4). Interpreter routing noted in Interpreter Connection section below

5). Audio routing noted in outdoor Event Space section below

5. Mounting & Equipment Racks

a. Rack equipment will be mounted in AV/IT Rack Room 258

H. Medium Conference Room

1. Displays

a. Utilizes One 86" LCD display

b. Pull out wall mount with integrated wall box

2. AV Sources

a. Two wired HDMI laptop inputs the conference table

b. Wireless presentation gateway

c. Owner furnished installed PC

d. Wall recess mounted PTZ camera below display

3. Video System

a. Utilizes shared conferencing center AV over IP switching system

b. Decoders are scaled for output to displays, USB converter, and CODEC inputs

c. Sources are switchable to either display, USB converter, and CODEC

4. Audio System

a. Recessed ceiling speakers for program audio

b. Utilizes shared conferencing center audio DSP with acoustic echo cancelation for conferencing

c. Beam forming ceiling microphone

5. Conferencing

a. Cameras and microphone noted above utilized for audio and video conferencing

b. Audio conferencing through DSP VoIP connection

c. Standards based video conferencing CODEC

d. USB converter for camera, presentation, and microphone signals to be used by the installed PC for software conferencing

6. Control

a. Utilizes shared conferencing center control processor

b. Wireless touch panel with wall mount charging station and table dock

c. Touch panel layout, graphics, and function will meet Vassar standards

1). Touch panels should present users with an intuitive interface that guides its operation and leverages presets to automate functions

2). Touch panel example page layouts are to be submitted for approval

d. Control functions will include:

1). System power state

2). Presentation source selection

3). Volume up/down/mute

4). Audio conferencing dialer and level controls

5). Video conferencing dialer and level controls

6). Camera pan, tilt and zoom controls with presets

7). System mode selection: presentation, audio conference, standard video conference, software conference

8). Interpreter routing noted in Interpreter Connection section below

7. Room Scheduling

a. One wall mounted touch panel mounted outside room entrance

1). Interfaces with existing Vassar College room scheduling system

2). Displays room schedule and allows room reservation at the panel

8. Mounting & Equipment Racks

a. Rack equipment will be mounted in AV/IT Rack Room 258

I. Large Conference Room

1. Configuration
    a. 2-way divisible space with identical sides
    b. Descriptions below note total equipment and functionality for combined system
2. Displays
    a. Utilizes two 86” LCD displays
    b. Pull out wall mounts with integrated wall boxes
    c. Utilizes two projector and 72.5” x 116” screen per side
    d. Ceiling recessed projector lifts
    e. Ceiling recessed electric screen with low voltage control interfaces
3. AV Sources
    a. Four AV over IP encoder for presentation sources at the reconfigurable tables
    b. Ten wired floor box connections for inputs to the AV over IP system
    c. Two wireless presentation gateways
    d. Two owner furnished installed PCs
    e. Two wall mounted PTZ cameras mounted at displays
    f. Two ceiling mounted PTZ cameras with inline video analytics functionality. The input from the analytics device with be automatically selected based on the selected function.
4. Video System
    a. Utilizes shared conferencing center AV over IP switching system
    b. Decoders are scaled for output to displays, USB converter, and CODEC inputs
    c. Sources are switchable to displays, projectors, USB converters, and CODECs
5. Audio System
    a. Recessed ceiling speakers for program audio
    b. Utilizes shared conferencing center audio DSP with acoustic echo cancelation for conferencing
    c. Four beam forming ceiling microphones
6. Conferencing
    a. Cameras and microphones noted above utilized for audio and video conferencing
    b. Audio conferencing through two DSP VoIP connections
    c. Standards-based video conferencing CODEC shared between both sides of Large Conference Room as well as both side of the Flexible Event Space

d. Two USB converter for camera, presentation, and microphone signals to be used by the installed PC for software conferencing

7. Control

a. Utilizes shared conferencing center control processor

b. Four wall mounted touch panels

c. Touch panel layout, graphics, and function will meet Vassar standards

1). Touch panels should present users with an intuitive interface that guides its operation and leverages presets to automate functions

2). Touch panel example page layouts are to be submitted for approval

d. Control functions will include:

1). Room configuration selection. When divided controls are local to the room side in which the panel is located. When combined all functions, sources and destinations are available at all touch panels.

2). System power state

3). Presentation source selection

4). Volume up/down/mute

5). Audio conferencing dialer and level controls

6). Video conferencing dialer and level controls

7). Camera automatic tracking over-ride and pan, tilt and zoom controls with presets

8). Camera analytics selection

9). System mode selection: presentation, audio conference, standard video conference, software conference

10). Routing noted in Broadcast Truck Connection section below

8. Room Scheduling

a. Two wall mounted touch panels mounted outside room entrances

1). Interfaces with existing Vassar College room scheduling system

2). Displays room schedule and allows room reservation at the panel

9. Mounting & Equipment Racks

a. Rack equipment will be mounted in AV/IT Rack Room 258

J. Flex Event Space

1. Configuration

a. 2-way divisible space, one projection based, the other utilizing an LCD display

b. Descriptions below note total equipment and functionality for combined system

2. Displays

a. Utilizes one 86” LCD display

b. Pull out wall mount with integrated wall box

c. Utilizes one projector and 72.5” x 116” screen

d. Ceiling recessed projector lift

e. Ceiling recessed electric screen with low voltage control interface

3. AV Sources

a. Four AV over IP encoder for presentation sources at the reconfigurable tables

b. Eight wired floor box connections for inputs to the AV over IP system

c. Two wireless presentation gateways

d. Two owner furnished installed PCs

e. Two wall mounted PTZ cameras mounted at displays

f. One ceiling mounted PTZ cameras with inline video analytics functionality available on projection side. The input from the analytics device with be automatically selected based on the selected function.

4. Video System

a. Utilizes shared conferencing center AV over IP switching system

b. Decoders are scaled for output to displays, USB converter, and CODEC inputs

c. Sources are switchable to display, projector, USB converters, and CODECs

5. Audio System

a. Recessed ceiling speakers for program audio

b. Utilizes shared conferencing center audio DSP with acoustic echo cancelation for conferencing

c. Two beam forming ceiling microphones

6. Conferencing

a. Cameras and microphones noted above utilized for audio and video conferencing

b. Audio conferencing through two DSP VoIP connections

c. Standards-based video conferencing CODEC shared between both sides of Large Conference Room as well as both side of the Flexible Event Space

d. Two USB converter for camera, presentation, and microphone signals to be used by the installed PC for software conferencing

7. Control

    a. Utilizes shared conferencing center control processor

    b. Two wall mounted touch panels

    c. Touch panel layout, graphics, and function will meet Vassar standards

        1). Touch panels should present users with an intuitive interface that guides its operation and leverages presets to automate functions

        2). Touch panel example page layouts are to be submitted for approval

    d. Control functions will include:

        1). Room configuration selection. When divided controls are local to the room side in which the panel is located. When combined all functions, sources and destinations are available at all touch panels.

        2). System power state

        3). Presentation source selection

        4). Volume up/down/mute

        5). Audio conferencing dialer and level controls

        6). Video conferencing dialer and level controls

        7). Camera automatic tracking over-ride and pan, tilt and zoom controls with presets

        8). Camera analytics selection

        9). System mode selection: presentation, audio conference, standard video conference, software conference

8. Room Scheduling

    a. Two wall mounted touch panels mounted outside room entrances

        1). Interfaces with existing Vassar College room scheduling system

        2). Displays room schedule and allows room reservation at the panel

9. Mounting & Equipment Racks

    a. Rack equipment will be mounted in AV/IT Rack Room 258

K. Broadcast Truck Connection

1. Video System

    a. Truck Dock patch location

        1). Ten (1) SDI Feeds

        2). Four (4) Dual LC Fiber Ties

3). 20 Audio Channel Feeds

4). Dual Channel Com Ties

5). Control LAN Connection

b. Two (2) SMPTE Hybrid Fiber wall plate connections at each side of the Large Conference Room with 4x8 SMPTE Hybrid patch bay in the AV Rack

c. Dual LC Fiber wall plate connections at each side of the Large Conference Room with 2x4 dual LC patch bay in the AV Rack

d. Rack mounted 6G SDI matrix router

e. Four AV over IP decoders to provide HDMI source content

f. Four (4) SDI inputs and outputs on a rack panel in the AV Rack

g. Connections to each Sony camera in the Large Conference Room

h. Two dry coax tie lines to each side of the Large Conference Room

i. Portable camera controller for Sony cameras

2. Audio System

a. Utilizes shared conferencing center audio DSP

b. Routable signals form program audio and all mics and mic inputs in the Large Conference Room

c. Tie line for two channels terminated for intercom to the Large Conference Room

d. Program audio for each side of the Large Conference Room routed to the wall plate in the corresponding side

3. Control

a. Controlled at wall mounted touch panel in Director’s Office

b. Control functions will include:

1). The active program audio source for each side of the Large Conference Room will always route to the PRGM L/R jack on the wall plates and associate truck rack jacks. When the room is combined, the same source will be routed to both.

2). Full routing of AV over IP video sources in the Large Conference Room to the 6G-SDI router, defaulting with presentation content

3). Full routing of audio from the Large Conference Room to the Truck Dock Plate including ceiling microphones, wireless microphones, wired mic jacks, and program audio.

4). The interpreted language feed for each side of the Large Conference Room will always route to the associated INTERPRET jack in the track rack. When the room is combined, the same source will be routed to both. If two languages are being interpreted, one will be on each jack regardless of room combine state.

c. Connection to the AV control LAN for connecting the Sony camera controller

4. Mounting & Equipment Racks

a. Wall box connection points in each side of the Large Conference Room

b. A patch panel in an outdoor, weatherproof box at the loading dock

c. 6G-SDI router and patch panels mounted in the shared AV Rack

L. Interpreter Connection

1. Video System

a. Utilizes shared conferencing center AV over IP switching system

b. Decoder to provide HDMI output for an owner furnished monitor to display the camera feed in the selected room

2. Audio System

a. Utilizes shared conferencing center audio DSP

b. Dante endpoint

1). Provides an audio output of the presenter in the selected room to an owner furnished interpreter station

2). Provides an audio input from the owner furnished interpreter station to feed the truck connection

3. Control

a. Controlled at wall mounted touch panel in Director's Office

b. Control functions will include:

1). Selection of room source for NVX and Dante signal pair for each of two interpreter stations. Routes are independent as one interpreter language may be in the Medium Conference Room while the other is in the Director's Office

4. Mounting & Equipment Racks

a. Components mounted in portable racks, one for each language

2.2 EQUIPMENT

A. Refer to the attached AV SYSTEMS EQUIPEMENT LIST Rev1- VASSAR for the following:

1. Type and quantity of spaces with audiovisual systems

2. Description and quantities of audiovisual equipment within each space

3. Notes detailing special audiovisual equipment considerations or coordination requirements

4. List of existing Owner furnished equipment

B. New Owner Furnished Equipment

1. Contractor shall take receipt of all new Owner furnished computers, codecs and CATV receivers at the project site and install as indicated in Audiovisual drawing package system flow diagrams.

PART 3 EXECUTION

3.1 SUBMITTALS

A. General

1. The Contractor shall maintain a master set of this entire Specification, including all drawings and addenda, at the site at all times during the installation. Any deviations from the Specification made during the installation shall be marked on this master set. The master set along with all relevant support documentation shall be provided as part of the As Built submittal in the format outlined under Final Documentation.

B. Software

1. The Contractor shall secure from the Owner or Owner's Representative, in writing, approval for all control system graphical user interface layouts (control surfaces), audio DSP device configurations, or other customized software product applications prior to installation.

2. Preliminary Control Surfaces Submittal

a. Prior to creation of the preliminary control surface submittal the Contractor shall coordinate a meeting among Contractor, Consultant and Owner to discuss overall programming intent and specific requirements or concerns that the Owners or consultant has related to the control surface look, operation and capabilities.

b. The intent of the preliminary control surfaces submittal is to create a base level collaboration tool whereby the contractor can solicit direction from the Owner and Consultant towards a mutually agreeable design. Based upon the equipment lists and control system functionality provided in the Audiovisual Systems Specification and in combination with the system topology illustrated on the signal flow drawings, the Contractor shall generate preliminary control surface layouts for all pushbutton panels, touch sensitive panels, PC based controllers or other control surfaces. The Contractor should endeavor to make the preliminary layouts as complete as possible. The layouts should illustrate all pushbuttons, labels, bar graphs, timers, video windows, etc. for each control panel and each system page. The Contractor should include suggestions for color schemes and graphics where applicable.

c. It is recommended that control touch panel layouts conform to the InfoComm Dashboard for Controls Design Guide. This design guide is available on the InfoComm website at http://www.infocomm.org.

d. The contractor shall receive written response indicating approval to proceed, or changes required to the control surfaces layouts, within 10 working days of receipt of the submittal by the Owner/Consultant.

3. Revised Preliminary Control Surfaces Submittal

a. If changes are required to the preliminary control surfaces submittal, the contractor shall generate a revised preliminary control surfaces submittal to include the additions, changes or revisions generated by the preliminary submittal review. The form and quantity of the submittal shall be identical to the preliminary submittal unless otherwise directed. If the revised control surfaces submittal reflects those additions, changes or

revisions called for in the preliminary submittal review, the contractor shall receive written approval to proceed within 10 working days of receipt of the submittal by the Owner/Consultant.

b. The Contractor shall respond with the updated control surface submittal capturing all required changes indicated in the Owner/Consultant response within 10 working days of receipt of the response.

c. A minimum of two control surface revisions shall be provided.

4. Post-Integration Adjustments

a. If so requested by the Owner or Consultant, and within 90 days of system acceptance as outlined in 'System Acceptance', the Contractor shall be prepared to make two visits to the site to make final adjustments to the control system code or programming without additional compensation. This could include, but may not be limited to, renaming or changing the size or location of buttons, page flip calls, or adjustments to code to provide a fully functioning system. If engraved control system panels require modification at a cost to the Owner, such cost information must be submitted to the Owner for approval prior to any work being performed.

b. The Contractor shall be responsible for insuring that any changes to the control system or control surfaces that occur post integration are appended to the Final System Documentation.

C. Shop Drawings

1. The Contractor must receive written approval from the Owner prior to fabricating or installing any materials. Approval will be given based upon shop drawings. The shop drawings shall indicate complete details of work to be performed. The Contractor shall submit electronic copies of shop drawings to the Owner and Consultant for review and approval. Drawings shall include a title block naming the project, Owner and Consultant, and, shall include a drawing title, drawing number, revision number if applicable and date.

2. The shop drawings listed below are required of the Contractor. Provide electronic files and up to (1) paper set if requested by Owner or Consultant. Submit all Shop Drawings complete as a single submission. Isolated items will not be accepted, except with prior written approval.

a. Audiovisual Cut Sheets, sorted by space type with an overall equipment list identifying quantities, manufacturer, model and all accessories

1). Where multiple options or models are shown on a cut sheet, the project specific option or model shall be highlighted.

2). Equipment color options shall be highlighted for Architect confirmation with returned submittal.

3). Cut sheets shall NOT include installation manuals or manufacturer overall product line brochures.

b. Facility drawings, based on the Consultant's drawings, an updated set of floor plans, elevations and RCPs identifying all equipment locations, supporting infrastructure and cabling requirements.

c. System Signal Flow: Complete functional system signal flow of all systems described herein and meeting the functions indicated in the Specification.

d. Cabling Schedule: A list containing the cable type, cable marker identifier, and origination and destination location and connector types for each cable.

e. Examples representative of the Contractor's final cable marking technique for each cable type.

f. Loudspeaker Mounting Details: Scaled drawings of complete loudspeaker mounting details, hardware and support surfaces, including details on all load requirements, safety factors, safety cables and structural materials.

g. Projector Mounting Details: Scaled drawings of complete projector mounting details, hardware and support surfaces, including details on all load requirements, safety factors, and structural materials.

h. Structural Anchorage: Provide structural calculations, drawings and details for the anchorage of equipment racks, loudspeaker rigging hardware, the projector rail-mount system, and all other mounts or hardware that attach to structure. The design shall be reviewed and approved by a Structural Engineer licensed in the project state.

i. Optical Systems: Scaled drawings to verify that the proposed projection devices, lenses and related optical systems will provide the desired image size. The Contractor shall be responsible for field verification of the on-site conditions if required.

j. Panels: Scaled drawings of interconnect panels, control surfaces, and other custom interfaces.

k. Peripheral Equipment: Scaled drawings of mounting arrangements of any peripheral equipment, which may be included in this Specification.

l. Equipment Rack Layouts: Fully detailed rack drawings indicating equipment orientation within the equipment rack.

m. Technical Furniture: Scaled drawings of all technical furniture indicating dimensions, materials, finishes, equipment locations and orientation, cable management accommodations, and all other details necessary to convey the physical and functional aspects of the furniture.

n. Others, as may be required by the Architect, Consultant or Owner.

D. Labels / Wire Markers

1. Except where otherwise indicated, all rack-mounted equipment, switches, controls, and interface panels shall be clearly labeled.

a. Panels and plates shall be a minimum 1/8" thick anodized aluminum etched and epoxy filled unless otherwise specified.

b. Rack mounted equipment shall be labeled with engraved and filled plastic laminate. Where appropriate, the function of, or the input, output, or loudspeaker(s), served by each device shall be indicated. Other methods of labeling rack mounted equipment may be accepted pending prior written approval by Owner.

c. All cables shall be permanently identified at each end by machine printed cable markers and protected by the appropriate size clear shrink tubing. Every cable shall have a unique tag number identifier for each cable. The Contractor shall include this unique tag number on the As-Built signal flow documentation. Each cable marker shall include, in addition to the unique tag number identifier, the name of the origination and destination equipment termination at each cable end (see example below). Cable markers shall be placed two (2) inches from where the cable exits the strain relief of the connector, but never within a cable bundle.

2. Identification Panel

a. An identification panel shall be installed within the equipment rack including Contractor and Consultant contact information. The panel shall be mounted in the top rack space.

3.2 CONTROL SYSTEM REQUIREMENTS

A. Control System User Interface

1. All panels are to have the time and date as icons, in the same position on every page.

2. All panels are to have a title, indicating the piece of equipment and/or functionality being controlled.

3. When a portable device is connected to the system while powered down the system shall be programmed to automatically wake and switch to the active input. Touch panels shall activate and switch to the local presentation page reflecting the active input used.

4. No individual component shall be programmed to function atypically.

5. Devices similar in nature shall be programmed to operate with a common format.

6. Pages for source equipment shall conform to the following guidelines:

   a. Transport controls should be on the main device page.

   b. The primary transport controls, <Play>, <Stop> and <Pause> should be larger than the other transport controls.

   c. Buttons shall include both graphic images and text.

   d. A button shall be included for a pathway to device specific controls, including menus and advanced device functions.

   e. A button shall be included for a pathway to recording functionality. This shall include a single-bus control for the recording source.

7. Final programming shall include capability to remotely control all functions of the audiovisual system. Individual device controls shall provide full manufacturer's functionality.

8. Provide control capability for every function available on every piece of equipment being controlled by the system. Define and provide "macro" commands for the most used functions.

9. Provide control panel layouts that are consistent from page to page. Whenever the same button appears on more than one page, it will be in the same position on each page.

10. Functions used during a general presentation shall be accessible with a minimal amount of button presses/page flips.

11. All power functions, or other destructive commands, activated by the users through the user interface shall be intercepted in the programming. The user shall be provided with the opportunity to cancel out the command prior to any actions being initiated and without disturbing the current operating model.

12. Where feasible, multi-level access to controls should be implemented. All software shall provide multiple levels of password protection. Initially three levels of security will be established and specific rights to program areas shall be assigned by user:

    a. Level 1 shall allow user to operate the system, without a password. Control shall be limited to basic functionality directly affecting the space in which the control is located.

b. Level 2 shall be password protected, and allow user to modify system parameters and features listed in level 1.

c. Level 3 shall be password protected, and allow a technician access to set-up functions, source selection, etc.

B. Control System Hardware

1. Provide remote control of systems with an integrated master controller, which provides ports for IR/serial, RS-232/422/485, Ethernet, relay closures and input and output control card frames and rack mounted, of all dedicated audiovisual components.

2. Unless where specified as Owner Furnished, provide all required network equipment, including, but not limited to, routers, hubs, gateways, media converters, etc., for integration of the networked AV Control system with the Owner's existing LAN and control system.

3. When a choice of control protocols is available for a piece of equipment, the most secure and flexible one shall be used; i.e. RS-232 control, where available, shall be used in place of either infra-red or relay control.

4. All equipment utilizing a "toggled" power command are not to be powered on and off from the control system.

C. Additional Control System Surfaces

1. Port all completed touch panel interfaces to web browser based control.

2. Port all completed touch panel interfaces to be fully mobile device compatible on Apple iOS or Android™ mobile devices.

3.3 INSTALLATION PRACTICES

A. General

1. All equipment shall be installed in accordance with this Specification, approved shop drawings, and manufacturer's recommendations.

2. All equipment with the exception of portable equipment shall be firmly fastened or attached in place. A safety factor of at least five or a published safe working limit shall be utilized for all brackets, fasteners and attachments. Provide safety retention cables for overhead equipment such as loudspeakers, projectors, etc.

3. In the installation of equipment and cable, consideration shall be given not only to operational efficiency, but also to overall aesthetic factors.

4. The Contractor shall insure that all equipment is installed such that proper cooling and ventilation is insured.

5. All equipment shall be installed in a manner which prevents hum, RF/EMI/EMF interference, and mechanical vibration based noises (e.g. fan mounts, etc.)

6. Projectors, lenses, and mirrors shall be solidly mounted and braced so that there will be no observable movement in the image induced by motor vibration or other mechanical operations.

7. All equipment shall be protected from construction dust and debris until final acceptance of the system.

8. All equipment shall be protected from theft until final acceptance of the system.

9. Any equipment designed for use by end-users in the facilities must be installed with theft deterrence/protection mountings and fasteners. Any tools required to mount/un-mount this equipment must be furnished to the Owner at the date of Owner acceptance.

10. The Contractor shall be obligated to protect completed work and uncompleted work against damage or loss until the Owner has given final acceptance. Should the need arise to repair work or replace items the Contractor shall do so at no cost to the Owner.

B. Furniture

1. The Contractor shall ensure that equipment or mounting hardware is compatible with and suitable for installation in furniture specified by the Architect, Consultant, or furniture supplier. It shall further be the Contractor's responsibility to ensure that such coordination with the Architect, Consultant, or furniture supplier occurs.

2. The Contractor shall exchange with and follow such shop drawings as to ensure that dimensions and structural supports are adequate for the installation of specified equipment. It is the Contractor's responsibility that the request and delivery of such critical coordination information is satisfactorily executed. In as much as the Contractor has control over the delivery of such information, it shall deliver it as requested by the Architect, Consultant, or furniture supplier.

C. Equipment Racks and Equipment Rack Cable Management

1. Racks shall be installed in such a way so as to permit access to all equipment for service.

2. Racks are considered complete components and should be completely assembled and tested at the Contractors facility prior to onsite installation.

3. All equipment in racks shall be fitted with vent panels and/or fans as required to provide ventilation and cooling according to equipment manufacturer's recommendations.

4. Adjacent racks shall be bolted together with appropriate ganging hardware.

5. As a general practice, all power cables, control cables, and high-level cables shall be dressed to the left rear of an equipment rack. Audio and video cables shall be dressed to the right rear of the rack. Audio, video and control cables shall be bundled separately and spaced not less than three (3) inches apart.

6. Internal equipment rack cabling shall be supported by lacing strips, support brackets, or other cable management systems as required to ensure that all cabling is supported in both the vertical and horizontal planes within the rack.

7. With the exception of ganged equipment rack assemblies, cabling routed between equipment racks or pieces of equipment exterior to equipment racks, or extending to the greater facility cabling infrastructure, shall be completely protected, end-to-end, by a raceway, wire-way, or duct appropriately sized for the cable run.

8. Cabling between rolling pieces of equipment not housed in rack cabinets or a rolling equipment rack and any device to which it is connected, shall be protected by a split-loom corrugated tubing wrap or other such flexible cable management system appropriately sized for the cable run.

9. Any controls not to be adjusted by the user and accessible from the front of the equipment rack must be furnished with security panels.

3.4 CABLING

A. CABLING TYPES

1. Refer to the Audiovisual drawing package for minimum audiovisual low-voltage cabling requirements.

2. Coordinate UTP and Fiber Optic cable types with Information Technology (IT) requirements and submit UTP cable for approval by Owner and Consultant.

B. CABLE INSTALLATION

1. Non-contiguous cable support mechanisms such as hangers, rings, and hooks shall not be spaced farther than four (4) feet apart. All manufactured raceways used for cables shall be installed according to the raceway manufacturer's specifications

2. Cable runs shall be supported with devices designed for this purpose and are to be installed independent of any other structural component.

3. Cables routed vertically up walls, or between floors as vertical riser, shall be supported with clamps or other mechanisms. These supports shall occur at least three times per floor.

4. The Contractor shall maintain, or where not already existing, provide through penetration fire stop systems to prevent the spread of fire through openings made in fire-rated walls or floors to accommodate penetrating items such as conduit, cables or other pathway. Fire stop shall restore floor and wall to the original fire rated integrity and shall be waterproof. The fire stop systems and products shall have been tested in accordance with the procedures of U.L. and material shall be U.L. classified as materials for use in through-penetration fire stops.

5. The fire stop system shall comply with the NEC and with NFPA 101-Life Safety Code (latest edition) and shall be made available for inspection by the local inspection authorities prior to cable system acceptance. The contractor shall be responsible for verifying the fire rating of all walls and floors affected by his work.

6. Cable pulling tension may not exceed manufacturer recommendations. Where cable-pulling lubricant is used, the lubricant must be compatible (non-damaging) with the conduit and cable sleeve materials and must not harden over time to prevent future pulls.

7. Cable stapling of any recognized media type shall not be permitted.

8. Cables shall be dressed in conveniently sized bundles and either laced or banded. Lacing or banding shall not be so tight as to deform cable bundles.

9. Cabling installed with a bend radius less than that recommended by the cabling manufacturer is not acceptable.

10. Cables and bundles terminating at equipment or connector panels shall be supported so as not to put strain on connections or connectors.

11. All cables, with the exception of video or pulse cables, which must be cut to an electrical length, shall be cut to the length dictated by the run. No splices shall be permitted in any pull boxes without prior approval of the Consultant.

12. Cabling for equipment mounted in drawers or on slides shall be provided with a service loop of appropriate length. A cable management support for the service loop shall be provided to prevent the service loop travel from interfering with the operation of the drawer or slide, or snagging on adjacent cabling.

13. Where indicated on the Audiovisual Drawing Set microphone level, line level, loudspeaker level, and video lines shall be run in separate conduits, trough, raceway divider, and cable bundles. Low voltage DC and control may be run along with any signal types other than microphone or line level runs.

C. TERMINATION

1. All termination components must meet or exceed all specifications for given media type and application as described in this document and system drawings.

2. Crimp on connectors shall be installed only on the appropriate size cable using the manufacturer recommended crimp tool and die set.

3. Connections to electronic devices providing screw terminals shall be terminated using the appropriate gauge insulated spade or ring crimp terminal connector and crimp tool.

4. All mechanical solder-on connectors shall be attached to cable ends using rosin core solder.

5. Audio signal cable shields shall be protected with the appropriate gauge Teflon or heat-shrinkable tubing. The jacket end of each audio cable shall be fitted with the appropriate gauge heat shrinkable tubing to provide additional protection to the base of the shield or shield foil. This also applies to the inside of mechanical connectors and cables that terminate at partitioned barrier strips.

D. AV Over UTP Cabling System

1. In some areas, analog video, audio, and control signals will be transmitted over a dedicated system of unshielded twisted pair (UTP) cabling utilizing specialized electronics. UTP transceivers located in the presentation spaces will connect to similar devices in the equipment racks via a cabling scheme comprised of RJ-45 receptacles, permanently installed cabling, equipment cords, and patch cords and patch panels.

2. Each AV over UTP port receptacle, permanently installed cable, equipment cord, patch cord and patch panel will be of a color or have markings that are non-standard with the voice/data system, and be plainly and permanently labeled (AV ONLY - NOT DATA).

3. To eliminate the problem of skew caused by the varying pair lengths inherent with CAT-5e/6 UTP cabling, a specialized skew-free UTP bulk cable, patch cables, and equipment cords are specified.

4. The Contractor shall test, verify and document the length and wire map of each Permanent Link cable run, each patch panel to transceiver cable segment, and each patch and equipment cord using a Fluke model 620 LAN Cable Meter or equivalent.

E. Grounding

1. General

a. To avoid system noise, data errors, safety hazards, and equipment damage, all devices and cabling shall be installed using a consistent grounding scheme. All devices shall be grounded and all ground conductors shall follow a star topology. The grounding system topology should be such that each equipment rack and each piece of signal bearing equipment is connected so that there is never more than a single path to ground. This section offers guidelines for grounding and shielding methodology. Grounding and shielding methodology may need to be augmented or modified for certain pieces of equipment or interconnections in order to meet the requirements of other sections of this specification. The Contractor shall be responsible for making necessary alterations in accordance with industry practices and such that the Performance Standards detailed in ‘Performance Standards’ are met.

b. Under no circumstances shall an AC neutral conductor be used to ground equipment.

c. Refer to the International Communications Industries Association, Inc. (InfoComm International) Basics of Audio and Visual Systems Design handbook, Section 10, Technical Power and Grounding Systems for additional guidelines.

2. Interconnection

   a. All connectors used on system I/O panels shall be electrically isolated from the panel and provide a pass through (uninterrupted) ground connection.

   b. Microphone cable shields shall be connected to the microphone frame and grounded only at the preamplifier input connector.

   c. All audio interconnections with cable lengths greater than 10 feet shall use balanced (symmetrical) signaling.

   d. All audio signal cable shields shall be grounded only at the input connection of each device. Signal cable shields, both connected to devices and floating, shall be protected by the appropriate gauge heat shrinkable tubing. Shields at the output connector shall be folded back over the cable jacket and covered with heat-shrinkable tubing. Do not cut off unused shields.

   e. Coaxial video and RF shields shall be connected at both ends.

3. Pull Strings

   a. A nylon pull string shall be left in every conduit. In the event additional cables are pulled in after the initial cable pull, a nylon pull string shall be pulled with the added cable.

3.5 PERFORMANCE STANDARDS

A. Audio

1. Polarity

   a. Absolute signal polarity will be maintained throughout the signal chain such that a positive signal at the input produces a corresponding positive excursion at the loudspeakers.

2. Electronics

   a. The audio system electronics shall deliver the following minimum performance standards as measured from all source inputs for microphones, audio tape machines, video tape machines, etc., through all mixers, audio distribution amplifiers, routers, etc., to all audio signal destinations.

   b. Frequency Response: ±0.5dB, 20-20,000 Hz.

   c. Hum and Noise: -70 dBu, 20-20,000 Hz, un-weighted.

   d. Distortion: 0.1% THD, 20-20,000 Hz

3. Speech Signal

   a. (a) The system shall provide a speech signal in the audience seating area that meets or exceeds the following requirements:

      1). Frequency response within +/- 3 dB from 500 Hz to 15,000 Hz.

      2). Overall SPL variance of +/- 3 dB.

      3). Measured Alcons of 10% or lower.

      4). Maximum average SPL of 85 dB (flat), with 10 dB of undistorted headroom available.

4. Music Signal

a. The system shall provide a music signal in the audience seating area that meets or exceeds the following requirements:

1). Frequency response within +/- 3 dB from 200 Hz to 17,000 Hz.

2). Overall SPL variance of +/- 3 dB.

3). Maximum average SPL of 90 dB (flat), with 10 dB of undistorted headroom available.

B. Optical

1. All video projection systems shall meet the following performance standards:

a. The total averaged light output from a video projector, in ANSI lumens, shall be tested by the Contractor and certified to be within ±15% of that specified by the projector manufacturer.

b. All video projection systems shall be measured by the Contractor using ANSI/INFOCOMM 3M-2011 Projected Image System Contrast Ratio and documented for Owner and Consultant review.

3.6 SYSTEM SETUP AND TUNING

A. Optimization

1. The Contractor shall install, configure, adjust, program, and calibrate all components in order to optimize the performance of all individual subsystems and the system as a whole.

B. Preliminary Tests and Submittals

1. General

a. Once the system is installed, the Contractor shall complete the following preliminary tests and prepare a written test report for the Owner and Consultant. The test report will list the results of each of the tests described in this section and certify that the installation is complete

2. Testing Format and Requirements

a. Sign-off documentation format will be provided to the contractor in advance of initial shop testing and will follow the ANSI/INFOCOMM 10:2013 Audiovisual Systems Performance Verification standard format.

b. A full ANSI/INFOCOMM 10:2013 review and validation of one (1) example of each system type documented by the Contractor will be required.

c. Subsequent system type reviews will include overall capabilities evaluations. Noted punch list items will be referenced to their ANSI/INFOCOMM 10:2013 equivalent.

d. Where significant defects are noted in the subsequent system type reviews, the Owner and Consultant may elect to require Contractor to document to the full ANSI/INFOCOMM 10:2013 standard and remedy all deficiencies noted.

3.7 FINAL TESTS

A. Upon approval of the Contractor's test report, and at a time that is mutually acceptable to the Contractor Owner and Consultant, the Contractor shall assist the Consultant in final system tests and adjustments. The Contractor's representatives assisting in the performance of these tests shall be thoroughly familiar with the details of the system and shall include the field supervisor responsible for installing the system.

B. To demonstrate the good working order of all playback devices in the system the Contractor shall make available high quality source materials for all audio and video media types represented in the system. To demonstrate the good working order of all computer-video displays the Contractor shall make available the computer-video signal generator described in 'Performance Standards - Preliminary Tests and Submittals - Computer Video Display Devices'. In addition, the Contractor shall make available a computer graphics signal generator or portable computer with the ability to output all video formats natively supported by the audiovisual system specified. The portable computer shall be capable of displaying spreadsheets, graphs, charts, pictures and text of varying sizes and fonts to effectively demonstrate the systems computer display imaging capabilities.

C. The Contractor shall:

1. Load source material into all input sources and the laptop computer.

2. Switch randomly between all sources and demonstrate that all functions of the control system are working properly and tracking correctly.

3. Demonstrate that the displays have been optimized for all sources.

4. Demonstrate that the system meets the criteria as outlined in 'Performance Standards'.

3.8 FINAL DOCUMENTATION

A. Upon completion of the work, the Contractor shall condense the master set along with any shop drawings into a single As Built document set. Any markings or deviations, which cannot be made clear on drawings, shall be accompanied by attached documentation, photos, or written addenda.

B. All documents and drawings must be submitted electronically in their native AutoCad and PDF format. Further, all PDF drawings must be submitted at their native scale. For example, a PDF created from a drawing whose native format was standard 'E' size (42-inch x 30-inch) shall be created at 42-inch x 30-inch (full size) to insure that there is no loss of resolution should the file be viewed or printed at a later date by the Owner.

C. Final submission of digital As Built drawings files shall be subject to submission by the Contractor as defined under said agreement.

1. Preliminary Final Documentation Submittal

a. Prior to Final Tests and project punch-listing, the Contractor shall prepare and submit one (1) copy of the documentation listed below to the Consultant and owner for review. The package shall include all of the documentation listed below and be in the exact form and format intended for delivery to the Owner.

b. The documentation shall be in electronic format AutoCad and PDF file format copies and organized as follows:

1). A cover and spine listing the Owner, Consultant, and Contractor.

2). A listing of each supplied item with manufacturer, model number and serial number.

3). Operator's manuals for each piece of equipment supplied by the Contractor.

4). A complete set of as-built drawings. The as-built drawings must reflect all changes to the system(s) made after the original bid documentation. The size of the as-built drawings shall be identical to the original drawings provided to Contractor, folded and inserted into the binders in plastic sleeves. Alternative formats may be acceptable upon prior approval by the Consultant and Owner.

2. Final Documentation Submittal

   a. Following successful completion of Final Tests and punch-listing, the Contractor shall prepare and submit to the Consultant and Owner electronic copies of the documentation listed under the Preliminary Final Documentation Submittal. The Final Documentation Submittal will include any and all adjustments or changes identified during the Preliminary Final Documentation Submittal review.

   b. The documentation shall contain PDF file-format copies for items 1 through 4 in Section A above and include detailed digital photographs showing the front views of all equipment racks. The photographs shall accurately reflect equipment front-panel settings at the time of project sign-off. All photographs must be properly exposed and focused, clearly showing the final settings for every device's push buttons, rotary controls, slider controls, or indicators. Subject areas must be free from glare as a result of flashes or other ambient lighting. Subject areas shall fill the image frame in a suitable manner. For large equipment racks, multiple exposures may be required, each indicating a separate portion of the rack. NOTE: All digital images shall be comprised of at least 1600 x 1200 viewable pixels, 24-bit color depth, JPEG file format.

3. Software

   a. Where custom software is developed as part of this project, the system source code and any associated related files, referenced files, and development software (and all relevant documentation and license) used to compile, develop, and build, etc. the executable code must be provided to the Owner only. The source code should be well documented in accordance with industry software engineering practices.

   b. The software developer shall retain intellectual property rights; the Owner shall have a license for perpetuity for use as it applies solely to this project, including the right to modify/enhance. The software code may not be sold or used, in part or in whole, in any other project or application other than that intended by this specification, in part or in whole, by the Owner or any other party.

   c. If a Subcontractor is used to write the software, the Contractor shall include, as part of the Final Documentation submittal, a signed letter on Subcontractor letterhead, granting the Owner ownership, use, and modification rights of the code and documentation as defined herein. The software shall be provided to the Owner as part of the Final Document Submittal.

   d. Copies of all manufacturer software required to program, compile, load and adjust audiovisual hardware settings or programming shall be provided.

   e. Copies of the current firmware and/or hotfix versions for all equipment with programmable firmware.

4. Delivery & Approval

   a. Unless otherwise arranged, The Contractor shall prepare and submit one complete set of the Final Documentation to the Consultant for review at the time of Final Tests. The package shall include all of the documentation listed above and be in the exact form and format intended for delivery to the Owner.

b. If the Final Documentation submittal is determined by the Consultant to be complete and accurate, the Consultant will approve the submittal and forward the Final Documentation package to the Owner.

c. If the Final Documentation submittal is determined by the Consultant and/or Owner to not be complete and/or accurate, the Consultant will return the package to the Contractor with a written listing of the required modifications. Upon completion of all of the required modifications, the Contractor shall resubmit the Final Documentation to the Consultant and Owner for approval. The Final Documentation submittal shall not be considered to be complete until all required modifications have been made and approved by the Consultant and Owner.

3.9 TRAINING

A. The Contractor shall provide a minimum of (40) hours of on-site training for (but not limited to) the Owner's staff at a time that is mutually agreeable for the Owner and Contractor.

B. The Contractor shall provide an additional minimum of (10) hours of content system initial template layouts, training and configuration.

C. Contractor shall provide (2) additional day(s) for system walk thus etc. at the request of the Owner and/or Consultant.

D. The Owner may choose to have the sessions spread out over a period of time and vary the staff being trained and the level of training. Final acceptance and/or final payment for the system shall not be delayed due to scheduling delays beyond the control of the Contractor. Contractor, should also be available for requested additional training.

E. As part of user training Contractor shall provide single page laminated room use cards for all rooms and tailored to each specific room type. Room card shall include:

1. Simple instructions for basic user functions (system on, off, media, making VTC & ATC calls).

2. Help desk contact information.

3. Room type capabilities (presentation, VTC, ATC, etc.)

4. Electronic version of the room use cards shall be provided to the Owner two weeks prior to move-in to allow for Owner formatting and review.

3.10 ONSITE SUPPORT STAFF

1. For the period of 30 days the Contractor shall provide (1) staff member onsite week days from 9am to 5pm to help support Owner move-in, administrative staff training, ongoing system troubleshooting and adjustment.

2. The staff member provided shall be familiar with the installation and operation of the system specified and shall have been onsite with the installation team at least two weeks prior to Owner move-in.

3.11 SYSTEM ACCEPTANCE

A. Upon successful completion of Final Tests, Documentation and Training, the Contractor shall notify the Owner, in writing, that the system is complete which notification shall be accompanied by consultant's continuation of completion. The Owner shall have fifteen (15) days to generate a punch list of omissions, adjustments, corrections and the like and respond in writing to the Contractor. In the absence of such a Punch List, the system shall be considered to be complete. The warranty shall commence on the day after Owner shall have conformed, in waiting, that the

work has been completed in accordance with the requirements of the contract documents or, if Owner fails to provide such written confirmation, or the Punch list, within each fifteen (15) day period, on the fifteen day after the Contractor's notification of completion of work (accompanied by consultant's confirmation), and the Owner thereupon shall process final payment. In the event that further work is required to complete this project, the Contractor shall be prepared to continue work, without additional compensation, until the system is accepted.

END OF SECTION 27 41 16

DIVISION 28
ELECTRONIC SAFETY AND SECURITY

SECTION 28 05 00 - COMMON WORK RESULTS FOR ELECTRONIC SAFETY AND SECURITY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions

B. Division 08 Section “Door Hardware”

C. Division 26 Section “Grounding and Bonding for Electrical Systems”

D. Division 26 Section “Hangers and Supports for Electrical Systems”

E. Division 26 Section “Raceway and Boxes for Electrical Systems”

F. Division 27 Section “Communications Horizontal Cabling”

G. Division 27 Section “Communications Equipment Room Fittings”

H. Division 27 Section “Communications Connecting Cords, Devices and Adapters”

I. Division 28 Section “Access Control and Intrusion Detection”

J. Division 28 Section “Electronic Surveillance”

1.2 SUMMARY

A. Work Included:

1. Provide labor, materials and equipment necessary to complete the work of this Section, including but not limited to the following:

    a. Provide labor, materials and equipment necessary to complete the work of the Electronic Safety and Security (ESS) Systems, including but not limited to the following:
    b. Grounding and bonding for Electronic Safety and Security (ESS).
    c. Pathways for ESS.
    d. Lightning and Surge Protection for ESS.
    e. Vibration and Seismic Controls for ESS.
    f. Equipment Enclosures for ESS.
    g. Electronic Components for ESS.
    h. Exposed Components.
    i. Cables for ESS.
    j. Identification for ESS.
    k. Electronic Safety and Security (ESS) equipment coordination and installation.

2. The Electronic Safety and Security (ESS) Systems, include but are limited to:

    a. Access Control System (ACS)
    b. Video Surveillance System (VSS).
    c. Associated cabling, enclosures and uninterruptible power supplies.
    d. Coordination:

        1) Coordination with door hardware
        2) Coordination and interface with the fire alarm system to tie the electrified locks power supplies to the building fire alarm
        3) Coordination with other trades

1.3 ABREVIATIONS AND DEFINITIONS

A. Abbreviations

ACS	Access Control Alarm Monitoring System
ACP	Access Control Panel
AFF	Above Finished Floor
ANSI	American National Standards Institute
AWG	American Wire Gauge
CPU	Central Processing Unit
CR	Card Reader
CRT	Computer Terminal with Keyboard
EIA	Electronic Industries Alliance
ESS	Electronic Safety and Security
FCC	Federal Communications Commission
Fps	frames per second
GUI	Graphical User Interface
IP	Internet Protocol
LAN	Local Area Network
LPS	Lock Power Supply
Mbps	Megabits per second
MC	Magnetic Contact
MHz	Megahertz
NIC	Network Interface Card
NVR	Network Video Recorder
RMS	Rack Mount Space (1.75”)
RU	Rack Unit (1.75”)
RAID	Redundant Array of Independent Disks
RAID0	Block Level Striping without Parity or Mirroring
RAID5	Block Level Striping with Distributed Parity
SCP	Security Control Panel
SCS	Structured Cabling System
SDK	Software Development Kit
SSA	Software Support Agreement
SMS	Security Management System
TB	Terra Bytes
TCP/IP	Transmission Control Protocol / Internet Protocol
UL	Underwriters Laboratories
UPS	Uninterrupted Power Supply
UTP	Unshielded Twisted Pair
VSS	Video Surveillance System
WAN	Wide Area Network

B. Definitions

1. “Provide” shall mean furnish and install.

2. "Work" shall mean all labor, materials, equipment, apparatus, controls, accessories, and all other items required for a proper and complete installation.

3. "Concealed" shall mean hidden from sight in chases, furred spaces, shafts, embedded in construction or in crawl space.

4. "Exposed" shall mean not installed underground or concealed as defined above.

5. "Furnished by others" shall mean materials or equipment purchased and set in place under other sections of the general contract and connected to the systems covered by this section of the specifications by this trade contractor.

6. "Coordinate" shall mean all work provided under this section of the specification shall be in compliance with work of other trades.

7. "Demonstration" shall mean the verification by operation, movement or adjustment of an item or system and the comparison of the item or system performance against a qualitative standard or standards as set forth in the specific requirements of the cited paragraph.

8. "Test" implies the systematic exercising of an item or system under all specified conditions with quantitative measurement of specified parameters and comparison of performance against the quantitative standards set forth. The Security Contractor shall pre-test/pre-commission the installed system before the the Vassar college Representatives shall test the system. It is the Security Contractors responsibility to provide sign-off sheets to the Vassar college Representatives certifying that the system is ready for testing and commissioning.

9. Base Design/System: The intent of this phrase(s) is to describe the security systems specified herein,. The base design and base system present minimum acceptable performance levels and Vassar college desire to provide priority consideration to the most economic security system that meets these performance levels.

10. Security Contractor: This term designates the company which conducts the Work and is responsible to ensure that others provide specified Work as described in the Specifications for security systems. This term specifically refers to a company that is qualified to perform the Work specified herein related to the integration of all electronic security access control systems and components and the fabrication and installation of all security equipment.

11. Electrical Contractor: The Electrical Contractor shall furnish and install all security system interconnecting conduits, junction boxes, outlet boxes, electrical troughs, cable ladders, plywood backboard and other associates mounting hardware. Interconnecting security conduits shall be installed with a nylon pull string inside the conduits for installation of interconnecting conductors. In addition, the Electrical Contractor shall install the electrical power for the security system. The Electrical Contractor shall refer to the electrical drawings and electrical specifications for installation requirements.

12. Door Hardware Supplier: The Company engaged to provide materials and services for all door hardware, door frames, and mechanical locking hardware.

13. Door/Frame Security Hardware Package: This term signifies the security hardware package associated with a security access controlled and/or alarm monitored door. Security door hardware includes an electrified lock, electric strike, electrified panic hardware, electric power transfers or electrified hinges, magnetic door contacts, lock power supplies, termination cabinets, and final connection of wiring to door security devices and to the appropriate screw terminals on the screw-type termination strips located in the termination box.

1.4 STANDARDS AND CODES

A. Ensure that the design and fabrication of the equipment is in accordance with applicable Commissionering codes and standards. When specific requirements are stated in this Section that exceed and/or overlap those requirements of the codes and standards referenced here, this Section shall govern.

B. Ensure compliance with all applicable prevailing codes and laws within the jurisdiction of the site as applicable to the extent of this section.

C. Provide a complete fully operational turnkey security system as specified within these documents.

D. The publications listed below form a part of this Specification to the extent referenced. The publications are referred to in the text by the basic designation only. The most current version of the following standards shall be referenced.

1. American National Standards Institute (ANSI) Publications:

   a. National Electrical Safety Code

2. American Society for Testing and Materials (ASTM) Publications:

   a. Standard Practice for Security Commissionering Symbols

3. National Fire Protection Association (NFPA) Publications:

   a. National Electrical Code

4. National Electrical Manufacturers Association (NEMA) Publications:

   a. Industrial Control Devices and Assemblies.
   b. Enclosures for Industrial Controls and Systems
   c. Enclosures for Industrial Controls and Systems
   d. Enclosures for Electrical Equipment

5. Underwriters Laboratories, Inc., Standard for Safety:

   a. UL 5 Surface Metal Raceways and Fittings
   b. UL 6 Rigid Metal Conduit
   c. UL 50 Cabinets and Boxes
   d. UL 65 Electric Wired Cabinets
   e. UL 83 Thermoplastic-Insulated Wires
   f. UL 96 Lightning Protection Components
   g. UL 193 Fuses
   h. UL 294 Access Control System Units
   i. UL 437 Key Locks
   j. UL 444 Communication Cables
   k. UL 486A/B Wire Connectors and Soldering Lugs
   l. UL 493 Thermoplastic-Insulated Underground Feeder and Branch Circuit Cables
   m. UL 497B - Protectors for Data Communication and Fire Alarm Circuits
   n. UL 512 Fuse Holders
   o. UL 514B Boxes, Fittings for Conduit and Outlets
   p. UL 603 Power Supplies For Use With Burglar-Alarm Systems
   q. UL 609 Local Burglar Alarm Units and Systems
   r. UL 611 Central-Station Burglar-Alarm Systems
   s. UL 632 Electrically Actuated Transmitters
   t. UL 634 Connectors and Switches For Use With Burglar Alarms Systems
   u. UL 639 Intrusion Detection Units
   v. UL 651 Conduit, Schedule 40' and 80' Rigid PVC
   w. UL 796 Electrical Printed Wiring Boards
   x. UL 797 Electrical Metallic Tubing
   y. UL 827 Central Stations For Watchman, Fire-Alarm, and Supervisory Services
   z. UL 1037 Anti-theft Alarms and Devices
   aa. UL 1076 Proprietary Burglar Alarm Units and Systems
   bb. UL 1773 Boxes, Termination

6. Applicable Federal, state and local laws, regulations, ordinances and codes.

7. Nothing in this Section, including revocation of certain specific codes, standards or specifications, shall relieve the Security Contractor of the responsibility for compliance with the codes, standards or specifications which are generally recognized to be applicable to the Work specified herein.

1.5 SUBMITTALS

A. General Procedures

1. All submittals shall comply with the requirements of Division 01.
2. Do not commence work that requires review of any submittals until receipt of returned submittals with appropriate final action.
3. Submittals that deviate from the procedures outlined herein will be rejected. No allowance or extension of project time will be considered due to lost time associated with procedural deviation.
4. Do not submit substitute items that have not been approved.
5. Preparation and Transmittal of Submittals:
6. Transmit each submittal with a transmittal form. Submittals received without a transmittal form may be returned without action. The transmittal form shall include: project name and address, number and date of submittal, name and address of the issuing entity.
    a. Sign or initial each copy of each submittal to certify compliance with requirements of the Contract Documents.
    b. Submittals shall include a Table of Contents listing all items included and relevant references to contract documents. For product data sheets the table of contents shall include: product name and manufacturer, page number of the corresponding specification section.
    c. Product data sheets shall be grouped according to the specifications sections. Submittals shall include relevant information only. Product being submitted shall be clearly identified.
7. Timing of Submittals
    a. Prepare and transmit each submittal requiring approval sufficiently in advance of scheduled performance of the related work to allow for adequate review and processing time, including time for re-submittal if necessary.
    b. If processing time for a particular submittal will be critical to progress of the work, advise and notify the Vassar College or its representatives accordingly.

B. List of Submittals:

1. Pre-Construction Submittals:
    a. Quality Assurance (QA) Plan
    b. Qualifications and Certificates
    c. Materials and Equipment List
    d. Product Data for every product installed
    e. Manufacturer Quality Assurance Tests and Source Quality Control Reports
    f. Shop drawings
    g. Samples
2. During Construction:
    a. Coordination Drawings
    b. System Labeling
3. Post Construction:
    a. Test Plan and Procedures
    b. Field Quality Control Reports/Test Results
    c. Record (as-built) Drawings
    d. Spare Parts List
    e. Manuals
    f. Maintenance Support
    g. Warranties

C. Quality Assurance Plan: submit a QA plan and reporting program containing a project schedule with anticipated milestone dates for all project related tasks (i.e. shop drawing submittal, various construction milestones, testing, acceptance, etc.).

D. Qualifications and Certificates

1. Installer Qualifications:

   a. Qualification Data: The work specified herein shall be performed by a qualified installer, as defined and described herein.
   b. Installer shall be certified installer for the specific manufacturers and systems provided.

2. Seismic Qualification Certificates: For equipment frames from manufacturer.

   a. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   b. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions. Base certification on the maximum number of components capable of being mounted in each rack type. Identify components on which certification is based.
   c. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Materials and Equipment List:

1. Complete list of all materials, equipment and accessories proposed for his Work. This list shall include manufacturers, complete catalog identification numbers and model or system designator, quantities, options, product data as described below, basic system Commission block diagrams, and CPU software operating features.
2. The submittal shall be in sufficient detail so that the equipment and materials proposed can be readily identified.
3. Submittal of partial lists is not acceptable.

F. Product Data:

1. For each type of product indicated.

2. Shall be ordered by specifications section. Each product data shall reference the appropriate section and subsection.

3. Collect Product Data into a single submittal for each element of construction or system.

4. Include construction details, material descriptions, dimensions of individual components and profiles, and standard colors and finishes. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories. Is shall also include roughing-in diagrams and templates, standard wiring diagrams, controls and performance curves. Where Product Data must be specially prepared or modified because standard printed data is not suitable for use, submit as “Shop Drawings”.

5. Clearly mark each copy to identify pertinent products, models, and accessories. Show performance characteristics and capacities. Show dimensions and clearances required. Include the following information:

   a. Reference to appropriate specification section and subsection.
   b. Compliance with recognized trade association standards.
   c. Compliance with recognized testing agency standards.
   d. Application of testing agency labels and seals.
   e. Notation of dimensions verified by field measurement.
   f. Notation of coordination requirements.
   g. Manufacturer's printed recommendations.

G. Samples: Along with project data and shop drawings, submit one (1) sample for each exposed security devices and security devices with color and finish options, for review by the Commissioner. The Vassar College Representatives/Commissioner shall retain these devices as record of the approved equipment for the length of the project.

H. Shop Drawings:

1. The shop drawing submittals shall include highly detailed, to-scale, drawings describing the products (systems, equipment, devices and materials) and services as to precise locations, mounting and installation methods, details and dimensions, schedules, conduit sizing, conduit routing, riser diagrams, point-to-point interconnect diagrams, equipment schedules, zoning schedule, door schedules, VSS camera schedules, system interface schedules or diagrams, power requirement schedules, stand-by/emergency power schedule, cost reports, and such other diagrammatic or written descriptions which shall allow a thorough and accurate understanding of the security systems and equipment that are being furnished, how they are intended to function, how they will be installed, and all other necessary information of similar intent.
2. No work shall not commence nor shall any equipment be ordered until the submittals have been approved in writing. All work shall be in accordance with approved submittals. A detailed completion schedule shall be submitted with all submittals.
3. Indicate, among other requirements noted herein, the accurate locations of all conduit, raceway, junction and utility boxes, termination panels, transformers (if any), power supplies, panels, and all other equipment noted.
4. Clearly illustrate all mounting locations and methods, with particular detail for the installation of intrusion sensors, locking hardware, and request-to-exit devices at doors, sensors located at windows and the mounting of interior and exterior VSS cameras. While some drawing details may be “typical,” the shop drawings shall illustrate the installation detail of each unique application.
5. Include plans, elevations, sections, details, and attachments to other work.
6. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
7. Equipment schedules and details shall provide the following information, as appropriate in each case: door number; door type; door position switch; request-to-exit type; request-to-exit location; auxiliary request-to-exit device, if any; lock type; power requirements; emergency power; access control type; special installation requirements; timed-shunt times; shunt type; precise, to-scale mounting location; zone or point designation; remote control of lock by specific and designated control console; VSS camera number activated by sensor or switch closure; input/output programming schedules; CPU output reports structure.
8. Camera schedules and details shall provide the following information: camera number; camera type; monitor number for each camera (if any); sequencing [if any]; camera model number; camera features, such as auto-iris; lens specification; power requirements; type of power input; cable type; length of cable run; camera mounts; camera housing; camera housing features, such as heater, etc.; camera drives; switcher position; switcher type; monitor type; cameras displayed on each monitor, especially linked displays; DVR positions; alarm queuing; special installation or carpentry requirements; camera and/or lens controls; alarm homing; termination method; lightning, ground loop, etc. protection.
9. Clearly illustrate the fields of view of each camera, as well as “park” positions for panning and zooming cameras (if any). If the camera is capable of wide-angle and telephoto viewing, both fields of view shall be indicated. The installer's “aiming point” shall be indicated. The submittal shall clearly identify outdoor cameras mounting details and maintenance access concepts and design.
10. System interface schedules or diagrams shall clearly identify: sensors and switches which queue cameras, as well as the number of camera activated; DVR activation logic; VSS monitor switching logic; interfaces, if any, between the access control system; distributed processing capabilities and functions; sensors and switches exclusively used as request-to-exit devices.
11. Equipment Racks and Cabinets: Include workspace requirements and access for cable connections.
12. Exposed equipment: Submit one (1) sample for each exposed security devices and security devices with color and finish options, for review by the Commissioner and Commissioner. The Commissioner/Commissioner shall retain these devices as record of the approved equipment for the length of the project.
13. Grounding: Indicate location of grounding bus bar and its mounting detail showing standoff insulators and wall mounting brackets.

I. System labeling: submit labeling scheme and samples.

J. All post construction submittals must be presented and approved prior to final acceptance.

K. Formal Test Plan and Procedures: 30 days prior to acceptance testing and final inspection, submit a formal test plan and test procedures.

L. Spare Parts and Components List: At the conclusion of the work, submit a complete list of manufacturers' recommended spare parts and components required in order to satisfactorily maintain and service the systems for a minimum of two years.

M. Manuals:

1. Prior to final acceptance, complete sets of Operation, Maintenance and Service Manuals shall be submitted for systems and equipment provided under this contract.

2. The manuals shall be compiled, assembled and indexed, in an easily identifiable hard cover form. Three (3) sets of the manuals shall be submitted prior to final acceptance testing.

3. The manuals shall include the following:

   a. Complete operating instructions.
   b. Complete maintenance instructions, wiring diagrams, troubleshooting instructions.
   c. System service instructions for work which manufacturers recommend user service.
   d. Complete parts lists for each major item of equipment and/or for each system.
   e. Complete collection of manufacturers' product and catalog literature for equipment and systems installed under this contract.
   f. Manufacturers' warranties.
   g. Operating characteristics, performance data, ratings, and manufacturers' specifications for each item of equipment or system.
   h. Where practical, internal wiring diagrams and schematics.
   i. Name, address, and telephone number for service for each item of equipment or system.
   j. Software User Documentation: Manual shall include operating instructions, programming instructions, technical documentation and maintenance procedures to permit making changes to system configuration.

N. Record Drawings

1. Produce, and keep up-to-date, a complete record as-built set of prints (black-line bonds) which shall be corrected, and marked-up to show every change from the original Specifications and Contract Drawings through final acceptance. This set of drawings shall be protected against soiling, tears, and similar damage and defacement. This set shall be kept on the job site and shall be used only as a record set. (This shall not be construed as authorization to make changes in the Work without proper approvals.)

2. The as-built drawings will be kept up-to-date and will be checked monthly as a requirement for approval of monthly progress payments.

3. Upon completion of the work and before final payment, produce and submit a final set of record drawings by updating the AutoCAD files of the construction set of drawings with the information from the as-built set. The submittal shall include the original record set of black-bonds and the electronic files of the as-built drawings in both AutoCAD format and PDF format.

4. At the conclusion of this project, two sets of black-line bond and two copies of the drawing files on Windows based media, formatted for use by AutoCad 2009 (or later version), of all the security drawings specifically prepared for this Contract, shall be provided. The drawings shall be instrument drawn and shall contain all changes shown in the record set. Sepia line drawings on paper are not acceptable.

O. Service/Maintenance Support

1. Maintenance and repair of the system (parts and labor) shall be provided free of charge during the warranty period, including repair of workmanship defects. Free software upgrades during the warranty period.

P. Warranties

1. All components, parts and assemblies supplied as part of this scope of work shall be warranted against defects in material and workmanship for a period of at least twelve (12) months (parts and labor), commencing upon the date of acceptance by the Vassar College. A qualified factory-trained service representative shall provide warranty service.

2. As a condition precedent to the final payment, execute a written guarantee (warranty) to the Vassar College certifying that all the contract requirements have been completed in accordance to the final Specifications and Contract Drawings and warranting all materials and equipment furnished by him under this contract to remain in satisfactory operating condition (ordinary wear and tear, abuse and causes beyond his control for this Work excepted) for a period of one (1) year from the date of final acceptance or beneficial use, whichever is later.

3. All defects or damages due to faulty materials or workmanship shall be repaired or replaced without delay to Vassar college satisfaction at no cost to the Vassar College.

4. Provide four (4) periodic inspections at no cost to Vassar College during the warranty period.

5. When equipment and labor covered by the installer's warranty or by a manufacturer's warranty have been replaced or restored because of his failure during the period of that warranty, the warranty period for the replaced or repaired equipment or restored work shall be reinstated for a period of time equal to the original warranty period, and commencing with the date of completion of the replacement or restoration work. In the event that any manufacturer customarily provides a warranty period greater than one (1) year, the Security Contractor's warranty shall be for the greater period of time.

6. In no case shall the integrated system/security equipment warranties be voided where user-programmable programming changes are performed by the trained Vassar College appointed system programming representative, to include redefining system input/output points, operation characteristics, time delays, and report formats to Vassar College site-particular requirements.

7. Free software upgrades during the warranty period.

Q. Definition of Acceptance

1. Vassar College acceptance of the installation will be based upon satisfactory performance during a thirty (30) day period of beneficial use beginning after all of the other acceptance requirements listed below have been satisfied in full by Vassar College.

2. Acceptance of the installation will be reasonably and good faith determined by Vassar College or its agents. Partial use of the installation prior to completion will not be considered as contributing in part or in whole to the thirty-day period. Problems discovered during the thirty (30) day period covered under the responsibilities of the Vendor must be fixed at no cost to Vassar College.

3. Acceptance will not be given, and no final payments will be made, until all problems have been fixed to Vassar College full satisfaction. Acceptance does not absolve the installer from any of its obligations under warranties and guarantees. The other acceptance criteria are the following:

4. All tests have been passed and all required test results have been submitted in appropriate format and have been accepted without dispute by Vassar College.

5. All required documentation has been submitted.

6. All required labeling has been completed.

7. All work has been completed as required by the specifications, including all cable runs and pathways in their permanent places, and all cabinets, racks and cable pathways (i.e. ladder, tray, etc.) secured.

8. All Punch List items have been completed.

9. All warranties for the installation have been obtained by installer.

10. The Security Contractor has submitted written notification that the installation is completed and that all specification requirements have been met.

11. Upon satisfactory completion of acceptance requirements by the Security Contractor, and after satisfactory performance during the thirty (30) day period, and correction of any defects found, Vassar College will notify the Security Contractor in writing of its acceptance of the installation.

1.6 SUBSTITUTIONS, DEVIATIONS AND CHANGES

A. Substitutions

1. Requests for substitution are permitted for materials specified with an "or approved equivalent" clause or other language of same effect in the Contract Documents. No request for substitution will be entertained if this clause has not been specified.

2. Request for substitution shall be submitted before, or with the bid response.

3. All requests for substitution shall be accompanied by a product data sheet submittal as outlined in paragraph 1.5 above.

4. Vassar College or duly authorized representative has no obligation to consider or approve requests for substitution after award of contract.

5. Substitutions may be permitted if the requirements of the proposed substitution comply with the general requirements and product specifications of the Contract Documents.

B. Deviations

1. Any deviations or changes involving extra work are not permissible without prior review and written approval by Vassar College or its duly authorized representative.

C. Changes

1. All work described in Contract Riders shall follow the methods, requirements and general arrangement of this Specification unless otherwise noted.

2. All pricing and proposals for changes shall be submitted detailing all items and related costs in accordance with the provisions of the Contract for changed work.

3. The Security Contractor may be required to provide sufficient manpower to install systems and cabling not specified herein. The Security Contractor, if required, shall provide this work at the labor rates specified, without negative impact on the project schedule.

1.7 TRAINING

A. Engage factory-authorized service representatives to train Vassar College maintenance personnel to adjust, operate, and maintain security access systems.

B. Refer to Division 01 Section "Demonstration and Training"

C. Develop separate training modules for the following:

1. Computer system administration personnel to manage and repair the LAN and databases and to update and maintain software.

2. Operators who prepare and input credentials to man the control station and workstations and to enroll personnel.

3. Security personnel.

D. The following establishes basic and minimum training requirements. The Security Contractor shall provide technical services and materials to instruct operators, maintenance persons, and programmers/database set-up personnel to operate, maintain and program the system. The Security Contractor shall provide training for no less than 5 personnel selected by Vassar College.

E. Training of console operators & maintenance personnel:

1. The instruction shall be provided by a competent factory trained Commissioner or professional instructor (that has completed manufacturer's training) representing the Security Contractor.

2. Provide each operator with complete, printed operating instructions and a brief sub system description in manual or handbook form. Training manuals shall be delivered for each trainee with two additional copies delivered for archiving at the project site. The manuals shall include an agenda, defined objectives for each lesson, and a detailed description of the subject matter for each lesson.

3. The operators shall be trained in preventative maintenance of equipment.

4. Certification of successful operators shall be provided upon the completion of training. Certification shall consist of correspondence drafted on the Security Contractor's Company Letterhead stating that Vassar College staff has been trained in accordance with the contract documents and manufacturers standards and are fully proficient in the operation of the newly installed Security System.

F. Where the Security Contractor presents portions of the course by audio-visual material, copies of the audio-visual material shall be delivered to the either as a part of the printed training manuals or on the same media as that used during the training sessions.

G. A training day is defined as 8 hours of classroom instruction, including two 15-minute breaks and excluding lunchtime, Monday through Friday, during the daytime shift in effect at the training facility. For guidance in planning the required instruction, the Security Contractor should assume that attendees will have a high school education or equivalent and are familiar with the facility. Approval of the planned training schedule shall be obtained from Vassar College at least 10 days prior to the training.

1.8 QUALITY ASSURANCE

A. Unless otherwise specifically noted, all equipment, material and articles to be installed shall be new, best of their respective kinds, free from defects, listed by Underwriter's Laboratories for the intended use, bearing their label and of the most suitable grade for the purpose intended.

B. Non-compliant products installed as a part of this Contract shall be removed and replaced and all costs for removal and replacement shall be borne solely by the Security Contractor.

C. Unless otherwise specifically noted, reference to any equipment, material, article or patented process, by trade name, make or catalog number shall be regarded as establishing a standard of performance and quality. Provide the name of the manufacturer, the model number and other identifying data and information respecting the performance, capacity, nature and rating of the electrical, mechanical and other equipment that the Security Contractor contemplates incorporating in the work.

D. When so directed, samples shall be submitted for approval at no cost to the Vassar College. Equipment, material and articles procured, installed, or used without required approval shall be at the risk of subsequent rejection. Warranties for all installed products shall be in accordance with the Contract General Provisions and as cited herein.

E. The services of a qualified manufacturer's technical representative, thoroughly experienced in the installation and operation of the type of system being provided shall be obtained by the Security Contractor, at no cost to Vassar College, to consult on equipment selection, installation, and testing of the specified systems if and as requested by the Vassar College or its authorized representatives.

F. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

G. Grounding: Comply with ANSI-J-STD-607-A.

H. Modularity: Provide components designed for modular increase or decrease of system capability by installation or removal of plug-in modules. System components shall be designed to facilitate modular subassembly and part replacement.

I. Reliability: Provide only new, unused components free from flaws or imperfections, which are in current manufacturing production. Components shall be manufactured to meet all the requirements specified herein and shall be free from characteristics or defects which affect the appearance or which might affect the serviceability or render the equipment unsuitable for the intended purpose. The workmanship shall be of superior quality. The MTBF for any sensor component shall not be less than five-thousand (5000) hours. Provide components designed

for continuous operation. Electronic components of the system shall be of the solid-state type, mounted on printed circuit boards conforming to UL seven-hundred-ninety-six (UL-796). Boards shall be plug-in, quick-disconnect type. Circuitry shall not be so densely placed as to impede maintenance. Power-dissipating components shall incorporate safety margins of not less than twenty-five (25) percent with respect to dissipation ratings, maximum voltages, and current-carrying capacity. Light duty relays and similar switching devices shall be solid-state type or hermetically sealed electro-mechanical type.

J. Maintainability: The components shall be capable of being maintained using commercially available standard tools and equipment. Components shall be so arranged and assembled that they are readily accessible to maintenance personnel without compromising the defeat resistance of the various ESS subsystems.

K. Availability: Provide products and services available within the project schedule established for this scope of work.

1.9 DELIVERY, STORAGE AND HANDLING

A. Comply with the requirements of the Construction Indoor Air Quality Management Plan and the Construction Waste Management Plan.

B. Deliver materials in original packaging, bearing brand name and identification of manufacturer or supplier.

C. Store materials to keep them dry and protected from soiling, dirt or damage. Neatly stack gypsum boards flat to prevent sagging.

D. Handle gypsum boards to prevent damage to edges, ends or surfaces. Protect trim accessories from being bent or damaged.

1.10 PROJECT CONDITIONS

A. Waste Management: Comply with the requirements of the Construction Waste Management Plan.

B. Environmental Limitations: Do not deliver or install equipment frames and cable trays until spaces are enclosed and weather tight, wet work in spaces is complete and dry, and work above ceilings is complete.

C. Where required by local code, trade harmony shall be observed by using only approved union (IBEW or CWA) based installation workforce. Coordinate with Vassar College or its authorized representatives.

1.11 COORDINATION

A. Coordinate layout and installation of security equipment in the telecommunications rooms, copper and/or fiber backbone and LAN requirements with Vassar College and the Structured Cabling System (SCS) installer.

B. Meet jointly with Vassar College to exchange information and agree on details of equipment arrangements and installation interfaces.

C. Record agreements reached in meetings and distribute them to other participants.

D. Coordinate location of power raceways and receptacles with locations of security equipment requiring electrical power to operate.

E. Coordinate arrangement, mounting, and support of electronic safety and security equipment:

1. To allow maximum possible headroom unless specific mounting heights that reduce headroom are indicated.
2. To provide for ease of disconnecting the equipment with minimum interference to other installations.
3. To allow right of way for piping and conduit installed at required slope.
4. Connecting raceways, cables, wireways, cable trays, and busways will be clear of obstructions and of the working and access space of other equipment.

F. Coordinate installation of required supporting devices and set sleeves in cast-in-place concrete, masonry walls, and other structural components as they are constructed.

G. Coordinate location of access panels and doors for electronic safety and security items that are behind finished surfaces or otherwise concealed.

H. Coordinate sleeve selection and application with selection and application of firestopping specified in the Electrical Section.

I. Coordinate routing of the security cables.

J. Coordinate the installation of the door/frame security package with the door hardware supplier. Security door hardware includes an electrified lock, electric strike, electrified panic hardware, electric power transfers or electrified hinges, magnetic door contacts, lock power supplies, termination cabinets, and final connection of wiring to door security devices and to the appropriate screw terminals on the screw-type termination strips located in the termination box. Responsibility for furnishing and installing a typical Door/Frame Security Package is divided as follows:

1. Door Hardware Supplier responsibilities:

    a. Shall furnish and install factory-prepared door frame fitted with factory prepared cut-outs and appropriate pre-welded outlet boxes to accept the door security devices.
    b. Shall furnish and install all non-security mechanical hardware. This shall include but not limited to mechanical hardware, hinges, door closers, door stops, etc.
    c. Shall furnish all electronic locksets, power transfer hinges, door monitoring contacts, request-to-exit devices for the new doors.

2. Security Contractor responsibilities:

    a. Shall install all door monitoring contacts, electromagnetic locks, shear locks, and request to exit devices for the existing doors. Devices shall be retrofitted to the exiting doors, as specified on the drawings.
    b. Shall install all magnetic contacts and electronic locksets and power transfer hinges, provided by the door hardware supplier, as specified on the drawings.
    c. Shall furnish and install termination cabinet furnished with screw-type termination block(s). The termination block(s) shall include additional screw terminals to accept the wiring interconnect inputs from the card reader(s), request-to-exit passive infrared detectors and/or the request-to-exit push button switch, and shunt switch, as required, which are not part of the door/frame security hardware package.
    d. Shall coordinate with the Electrical Contractor who will be providing all hi-voltage power to security equipment ad required, including but not limited to, the types and sizes of interconnecting wiring, outlet box sizes, electrical contacts needed and screw terminal sizes.
    e. Shall coordinate with the electrical contractor who will be providing Fire Alarm relays for interfacing with the electrified locking devices power supplies.
    f. Shall coordinate with the elevator vendor who will be providing elevator cars, controllers and traveling cables.
    g. Shall coordinate with Telecommunications Contractor who will be providing data connections for the cameras, control panels, servers, workstations and any other security equipment that requires data or telephone connectivity.
    h. Shall coordinate with the VASSAR who will be providing the Local Area Network (LAN) switches).
    i. Shall coordinate with the building security for access control cards, elevator interface and visitor management system.

3. Electrical Contractor responsibilities:

    a. Shall furnish, install and final connect all security door conduits and interconnect wires from door power supply and termination cabinet and/or junction box to all security devices associated with a door/frame security door location.
    b. Shall furnish and install all other security system interconnecting conduits, junction boxes, outlet boxes, electrical troughs, and other associated mounting hardware. Interconnecting security conduits shall be installed with a nylon pull string inside the conduits for installation of interconnecting conductors.

PART 2 - PRODUCTS

2.1 GROUNDING AND BONDING FOR SECURITY SYSTEMS

A. Comply with requirements in Division 26 Section "Grounding and Bonding for Electrical Systems" for grounding conductors and connectors.

B. Comply with ANSI-J-STD-607-A.

2.2 PATHWAYS FOR ELECTRONIC SAFETY AND SECURITY

A. Hangers and Supports

1. Cable Support: NRTL labeled.
2. Comply with NFPA 70 and UL 2043 for fire-resistant and low-smoke-producing characteristics.
3. Cable hangers and non-continuous supports shall be designed to prevent degradation of cable performance and pinch points that could damage cable. Cable tie slots fasten cable ties to brackets.
4. Shall have various attachment options for: wall, ceiling, joist, beam, flange, raised floor pedestal and others type of mounting.
5. Support brackets with cable tie slots for fastening cable ties to brackets.
6. Lacing bars, spools, J-hooks, and D-rings, straps and other devices.
7. Cable straps (ties) shall be reusable Velcro-style with hook and loop or d-ring, available in various colors and sizes. Plenum rated straps shall be used in plenum spaces.

B. Conduits and Back Boxes:

1. Provide where indicated on drawings or as required.
2. Conduit and boxes sizes as shown on the communications drawings.
3. Comply with requirements in Division 26 Section "Raceway and Boxes for Electrical Systems."
4. Flexible metal conduit shall not be used unless specifically noted.

C. Sleeves

1. Refer to Division 26 “Electrical”.

D. Sleeve Seals and Firestopping

1. Install to seal exterior wall penetrations.
2. Use type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal
3. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and pathway or cable.

E. Grout

1. Nonmetallic, Shrinkage-Resistant Grout: ASTM C 1107, factory-packaged, nonmetallic aggregate grout, noncorrosive, non-staining, mixed with water to consistency suitable for application and a 30-minute working time.

2.3 LIGHTING AND SURGE PROTECTION

A. Intrusion detection, access monitoring and control, video circuitry, and communication circuits that connect to outdoor mounted equipment shall be protected at both ends against excessive voltages.

B. This requirement shall apply for circuits that are routed both in underground conduits and overhead runs. As a minimum, both primary detection devices, such as three (3) electrode gas-type surge arrestor, and secondary protectors shall be installed to reduce dangerous voltages to levels that will cause no damage. Fuses shall not be permitted as lightning and power surge protection devices.

C. Provide fail-safe gas tube type surge arrestors on all exposed security data circuits. Breakdown voltage for the unit shall be three-hundred to five-hundred (300-500) VDC. The unit shall have equal performance for bi-polar operation with an automatic reset feature, and a minimum life of one thousand (1000) surges with ten (10) times one-thousand (1000) microsecond wave-form at one-thousand (1000) amperes.

2.4 VIBRATION AND SEISMIC CONTROLS FOR ESS

A. Security systems components shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

B. The term “withstand” means “the unit will remain in place without separation from any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event”.

C. Equipment shall be seismically rated and braced according to IBC 1621.

2.5 IDENTIFICATION FOR SECURITY ESS

A. Comply with requirements of Division 26 Section "Identification for Electrical Systems".

B. The identification for the communications systems shall meet all the requirements of a Class 3 facility as defined by ANSI/TIA/EIA 606-A, Administration Standard for the Telecommunications Infrastructure of Commercial Buildings.

C. Comply with TIA/EIA-606-A and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

D. Identify all the components of the security systems.

E. For fire-resistant plywood, do not paint over manufacturer's label.

F. All labels shall be preprinted or computer-printed type.

G. Type, format, wording, printing, and placement of labels shall be coordinated with VASSAR’s existing administration plan

H. Labeling System

1. PC-based software, WINDOWS compatible, capable of supporting alpha numeric characters and Windows True Type Fonts.
2. Compatible with laser printers.
3. Label sizes supported:
4. Minimum: 0.8" W x 0.2" H.
5. Maximum: 3.0" W x 12.0" H.

2.6 EXPOSED COMPONENTS

A. Components exposed and accessible to the public shall be of a design and construction typical and suitable for such use. All device fasteners shall be an approved security type. All components and materials shall be resistant to vandalism and waterproof.

2.7 ELECTRONIC COMPONENTS FOR ESS

A. All electronic components of the system shall be of the solid-state type, mounted on printed circuit boards conforming to UL seven-hundred-ninety-six (UL 796). Boards shall be plug-in, quick-disconnect type. Circuitry shall not be so densely placed as to impede maintenance. All power dissipating components shall incorporate safety margins of not less than twenty-five (25) percent with respect to dissipation ratings, maximum voltages, and current-

carrying capacity. All electronic printed circuit boards furnished and installed shall be provided with a mildew/fungus-resistant and moisture inhibiting coating.

2.8 CABLES FOR ESS

A. All cables installed in plenum spaces shall be plenum rated.

B. Jacket color shall be yellow for all security cables.

C. PVC-Jacketed, RS-232 Cable: Paired, 2 pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, polypropylene insulation, and individual aluminum foil-polyester tape shielded pairs with 100 percent shield coverage; PVC jacket. Pairs are cabled on common axis with No. 24 AWG, stranded (7x32) tinned copper drain wire.

1. NFPA 70, Type CM.

2. Flame Resistance: UL 1581 Vertical Tray.

3. Plenum-Type, RS-232 Cable: Paired, 2 pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, plastic insulation, and individual aluminum foil-polyester tape shielded pairs with 100 percent shield coverage; plastic jacket. Pairs are cabled on common axis with No. 24 AWG, stranded (7x32) tinned copper drain wire.

4. NFPA 70, Type CMP.

5. Flame Resistance: NFPA 262 Flame Test.

D. PVC-Jacketed, RS-485 Cable: Paired, 2 pairs, twisted, No. 22 AWG, stranded (7x30) tinned copper conductors, PVC insulation, unshielded, PVC jacket, and NFPA 70, Type CMG. RS-485 communications require 2 twisted pairs, with a distance limitation of 4000 feet.

1. Plenum-Type, RS-485 Cable: Paired, 2 pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, fluorinated-ethylene-propylene insulation, unshielded, and fluorinated-ethylene-propylene jacket.

2. NFPA 70, Type CMP.

3. Flame Resistance: NFPA 262 Flame Test.

E. Multiconductor, PVC Readers and Wiegand Keypads Cables: No. 22 AWG, paired and twisted multiple conductors, stranded (7x30) tinned copper conductors, semirigid PVC insulation, overall aluminum foil-polyester tape shield with 100 percent shield coverage, plus tinned copper braid shield with 65 percent shield coverage, and PVC jacket.

1. NFPA 70, Type CMG.

2. Flame Resistance: UL 1581 Vertical Tray.

3. For TIA/EIA-RS-232 applications.

F. Paired PVC Readers and Wiegand Keypads Cables: Paired, 3 pairs, twisted, No. 22 AWG, stranded (7x30) tinned copper conductors, polypropylene insulation, individual aluminum foil-polyester tape shielded pairs each with No. 22 AWG, stranded tinned copper drain wire, 100 percent shield coverage, and PVC jacket.

1. NFPA 70, Type CM.

2. Flame Resistance: UL 1581 Vertical Tray.

G. Paired PVC Readers and Wiegand Keypads Cable: Paired, 3 pairs, twisted, No. 20 AWG, stranded (7x28) tinned copper conductors, polyethylene (polyolefin) insulation, individual aluminum foil-polyester tape shielded pairs each with No. 22 AWG, stranded (19x34) tinned copper drain wire, 100 percent shield coverage, and PVC jacket.

1. NFPA 70, Type CM.

2. Flame Resistance: UL 1581 Vertical Tray.

H. Plenum-Type, Paired, Readers and Wiegand Keypads Cable: Paired, 3 pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, plastic insulation, individual aluminum foil-polypropylene tape shielded pairs each with No. 22 AWG, stranded tinned copper drain wire, 100 percent shield coverage, and fluorinated-ethylene-propylene jacket.

1. NFPA 70, Type CMP.
2. Flame Resistance: NFPA 262 Flame Test.

I. Plenum-Type, Multiconductor, Readers and Wiegand Keypads Cable: 6 conductors, No. 20 AWG, stranded (7x28) tinned copper conductors, fluorinated-ethylene-propylene insulation, overall aluminum foil-polyester tape shield with 100 percent shield coverage plus tinned copper braid shield with 85 percent shield coverage, and fluorinated-ethylene-propylene jacket.

1. NFPA 70, Type CMP.
2. Flame Resistance: NFPA 262 Flame Test.

J. Paired Lock Cable: 1 pair, twisted, No. 16 AWG, stranded (19x29) tinned copper conductors, PVC insulation, unshielded, and PVC jacket.

1. NFPA 70, Type CMG.
2. Flame Resistance: UL 1581 Vertical Tray.

K. Plenum-Type, Paired Lock Cable: 1 pair, twisted, No. 16 AWG, stranded (19x29) tinned copper conductors, PVC insulation, unshielded, and PVC jacket.

1. NFPA 70, Type CMP.
2. Flame Resistance: NFPA 262 Flame Test.

L. Paired Lock Cable: 1 pair, twisted, No. 18 AWG, stranded (19x30) tinned copper conductors, PVC insulation, unshielded, and PVC jacket.

1. NFPA 70, Type CMG.
2. Flame Resistance: UL 1581 Vertical Tray.

M. Plenum-Type, Paired Lock Cable: 1 pair, twisted, No. 18 AWG, stranded (19x30) tinned copper conductors, fluorinated-ethylene-propylene insulation, unshielded, and plastic jacket.

1. NFPA 70, Type CMP.
2. Flame Resistance: NFPA 262 Flame Test.

N. Paired Input Cable: 1 pair, twisted, No. 22 AWG, stranded (7x30) tinned copper conductors, polypropylene insulation, overall aluminum foil-polyester tape shield with No. 22 AWG, stranded (7x30) tinned copper drain wire, 100 percent shield coverage, and PVC jacket.

1. NFPA 70, Type CMR.
2. Flame Resistance: UL 1666 Riser Flame Test.

O. Plenum-Type, Paired Input Cable: 1 pair, twisted, No. 22 AWG, stranded (7x30) tinned copper conductors, fluorinated-ethylene-propylene insulation, aluminum foil-polyester tape shield (foil side out), with No. 22 AWG drain wire, 100 percent shield coverage, and plastic jacket.

1. NFPA 70, Type CMP.
2. Flame Resistance: NFPA 262 Flame Test.

P. Paired AC Transformer Cable: 1 pair, twisted, No. 18 AWG, stranded (7x26) tinned copper conductors, PVC insulation, unshielded, and PVC jacket.

1. NFPA 70, Type CMG.

Q. Plenum-Type, Paired AC Transformer Cable: 1 pair, twisted, No. 18 AWG, stranded (19x30) tinned copper conductors, fluorinated-ethylene-propylene insulation, unshielded, and plastic jacket.

1. NFPA 70, Type CMP.
2. Flame Resistance: NFPA 262 Flame Test.

R. LAN Cabling: Comply with Division 28 Section "Conductors and Cables for Electronic Safety and Security."

1. NFPA 262.

S. Composite Cable:

1. Element 1 (Lock Power): 18 AWG, 4 Conductor Non-Shielded Plenum
2. Element 2 (Card Reader): 22 AWG, 3 Pair Overall Shielded Plenum
3. Element 3 (Door Position Switch): 22 AWG, 2 Conductor Non-Shielded Plenum
4. Element 4 (Request to Exit Device): 22 AWG, 4 Conductor Non-Shielded Plenum

PART 3 - EXECUTION

3.1 COMMON REQUIREMENTS FOR SECURITY SYSTEMS INSTALLATION

A. All materials shall be installed as per the manufacturers' instructions, unless noted otherwise.

B. Comply with NECA 1.

C. Measure indicated mounting heights to bottom of unit for suspended items and to center of unit for wall-mounting items.

D. Headroom Maintenance: If mounting heights or other location criteria are not indicated, arrange and install components and equipment to provide maximum possible headroom consistent with these requirements.

E. Equipment: Install to facilitate service, maintenance, and repair or replacement of components of both communications equipment and other nearby installations. Connect in such a way as to facilitate future disconnecting with minimum interference with other items in the vicinity.

F. Right of Way: Give to piping systems installed at a required slope.

G. Bundle, lace, and train conductors and cables to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

H. Coordinate location of power raceways and receptacles with locations of communications equipment requiring electrical power to operate.

I. Clean exposed surfaces and protect as necessary to ensure freedom from damage and deterioration at time of Substantial Completion.

J. Thoroughly clean areas and spaces where work is performed or used as access to work. Remove completely, paint, mortar, oils, putty and items of similar nature. Thoroughly clean piping, conduit and similar features before painting or other finishing is applied. Restore all surfaces to their original condition.

K. All wall-mounted equipment shall be mounted square and plumb.

L. Complete work according to the agreed upon schedule. Cooperate in coordinating your activities with other planned and ongoing work at the site in a manner that facilitates meeting the schedule. This includes coordination with the various trades in determining work schedules and in resolving physical installation issues.

M. All materials, cables, components, and all aspects of the installation must meet all local, state, and federal laws, as well as applicable code and regulatory requirements. They must also meet the requirements of any other entity legally empowered to set standards or codes governing composition and use in this installation, as well as any rules specific to the site. Code and regulatory requirements must prevail if there are any conflicts with requirements stated or implied in this specification and its companion documents. Where there is uncertainty in determining precedence, or what specific code or regulatory requirements apply, an Authority Having Jurisdiction (AHJ) over the issue in question will decide.

N. Vassar College reserves the right to require the Security Contractor to remove from the project any employee that it deems careless, problematic, or is identified by competent authority as not conforming to required safety codes,

regulations, or standards, or is cited for performing or acting in an objectionable manner, thus affecting the safety or productivity of others.

O. Take all necessary safety and health precautions and warnings required by codes and regulations to protect the project, its workers, the public, and the property of others. Applicable OSHA regulations or AHJ directives must be followed.

P. Accept responsibility for all damages to persons or property that occurs as a result of its fault or negligence.

Q. Designate a Project Manager to act as the technical and managerial interface with the Client and or its representatives.

R. Participate in meetings covering technical, installation, and coordination and management issues.

S. Perform all work required under this specification in a skillful and professional manner in accordance with standards and practices documented and/or accepted by industry, such as the ANSI/TIA/EIA, NECA standards and codes. The Security Contractor's technicians must be familiar with the proper assembly and installation of all components they are working with and must follow manufacturer's specific installation requirements.

T. Maintain its installation and storage areas free from an accumulation of waste material and rubbish and dispose of them in a manner acceptable to the Client, building management and the General Contractor/Construction Manager.

U. Provide all tools needed to perform its required work. Upon completion of the project, all tools, equipment, and materials not designated as belonging to the Client must be removed. After completion, the work areas must be left in a clean and unobstructed condition.

V. Security Contractor must be responsible for the security of all its installation materials, whether purchased by, or supplied to the Security Contractor, as well as tools and ancillary components and documents.

W. Order all components in a timely manner so that installation dates are not compromised. Materials must either be on hand, or available on short notice, so that the installation may be expedited if required, or if the opportunity to do so presents itself.

X. Obtain all necessary permits.

Y. Ensure that any excess materials are ordered for the project they are kept in their original condition and packaging for restocking.

Z. Where required by local code, trade harmony shall be observed by using only approved union-based installation workforce.

3.2 GROUNDING AND BONDING

A. Comply with requirements in Division 26 Section "Grounding and Bonding for Electrical Systems" for grounding conductors and connectors.

B. Comply with ANSI-J-STD-607-A.

C. All cabling used to bond grounds are to be tagged with labels with the point of origin i.e. going to/coming from, with printed labels.

3.3 PATHWAYS INSTALLATION FOR SECURITY SYSTEMS

A. Comply with NECA 1.

B. Comply with requirements in Division 26 Section "Raceway and Boxes for Electrical Systems" for installation of conduits and wireways.

C. All conduits shall be electrical metallic tubing (EMT), except where otherwise noted. Exceptions shall be requested in writing as appropriate, such as for different conduit types for various classes of construction, such as for cast-in-place concrete, and placement in cable ducts. Minimum size of conduit shall be three quarter (3/4) inch. Connections shall be threadless type fittings or couplings. Fastenings and supports for conduit shall be in accordance with the national and local codes.

D. Security Contractor shall submit conduit and wire layout drawings showing circuit numbers, wiring and conduit routings for approval by the Commissioner prior to the initiation of Work. Shop drawings of the security systems conduit routing shall be coordinated by Security Contractor with fire wall construction, mechanical duct work, structural components, fire protection, and plumbing.

E. Install manufactured conduit sweeps and long-radius elbows whenever possible.

F. Care shall be taken to ensure that access to other building components (e.g., air conditioning ducts) is not restricted by cable pathways.

G. Cable management and support hardware must be UL listed for use in the environments in which they will be employed.

H. Position conduit ends adjacent to a corner on backboard where a single piece of plywood is installed, or in the corner of room where multiple sheets of plywood are installed around perimeter walls of room.

I. Secure conduits to backboard when entering room from overhead.

J. Extend conduits 3 inches above finished floor.

K. Provide metal conduits with grounding bushings and connect with grounding conductor to grounding system.

L. Bundle, lace, and train conductors and cables to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

M. Pathways shall be installed parallel or perpendicular to walls, structural members, or intersections of vertical planes and ceilings. Changes in direction of runs shall be made with symmetrical bends or cast metal fittings.

N. All conduits shall be affixed or supported at intervals and using prescribed methods and devices in accordance with governing codes. No run of conduit between outlets or fittings shall contain more than four quarter bends (360 degrees). Bends shall be made such that the conduit will not be injured and that the interval diameter will be effectively reduced.

O. All conduit connections shall be tight so as not to create intermittent loss of ground protection. All cut ends entering into fittings shall be reamed smooth or have a bushing inserted to prevent damage to wire insulation.

P. Conduit, raceways and other pathways shall be kept at least six inches from uninsulated flues, steam pipes or any pipe containing a hot gas or liquid. So far as practical, avoid traps and dips in conduit runs, which might collect moisture.

Q. Strict attention shall be given to all conduits containing fiber optic cabling to ensure that manufacturer's recommended conduit bend radii limitations/restrictions are followed.

R. Where conduits connect to sheet steel enclosures, they shall be fastened with two (2) locknuts where insulating bushings are used. Bushings shall be installed on ends of all conduits where they terminate in pull boxes, outlet boxes, cabinets, etc. and shall be of the insulating type and shall be securely fastened with locknuts on each side. Crushed or deformed conduits shall not be installed. Bushings shall not be used as locknuts. Open ends shall be sealed around security conductors to be liquid tight using an approved air-drying sealer after capping ends with insulated bushings.

S. Conduits crossing expansion joints in concrete slabs shall be provided with suitable expansion fittings, or other suitable means, to compensate for building expansion and contraction. Conduits traversing hazardous areas shall use the penetrations and fittings shown on the drawings and provided under other sections of the contract. Seal the fittings subsequent to verifying the integrity of the contained conductors.

T. Pathways shall not block ceiling or equipment access doors. Where conduit or raceway is passed through walls, floors, ceilings or roofs, annular space shall be sealed or patched. Openings in firewalls and all corridor walls shall be sealed with mineral wool or an approved silicone sealant.

U. No pathways shall be fastened to other pipe or conduit or installed so as to prevent the ready removal of other pipe or conduit for repairs.

V. Conduit, panels, devices and boxes shall be secured by means of shields in concrete, machine screws on metal surfaces and wood screws on wood construction material. Threaded studs driven in my power charge and provided with either lock-washers and nuts or nail type nylon anchors are not acceptable in lieu of machine screws. Wood

plugs shall not be used as expansion shields. Unless conditions or Drawings dictate otherwise, panels shall be located between 3'-6" and 6'-0" above floor level.

3.4 SLEEVES INSTALLATION FOR SECURITY SYSTEMS

A. Concrete Slabs and Walls: Install sleeves for penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of slabs and walls.

B. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.

C. Fire-Rated Assemblies: Install sleeves for penetrations of fire-rated floor and wall assemblies unless openings compatible with firestop system used are fabricated during construction of floor or wall.

D. Cut sleeves to length for mounting flush with both surfaces of walls.

E. Extend sleeves installed in floors 50 mm above finished floor level.

F. Size pipe sleeves to provide 6.4-mm annular clear space between sleeve and pathway or cable, unless indicated otherwise.

G. Seal space outside of sleeves with grout for penetrations of concrete and masonry

1. Promptly pack grout solidly between sleeve and wall so no voids remain. Tool exposed surfaces smooth; protect grout while curing.

H. Interior Penetrations of Non-Fire-Rated Walls and Floors: Seal annular space between sleeve and pathway or cable, using joint sealant appropriate for size, depth, and location of joint. Comply with requirements in Division 7 Section "Joint Sealants."

I. Fire-Rated-Assembly Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pathway and cable penetrations. Install sleeves and seal pathway and cable penetration sleeves with firestop materials. Comply with requirements in Division 7 Section "Through-Penetration Firestop Systems."

J. Roof-Penetration Sleeves: Seal penetration of individual pathways and cables with flexible boot-type flashing units applied in coordination with roofing work.

K. Aboveground, Exterior-Wall Penetrations: Seal penetrations using steel or cast-iron pipe sleeves and mechanical sleeve seals. Select sleeve size to allow for 25-mm annular clear space between pipe and sleeve for installing mechanical sleeve seals.

L. Underground, Exterior-Wall Penetrations: Install cast-iron pipe sleeves. Size sleeves to allow for 25-mm annular clear space between pathway or cable and sleeve for installing mechanical sleeve seals.

3.5 FIRESTOPPING

A. Apply firestopping to penetrations of fire-rated floor and wall assemblies for electronic safety and security installations to restore original fire-resistance rating of assembly. Firestopping materials and installation requirements are specified in Specification Section “Penetration Firestopping”.

B. Cable/wire runs and conduit shall be installed in accordance with applicable electrical Work standards, national and local codes as well as manufacturers' specifications of installed equipment.

C. Where required by local code, trade harmony shall be observed by using only approved union based installation workforce.

3.6 CABLE/WIRES INSTALLATION

A. Cable/wire runs and conduit shall be installed in accordance with applicable electrical Work standards, national and local codes as well as manufacturers' specifications of installed equipment.

B. All ESS conductors shall be separated from 240V primary power lines. ESS conductors shall not share any conduit in which primary power conductors are run. Junction and receptacle boxes carrying 240V, or higher voltage, shall not in any way be attached to or carry security systems conductors.

C. Conductors shall be copper, and shall not have a diameter less than eighteen (18) AWG unless otherwise indicated. Exceptions will be made for vendor-provided leads and internal equipment wiring. If required, modify equipment wiring fittings which will not accept eighteen (18) AWG minimum conductors. Conductors for intercom systems and for multiplexer data communications shall be a minimum of twenty-two (22) AWG. Other exceptions may be granted for use of smaller gauge conductors upon approval by the VASSAR's representatives.

D. Conductors interconnected to equipment subject to movement shall be stranded or shall be of a type manufactured specifically for such interconnections.

E. Wire fill, conductors, and conduit shall be sized in compliance with the National Electrical Code. The number of conductors required may vary on the basis of the manufacturers of the selected equipment. In no event, shall conduit fill exceed 40%.

F. In the event that ESS conductors must share conduit with other low voltage conductors, prior approval is required. All system conductors shall be run concealed wherever practical, and shall be placed in conduit.

G. All conductors shall be run continuously between sensors, processors, junction boxes, terminal strips or panels, and other approved devices. Splices between such locations are not to be permitted. Necessary junctions shall be made using screw-type terminal blocks, or in accordance with manufacturer's requirements for equipment connections.

H. Line supervision requirements shall be observed

I. All conductors shall be color coded and tagged consistently. Coordination with the VASSAR's representatives regarding the exact wire coding and tagging is mandatory. Transposing or changing color coding of conductors shall not be permitted. Conductor identification shall be provided within each enclosure where a tap, splice or termination is made, and at the equipment terminal of each conductor. Terminal and conductor identification shall match that shown on approved shop drawings. Hand lettering or marking will not be accepted. Marking shall be an approved permanent type utilizing an approved method. Tagging devices shall be approved and shall be permanent, not subject to inadvertent separation. All conductors at control consoles shall be bundled, neatly fanned out, and tagged. Cables and wires shall be tagged to clearly indicate their electrical characteristics, circuit number and panel designation. Tagging shall be such that several conductors may be disconnected and reconnected without the use of drawings.

J. If required by manufacturers' specifications, shielding requirements shall be observed.

K. Only approved pulling compounds shall be used. Pull strengths shall not exceed standards established by the National Electrical Code.

L. Submit conduit and wire layout drawings showing circuit numbers, wiring and conduit routings for approval by the Commissioner prior to the initiation of Work. Shop drawings of the security systems conduit routing shall be coordinated by Security Contractor with fire wall construction, mechanical duct work, structural components, fire protection, and plumbing.

3.7 SLEEVE-SEAL INSTALLATION

A. Install to seal exterior wall penetrations.

B. Use type and number of sealing elements recommended by manufacturer for pathway or cable material and size. Position pathway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pathway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.8 IDENTIFICATION FOR SECURITY SYSTEMS

A. Identify ALL system components, wiring, and cabling complying with TIA/EIA-606-A. Comply with requirements in Division 26 Section "Identification for Electrical Systems." Comply with requirements in Division 09 Section "Interior Painting" for painting backboards. For fire-resistant plywood, do not paint over manufacturer's label.

B. See evaluations for discussion of TIA/EIA standard as it applies to this Section. Paint and label colors for equipment identification shall comply with TIA/EIA-606-A for Class 3 level of administration including optional identification requirements of this standard.

C. All permanent labels must be durable and legible and suited for long term use in the environments in which they will be located. Labels shall be preprinted or computer-printed type. Handwritten labels are unacceptable unless approved by Vassar College.

D. Label all equipment, enclosures, cables, terminations and any other components using unique identifiers.

E. Labeling scheme for all communications systems is subject to prior approval by Vassar College.

F. All cables shall be color coded and tagged consistently. Transposing or changing color coding of conductors shall not be permitted. Conductor identification shall be provided within each enclosure where a tap, splice or termination is made, and at the equipment terminal of each conductor. Terminal and conductor identification shall match that shown on approved shop drawings. Hand lettering or marking will not be accepted. Marking shall be an approved permanent type utilizing an approved method. Tagging devices shall be approved and shall be permanent, not subject to inadvertent separation. All conductors at control consoles shall be bundled, neatly fanned out, and tagged. Cables and wires shall be tagged to clearly indicate their electrical characteristics, circuit number and panel designation. Tagging shall be such that several conductors may be disconnected and reconnected without the use of drawings.

3.9 CLEAN, SQUARE INSTALLATION

A. All equipment shall be clean and free of paint and other defacing materials. All installations shall be square and plumb. Take care that other trades do not deface equipment and do not move equipment out of square and plumb.

3.10 ELECTRICAL POWER

A. High Voltage Power:

1. The Electrical Contractor shall furnish and install wiring, conductors, conduit, and termination for the supply of power to security system components. Except for the interconnection into the door hardware furnished devices, it shall be the responsibility of the Security Contractor to furnish and install all low-voltage conductors and to make all final connections of same. The Security Contractor shall provide the Electrical Contractor with complete information regarding high voltage power requirements.

B. Low Voltage Power:

1. Low voltage power shall be provided through the use of two-winding isolation-type transformers and rectifier circuits and shall supply DC voltages, where and as required. Voltage levels shall be as rated for the various systems' operational requirements. All low voltage power supplies shall be fully regulated, float type, with battery back-up, capable of supporting the operation of all equipment for a minimum of four hours. Low voltage power supplies shall be required to provide central lock power, camera power, advanced processor controller power and sensor devices power.

C. Batteries:

1. Provide backup power by dedicated batteries in remotely located system elements such as remote access control panel units. Batteries shall be sized to provide continuous stand-by operation for a minimum of four (4) hours without recharge or replacement.

3.11 TESTING

A. General: Verify that all requirements of this specification are met. Verification shall be through a combination of analyses, inspections, demonstrations and tests, as described below.

B. Verification by Inspection: Verification by inspection includes examination of an item and the comparison of pertinent characteristics against the qualitative or quantitative standard set forth in the cited paragraph. Inspection may require moving or partially disassembling the item to accomplish the verification. Inspection shall be made of all equipment installations, proper functioning of all locking hardware and lock controls, mounting and wiring of electrical and signal distribution cabinets and components, and mounting and placement of sensors, VSS cameras, etc. to ensure compliance to the specifications and that the overall installation is accomplished in a professional and workmanlike manner. Vassar College quality control representative(s) and the shall have full opportunity to witness the required Security Contractor inspections or to conduct his own inspections of the installation.

C. Verification by Test and Demonstration: Verify by formal demonstrations or tests that the requirements of this Specification have been met.

D. Test Verification Requirements: Paragraphs 1-3 below list specific requirements which shall be verified by formal demonstration/test. Vassar College, or its authorized representatives, shall be afforded a fourteen (14) day advance notice of all subsystem demonstrations/tests. Vassar College' Representative reserve the right to witness any and/or all of the tests described below.

1. Preliminary Tests: Following installation, individually test each sensor and other components and verify the proper functioning of each component within a particular subsystem. Each subsystem shall be similarly tested until all detection zones, alarm assessment components, alarm reporting and display, and access control functions have been verified. Any deficiency pertaining to these requirements shall be corrected by the Security Contractor prior to final functional and operational tests of the system. When subsystem verification is complete, the entire system shall be tested to assure that all elements are compatible and function properly as a complete system.

2. System Operation Test: Following completion of the preliminary tests and the security system and component formal demonstrations, the Security Contractor shall conduct a formal test, to be known as the "System Operation Test", in which all components and subsystems of the security system are demonstrated to operate together as an integrated system. This test shall be performed over a continuous seventy-two (72) hour period. A testing plan and test procedures for each portion of the test shall be prepared by the Security Contractor and submitted 45 days prior to the start of any testing for approval in accordance with this Specification. Approval of the test procedures must be obtained prior to notification of testing to Vassar College or its representative. The Security Contractor shall demonstrate that the security system components and subsystems meet specification requirements in the "as-installed" operating environment during the "System Operation Test". While no formal environmental testing is required, the Security Contractor shall measure and record temperature, humidity, and other environmental parameters, and shall include this data in the test report to document the environmental parameters and the environment conditions which were encountered during the "System Operation Test".

3. Tests Upon Completion of Work: Upon completion of the Work, the system shall be subjected to complete functional and operational tests. When all required corrections have been accomplished, the system shall be retested. Vassar College Representatives shall be notified in writing fourteen days in advance of the proposed final acceptance testing and inspection date. The advance notice shall include certification that the installation is complete and operable and has satisfactorily performed the final tests specified herein. The acceptance testing and final inspection will be accomplished in the company of the Vassar College representatives. Prior to the test date, prepare and submit for approval a complete and detailed final acceptance test check off list ("punch list"). The list shall be a complete representation of all specified functions and conditions, including contingency, priority, and abnormal modes of operation. The arrangement of the list shall be such as to provide an orderly method of tabulating checks of system features, response and operation. The tests shall be structured so that all sensors and controls are stimulated directly in their installed and finally adjusted positions and all audible and visual displays, signals, alarms and other responses are observed and printed. At the time of final acceptance testing all required tests shall be repeated and all defects will be corrected until the system is found to be acceptable to Vassar College Representative. A log of all test activities and results shall be maintained by the Security Contractor. Typed copies of this log shall be submitted within seven days of the testing. Final tests shall include, but not limited to the following:

   a. Test of all central CPU's, peripherals, and all panel control functions.
   b. Test all graphic control and annunciation panel functions and displays.
   c. Test electrical supervision of all input/output sensor and data communication bus circuits.
   d. Test of all alarm initiating devices.
   e. Test of remote battery and battery chargers.
   f. Test of the UPS system including a battery discharge test
   g. Test of access control system to include tie-in to fire alarm system.
   h. Complete operation tests under emergency power.
   i. Test of fiber optics signal transmission system.
   j. Visual inspection of all wiring;

k. Verification that all required submittals have been provided and have been accepted;
l. Demonstrate software and programming/reprogramming functions of all micro-processor systems.
m. Verification of systems response time.
n. Carefully plan and coordinate the final acceptance tests so that all tests can be satisfactorily completed during one continuous testing period. Provide all necessary instruments, labor and materials required for tests, the equipment manufacturer's technical representative, and qualified technicians in sufficient numbers to perform the tests within the time limits imposed by this Specification.
o. In the event that Vassar College, or authorized representative(s) are required to witness a re-test at a later date because the Security Contractor is either not adequately prepared to conduct the acceptance tests or because the systems being tested are failing such tests, which shall be solely determined by Vassar College representatives witnessing the tests, the costs of witnessing additional tests (based on time and materials at the established rates of Vassar College representatives) shall be borne exclusively by the Security Contractor. In such an event, the Security Contractor shall directly compensate Vassar College representatives witnessing the tests; compensation shall be provided within thirty calendar days of such, and all, additional tests.
p. Although successful completion of the final acceptance test has been completed, the security system shall not be considered accepted until it is determined that the complete security system is continuously trouble-free and operational, in a manner satisfactory to Vassar College, for at least a seven-day period following final acceptance testing. A print-out of the system's activity log will be accepted as proof of compliance with this requirement. In the event that the system fails this operational test, make the necessary adjustments and the seven-day period will restart from the beginning. If the system fails to complete this operational test for four (4) consecutive seven-day restarted test periods, the system shall be considered inoperable and unacceptable. Make all necessary repairs, adjustments, and/or replacements, at his cost. When all adjustments have been completed and after proper notice has been given, the complete acceptance test will be re-performed and witnessed from the beginning. The Security Contractor shall be liable for all expenses for witnessing the retest as specified above. Repeated unsatisfactory operation and chronic system failures shall be considered cause for the complete system removal and replacement by Vassar College. In this event, the Security Contractor shall be liable for all expenses and damages incurred, including legal fees and court costs.

4. Reliability/Maintainability Data: Record hours of component, subsystem and system operation, together with failure and repair data. This information shall be incorporated into the System Test Report to be submitted.

3.12 MAINTENANCE AND OPERATING INSTRUCTIONS

A. Prior to completion of the workt, provide field operating instructions with respect to operation functions and maintenance procedures for the equipment and systems installed. Prepare six (6) copies of maintenance and operating instruction manuals prior to application for final payment. Organize operating and maintenance data into suitable sets of manageable size.

B. All equipment provided under this Section of the Specifications shall be placed in operation and shall function continuously in an operation test for a period of one week, without shut down due to mechanical failure.

C. Prior to scheduling the project final inspection and after completion of the entire installation period, provide all work required to adjust all controls, and all maintenance to place the systems in operation to meet the requirements of this Section of the Specifications and Contract Documents.

D. Provide operating, service, maintenance instruction manuals containing replacement data for the equipment which will require operating, maintenance or replacement and one copy of this literature shall be available during the instruction of the operating personnel while the others are checked for completeness.

E. Sufficient advance notice shall be given to Vassar College designated operating personnel for the specific instruction period. Upon completion of instruction, obtain from the representative(s) written verification that the above mentioned instruction has been performed. Such verification shall be forwarded to Vassar College.

F. Each copy of the approved operating and maintenance manual shall contain copies of approved shop drawings, equipment literature, cuts, bulletins performance charts, pump curves, details, equipment and Commissionering data

sheets and typewritten instructions relative to the care and maintenance for the operation of the equipment, all properly indexed and bound in a hard back three ring binder. Fly sheets shall be placed before instructions covering each section. The instruction sheets shall be in 8 1/2 inches by 11 inches with large sheets of drawings folded in neatly. Each manual shall have the following minimum contents:

1. Table of Contents
2. Maintenance
    a. Maintenance and Lubricating Instructions
    b. Replacement Charts
    c. Preventive Maintenance Recommendations
    d. Trouble-shooting Charts for Equipment Components
    e. Testing Instructions for each Typical Component
    f. System Draining and Filling Instructions
    g. Two typed sets of charts indicating equipment tag number, location of equipment, specific equipment service, greasing and lubricating requirements as recommended, lubricant type and intervals of lubrication.
    h. Two types sets of instructions for ordering spare parts. Each set shall include name, telephone number and address of where they may be obtained.
3. Manufacturer's Literature
    a. The equipment for which shop drawings have been submitted and approved.
    b. Wiring Diagrams
    c. Installation Drawings
    d. Manufacturer's Representative and Contract Information
    e. Guarantees

3.13 CLEANING AND ADJUSTING

A. Subsequent to installation, clean each system component of dust, dirt, grease or oil incurred or accrued from other project activities, and prepare for system activation by manufacturer's recommended procedures for adjustment, alignment or synchronization.

B. Each component shall be prepared in accordance with the appropriate provisions of the component's installation, operations and maintenance manuals.

C. Any damage caused by the Security Contractor to parts of the building, its finish, or furnishings, shall be repaired by Security Contractor at no increase in Contract costs.

D. All items of equipment shall be thoroughly inspected and any items dented, scratched or otherwise damaged, in any manner, shall be replaced or repaired and painted to match the original finish. All items so repaired and refinished shall be brought to the attention of VASSAR’s Representative for inspection and approval.

3.14 SPECIAL TOOLS

A. Provide any and all special tools, recommended by the manufacturer of items furnished, noted as not being commonly available.

3.15 CERTIFICATES OF APPROVAL

A. Upon completion of the work, furnish to Vassar College Representative in duplicate, certificates of inspection and/or approval from state and local inspection authorities having jurisdiction indicating the installed systems compliance to their requirements.

END OF SECTION

SECTION 28 10 00 - ELECTRONIC ACCESS CONTROL AND INTRUSION DETECTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. The following documents apply to all required work for the Project: (1) the Contract Drawings, (2) the Specifications, (3) the General Conditions.

B. General Conditions

C. Division 08 Section “Door Hardware”

D. Division 26 Section “Grounding and Bonding for Electrical Systems”

E. Division 26 Section “Hangers and Supports for Electrical Systems”

F. Division 26 Section “Raceway and Boxes for Electrical Systems”

G. Division 27 Section “Communications Horizontal Cabling”

H. Division 27 Section “Communications Equipment Room Fittings”

I. Division 27 Section “Communications Connecting Cords, Devices and Adapters”

J. Division 28 Section “Common Work Results for Electronic Safety and Security”

1.2 SUMMARY

A. This section describes the components that shall comprise the Access Control and practices to be used when installing them. All information herein is intended to present minimum standards of performance, quality and construction.

B. The system shall include all hardware and software required for a complete and fully functional system, whether specified herein or not.

C. Section Includes:

1. Access Control System (ACS)
    a. Software
    b. Electromechanical Guest Room Locks
    c. Remote / Elevator Controller devices
    d. Field Devices
    e. Cabling and Power Supplies
2. Coordination with:
    a. Door Hardware Vendor
    b. Fire Alarm Vendor
    c. Elevator Vendor
    d. Other Trades

1.3 ABBREVIATIONS AND DEFINITIONS

A. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security”

1.4 STANDARDS AND CODES

A. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security”

1.5 SUBMITTALS

A. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security”

1.6 SUBSTITUTIONS, DEVIATIONS AND CHANGES

A. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security”

1.7 TRAINING

A. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security”

1.8 QUALITY ASSURANCE

A. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security”

1.9 PROJECT CONDITIONS

A. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security”

1.10 COORDINATION

A. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security”

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. ACS

1. Assa Abloy
2. No substitutions

2.2 SYSTEMS DESCRIPTION

A. This section outlines the requirements for the Access Control System (ACS). All information herein is intended to present minimum standards of performance, quality and construction.

B. Provide and install systems which shall include all hardware and software required for a complete and fully functional system, whether specified herein or not.

C. Coordinate the installation of the door/frame security package with the Door Hardware Section of project specifications. Generate a spreadsheet identifying all the doors to receive electronic security devices and validate that the door hardware submittal and doors submittal shall support the required security functions. Should a conflict in function be identified, the security contractor shall alert the Commissioner. The contractor shall be responsible to ensure that the door and door hardware supplier is aware of the required security functions.

D. Electronic locking devices will be provided under the Door Hardware Section.

E. Coordinate the installation with all other trades.

F. Provide complete initialization of the system's hardware and software. Consult with Vassar College to determine requirements prior to initialization

G. Coordinate the security requirements of this Section with all other trades.

H. FUNCTIONAL REQUIREMENTS

I. The ACS shall manage the guest room access, elevator access & lobby doors.

2.3 SYSTEM PARAMETERS

A. Provide all required system components and accessories for the devices shown on drawings.

B. In addition, the system shall be scalable to allow addition of future devices. Provide 5% spare capacity.

2.4 SYSTEM PERFORMANCE CRITERIA

A. Within the context of the overall system performance previously described, the system components shall be designed to operate as described herein.

1. Modularity: Provide components designed for modular increase or decrease of system capability by installation or removal of plug-in modules. System components shall be designed to facilitate modular subassembly and part replacement.
2. Reliability: Provide only new, unused components free from flaws or imperfections, which are in current manufacturing production. Components shall be manufactured to meet all the requirements specified herein and shall be free from characteristics or defects which affect the appearance or which might affect the serviceability or render the equipment unsuitable for the intended purpose. The workmanship shall be of superior quality. The MTBF for any sensor component shall not be less than five-thousand (5000) hours. Provide components designed for continuous operation. Electronic components of the system shall be of the solid-state type, mounted on printed circuit boards conforming to UL seven-hundred-ninety-six (UL-796). Boards shall be plug-in, quick-disconnect type. Circuitry shall not be so densely placed as to impede maintenance. Power-dissipating components shall incorporate safety margins of not less than twenty-five (25) percent with respect to dissipation ratings, maximum voltages, and current-carrying capacity. Light duty relays and similar switching devices shall be solid-state type or hermetically sealed electro-mechanical type.
3. Maintainability: The components shall be capable of being maintained using commercially available standard tools and equipment. Components shall be so arranged and assembled that they are readily accessible to maintenance personnel without compromising the defeat resistance of the various security subsystems.
4. Availability: Provide products and services available within the project schedule established for the Contractor's Work. Delays due to a manufacturer's inability to deliver the required products and materials within the established schedule shall be regarded as a default in the Agreement between the Contractor and Vassar College, subject to the terms and conditions within this Agreement governing default or terms of comparable intent.

2.5 FRONT DESK EQUIPMENT AND SOFTWARE

A. System Server: Provide a server with monitor, mouse, and keyboard, and RFID encoder.

1. Server Requirements:

a. Operating System: Microsoft Windows™ 7/8/Server 2008/2012. 32 or 64 bit.
b. 4 GB RAM
c. 80GB HDD
d. Ethernet Network Card
e. Two (2) Serial ports.
f. Four (4) USB ports.

B. System Software: Provide software compatible with operating system provided with the server and LAN networking. Provide software with TCP/IP addressing capabilities, and capability to interface with the major Property Management System (PMS) and Point of Sale (POS) systems.

1. Software System Features:
a. 10,000 unique user ID's.
b. 250 User groups.
c. Up to 99 Check-in stations.
d. Unlimited timetables.
e. PMS Interface through TCP/IP, Serial RS-232.

C. Card Encoders: Provide RFID MIFARE encoders compatible with the following frequencies: ISO 14.443A, ISO 14.443B, and ISO 15.693. Provide system capable of supporting up to 99 check-in stations and being directly

connected into the LAN network, using TCP/IP addressing or the PC serial port. Provide two (2) stations for properties up to 300 rooms, and three (3+) stations for properties over 300 rooms.

D. Lock Programmers: Provide system compatible, password controlled programmer using Windows OS application. Audit Trail information shall be viewable on the lock programmer. Provide Lock Service PC with emergency lock override capabilities.

E. Offline System Option: This facility will operate with offline lock programming and control. No online system components or lock end-nodes are required.

F. Online Ready System Option: This facility will operate with offline lock programming and control. No online system components are required, but provide lock end-nodes for possible future addition of an online system.

G. Acceptable Manufacturers:

1. VingCard (VI) – VisiOnline Software

2.6 ELECTROMECHANICAL GUEST ROOM MORTISE LOCKS

A. Mechanical Requirements: Furnish with standard 2 3/4" backset, 3/4" throw anti-friction stainless steel latchbolt, and a full 1" throw stainless steel deadbolt. Provide a panic release where the deadbolt and latch are simultaneously retracted by the inside handle for easy egress in emergency situations. Auto deadbolt option where both the latch and deadbolt lock the door independently from each other shall be available. Where specified, supply locksets with an optional mechanical override cylinder. Register use of mechanical key override in the lock memory for audit trail.

B. Electrical and Reader Requirements: 13.56MHz RFID readers which are compatible with ISO 14.443A (MIFARE), ISO 14.443B, ISO 15.693, NFC (Near Field Communication), and Bluetooth Low Energy (BLE) standards. Lock functioning is motorized and powered by standard AA batteries. Mechanisms are to be within the lock case and not accessible from the outside. Provide flash RAM memory and a 2000 event audit trail.

C. Locks are of two piece construction with separate lever/rose and slim line reader. One piece full escutcheons will not be accepted.

D. Provide the necessary end-nodes if an Online or Online Ready system is being utilized.

E. Acceptable Manufacturers:

1. VingCard (VI) – Signature RFID.
2. No Substitution – Facility Standard

F. Coordinate with the Door hardware vendor.

2.7 ELECTROMECHANICAL EXIT DEVICES

A. Mechanical Requirements: ANSI/BHMA A156.3, Grade 1 certified panic and fire exit hardware devices. Devices must be available in both rim and vertical rod designs. Provide device sizes to suit door width and height.

B. Electrical Requirements: Match the reader technology for the guest room locks. Functioning is motorized and powered by standard AA batteries. Provide flash RAM memory and a 2000 event audit trail.

C. Outside lever trim only. Exit device is specified in section 087100. Rim or Vertical Rod Panic Interface as indicated in hardware sets.

D. Acceptable Manufacturers:

1. VingCard (VI) – VC3000ED Series.
2. No Substitution – Facility Standard.

E. Coordinate with the Door hardware vendor.

2.8 REMOTE CONTROLLERS

A. Match the reader technology for the guest room locks. 24VDC hardwired, constructed of weather resistant electronics suitable for either indoor or outdoor applications. Used at locations which cannot accept mortise locks or

exit devices such as parking garage gates, pool entrances, elevators, and automatic doors. Provide a 24VDC 2 amp power supply and relay box for each controller. The maximum distance between the controller and the relay box is 60 feet.

B. Acceptable Manufacturers:

1. VingCard (VI) – Remote Controller RFID.

2.9 ELEVATOR CONTROLLERS

A. Match the reader technology for the guest room locks. Provide one controller per elevator panel. If multiple floors are being controlled provide the required multi-output control boards. Provide a 24VDC 2 amp power supply and relay box for each controller.

B. Acceptable Manufacturers:

1. VingCard (VI) – Elevator Controller RFID.

2.10 KEYCARDS

A. Provide RFID keycards as required by the access control system specified herein. Provide a second layer of anti-cloning encryption to eliminate card duplication. Cards are to be capable of resisting tearing, bending, scratching, and moisture.

B. Guest Card Memory: UL (Ultralight) 256k.

C. Guest Card Memory: MIFARE 1K for Point of Sale (POS) and parking gate interfaces.

D. Staff Card Memory: MIFARE 4K.

E. Quantity: Minimum of five guest cards per guest room. Minimum of three staff cards per estimated number of staff members.

F. Provide customized card logo as directed by the property owner.

G. Acceptable Manufacturers:

1. VingCard (VI).
2. No Substitution – Facility Standard.

2.11 CABLES

A. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security.

2.12 GROUNDING

A. Comply with requirements in Division 26 Section "Grounding and Bonding for Electrical Systems" for grounding conductors and connectors.

B. Insulators shall electrically isolate bus bars from the wall, or other mounting surfaces, thereby controlling the current path.

C. Provide required stainless-steel hardware to fasten the two-hole ground lugs to the bus bar.

2.13 LABELING

A. Comply with TIA/EIA-606-A and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

PART 3 - EXECUTION

3.1 INSTALLATION PRACTICES

A. All materials shall be installed as per the manufacturers’ instructions, unless noted otherwise.

B. Comply with NECA 1.

C. Bundle, lace, and train conductors and cables to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

D. Comply with NECA 1, "Good Workmanship in Electrical Contracting."

E. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security”.

F. All equipment shall be installed according to manufacturers’ instructions.

3.2 GENERAL

A. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting installation.

B. Examine roughing-in for LAN and control cable conduit systems to PCs, Controllers, card readers, and other cable-connected devices to verify actual locations of conduit and back boxes before device installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

D. Comply with EIA/TIA-606, "Administration Standard for the Telecommunications Infrastructure of Commercial Buildings."

E. Obtain detailed Project planning forms from manufacturer of access-control system; develop custom forms to suit Project. Fill in all data available from Project plans and specifications and publish as Project planning documents for review and approval.

F. Record setup data for control station and workstations.

G. For each Location, record setup of Controller features and access requirements.

H. Propose start and stop times for time zones and holidays, and match up access levels for doors.

I. Set up groups, facility codes, linking, and list inputs and outputs for each Controller.

J. Assign action message names and compose messages.

K. Set up alarms. Establish interlocks between alarms, intruder detection, and video surveillance features.

L. Prepare and install alarm graphic maps.

M. Develop user-defined fields.

N. Develop screen layout formats.

O. Propose setups for guard tours and key control.

P. Discuss badge layout options; design badges.

Q. Complete system diagnostics and operation verification.

R. Prepare a specific plan for system testing, startup, and demonstration.

S. Develop acceptance test concept and, on approval, develop specifics of the test.

T. Develop cable and asset management system details; input data from construction documents. Include system schematics and Visio Technical Drawings.

3.3 CABLING

A. Wiring Method: Install wiring in raceway and cable tray except within consoles, cabinets, desks, and counters and except in accessible ceiling spaces and in gypsum board partitions where unenclosed wiring method may be used. Use NRTL-listed plenum cable in environmental air spaces, including plenum ceilings. Conceal raceway and cables except in unfinished spaces.

B. Install LAN cables using techniques, practices, and methods that are consistent with Category 6 rating of components and that ensure Category 6 performance of completed and linked signal paths, end to end.

C. Install cables without damaging conductors, shield, or jacket.

D. Boxes and enclosures containing security system components or cabling, and which are easily accessible to employees or to the public, shall be provided with a lock. Boxes above ceiling level in occupied areas of the building shall not be considered to be accessible. Junction boxes and small device enclosures below ceiling level and easily accessible to employees or the public shall be covered with a suitable cover plate and secured with tamperproof screws.

E. Install end-of-line resistors at the field device location and not at the Controller or panel location. All wiring where exposed shall be installed in conduit, minimum 3/4" or larger, in accordance with NFPA 70 and local codes.

F. All cables shall be terminated and connected onto termination strips. Conductors at all junction points or termination shall be tagged with conductor identification.

G. Comply with EIA/TIA-569, "Commercial Building Standard for Telecommunications Pathways and Spaces."

H. Cable application requirements are minimum requirements and shall be exceeded if recommended or required by manufacturer of system hardware.

I. RS-232 Cabling: Install at a maximum distance of 50 feet.

J. RS-485 Cabling: Install at a maximum distance of 4000 feet.

K. Card Readers and Keypads:

1. Install number of conductor pairs recommended by manufacturer for the functions specified.

2. Unless manufacturer recommends larger conductors, install No. 22 AWG wire if maximum distance from Controller to the reader is 250 feet, and install No. 20 AWG wire if maximum distance is 500 feet.

3. For greater distances, install "extender" or "repeater" modules recommended by manufacturer of the Controller.

4. Install minimum No. 18 AWG shielded cable to readers and keypads that draw 50 mA or more.

3.4 ELECTRICAL POWER

A. All AC power feeds to the system shall be installed in conduit separate from the data bus communication and low voltage control cables. The 240 VAC input power shall be furnished and installed by the Electrical Contractor. The Security Contractor shall be responsible for coordinating his requirements with the Electrical Contractor.

B. The Security Contractor shall furnish and install, in accordance with the manufacturer's instructions, all interconnect wiring, and equipment necessary for the erection of a complete system as described herein and shown on the drawings. All wiring termination, except 240 VAC power inputs and above door finish hardware device inputs, shall be the responsibility of the Security Contractor.

3.5 SYSTEM SOFTWARE

A. Coordination with Vassar College required for system configuration and programing. Use common “System’s Operational Protocol” for programming Security Systems for Vassar College facilities, thereby facilitating training and trouble shooting by Vassar College staff.

B. Develop, install, and test software and databases for the complete and proper operation of systems involved. Assign software license to Vassar College.

C. The software shall be entered into the system computer systems and debugged. The Contractor shall be responsible for documenting and entering the initial database into the system. The Contractor shall provide the necessary blank forms with instructions to fill in all the required data information that will make up the database. The database shall then be reviewed by the Contractor and entered into the system. Prior to full operation, a complete demonstration of the computer real time functions shall be performed. A printed validation log shall be provided as proof of operation for each software application package. In addition, a point utilization report shall be furnished listing each point, the associated programs utilizing that point as an input or output and the programs which that point initiates.

3.6 TESTING AND SYSTEM ACCEPTANCE

A. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security”.

3.7 DEMONSTRATION

A. Refer to Division 28 Section “Common Work Results for Electronic Safety and Security”.

B. Engage a factory-authorized service representative to train Vassar College maintenance personnel to adjust, operate, and maintain security access system. Refer to Division 01 Section "Demonstration and Training"

C. Develop separate training modules for the following:

1. System managers to maintain and update software and databases: VisiOnline Software training course, or approved equal
2. Security staff monitoring the system
3. Maintenance staff

END OF SECTION

SECTION 28 31 00

ADDRESSABLE FIRE ALARM SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of contract, including General and Supplementary conditions and Division-1 specification sections, apply to work of this section.

B. Division 26, Basic Electrical Materials & Methods apply to work specified in this section.

C. Division 26 “Electrical Identification” apply to work in this section for labeling of conduit and equipment.

D. Related work specified in other divisions of these specifications.

1. Installation of duct type smoke detectors.
2. Control wiring from Fire Alarm Control equipment to mechanical fans, dampers, control equipment both low voltage and line voltage and all other control wiring associated with mechanical equipment.

E. Secure permits and approvals prior to installation.

F. Prior to commencement and after completion of work notify Authorities Having Jurisdiction.

G. Submit letter of approval for installation before requesting acceptance of system.

1.2 SUMMARY

A. Provide a complete and coordinated Class A wiring, fire management system in accordance with the contract documents.

B. System shall be compatible and integrated into existing campus SAFECO ALARM SYSTEMS INC .Contact Mr. Paul Sistare at 845-338-4440. System shall be installed and warrantied under direct supervision of SAFECO and Mr. Paul Sistare.

C. Any fire alarm devices, wiring etc., not indicated on the drawings, but required by the Authority Having Jurisdiction and Fire Department, shall be provided as part of this specification. As minimum, an additional 25 audio/visual alarms 25 smoke detectors and 25 addressable interface devices shall be included in price including labor, circuitry and programming. Devices shall be placed as directed in field.

1.3 RELATED WORK

A. The Contractor shall coordinate work in this Section with all related trades. Work and/or equipment provided in other Sections and related to the alarm system shall include, but not be limited to:

1. Fire/Smoke Dampers wiring and connections shall be provided under this contract. Refer to mechanical drawings for quantities and locations.

2. Sprinkler waterflow and supervisory switches shall be furnished and installed by the plumbing contractor, but wired and connected by the electrical contractor. Modification of existing sprinkler devices to accommodate monitoring by the new Sprinkler system shall be the responsibility of the alarm system installing contractor (if applicable).

3. Duct smoke detectors shall be furnished, wired and connected by the electrical contractor. The HVAC contractor shall furnish necessary duct opening to install the duct smoke detectors.

4. New air handling and smoke exhaust system fan control circuits and status contacts to be furnished by the HVAC control equipment.

5. Elevator recall control circuits to be provided by the elevator control equipment. Modifications to the existing elevator controls to accommodate ANSI A17.1 shunt trip activation shall be provided by the elevator controls contractor. Any shunt trip circuit breakers and related wiring required for ANSI A17.1 compliance shall be provided by the electrical contractor (see power riser for more details).

6. Dry pipe/deluge sprinkler system release valve control circuits and supervision contacts shall be provided by the dry pipe/deluge sprinkler system control equipment (if applicable).

7. Conduit: Section 26 05 33.

8. Wire and Cables: Section 26 05 13.

9. Installing dedicated outgoing RJ-31X telephone lines (2) in rigid conduit shall be the responsibility of the Installing Electrical Contractor. Establishment of central station monitoring account shall be the responsibility of the fire alarm equipment vendor. Central station subscription information shall be provided by the customer.

1.4 SUBMITTALS

A. Procedure - prepare and make submittals listed in accordance with Division 1, “Submittals” as required by Local Department of Fire.

B. Provide list of all types of equipment and components provided. This shall be incorporated as part of a Table of Contents, which will also indicate the manufacturer’s part number, the description of the part, and the part number of the manufacturer’s product datasheet on which the information can be found.

C. Provide description of operation of the system (Sequence of Operation), similar to that provided in Part 2 of this Section of the Specifications, to include any and all exceptions, variances or substitutions listed at the time of bid. Any such exceptions, variances or substitutions that were not listed at the time of bid and are identified in the submittal, shall be grounds for immediate disapproval without comment. The sequence of operation shall be project specific, and shall provide individual sequences for every type of alarm, supervisory, or trouble condition that may occur as part of normal or off-normal system use.

D. Product Data - submit manufacturer’s specifications, recommendations, and installation instruction for use intended. The data shall include but is not limited to the following:

1. Control panels and remote data gathering panels.
2. Cabinets
3. Manual stations
4. Batteries
5. Battery charger
6. Smoke sensors
7. Installer’s training history
8. Visual alarms
9. Audio/visual alarms
10. Addressable interface devices
11. Central processing unit
12. Wiring conductors

13. Wire connectors
14. Thermal sensors
15. Electromagnetic door hold-open devices
16. Remote alpha numeric LCD annunciators with control capabilities.
17. Manufacturer's recommended calibrated test method for smoke sensors and smoke detectors.
18. Include Underwriters Laboratories or Factory Mutual listing cards for equipment provided.

E. Provide manufacturer's printed product data, catalog cuts and description of any special installation procedures. Poorly photocopied and/or illegible product data sheets shall not be acceptable and shall be rejected. All product datasheets shall be highlighted or stamped with arrows to indicate the specific components being submitted for approval.

F. Provide manufacturer's operator's instruction manual for specified system.

G. Provide samples of various items when requested.

H. Provide copy of New York License to perform such work.

I. Provide copies of NICET Level II Fire Alarm certifications for the two (2) technicians assigned to this project.

J. Drawings

1. Detailed drawings for the fire alarm system shall consist of illustrations, schedules, performance charts, battery calculations, point lists, instructions, diagrams, sequence of operation, and complete detailed drawings of the fire alarm system.
2. A descriptive index of drawings in the submittal with drawings listed in sequence by drawing number.
3. A legend sheet identifying device symbols, nomenclature, and conventions used in the package.
4. Floor plans drawn to a scale not less than 1/8-inch equals 1 foot which clearly show locations of devices, equipment, risers, panels, electrical power connections, approximate location of conduit runs, and other details required to clearly describe the proposed system.
5. Location of control panels, detectors, supervisory switches, manual pull stations, visual/audible alarms and electrical devices. Clearly and completely indicate the function of the control panel and devices. Indicate conduit routing and sizes, and the number of conductors contained in each. Indicate points of connection and terminals used for electrical field connections in the system, with a wiring color code. Indicate termination points of devices and indicate the interconnection of modules required for proper operation of the system. Indicate interconnection between modules and devices. Control diagrams shall be supplemented with a narrative description of the system. Point-to-point wiring diagrams shall indicate control panel wiring and make and model of devices and equipment. Signal circuit diagrams shall show current draw and load by device and by circuit.
6. Device riser diagram shall individually depict all control panels, annunciators, addressable devices, and notification appliances. Riser diagrams shall include a specific, proposed point descriptor above each addressable device. Riser diagrams shall include a specific, discrete point address that shall correspond to addresses depicted on the device layout floor plans. Drawing shall provide wire specifications, and wire tags shown on all conductors depicted on the riser diagram. All circuits shall have designations that shall correspond with those require on the control panel and floor plan drawings. End-of-line resistors (and values) shall be depicted.
7. Device typical wiring diagram drawing(s) shall be provided which depict all system components, and their respective field wiring termination points. Wire type, gauge, and jacket shall also be indicated. When an addressable module is used in multiple configurations for monitoring or controlling various types of equipment, different device typical diagrams shall be provided. End-of-line resistors (and values) shall be depicted.

K. Design Data

1. Battery standby power requirements calculations.
2. Battery calculations shall be provided on a per power supply/charger basis. These calculations shall clearly indicate the quantity of devices, the device part numbers, the supervisory current draw, the alarm current draw, totals for all categories, and the calculated battery requirements (which reflect a 20% DEGRADE, for 24 Hour supervisory, 45 minute alarm operation). Battery calculations shall also reflect all control panel component, remote annunciator, and auxiliary relay current draws. Failure to provide these calculations shall be grounds for the complete rejection of the submittal package.

L. Field Test Reports

1. Preliminary and acceptance tests.
2. Include the control panel and initiating and indicating devices, a unique identifier for each device with an indication of test results, and signature of the factory-trained technician of the control panel manufacturer and equipment installer. With reports on preliminary tests, include printer information.

M. Records Drawings

1. Upon completion, and before final acceptance of the work, submit a complete set of CAD generated as-built drawings for the fire alarm system, including components and any other associated appurtenances. Include as-built circuit diagrams complete with conductor color codes and a listing of initiating device locations and fixing voltage for each. Submit a minimum ten of 11 x 17 inch reproducible as-built drawings with title block similar to contractor drawings, and provide CAD diskettes of entire project. Submit as-built drawings in addition to the record drawings required by Division 1, “Operation and Maintenance Data”.
2. List of FACP alphanumeric address names
3. Request for formal inspection and tests
4. When tests have been completed and corrections made, submit a signed, dated certificate with a request for formal inspection and tests.

N. Operation and Maintenance Manuals

1. Fire alarm control panel
2. Smoke and thermal sensors
3. Interface and control modules
4. Submit in accordance with Division 1, “Operation and Maintenance Data”. Include current unit prices and source of supply for parts list, and a list of parts recommended by the manufacturer to be replaced after one year and three years of service. Include in the fire alarm control panel, full and comprehensive manufacturer’s repair and service manuals.

O. See section 3.3 F. Documentation and Training for other documents related to this section.

1.5 QUALITY ASSURANCE

A. Qualifications the manufacturer’s authorized distributor must substantiate that within a 50 mile radius of the job site, there is an established agency which stocks a full complement of parts and offers full service during normal working hours on all equipment to be furnished and that the agency will supply parts without delay and at a reasonable cost.

B. Qualifications of Installer: Prior to installation, submit data for approval showing that the Contractor has successfully installed addressable, analog intelligent interior fire alarm systems of the same type as specified herein, or that the Contractor has a firm contractual agreement with a subcontractor having such required experience. Include the names and locations of at least two installations where the Contractor, or the subcontractor referred to above, has installed such systems. Indicate the type and design of each system and certify that each system has performed satisfactorily in the manner intended for a period of not less than 18 months. Submit names and phone numbers of points of contact at each site.

C. Codes and Standards: Except as modified by governing codes and where more stringent standards are specified by the contract documents, comply with the latest applicable provisions and the latest recommendations of the following:

1. All equipment shall be UL listed for its intended use.
2. National Electric Code, Article 760.
3. National Fire Protection Association Standards: NFPA72 and NFPA 101.
4. Local and State Building Codes and the Local Authorities Having Jurisdiction.
5. MEA / BSA
6. Underwriters Laboratories Inc.: The system and all components shall be listed by Underwriters Laboratories Inc. for use in fire protective signaling system under the following standards as applicable:

UL 864/UOJZ, APOU	Control Units for Fire Protective Signaling Systems.
UL 268	Smoke Detectors for Fire Protective Signaling Systems.
UL 268A	Smoke Detectors for Duct Applications.
UL 217	Smoke Detectors Single Station.
UL 521	Heat Detectors for Fire Protective Signaling Systems.
UL 228	Door Holders for Fire Protective Signaling Systems.
UL 464	Audible Signaling Appliances.
UL 1638	Visual Signaling Appliances.
UL 38	Manually Activated Signaling Boxes.
UL 346	Waterflow Indicators for Fire Protective Signaling Systems.
UL 1971	Standard for Signaling Devices for the Hearing Impaired
UL 1481	Power Supplies for Fire Protective Signaling Systems.
UL 1711	Amplifiers for Fire Protective Signaling Systems.

7. Americans with Disabilities Act (ADA)
8. International Standards Organization (ISO): ISO-9001
9. Local and City Codes.

D. Federal Specifications Compliance: Comply with FED-STD-595, “Colors used in Government Procurement”.

E. Guarantee - all components, parts and assemblies supplied by the manufacturer shall be guaranteed against defects in materials and workmanship for a period of 12 months upon acceptance. Warranty service shall be provided by a trained specialist of the equipment manufacturer. The specialist shall be based in a fully-staffed branch office located within 50 miles from the job site.

F. Testing - conduct a total system test for Architect/Engineer and Local Fire Department. Tests shall include as a minimum.

1. Verify operation of all manual pull stations and detectors.
2. Verify line supervision of each initiating and indicating circuit.
3. Verify the Class A operation of each initiating circuit.
4. Verify operation of all indicating devices.
5. Verify operation of all alarm initiated function.
6. Perform smoke test(s) as directed by the Local Fire Department. Provide electricians, and factory representatives to perform as many tests as required to approve system. The Engineer, Owner and Architect shall be advised a minimum of five working days before each test.

G. All equipment provided as part of this section shall be the product of a single fire alarm equipment manufacturer.

H. Equipment and devices shall be from a manufacturer who has been manufacturing similar products for a minimum of 5 years. Furnish materials and equipment that are current products of one manufacturer regularly engaged in the production of such equipment.

I. Regulatory Requirements

1. Devices and equipment for fire alarm service shall be listed by Underwriters Laboratories, Inc. and listed in UL FPKD or approved by Factory Mutual and listed in FM P7825. The omission of these terms under the description of any item of equipment described shall not be construed as waiving this requirement.

J. Requirements for Fire Protection Service

1. Equipment and material shall have been tested by Underwriters Laboratories, Inc. and listed in UL FPKD or approved by Factory Mutual and listed in FM P7825. The omission of these terms under the description of any item of equipment described shall not be construed as waiving this requirement.

K. Standard Products

1. Materials and equipment shall be standard new products of a manufacturer regularly engaged in the manufacturer of such products. Select material from one manufacturer, and not a combination of manufacturers, for any particular classification of materials.

L. Modification of References

1. In NFPA publications referred to herein, consider advisory provisions to be mandatory, as though the word "shall" had been substituted for "should" wherever it appears; interpret reference to "authority having jurisdiction".

1.6 DELIVERY, STORAGE AND HANDLING

A. Protect equipment delivered and placed in storage from the weather, humidity and temperature variation, dirt and dust, and other contaminants.

1.7 SPARE PARTS

A. Spare parts shall be directly interchangeable with the corresponding components of the installed system. Spare parts shall be suitably packaged and identified by nameplate, stamping or tagging. Furnish the following:

1. Four keys or tools for resetting manual systems.
2. Four keys for locks of control panels or cabinets.
3. Three (bases and heads) of each type smoke (area and duct) and thermal sensors.
4. Three of each type monitor module.
5. Three of each type control module.
6. Three fuses of each type provided. Spare fuses shall be mounted in the fuse holder located inside each control panel.
7. One of each type audio/visual device.
8. One of each type visual device.

PART 2 - PRODUCTS

2.1 SYSTEM DESIGN

A. Acceptable Manufacturers:

1. SAFECO ALARM SYSTEMS INC
2. All products used shall be of a single manufacturer. Submission of notification appliances, auxiliary relays, or documentation from other than a single manufacturer shall not be acceptable and will be grounds for immediate disapproval without comment.

3. The Sprinkler / Smoke Detection System supplied under this specification shall be a microprocessor-based. All Control Panel Assemblies and connected Field Appliances shall be both designed and manufactured by the same company, and shall be tested and cross-listed as compatible to ensure that a fully functioning Life Safety System is designed and installed.

B. Scope :

1. The work covered by this section of the specifications includes the furnishing of all labor, equipment, materials, and performing all operations in connection with the installation of the multiplex addressable Fire Alarm System (Class A) as shown on the drawings, as hereinafter specified, and as directed by the architect/engineer. It shall be complete with all necessary hardware, software and memory specifically tailored for this installation. It shall be possible to permanently modify the software on site by using a plug-in programmer.
2. The Fire Alarm System shall consist of all necessary hardware and software equipment to perform the following functions:
   a. Fire Alarm and Detection Operations.
   b. Two-way Supervised Voice Communication Operations.
   c. One-way Supervised Automatic Voice Alarm Operations.
   d. Remote Manual and Automatic Control of elevators, all Smoke Control Related Fan Systems, remote monitoring of sprinkler, fire pump, and emergency power systems.
   e. Interface to the public address speaker system for the seating bowl.
   f. Interface to Division 23 smoke control equipment with appropriate outputs, controls and graphics.
3. Each item of the Fire Alarm System shall be listed as a product of a single fire alarm system manufacturer under the appropriate category by the Underwriters' Laboratories, Inc. (UL), and shall bear the "U.L." label. The Control Equipment for all Systems shall be listed under UL category UOJZ as a Single Control Unit.
4. The complete installation shall conform to the applicable sections of NFPA-72, NEC 76, Life Safety Code 101, and Local authorities having jurisdiction.
5. Nodes as defined for this specification shall be intelligent, microprocessor based devices that connect to, and handle network communications.
6. By programmable selection at each node:
   a. The specific detail information of any point connected to any node in the network may be made accessible (declared public) to the network.
   b. Points within each node shall be able to be grouped by area, type of device, type of function, or any other user selectable category, and custom labeled as a point list. A point list shall be acted upon as though it was a point for purposes of interaction with the node custom control program. Detail information shall not burden the point list messages, only the quantity and type of status shall be broadcast into the network.
7. The fire alarm system shall be provided with the primary monitoring host computer system for alarms, trouble, and supervisory indication located as shown on the construction documents. This host shall be U.L. listed for use with the fire alarm system. The host system shall be connected to the fire alarm control panels utilizing an RS-485, BacNet Level II, or equivalent network protocol on a twisted pair communication bus network.
8. Survivability: When wiring connecting the FSCS to any remote mounted controlling device exceeds 100 feet; the wire shall be 2-hour rated in addition to being in conduit.

9. All locally required Sprinkler – Smoke Detection system peripherals, placards, pull station white stripe plate, riser diagram, etc. shall be included in the system price.

C. Alarm System

1. Furnish and install a fully field programmable/addressable analog fire detection system. The System shall determine the number and types of modules installed, the number of analog addressable loops, and all installed devices. It shall determine the type of device and the device number. The System shall use Style 4 (Class A) signaling line circuits and Style Z (Class A) indicating appliance circuits with individual device

supervision and annunciation, primary and secondary supervision, and interfaces to the public address system (furnished by others). Include control panels, central processing unit, microphone, signal zone selectors, manual pull stations, smoke sensors, thermal sensors, addressable input interface devices, control and isolation devices, analog/addressable loop modules, audio/visual devices, visual devices, wiring, connections to devices, outlet boxes, junction boxes, and other necessary material for a complete operating system. System shall allow for loading or editing special instructions and operation sequences as required. System shall be site programmable to accommodate and facilitate expansion or changes. System shall be capable of generating the programming necessary to establish a fully functional general alarm system upon initialization. Software operations are to be stored in a non-volatile programmable memory. Loss of primary and secondary power shall not erase the instructions stored in memory. Selective input/output control functions based on ANDing, Oring, NOTing, timing and special coded operations shall be incorporated in the resident software programming of the system.

D. Job Site Changes

1. To accommodate and facilitate job site changes, initiating and indicating circuits shall be individually configurable on site to provide either alarm/trouble operation, alarm only, trouble only, current limited alarm, no alarm, normally closed device monitoring, a non-latching circuit or an alarm verification circuit.

E. Operations

1. Display
   a. Under normal condition, front panel shall display a “SYSTEM NORMAL” or equivalent message and the current time and date.
2. Sequence of Operation
   a. The system shall identify any off normal condition and log each condition into the system database as an event.
      (1) The system shall automatically display on the control panel Liquid Crystal Display the first event of the highest priority by type. The priorities and types shall be alarm, supervisory, trouble, and monitor.
      (2) The system shall have a Queue operation, and shall not require event acknowledgment by the system operator. The system shall have a labeled color coded indicator for each type of event; alarm - red, supervisory - yellow, trouble - yellow, monitor - yellow. When an unseen event exists for a given type, the indicator shall be lit.
      (3) For each event, the display shall include the current time, the total number of events, the type of event, the time the event occurred and up to a 40 character custom user description.
      (4) The user shall be able to review each event by simply selecting scrolling keys (up-down) for each event type.
      (5) New alarm, supervisory, or trouble events shall sound an audible signal at the control panel.
   b. Operation of any alarm-initiating device shall automatically:
      (1) Update the control/display as described above (a.(1)).
      (2) Sound all audible appliances in a Temporal-3 Pattern. ALL AUDIBLE APPLIANCES SHALL BE SYNCHRONIZED WITH EACH OTHER WHEN TWO OR MORE HORNS CAN BE HEARD. Audible devices shall have the ability to be silenced.
      (3) Activate all strobe appliances throughout the facility. ALL STROBE APPLIANCES SHALL BE SYNCHRONIZED WITH EACH OTHER, IN ANY LOCATION WITH TWO OR MORE DEVICES IN A COMMON FIELD OF VIEW. Visual devices shall be non-silenced unless the system is successfully reset.
      (4) Operate control relay contacts to shutdown all HVAC units serving the floor of alarm initiation.
      (5) Operate control relay contacts to return all elevators that serve the floor of alarm initiation to the ground floor. If the alarm originates from the ground floor, operate control circuits contacts to return all elevators to the floor above or to a level as directed by the local fire department.

(6) Operate control relay contacts to release all magnetically held smoke doors throughout the building.
(7) Visually annunciate the individual point of alarm on all remote annunciator panels. The visual indication shall remain on until the alarm condition is reset to normal.
(8) Transmit an alarm condition, via the integral central station communicator, to central station/Local Fire Department (as required by the AHJ).

c. Elevator smoke and heat detector sequences shall comply with the ANSI A17.1 requirements for main/alternate floor recalls, and shunt trip activations.

d. Activation of a sprinkler supervisory initiating device shall:(if applicable)
(1) Update the control/display as described above (a.(1)).
(2) Transmit a supervisory condition, via the integral central station communicator, to central station/Local Fire Department (as required by the AHJ).
(3) Visually annunciate the individual point of alarm on all remote annunciator panels. The visual indication shall remain on until the alarm condition is reset to normal.

e. The entire fire alarm system wiring shall be electrically supervised to automatically detect and report trouble conditions to the fire alarm control panel. Any opens, grounds or disarrangement of system wiring and shorts across alarm signaling wiring shall automatically:
(1) Update the control/display as described above (a.(1)).
(2) Transmit a trouble condition, via the integral central station communicator, to central station/Local Fire Department (as required by the AHJ).
(3) Visually and audibly annunciate a general trouble condition, on the remote annunciator panels. The visual indication shall remain on until the trouble condition is repaired.

F. Primary Power

1. Provide normal and/or emergency power as per fire alarm detail on drawings.

2. Obtain primary power 208/120 VAC 50/60hz, from main service switchboard, and emergency power from emergency generator utilizing fuse switches as indicated in fire alarm power supply detail. Primary and emergency power sources shall be identified FIRE ALARM SYSTEM with a red and white engraved plastic sign permanently affixed to the face of the cutout. Provide multiple fuse switch power supplies from both normal and emergency sources as required for the components furnished, including, but not limited to, fire alarm panels, transmitters for off-site reporting, etc.

G. Auxiliary Power (Secondary Power)

1. Provide for system operation in the event of normal and/or emergency power source failure. Transfer from normal to auxiliary (secondary) power or restoration from auxiliary to normal and/or emergency power shall be automatic and shall not cause transmission of a false alarm.
   a. Batteries
      Provide rechargeable lead acid type with sufficient ampere-hour rating to operate the system under supervisory and trouble conditions, including audible trouble signal devices for 24 hours and audible and visual signal devices under alarm conditions for an additional 5 minutes. House batteries either within the control panel or in a separate substantial steel cabinet, and finish on inside and outside with enamel paint; equip with a non corrosive base and cylinder lock keyed to match FACP. Separate cells to prevent contact between terminals of adjacent cells and between terminals and other metal parts. Locate cabinet to allow convenient viewing and servicing of the batteries. A separate cabinet shall have twice the volume of batteries it will contain. The battery cabinet, if provided, shall be identified FIRE ALARM SYSTEM BATTERY CABINET with a red and white engraved plastic sign permanently affixed to the face of the panel.
   b. Battery Charger
      Provide solid state automatic float type, capable of recharging completely discharged batteries to fully charged condition in 24 hours or less. Locate charger within the control panel or within the battery cabinet. Provide voltmeter and ammeter to indicate battery voltage and charging current.

H. Wiring

1. Each addressable analog loop shall be circuited so device loading is not to exceed 80% of loop capacity in order to leave for space for future devices. The loop shall have Class A operation.
2. Where it is necessary to interface conventional initiating devices provide intelligent input modules to supervise Class A zone wiring.
3. Each of the following types of devices or equipment shall be provided with supervised circuits as shown on the drawings but shall be typically as follows:
   a. Sprinkler Valve Supervisory Switches: Provide one (1) supervisory module circuit for each sprinkler valve supervisory switch (if applicable).
   b. When waterflow and tamper switches exist at the same location, provide one (1) dual input addressable module. When odd numbers of devices exist at a single location, provide additional single input addressable modules (if applicable).
4. Each of the following types of alarm notification appliances shall be circuited as shown on the drawings but shall be typically as follows:
   a. Audible Signals: Provide sufficient spare capacity to assure that the addition of five (5) audible devices can be supported without the need for addition control components (power supplies, signal circuit modules, batteries, etc.).
   b. Visual Signals Provide sufficient spare capacity to assure that the addition of three (3) audible devices can be supported without the need for addition control components (power supplies, signal circuit modules, batteries, etc.).
5. Each of the following types of remote equipment associated with the alarm system shall be provided with a form ‘C’ control relay contact as shown on the drawings, but shall be typically as follows:
   a. HVAC Fan Systems: Provide one (1) shutdown control relay contact for each HVAC fan system.
   b. HVAC Supply Fans: Provide one (1) shutdown control relay contact for each HVAC supply fan.
   c. HVAC Return Fans: Provide one (1) shutdown control relay contact for each HVAC return fan.
6. Provide a dedicated 24VDC circuit to feed all auxiliary relays required for inductive loads. Circuits shall be supervised via an end-of-line relay and addressable input module. Auxiliary relays shall not derive their power from the starter or load being controlled.
7. Each control or data gathering panel shall have a dedicated 20Amp-120VAC feed from the nearest available emergency panel. An appropriate fuse cut out or lockable C.B. shall be included.

2.2 UL LISTED AND APPROVED EQUIPMENT

A. Fire Alarm Control Panel Requirements:

1. The fire alarm control panel or panels and all system devices (horn-strobes, strobes, pull stations, smoke and heat detectors shall All under one label "UL listed and approved" for the use of fire alarm systems in this area of the United States of America. The operating controls shall be located behind locked door with viewing window. All control modules shall be labeled, and all zone locations shall be identified.

B. System Controllers

1. The main controller shall be supervised, site programmable, and of modular design supporting up to 96 detectors and 94 remote modules, and two Notification Appliance Circuits (NACs). Additional support for expansion modules will add up 96 detectors and 94 modules including two additional NAC circuits. NAC's shall be convertible to power risers to serve remote multiple NAC modules for zoned signal applications. The system shall support up to five controllers connected together in a peer-to-peer topology. The cabinet shall be steel with a red finish.

C. The system shall store all basic system functionality and job specific data in non-volatile memory. All site specific and operating data shall survive a complete power failure intact. Passwords shall protect any changes to system operations.

D. The Main Controller Module shall control and monitor all local or remote peripherals. It shall support the 2-LCD Display Module, power supply, remote LCD and zone display annunciators, strip and carriage printers, and support communication interface standard protocol (CSI) devices such as color computer annunciators and color graphic displays. The annunciator port shall be capable of supporting up to 30 remote annunciators. The 2-MCMN shall provide one loop controller circuit, two notification appliance circuits, and common form 'R' contacts for alarm, supervisory, and trouble. Contact ratings shall be 24Vdc at 1A.

E. The panel shall have an interface module for remote site monitoring. The module shall have a dialer (alarm communicator transmitter (DACT)) module to transmit alarm, supervisory and trouble signals to a Central Monitoring Station (CMS). The DACT shall support dual telephones lines, 20 PPS 4/2 communications, and configured for dual tone multi-frequency (DTMF) or pulse modes. It shall be possible to delay AC power failure reports, auto test call, and site program using a touch tone phone and password. The dialer shall be capable of transmitting up to 40 individual alarm conditions to central station.

F. The system shall have built-in automatic system programming to automatically address and map all system devices attached to the main controller. A minimum default single stage alarm system operation shall be supported with alarm silence, event silence, drill, lamp test, and reset common controls.

G. Advanced Windows-based System Definition Utility with Program Version Reporting to document any and all changes made during system start-up or system commissioning shall be used to maintain site specific programming. Time and Date Stamps of all modifications made to the program must be included to allow full retention of all previous program version data. It shall support programming of any input point to any output point. The system shall support the use of Bar Code readers to assist custom programming functions. It shall allow authorized customization of fundamental system operations using initiating events to start actions, timers, sequences and logical algorithms. The system program shall meet the requirements of this project, current codes and standards, and satisfy the local Authority Having Jurisdiction.

H. The system shall support distributed processor intelligent detectors with the following operational attributes; integral multiple differential sensors, automatic device mapping, electronic addressing, environmental compensation, pre-alarm, dirty detector identification, automatic day/night sensitivity adjustment, normal/alarm LEDs, relay bases, sounder bases and isolator bases.

I. The system shall use full digital communications to supervise all addressable loop devices for placement, correct location, and operation. It shall allow swapping of "same type" devices without the need of addressing and impose the "location" parameters on replacement device. It shall initiate and maintain a trouble if a device is added to a loop and clear the trouble when the new device is mapped and defined into the system.

J. Each controller shall contain a RS232 printer/programming port for programming locally via a windows based PC or down loading through modems from a remote PC. When operational, each controller shall support a printer through the RS232 port and be capable of message routing.

K. System circuits shall be configured as follows: Addressable analog Signaling Line Circuit (SLC) loops Class A (Style 4); Initiating Device Circuits Class A; Notification Appliance Circuits Class A; Network Communications Class A; Annunciator Communications Class A.

L. Single stage operation shall be provided.

M. The system shall have a UL Listed Detector Sensitivity test feature, which will be a function of the smoke detectors and performed automatically every 4 hours.

N. The system shall support 100% of all remote devices in alarm and provide support for a 100% compliment of detector isolator bases.

O. All panel modules shall be supervised for placement and return trouble if damaged or removed.

P. The system shall have a CPU watchdog circuit to initiate trouble should the CPU fail.

Q. The system evacuation signal rate shall be temporal 3-3-3.

R. Audible notification appliances shall be affected by the control panel signal silence switch. Visual signal appliance shall not be affected by the control panel signal silence switch.

S. User Interface

The 2-LCD Display Module shall be of membrane style construction with a 4 line by 20 character Liquid Crystal Display. The LCD shall use super-twist technology and backlighting for high contrast visual clarity. In the normal mode display the time, the total number of active events and the total number of disable points. In the alarm mode display the total number of events and the type of event on display. Reserve 40 characters of display space for user custom messages. The module shall have visual indicators for the following common control functions; AC Power, alarm, supervisory, monitor, trouble, disable, ground fault, CPU fail, and test. There shall be common control keys and visual indicators for; reset, alarm silence, trouble silence, drill, and one custom programmable key/indicator. Provide four pairs of display control keys for selection of event display by type (alarm, supervisory, monitor and trouble) and forward / backward scrolling through event listings. The operation of these keys shall be integrated with the related common control indicators to flash the indicators when undisplayed events are available for display and turn on steady when all events have been displayed. Allow the first event of the highest priority to capture the LCD for display so that arriving fire fighters can view the first alarm event “hands free”. Provide system function keys; status, reports, enable, disable, activate, restore, program, and test. The module shall have a numeric keypad, zero through nine with delete and enter keys.

S. Power Supplies

The power supply shall be a high efficiency switch mode type with line monitoring to automatically switch to batteries for power failure or brown out conditions. The automatic battery charger shall have low battery discharge protection. The power supply shall provide internal power and 24 Vdc at 7.0A continuous for notification appliance circuits. The power supply shall be capable of providing 7A to output circuits for a maximum period of 100 ms. All outputs shall be power limited. The battery shall be sized to support the system for 24 hours of supervisory and trouble signal current plus general alarm for 45 minutes.

T. Auxiliary power supplies shall be a high efficiency switch mode type with line monitoring to automatically switch to batteries for power failure or brown out conditions. The automatic battery charger shall have low battery discharge protection. The power supply shall provide internal power and 24 Vdc at 7.0A continuous for notification appliance circuits. The power supply shall be capable of providing 7A to output circuits for a maximum period of 100 ms. All outputs shall be power limited. The battery shall be sized to support the system for 24 hours of supervisory and trouble signal current plus general alarm for 5 minutes.

U. Network alphanumeric annunciators shall be located throughout the facility as indicated on the plans. The system shall have the capacity to support five network annunciators in addition to five control panels. Each annunciator shall contain a supervised, back lit, liquid crystal with a minimum of 4 line with 20 characters per line. Where required, the annunciator shall include additional zonal annunciation and manual control without additional enclosures. The annunciator shall support full ability to serve as the operating interface to the system and shall include the following features:

Matched appearance with other system displays
Each LCD Display on each node (cabinet) in the system shall be configurable to show the status of any or all of the following functions anywhere in the system:

Alarm
Supervisory
Trouble
Monitor

V. Each annunciator must be capable of supporting custom messages as well as system event annunciation. It must be possible to filter unwanted annunciation of trouble, alarm or supervisory functions on a by point or by geographic area.

W. The annunciators shall be mounted in stand-alone enclosures or integrated into the network panels as indicated on the plans.

2.3 COMPONENT DESIGN

A. Colors

1. Provide finish colors under this section in accordance with FED-STD-595.

B. Intelligent Devices—General

1. Each remote device shall have a microprocessor with non-volatile memory to support its functionality and serviceability. Each device shall store as required for its functionality the following data: device serial number, device address, device type, personality code, date of manufacture, hours in use, time and date of last alarm, amount of environmental compensation left/used, last maintenance date, job/project number, current detector sensitivity values, diagnostic information (trouble codes) and algorithms required to process sensor data and perform communications with the loop controller.
2. Each device shall be capable of electronic addressing, either automatically or application programmed assigned, to support physical/electrical mapping and supervision by location. Setting a device's address by physical means shall not be necessary.

C. Intelligent Detectors—General

1. The System Intelligent Detectors shall be capable of full digital communications using both broadcast and polling protocol. Each detector shall be capable of performing independent fire detection algorithms. The fire detection algorithm shall measure sensor signal dimensions, time patterns and combine different fire parameters to increase reliability and distinguish real fire conditions from unwanted deceptive nuisance alarms. Signal patterns that are not typical of fires shall be eliminated by digital filters. Devices not capable of combining different fire parameters or employing digital filters shall not be acceptable.
2. Each detector shall have an integral microprocessor capable of making alarm decisions based on fire parameter information stored in the detector head. Distributed intelligence shall improve response time by decreasing the data flow between detector and analog loop controller. Detectors not capable of making independent alarm decisions shall not be acceptable. Maximum total analog loop response time for detectors changing state shall be 0.5 seconds.

3. Each detector shall have a separate means of displaying communication and alarm status. A green LED shall flash to confirm communication with the analog loop controller. A red LED shall flash to display alarm status.

4. The detector shall be capable of identifying up to 32 diagnostic codes. This information shall be available for system maintenance. The diagnostic code shall be stored at the detector.

5. Each smoke detector shall be capable of transmitting pre-alarm and alarm signals in addition to the normal, trouble and need cleaning information. It shall be possible to program control panel activity to each level. Each smoke detector may be individually programmed to operate at any one of five (5) sensitivity settings.

6. Each detector microprocessor shall contain an environmental compensation algorithm which identifies and sets ambient "Environmental Thresholds" approximately six times an hour. The microprocessor shall continually monitor the environmental impact of temperature, humidity, other contaminates as well as detector aging. The process shall employ digital compensation to adapt the detector to both 24 hour long term and 4 hour short term environmental changes. The microprocessor shall monitor the environmental compensation value and alert the system operator when the detector approaches 80% and 100% of the allowable environmental compensation value. Differential sensing algorithms shall maintain a constant differential between selected detector sensitivity and the "learned" base line sensitivity. The base line sensitivity information shall be updated and permanently stored at the detector approximately once every hour.

7. The intelligent analog detectors shall be suitable for mounting on any Signature Series detector mounting base.

8. The Fire alarm system shall have the ability to set elevator lobby Ionization or Multi Sensing smoke detectors for alarm verification. Detector in the alarm verification mode shall indicate, by point in a text format at the main control and at the remote LCD annunciators.

D. Fixed Temperature/Rate of Rise Heat Detector

1. Provide intelligent combination fixed temperature/rate-of-rise heat detectors. The heat detector shall have a low mass thermistor heat sensor and operate at a fixed temperature and at a temperature rate-of-rise. It shall continually monitor the temperature of the air in its surroundings to minimize thermal lag to the time required to process an alarm. The integral microprocessor shall determine if an alarm condition exists and initiate an alarm based on the analysis of the data. Systems using central intelligence for alarm decisions shall not be acceptable. The intelligent heat detector shall have a nominal fixed temperature alarm point rating of $135^{O}F$ ($57^{O}C$) and a rate-of-rise alarm point of $15^{O}F$ ($9^{O}C$) per minute. The heat detector shall be rated for ceiling installation at a minimum of 70 ft (21.3m) centers and be suitable for wall mount applications.

E. Photoelectric Smoke Detector

1. Provide intelligent photoelectric smoke detectors. The analog photoelectric detector shall utilize a light scattering type photoelectric smoke sensor to sense changes in air samples from its surroundings. The integral microprocessor shall dynamically examine values from the sensor and initiate an alarm based on the analysis of data. Systems using central intelligence for alarm decisions shall not be acceptable. The detector shall continually monitor any changes in sensitivity due to the environmental effects of dirt, smoke, temperature, aging and humidity. The information shall be stored in the integral processor and transferred to the analog loop controller for retrieval using a laptop PCI. The photo detector shall be rated for ceiling installation at a minimum of 30 ft (9.1m) centers and be suitable for wall mount applications. The photoelectric smoke detector shall be suitable for direct insertion into air ducts up to 3 ft (0.91m) high and 3 ft (0.91m) wide with air velocities up to 5,000 ft/min. (0-25.39 m/sec) without requiring specific duct detector housings or supply tubes.

2. The percent smoke obscuration per foot alarm set point shall be field selectable to any of five sensitivity settings ranging from 1.0% to 3.5%. The photo detector shall be suitable for operation in the following environment:

   - Temperature: 32°F to 120°F (0°C to 49°C)
   - Humidity: 0-93% RH, non-condensing
   - Elevation: no limit

F. 4D Multisensor Detector

1. Provide intelligent 4D multisensor smoke detectors. The multisensor analog detector shall use a light scattering type photoelectric smoke sensor, a unipolar ionization smoke sensor and an ambient temperature sensor to sense changes in air samples from its surroundings. The integral microprocessor shall employ time based algorithms to dynamically examine values from the three sensors simultaneously and initiate an alarm based on that data. The 4D Multisensor shall be capable of adapting to ambient environmental conditions. The temperature sensor shall self-adjust to the ambient temperature of the surrounding air and input an alarm when there is a change of 65°F (35°C) in ambient temperature. Systems using central intelligence for alarm decisions shall not be acceptable. The detector shall continually monitor any changes in sensitivity due to the environmental affects of dirt, smoke, temperature, age and humidity. The information shall be stored in the integral processor and transferred to the analog loop controller for retrieval using a laptop PC or the SIGA-PRO Signature Program/Service Tool. Separately mounted photoelectric detectors, ionization detectors and heat detectors in the same location are not acceptable alternatives. The 4D Multisensor smoke detector shall be rated for ceiling installation at a minimum of 30 ft (9.1m) centers and suitable for wall mount applications. The 4D Multisensor shall be suitable for direct insertion into air ducts up to 3 ft (0.91m) high and 3 ft (0.91m) wide and air velocities up to 500 ft/min. (0-2.54 m/sec) without requiring specific duct detector housings or supply tubes.

2. The percent smoke obscuration per foot alarm set point shall be field selectable to any of five sensitivity settings ranging from 1.0% to 3.5%. The integral heat sensor shall cause an alarm when it senses a change in ambient temperature of 65°F (35°C) or reaches it fixed temperature alarm set point of 135°F (57°C) nominal. The 4D Multisensor detector shall be suitable for operation in the following environment:

   - Temperature: 32°F to 100°F (0°C to 38°C)
   - Humidity: 0-93% RH, non condensing
   - Elevation : Up to 6,000 ft (1828 m)

G. Standard Detector Mounting Bases

Provide standard detector mounting bases suitable for mounting on North American 1-gang, 3½" or 4" octagon box and 4" square box. The base shall, contain no electronics, support all Signature Series detector types and have the following minimum requirements:

1. Removal of the respective detector shall not affect communications with other detectors.
2. Terminal connections shall be made on the room side of the base. Bases which must be removed to gain access to the terminals shall not be acceptable.
3. The base shall be capable of supporting one (1) Remote Alarm LED Indicator. Provide remote LED alarm indicators where shown on the plans.

H. Combination Smoke and CO Alarms

If indicated on the project plans, provide combination 120 VAC / 9 Vdc smoke and CO alarms. The combination smoke and CO alarm shall include a relay contact that may be monitored by the smoke detection system as either a non-alarm or a supervisory condition (subject to approval from local code agencies). Smoke and CO alarms shall be MEA approved and installed in accordance with the latest requirements of local code.

I. Duct Detector

Provide Low profile intelligent addressable DUCT smoke detector. Provide for variations in duct air velocity between 100 and 4,000 feet per minute and include a wide sensitivity range of .79 to 2.46%/ft. Obscuration. Include one Form-C shut down relay rated 2.0 amps @ 30 Vdc and also include slave high contact relays if required. Provide an air exhaust tube and an air sampling inlet tube that extends into the duct air stream up to ten feet. The addressable DUCT housing shall be suitable for extreme environments, including a temperature range of –20 to 158 degrees F (-29 to 70 degrees Celsius) and offer a harsh environment gasket option. Provide Remote Alarm LED Indicators and/or remote test station as indicated on the project plans.

J. Intelligent Modules—General

It shall be possible to address each Intelligent Signature Series module without the use of DIP or rotary switches. Devices using DIP switches for addressing shall not be acceptable. The personality of multifunction modules shall be programmable at site to suit conditions and may be changed at any time using a personality code downloaded from the Analog Loop Controller. Modules requiring EPROM, PROM, ROM changes or DIP switch and/or jumper changes shall not be acceptable. The modules shall have a minimum of 2 diagnostic LEDs mounted behind a finished cover plate. A green LED shall flash to confirm communication with the loop controller. A red LED shall flash to display alarm status. The module shall be capable of storing up to 24 diagnostic codes which can be retrieved for troubleshooting assistance. Input and output circuit wiring shall be supervised for open and ground faults. The module shall be suitable for operation in the following environment:

- Temperature: 32°F to 120°F (0°C to 49°C)
- Humidity: 0-93% RH, non-condensing

K. Single Input Module

Provide intelligent single input modules. The Single Input Module shall provide one (1) supervised Class A input circuit capable of a minimum of 4 personalities, each with a distinct operation. The module shall be suitable for mounting on North American 2 ½" (64mm) deep 1-gang boxes and 1 ½" (38mm) deep 4" square boxes with 1-gang covers. The single input module shall support the following circuit types:

- Normally-Open Alarm Latching (Manual Stations, Heat Detectors, etc.)
- Normally-Open Alarm Delayed Latching (Waterflow Switches)
- Normally-Open Active Non-Latching (Monitor, Fans, Dampers, Doors, etc.)
- Normally-Open Active Latching (Supervisory, Tamper Switches)

L. Dual Input Module

Provide intelligent dual input modules. The Dual Input Module shall provide two (2) supervised Class A input circuits each capable of a minimum of 4 personalities, each with a distinct operation. The module shall be suitable for mounting on North American 2 ½" (64mm) deep 1-gang boxes and 1 ½" (38mm) deep 4" square boxes with 1-gang covers. The dual input module shall support the following circuit types:

- Normally-Open Alarm Latching (Manual Stations, Heat Detectors, etc.)
- Normally-Open Alarm Delayed Latching (Waterflow Switches)
- Normally-Open Active Non-Latching (Monitor, Fans, Dampers, Doors, etc.)
- Normally-Open Active Latching (Supervisory, Tamper Switches)

M. Monitor Module

Provide intelligent monitor modules. The Monitor Module shall be factory set to support one (1) supervised Class A Normally-Open Active Non-Latching Monitor circuit. The monitor module shall be suitable for mounting on North American 2 ½" (64mm) deep 1-gang boxes and 1 ½" (38mm) deep 4" square boxes with 1-gang covers.

N. Waterflow/Tamper Module

Provide intelligent waterflow/tamper modules. The Waterflow/Tamper Module shall be factory set to support two (2) supervised Class A input circuits. Channel A shall support a Normally-Open Alarm Delayed Latching Waterflow Switch circuit. Channel B shall support a Normally-Open Active Latching Tamper Switch. The waterflow/tamper module shall be suitable for mounting on North American 2 ½" (64mm) deep 1-gang boxes and 1 ½" (38mm) deep 4" square boxes with 1-gang covers.

O. Single Input Signal Module:

Provide intelligent single input signal modules. The Single Input (Single Riser Select) Signal Module shall provide one (1) supervised Class A output circuit capable of a minimum of 2 personalities, each with a distinct operation. When selected as a telephone power selector, the module shall be capable of generating its own "ring tone". The module shall be suitable for mounting on North American 2 ½" (64mm) deep 2-gang boxes and 1 ½" (38mm) deep 4" square boxes with 2-gang covers, or European 100mm square boxes. The single input signal module shall support the following operations:

- Audible/Visible Signal Power Selector (Polarized 24 Vdc @ 2A, 25Vrms @50w or 70 Vrms @ 35 Watts of Audio)
- Telephone Power Selector with Ring Tone (Fire Fighter's Telephone)

P. Control Relay Module:

Provide intelligent control relay modules. The Control Relay Module shall provide one form "R" dry relay contact rated at 2 amps @ 24 Vdc to control external appliances or equipment shutdown. The control relay shall be rated for pilot duty and releasing systems. The position of the relay contact shall be confirmed by the system firmware. The control relay module shall be suitable for mounting on North American 2 ½" (64mm) deep 1-gang boxes and 1 ½" (38mm) deep 4" square boxes with 1-gang covers.

Q. Remote Relays, Multi-Voltage Control Relays

Provide remote control relays connected to supervised ancillary circuits for control of fans, dampers, door releases, etc. Relay contact ratings shall be SPDT and rated for 10 amperes at 115 Vac. A single relay may be energized from a voltage source of 24 Vdc, 24 Vac, 115 Vac, or 230 Vac. A red LED shall indicate the relay is energized. A metal enclosure shall be provided.

R. Intelligent Manual Pull Stations—General

1. It shall be possible to address each fire alarm pull station without the use of DIP or rotary switches. Devices using DIP switches for addressing shall not be acceptable. The manual stations shall have a minimum of 2 diagnostic LEDs mounted on their integral, factory assembled single or two stage input module. A green LED shall flash to confirm communication with the loop controller. A red LED shall flash to display alarm status. The station shall be capable of storing up to 24 diagnostic codes which can be retrieved for troubleshooting assistance. Input circuit wiring shall be supervised for open and ground faults. The fire alarm pull station shall be suitable for operation in the following environment:

   - Temperature: 32^{O}F to 120^{O}F (0^{O}C to 49^{O}C)
   - Humidity: 0-93% RH, non-condensing

2. The manual station shall be painted with a one inch wide (1" W.) white stripe running diagonally from the upper left corner to the lower right corner.

S. Manual Pull Station

Provide intelligent single action, single stage fire alarm stations. The fire alarm station shall be of metal construction with an internal toggle switch. Provide a locked test feature. Finish the station in red with silver "PULL IN CASE OF FIRE" English lettering. The manual station shall be suitable for mounting on North American 2 ½" (64mm) deep 1-gang boxes and 1 ½" (38mm) deep 4" square boxes with 1-gang covers.

T. Notification Appliances – General

1. All appliances shall be UL Listed for Fire Protective Service.
2. All strobe appliances or combination appliances with strobes shall be capable of providing the "Equivalent Facilitation" which is allowed under the Americans with Disabilities Act accessibly guidelines (ADA(AG)), and shall be UL 1971, and ULC S526 Listed.
3. All appliances shall be of the same manufacturer as the Fire Alarm Control Panel (NO EXCEPTIONS) specified to insure absolute compatibility between the appliances and the control panels, and to insure that the application of the appliances are done in accordance with the single manufacturers' instructions.
4. Any appliances that do not meet the above requirements, and are submitted for use must show written proof of their compatibility for the purpose intended. Such proof shall be in the form of documentation from THE CONTROL PANEL MANUFACTURER clearly stating that the control equipment (as submitted) is 100% compatible with the submitted Notification Appliances.

U. Strobes

Provide low profile wall mounted strobes at the locations shown on the drawings. Strobes shall provide synchronized flash outputs. Strobe output shall be field selectable as indicated on the drawings in one of the following intensity levels; 15cd, 30cd, 75cd or 110cd. Low profile strobes shall mount in a North American 1-gang box or surface mounted on a matching back box provided by the manufacturer, as directed in the field.

V. Temporal Horn Strobes

Provide low profile wall mount horn/strobes at the locations shown on the drawings. The horn/strobe shall provide an audible output of 84.4 dBA at 10 ft at the high setting and for smaller room size locations (as indicated on the plans) a low dB setting (field selectable) of 79.4 dB at 10 ft. when measured in reverberation room per UL-464. Strobes shall provide synchronized flash outputs. The strobe output shall be as indicated on the drawings in one of the following field selectable intensity levels; 15cd, 30cd, 75cd & 110cd devices (the fire alarm vendor may select below 75 candela where allowed by the local authority and/or the latest release of ADA). The horn shall have a selectable steady and/or synchronized temporal output. Low profile horn/strobes shall mount in a North American 1-gang box or surface mounted on a matching back box provided by the manufacturer, as directed in the field.

W. Temporal Horn

Provide low profile wall mount horn at the locations shown on the drawings. The horn shall provide an audible output of 84.4 dBA at 10 ft at the high setting and for smaller room size locations (as indicated on the plans) a low dB setting (field selectable) of 79.4 dB at 10 ft. when measured in reverberation room per UL-464. The horn shall have a selectable steady or synchronized temporal output. Low profile horn shall mount in a North American 1-gang box or surface mounted on a matching back box provided by the manufacturer, as directed in the field.

X. Electromagnetic Doorholders – General

Electromagnetic doorholders submitted for use must have written proof of their compatibility for the purposes intended. Such proof shall be in the form of documentation from all manufacturers that clearly states that their equipment (as submitted) is 100% compatible with each other for the purposes intended.

Y. Electromagnetic Doorholders Wall Mounted, 1504/1505/1508/1509 Series

Provide flush, semi-flush or surface wall mounted electromagnetic doorholder/releases rated at 24 Vac/dc as directed by the Consulting Engineer. Finish shall be brushed zinc.

Z. Operating Instruction/Riser Diagram Holders

Shall be red painted steel, frame holder with clear, Acrylic window with nine inch by twelve inch (9" x 12") dimensions. One (1) holder shall be provided for the fire alarm control panel FACP)/system operating instructions and one (1) holder shall be provided for a reduced copy (8-1/2" X 11") of the fire alarm system riser diagram. The operating instruction and riser diagram holders shall be mounted adjacent to the fire alarm control panel (FACP).

AA. STI Stopper II Lexan Guards

Manual pull stations that are provided with STI Stopper II lexan guards shall include non-audible alarms as required on the plans. They shall be surface or flush mounting, as required for each individual device.

BB. Alarm System Fused Cut-out

The Contractor shall provide an individual cartridge fused cut-out panel with three (3) poles and a removable, solid copper, neutral bar in fuse gap for the FCS and remote transponders.

1. Fused cut-outs shall be provided with silver sand fuses, current limiting type with an interrupting capacity rating of 200,000 amps (r.m.s. symmetrical). The size of the fuses shall be thirty (30) amperes.
2. The fused cut-out panel shall bear an engraved white-core phenolic or bakelite identification nameplate stating in minimum one-quarter inch (1/4") high white letters on a red background "FIRE ALARM FUSED CUT-OUT".
3. A four (4) wire feeder shall bring three phase 120/208 volt service to the fused cut-out. The feeder shall be tapped off the main building service ahead of the main service switch but after the Current Transformers (Metering Transformers).

2.4 SUPPORT FOR INSTALLER AND OWNER MAINTENANCE

A. Provide a coded one-man walk test feature. Allow audible or silent testing. Signal alarms and troubles during test. Allow receipt of alarms and programmed operations for alarms from areas not under test.

B. Provide internal system diagnostics and maintenance user interface controls to display/report the power, communication, and general status of specific panel components, detectors, and modules.

C. Provide loop controller diagnostics to identify common alarm, trouble, ground fault, Class A fault, and map faults. Map faults include wire changes, device type changes by location, device additions/deletions and conventional open, short, and ground conditions. Ground faults on the circuit wiring of remote module shall be identified by device address.

D. Allow the user to display/report the condition of addressable analog detectors. Include device address, device type, percent obscuration, and maintenance indicator. The maintenance indicator shall provide the user with a measure of contamination of a device upon which cleaning decisions can confidently be made.

E. Allow the user to report history for alarm, supervisory, monitor, trouble, smoke verification, watchdog, and restore activity. Include Facility Name, Licensee, Project Program Compilation date, Compiler Version, Project Revision Number, and the time and date of the History Report.

F. Allow the user to disable/enable devices, zones, actions, timers and sequences. Protect the disable function with a password.

G. Allow the user to activate/restore outputs, actions, sequences, and simulate detector smoke levels.

H. Allow the service user to enter time and date, reconfigure an external port for download programming, initiate auto programming and change passwords. Protect these functions with a password.

I. THE END-USER SHALL RETAIN COMPLETE RIGHTS AND OWNERSHIP TO ALL SOFTWARE RUNNING IN THE SYSTEM. The alarm equipment vendor shall provide useable hard and soft copies of the software database to the End-User at the end of the warranty period. The database provided shall be useable by any authorized and certified distributor of the product line, and shall include all applicable passwords necessary for total and unrestricted use and modification of the database. The Consulting Engineer shall define the extent of hardcopy database documentation to be provided.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The entire system shall be installed in a workmanlike manner, in accordance with approved manufacturer's wiring diagram. The contractor shall furnish all conduit, wiring, outlet boxes, junction boxes, cabinets and similar devices necessary for the complete installation. All wiring shall be of the type recommended by the manufacturer, approved by the local Fire Department and specified within.

B. All penetration of floor slabs and firewalls shall be sleeved (1" conduit minimum) fire stopped in accordance with all local fire codes.

C. End of Line Resistors shall be furnished as required for mounting as directed by the manufacturer. Devices containing end-of-line resistors shall be appropriately labeled. Devices should be labeled so removal of the device is not required to identify the EOL device.

D. All manual pull stations shall be mounted 48 inches above the finished floor, as measured to the handle.

E. All audio/visual devices shall be mounted 80 inches above the finished floor, as measured at the bottom of the lens such that the entire lens is above 80". Devices shall be mounted no less than 6 inches from the ceiling. All audiovisual devices shall have lexan covers in all areas.

F. No area smoke detectors shall be mounted within 36 inches of any HVAC supply, return air register or lighting fixture.

G. No area smoke or heat detector shall be mounted within 12 inches of any wall. All detectors shall be installed in strict accordance with NFPA 72.

H. All mechanical rooms, boiler rooms, wiring closets, custodian rooms, attic spaces, etc. or areas with exposed or hard ceilings shall be piped with 3\4" conduit. Fire alarm cabling may be routed without conduit above hung ceilings. Support with J-hooks every 5 feet. All cabling shall be plenum rated.

I. All areas in public view shall be in metal conduit. All boxes must be painted red and labeled.

J. All addressable modules shall be mounted within 36 inches of the monitored or controlled point of termination. This shall include, but is not necessarily limited to, fan shutdown, elevator recall, shunt trip, sprinkler status points, or door release. Label all addressable modules as to their function.

K. New door holders shall derive their 24VAC/VDC power from a separate power supply housed in a dedicated, metal enclosure. The power supply shall be provided with a 120VAC feed, and is to be centrally located to serve door

holders on a per floor or area basis. All existing door holders shall be connected to new FACP. E.C. shall extend all existing wiring in order to make this work. Locations and quantities of door holder power supplies shall be referenced and submitted in the submission package for approval by the Consulting Engineer.

L. All low voltage wiring terminated to the fire alarm system shall be PLENUM RATED with no exceptions and no less than No. 12 AWG in size for NAC circuits and 16 AWG for Initiating Circuits, and solid copper.

M. All line voltage (120VAC) wiring shall be no less than No. 12 AWG in size, and solid copper. This shall include all system grounding.

N. FACP must have a DEDICATED fuse cut-out.

O. All wiring shall be color-coded throughout, to National Electrical Code standards.

P. Power-limited/Non-power-limited NEC wiring standards SHALL BE OBSERVED.

Q. All junction box covers shall be painted red and labeled INTERIOR FIRE ALARM SYSTEM.

R. Alarm system wiring shall not co-mingle with any other system wiring in the facility. Conduits shall not be shared under any circumstance. Only when fire alarm wiring enters the enclosure of a monitored or controlled system will co-habitation be permitted (i.e. at fan starters or elevator controllers). THIS WILL BE FIELD INSPECTED BY THE PROJECT ENGINEER.

S. Fire alarm control panel enclosures shall have engraved labels indicating, “FIRE ALARM SYSTEM”, and the areas of the building served by that panel.

T. Auxiliary relays shall be appropriately labeled to indicate “FIRE ALARM SYSTEM” and their specific function (i.e. FAN S-1 SHUTDOWN).

U. All fire alarm wiring shall be continuous and unspliced. Terminations shall only occur at fire alarm devices or control panel enclosures under terminal screws. All other splicing methods are specifically disallowed (i.e. plastic wirenuts).

V. All alarm wiring shall be installed using a dedicated system of supports (i.e. bridle rings). Fire alarm wiring shall not be bundled or strapped to existing conduit, pipe or wire in the facility. THIS WILL BE FIELD INSPECTED BY THE PROJECT ENGINEER.

W. All alarm wiring shall be sleeved when passing through any wall, using conduit sleeves (1” min.) with bushings, and fire stopped in accordance with Code.

X. The system shall be arranged to receive power from one three wire 120 Vac, 20 A supply. All low voltage operation shall be provided from the fire alarm control panel.

Y. All alarm devices shall be accessible for periodic maintenance. Should a device location indicated on the Contract Drawings not meet this requirement, it shall be the responsibility of the installing contractor to bring it, in writing, to the attention of the Project Engineer. Failure to bring such issues to the attention of the Project Engineer shall be the exclusive liability of the installing Electrical Contractor.

Z. The installing Electrical Contractor shall be responsible for the removal of ENTIRE existing alarm system components and controls on the demolition drawing shown or not, upon approval of the AHJ and the Consulting Engineer. The End-User reserves the right to retain any existing alarm system components, upon their request. All existing alarm system components requiring special handling for disposal (due to radioactivity) shall be the responsibility of the installing contractor. Written proof of proper disposal by the installing contractor shall be required prior to release of outstanding retainage.

3.2 PAINTING

A. Paint exposed electrical, fire alarm conduit and surface metal raceway to match adjacent finishes in exposed areas. Paint conduit and surface metal raceways red in unfinished areas and above finished ceilings.

3.3 FIELD QUALITY CONTROL

A. The system shall be installed and fully tested under the supervision of a trained manufacturer's representative. The system shall be demonstrated to perform all of the function as specified.

B. The installing contractor or fire alarm equipment vendor shall have no less than two (2) NICET Level II fire alarm technicians dedicated to this project.

C. The Installing Contract and the Alarm System Vendor shall, upon the request of the Consulting Engineer or End-User, attend any and all project meetings for the purpose of accurately determining progress.

D. It shall be the responsibility of the installing contractor to assure that construction debris does not adversely affect any sensing devices installed as part of this project. Should it be deemed necessary by the Consulting Engineer, End-User or AHJ, the installing contractor shall be responsible for the cleaning of all smoke detectors prior to final acceptance.

E. Preliminary Tests

1. Conduct the following tests during installation of wiring and system components. Correct any deficiencies pertaining to these requirements prior to formal functional and operational tests of the system.
2. Ground Resistance
    a. Measure the resistance of each connection to ground. Ground resistance shall not exceed 10 ohms.
3. Dielectric Strength and Insulation Resistance
    a. Test dielectric strength and the insulation resistance of system interconnecting wiring by means of an instrument capable of generating 500 volts dc and equipped to indicate leakage current in 1000 mega-ohms. For the purpose of this test, instrument shall be connected between each conductor on the line and between each conductor and ground at control panel and of line, with the other extremity open circuited and series-connected devices shunted or in place. System shall withstand test without breakdown and indicate a resistance of not less than 500,000 ohms, the measurement being taken after an electrification of not more than 1.0 minute with a dc potential of not less than 100 volts nor more than 550 volts. Dielectric tests shall be witnessed by Engineer or his designee.
4. Smoke and Thermal Sensor Tests
    a. Prior to formal inspection and tests, clean and perform sensitivity tests on each smoke and thermal sensor. Clean the smoke and thermal sensors in accordance with the manufacturer's recommended procedures. Perform voltage activation sensitivity test on each sensor and record the results. Remove sensors with a sensitivity level above or below the UL accepted sensitivity range for that sensor and replace with new sensors. Present recorded data at the formal inspection for verification. Approved copies shall become part of the operations and maintenance manual for the fire alarm system.
5. Field Inspection and Test
    a. Before final acceptance of the work, test each system to demonstrate compliance with the contract requirement. Each system shall be subjected, at minimum, to complete functional and operational tests including tests in place of each smoke sensor and detector, each thermal sensor, each manual station and visual and audio/visual device, tests of wiring supervision and tests of control panel functions. Test the interface to the Public Address system and coordinate the P.A. alarm signal generation with the public address system subcontractor. Preliminary tests shall be performed in accordance with manufacturer's published testing instructions and in accordance with NFPA 72. Furnish one extra Operations and Maintenance Manual with the formal request for final acceptance testing. The system shall be operational, with no trouble or alarm conditions, a minimum of 14 consecutive days prior to formal tests. Printer shall be operational during the preliminary tests and

break-in period. Provide printer records with the request for formal inspection as evidence of completion of required preliminary test.

6. Formal Inspection and Test
   a. The Authority having Jurisdiction will witness formal tests after receipt of written certification that preliminary tests have been completed and that the system is ready for final inspection. The system manufacturer's technical representative shall be present for the inspection and test. At minimum, preliminary tests shall be repeated and functional and operation tests conducted, as requested by the Architect/Engineer. Correct defects and conduct additional tests to demonstrate that the system conforms to contract specifications. Contractor shall provide two-way radios, personnel and test equipment required for conducting tests. Smoke detectors shall be tested using the manufacturer's calibrated test method. In addition, formal testing will require real smoke to be used to test smoke detectors. Canned smoke will not be permitted. Test equipment shall be turned over to the Authority having Jurisdiction following test completion.
7. Manufacturer's Field Service
   a. Manufacturer's Representative

      Furnish the services of a factory-trained fire alarm system manufacturer's representative or technician, experienced in the installation and operation of the type of system being provided, to supervise the installation, testing, including formal testing, adjustment of the system, and instruction to the facility personnel. Furnish names and phone numbers of the factory-trained fire alarm system representatives or technicians.

F. Documentation And Training

1. The contractor shall compile and provide to the owners three (3) complete manual on the completed system to include SITE SPECIFIC operating and maintenance instruction, catalog cuts of all equipment and components, as-built wiring diagrams and a manufacturer's suggested spare parts list.
2. In addition to the above manuals, the Electrical Contractor shall provide the services of the manufacturer's trained representative for two (2) separate calendar days for a period of four (4) hours per day to instruct the owners' designated personnel on the operation and maintenance of the entire system.
3. As-built drawings shall consist of the following:
   a. Complete revision of all previously submitted drawings
   b. Point-to-point depiction of all device wiring on the device layout floor plans.
   c. One (1) set of B-size, laminated as-built drawings.
   d. Two (2) sets of 30"x42"inch 1\16"=1' scale drawing showing all points of alarm. One set shall be submitted with the close-out documents. Second set shall be mounted in frame with a lexan cover. These drawing must be submitted to project Engineer or approval.
4. Turnover of all software database hard/soft copies shall be required. This shall include all possible programming software logs, diskettes or CDs containing exported project files, hard copies of all device maps, the revision number of the version of programming utility used, and all required passwords. The turnover of all database information shall occur prior to the end of the One (1) warranty period (or period as amended earlier in this specification).

G. Adjustments

1. Equipment manufacturer shall provide necessary subsequent custom reprogramming to modify and adjust operations and individual identification nomenclature to the owner satisfaction four months after final system acceptance and twelve months after system acceptance. Reprogramming is to be done at the job site and witnessed by the Authority having Jurisdiction representative. Revision of as-built and record drawings shall be by the installing Contractor.

END OF SECTION

DIVISION 31
EARTHWORK

SECTION 31 14 13

SOIL STRIPPING AND STOCKPILING

PART 1 — GENERAL

1.1 SUMMARY

A. The Scope of Work in this section includes, but is not limited to the following:

1. Testing of existing site soils.

2. Harvesting and stockpile of existing site soils suitable for Planting Soil.

3. All labor, materials, tools, supplies, equipment, facilities, transportation and services necessary for, and incidental to performing all operations in connection with stripping, testing and stockpiling of existing site soils as specified herein.

4. Clean up and disposal of all excess and surplus material.

B. Related Sections:
1. Section 329100, PLANTING SOIL.

1.2 REFERENCES

A. The following references will be used:
1. ASTM C136, Sieve Analysis of Fine & Coarse Aggregates
2. ASTM D2974, Standard Test Methods for Moisture, Ash, and Organic Matter of Peat and Other Organic Soils.
3. ASTM D5268, Standard Specification for Topsoil Used for Landscaping Purposes.
4. U.S. Department of Agriculture, Natural Resources Conservation Service, 2003. National Soil Survey Handbook, title 430-VI. Available Online.
5. Social Science Society of America (SSSA), Methods of Soil Analysis (www.soils.org)

1.3 PERMITS AND REGULATIONS

A. The Contractor shall obtain and pay for all permits related to this section of the work unless previously excluded under provision of the contract or general conditions. The Contractor shall comply with all laws and ordinances bearing on the operation or conduct of the work as drawn and specified. If the Contractor observes that a conflict exists between permit requirements and the work outlined in the contract documents, the Contractor shall promptly notify the Owner's Representative in writing including a description of any necessary changes and changes to the contract price resulting from changes in the work.

1.4 DEFINITIONS

A. Ped: a clump or clod of soil held together by a combination of clay, organic matter, and fungal hyphae, retaining the original structure of the harvested soil.

B. Soil Horizons: as defined in the USDA National Soil Survey Handbook: http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/scientists/?cid=nrcs142p2_054242.

C. Subgrade: surface or elevation of subsoil remaining after completing excavation.

D. Subsoil: All soil beneath the topsoil layer of the soil profile, and typified by the lack of organic matter and soil organisms.

E. Surface Soil: Soil that is present at the top layer of the existing soil profile at the Project site. In undisturbed areas, the surface soil is typically topsoil; but in disturbed areas such as urban environments, the surface soil can be subsoil.

F. Topsoil: naturally produced and harvested soil from the A horizon or upper layers or the soil as further defined in this specification.

G. Vegetation: Trees, shrubs, groundcovers, grass, and other plants.

1.5 SUBMITTALS

A. Submit a soil stripping and stockpile plan for approval by the Landscape Architect and Owner's Representative.
   1. Include a map of how the soils vary across the area to be harvested, existing topsoil (O and or A horizon) depths, and planned stripping depths.
   2. Soil sampling sites should be clearly marked on the plan.

B. Submit certified soil test analysis reports for a minimum of 5 samples obtained on site that represent the range of the soil available at the source. Samples should be labeled to include the location of the source of the material. All soil testing will be at the expense of the Contractor.

C. Provide a particle size analysis (% dry weight) and USDA soil texture analysis.

D. Provide the following other soil properties:
   1. pH and buffer pH.
   2. Percent organic content by oven dried weight.
   3. Nutrient levels by parts per million including: phosphorus, potassium, magnesium, manganese, iron, zinc and calcium. Nutrient test shall include the testing laboratory recommendations for supplemental additions to the soil for optimum growth of the plantings specified.
   4. Soluble salt by electrical conductivity of a 1:2 soil water sample measured in Milliohm per cm.
   5. Cation Exchange Capacity (CEC).

E. Provide certification that soil to be stockpiled is free of hazardous compounds as described herein.

1.6 QUALITY ASSURANCE

A. Soil testing laboratory qualifications: an independent laboratory, with the experience and capability to conduct the testing indicated and that specializes in USDA agricultural soil testing, Planting Soil Mixes, and the types of tests to be performed. Geotechnical engineering testing labs shall not be used.
   1. Recommended Laboratory: Wallace Laboratories, us.wlabs.com.

1.7 PRE-CONSTRUCTION CONFERENCE

A. Schedule a pre-construction meeting with the Owner's Representative at least seven (7) days before beginning work to review any questions the Contractor may have regarding the work, administrative procedures during construction and project work schedule.

PART 2 — PRODUCTS

2.1 NATIVE TOPSOIL

A. Topsoil shall be harvested on site from the O and or A horizons of the soil profile.

B. Soil texture shall be loamy (sandy loam, silt loam, sandy clay loam, clay loam) with average clay content maximum 25% and silt content no more than 30%.

C. Soil shall contain less than 5% total volume of the combination of subsoil, refuse, roots larger than 1 inch diameter, heavy, sticky or stiff clay, stones larger than 2 inches in diameter, noxious seeds, sticks, brush, litter, or any substance that is potentially toxic to plant growth. Gravel and stone content shall be less than 15% by weight.

D. Soil must be free of plants or plant parts of bermudagrass, quackgrass, Johnsongrass, nutsedge, poison ivy, thistles, or others as specified.

E. Soil must be free of contamination from hazardous compounds, including metals, polynuclear aromatic hydrocarbons (PAHs), and petroleum compounds in excess of concentrations higher than NYS Department of Environmental Conservation (DEC) Soil Cleanup Objectives limits.

PART 3 — EXECUTION

3.1 COORDINATION

A. The Contractor shall coordinate with all other work that may impact the completion of the work.

B. Prior to the start of work, prepare a detailed schedule of the work for coordination with other trades.

3.2 PREPARATION

A. All Erosion and Sedimentation control measures should be in place prior to soil harvesting.

B. Underground conditions:
1. Contractor shall carefully examine the civil, record, and survey drawings to become familiar with the existing underground conditions before digging.
2. Determine location of underground utilities and perform work in a manner that will avoid damage. Hand excavate as required.

C. Remove existing sod and grass before proceeding.

3.3 HARVESTING

A. Contractor shall strip available Topsoil to its full depth from within the Contract limits, excluding areas in close proximity to trees designated to remain, unless otherwise specified or directed by the Owner's Representative.

B. Soil stripping should not be performed when soil is wet or frozen.

C. Excavate soil using equipment and methods to preserve the clumps and peds in the soil. Generally this means using the largest piece of equipment that is practical for the project size and scope. Do not screen soil.

D. Strip Topsoil in a manner to prevent intermingling with underlying subsoil or other waste materials.

3.4 STOCKPILING

A. Contractor shall stockpile Native topsoil in a storage pile in an area as directed by the Owner's Representative. Contractor shall not stockpile topsoil within the dripline of trees to remain.

B. Locate stockpiles so that they are 50 feet from any storm drain inlet, open channel, wetland or waterbody. Redirect any concentrated flow around the stockpile using an approved erosion and sediment control measure.

C. Storage pile shall be shaped to freely drain surface water during and after stockpiling operations. Side slopes of the stockpile shall not exceed 2:1. Contractor shall limit height of topsoil stockpiles to 72 inches.

D. Secure the perimeter of the stockpile with an approved erosion and sediment control perimeter device.

E. Protect stockpiles from wind, rain and washing that can erode soil or separate fines and coarse material, and contamination by chemicals, dust and debris that may be detrimental to plants or soil drainage.

F. Protect stock piles from erosion by compacting or tracking the soil surface, covering with breathable fabric or planting with annual grasses as appropriate for the season, location, and length of expected time of storage.
   1. The vegetation chosen shall last the duration of the stockpile; the stockpile shall be restabilized if the temporary vegetation dies or erosion results.
   2. Weeds should not be allowed to grow on stockpiles.

G. Excess topsoil shall be hauled by the Contractor and stockpiled on the Owner's property as directed by the Project Representative.

3.5 PROTECTION

A. Damage done by the Contractor, or any of their sub-contractors to existing or existing features to remain, including large existing trees, soil, paving, utilities, lighting, irrigation, other finished work and surfaces including those on adjacent property, shall be cleaned, repaired or replaced by the Contractor at no expense to the Owner. The Owner's Representative shall determine when such cleaning, replacement or repair is satisfactory. Damage to existing trees shall be assessed by a certified arborist.

END OF SECTION

DIVISION 32
EXTERIOR IMPROVEMENTS

SECTION 321216

BITUMINOUS CONCRETE PAVING

PART 1 — GENERAL

1.1 SUMMARY

A. This section includes
   1. Pedestrian Bituminous Concrete Pavement for paths

B. Provide all equipment and materials, and do all work necessary to construct the bituminous concrete paving, including new pavement and repairs to existing pavement, as indicated on the Drawings and as specified.

1.2 RELATED WORK

A. Examine Contract Documents for requirements that affect work of this Section. Other Specification Sections that relate directly to work of this Section include, but are not limited to:

   1. Section 055901, METAL EDGING.

1.3 REFERENCES

A. Comply with applicable requirements of the following standards. Where these standards conflict with other specified requirements, the most restrictive requirements shall govern.

   1. American Association of State Highway and Transportation Officials (AASHTO):
      M 81 Cut-Back Asphalt (Rapid Curing Type)
      M 82 Cut-Back Asphalt (Medium Curing Type)
      M 140 Emulsified Asphalt
      M 226 Viscosity-Graded Asphalt Cement

   2. American Society for Testing and Materials (ASTM):
      D 1557 Moisture-Density Relations of Soils and Soil Aggregate Mixtures Using 10-lb. (4.54-kg) Rammer and 18-in. (475-mm) Drop

   3. Federal Specifications (Fed. Spec.):
      SS-S-1401 Sealing Compound, Hot Applied, for Concrete and Asphalt Pavements

   4. New York State Department of Transportation (NYSDOT):
      Standard Specifications

1.4 QUALITY ASSURANCE

A. Unless otherwise specified, work and materials for construction of the bituminous concrete paving shall conform to the applicable portions of the following:

   1. NYSDOT Specifications Section 302 for base and Section 400 for pavement.

1.5 SUBMITTALS

A. Product Data: Submit manufacturer's printed product data, specifications, standard details, installation instructions, use limitations and recommendations for each product used. Provide certifications that materials and systems comply with specified requirements.

B. Installer qualifications: Installer must submit evidence of a successful installation history with comparable materials and designs specified.

PART 2 — PRODUCTS

2.1 ASPHALTIC CONCRETE

A. AASHTO M226 viscosity grade to meet State standard specifications.

1. Binder or bottom course paving for bituminous concrete paths shall have maximum aggregate size passing 1 in. sieve, and bitumen content of 5% ± 1/2% by weight.

2. Top or wearing course paving for bituminous concrete paths shall have maximum aggregate size passing 5/8 in. sieve, and bitumen content of 6-1/2% ± 1/2 % by weight.

2.2 AGGREGATE BASE COURSE

A. Material for aggregate base course shall be a graded, granular, non-frost susceptible, free-draining material, consisting of either durable stone and coarse sand or of blast furnace slag, practically free from loam and clay, and which can be readily compacted to form a stable foundation.

2.3 BITUMINOUS MATERIALS

A. Bituminous materials for prime coat shall be one of the following:

1. Cut-back asphalt (rapid-curing type) conforming to AASHTO M 81, Grade RC-70 or RC-250.

2. Emulsified asphalt rapid-setting type conforming to AASHTO M 140, Grade RS-1.

B. Bituminous material for tack coat shall be emulsified asphalt rapid-setting type conforming to AASHTO M 140, Grade RS-1.

C. Bituminous crack sealer shall be a hot-applied bituminous sealer conforming to Fed. Spec. SS-S-1401

2.4 EDGE RESTRAINT

A. Refer to Section 055901, METAL EDGING.

PART 3 — EXECUTION

3.1 PREPARATION

A. Protection of Existing Conditions:
1. Use every possible precaution to prevent damage to existing conditions to remain such as trees, structures, utilities, irrigation systems, and paving on or adjacent to the site of the Work.
2. Use every possible precaution to prevent excessive compaction of planting area soil within or adjacent to the areas of Work.

3. Provide barricades, fences or other barriers as necessary to protect existing conditions to remain from damage during construction.
4. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
5. Submit written notification of conditions damaged during construction to the construction manager and Owner's Representative immediately.

3.2 GRADING

A. Areas to be paved will be compacted and brought approximately to subgrade elevation under Section 02200, EARTHWORK before work of this section is performed. Final fine grading, filling, and compaction of subgrade to receive paving, as required to form a firm, uniform, accurate, and unyielding subgrade at required elevations and to required lines, shall be done under this Section.

B. Existing subgrade material which will not readily compact as required shall be removed and replaced with satisfactory materials. Additional materials needed to bring subgrade to required line and grade and to replace unsuitable material removed shall be material conforming to this Section.

C. Subgrade of areas to be paved shall be recompacted as required to bring top 8 in. of material immediately below gravel base course to a compaction of at least 90% of maximum density, as determined by ASTM D 1557, Method D.

D. Areas being graded or compacted shall be kept shaped and drained during construction. Ruts greater than or equal to 2 in. deep in subgrade, shall be graded out, reshaped as required, and recompacted before placing pavement.

E. Materials shall not be stored or stockpiled on subgrade.

F. Disposal of debris and other material excavated and/or stripped under this section, and material unsuitable for or in excess of requirements for completing work of this Section shall conform to the following:
1. Material shall be legally disposed of off-site.

2. Material shall be disposed of in waste disposal area indicated on the Drawings.

3.3 AGGREGATE BASE COURSE

A. Compaction of aggregate base course shall be to 95% of maximum density as determined by ASTM D 1557, Method D. Stone greater than 2-1/2 in. shall be excluded from course.

B. Width of base course shall be greater than or equal to the width of pavement surface, if continuous lateral support is provided during rolling, and shall extend at least 2 x base thickness beyond edge of the course above, if not so supported.

C. Subgrade and base course shall be kept clean and uncontaminated. Less select materials shall not be permitted to become mixed with gravel. Materials spilled outside pavement lines shall be removed and area repaired.

D. Portions of subgrade or of construction above which become contaminated, softened, or dislodged by passing of traffic, or otherwise damaged, shall be cleaned, replaced, and otherwise repaired to conform to the requirements of this specification before proceeding with next operation.

3.4 INSTALLATION OF BITUMINOUS CONCRETE PAVING

A. General:

1. Work shall not be performed during rainy weather or when temperature is less than 40^{o} F.

2. Adjacent stone, concrete, or brick work, etc. shall be protected from stain and damage during entire operation. Damaged and stained areas shall be replaced or repaired to equal their original condition.

3. Deliveries shall be timed to permit spreading and rolling all material during daylight hours, unless artificial light, satisfactory to Landscape Architect and Owner's Representative, is provided. Loads which have been wet by rain or otherwise will not be accepted. Hauling over freshly laid or rolled material will not be permitted.

B. Edge restraints:
1. Set and anchor edge restraints per Section 055901, METAL EDGING, and in accordance with manufacturer's instructions.

2. Lay bituminous concrete pavement adjacent to and approximately 1/2 inch over top of edge restraint, depending on expected compaction results.

3. Compact first pass with desired equipment within 6 inches of edge restraint. "Pinch roll" to create a hard joint. Subsequent passes may be directly against or over top of edging to ensure complete compaction of asphalt pavement.

4. Finish pavement shall be compacted and level with, but not to exceed 1/2 inch above top of edge restraint.

C. Placing and Rolling:
1. Asphaltic binder and top courses shall each be applied individually, in single lifts of full thickness indicated on the Drawings.

2. Placing and rolling of mixture shall be as nearly continuous as possible. Rolling shall begin as soon after placing as mixture will bear the operation without undue displacement. Delays in rolling freshly spread mixture will not be permitted.

3. Rolling shall proceed longitudinally, starting at edge of newly placed material and proceeding toward previously rolled areas. Rolling overlap on successive strips shall be greater than or equal to 1/2 width of roller rear wheel. Alternate trips of roller shall be of slightly different lengths.

4. Corrections required in surface shall be made by removing or adding materials before rolling is completed. Skin patching of areas where rolling has been completed will not be permitted. Course shall be subjected to diagonal rolling, crossing lines of the first rolling while mixture is hot and in compactable condition. Displacement of mixture or other fault shall be corrected at once by use of rakes and application of fresh mixture or removal of mixture, as required. Rolling of each course shall be continued until roller marks are eliminated. Roller shall pass over unprotected edge of course only when paving is to be discontinued for sufficient time to permit mixture to become cold.

5. In places not accessible to roller, mixture shall be compacted with hand tampers. Hand tampers shall weigh at least 50 lb. and shall have a tamping face less than or equal to 100 sq. in. Mechanical tampers capable of equal compaction will be acceptable in areas in which they can be employed effectively.

D. Joints:
1. Joints shall present same texture, density, and smoothness as other sections of the course. Continuous bond shall be obtained between portions of existing and new pavements and between successive placements of new pavement. New material at joints shall be thick enough to allow for

compaction when rolling. Compaction of pavement, base, and subgrade at joints shall be such that there is no yielding of new pavement relative to existing pavement when subjected to traffic.

2. Contact surfaces of previously constructed pavement (if greater than or equal to seven days since binder placed), shall be thoroughly cleaned and painted with a thin uniform coating of bitumen immediately before fresh mixture is placed. Tack coat shall be applied at rate which will leave asphaltic residue of 5 to 7 gal./100 sq. yd. after evaporation of vehicle. Base surface shall be dry and clean when tack coat is applied. Asphaltic paving material shall not be placed until vehicle has completely evaporated from tack coat. Adjoining new paving shall be placed before tack coat has dried or dusted over.

E. After final rolling, traffic shall not be permitted on pavement until it has cooled and hardened, and in no case less than six hours.

F. Repairs
1. Portions of pavement courses which become mixed with foreign material or are in any way defective shall be removed, replaced, replaced with fresh mixture, and compacted to density of surrounding areas. Asphaltic material spilled outside lines of finished pavement shall be immediately and completely removed. Such material shall not be employed in the work.

3.5 FIELD QUALITY CONTROL

A. Test pavement continuously following compaction for smoothness and proper profile by laying a 10-foot straightedge on the paving finished surface, applied both parallel to and at right angles to centerline of paved area.
1. Surface shall not vary more than 1/4 inch, except at or grade breaks.

2. At joint with existing pavement, and at other locations where an essentially flush transition is required, pavement elevation tolerance shall not exceed 0.01 ft.

3. At other areas pavement elevation tolerance shall not exceed $\pm$ 0.05 ft.

4. Irregularities exceeding these amounts or which retain water on surface shall be corrected by removing defective work and replacing with new material conforming to this Section.

5. Correct areas not meeting specified surface tolerance immediately after compaction.

B. Verify compliance with ADA ground surface requirements for accessibility.

END OF SECTION 321216

SECTION 32 13 13

LANDSCAPE CONCRETE

PART 1 — GENERAL

1.1 RELATED DOCUMENTS

A. The general provisions of the Contract, including General and Supplementary Conditions and Division 1, General Requirements, apply to the work specified in this Section.

1.2 SUMMARY

A. Section Includes:
1. Pedestrian Concrete Pavement
2. Concrete Base Slabs for Concrete Pavers – Vehicular
3. Concrete Footings for Paver Retention Angles.
4. Concrete Sub-stairs and Footings for Monolithic Stone Steps.
5. Concrete Footings for Dry Stacked Stone Wall.
6. Concrete Footings for Granite Curb.
7. Concrete Footings for Monolithic Stone Benches.
8. Concrete Curbs

B. Related Sections:

5. 306.1 - Cold Weather Concreting.

1.4 DEFINITIONS

A. Approved, Approval, Acceptance, Acceptable, or Accepted: Acceptance by the Landscape Architect in writing, except where indicated otherwise.

B. Finishing Tolerances:
1. “Class A”: True plane within 1/8-inch in 10 feet as determined by a 10-foot straightedge placed anywhere on the slab in any direction.
2. “Class B”: True plane within 1/4-inch in 10 feet as determined by a 10-foot straightedge placed anywhere on the slab in any direction.

C. Excessive Compaction: Planting soil mix compaction greater than 80 percent maximum dry density as determined by ASTM D 1557.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples:
1. Expansion Joint Fill Material - Three 12-inch lengths.
2. Micro-Reinforcement – Three-pint freezer bags half full each.
3. Abrasive Grit – Three-pint freezer bags 1/4 full each.
4. Rectangular Dowel Sleeves - Three sleeves.
5. Plate Dowels – Three plate dowels with pocket sleeves.

C. Certificates:
1. Signed certificates from suppliers and manufacturers showing conformance of materials and manufactured items with the standards of this Section.

D. Concrete Mix Design: Mix Design Data for each type of concrete mix including:
1. Name, address, and telephone number of batch plant preparing Statement of Mix Design.
2. Date of Mix Design
3. Project location.
4. Contractor requesting load delivery.
5. Mix Design Number
6. Admixtures.

7. Integral Color Admixtures.
8. Gradations for sand and aggregate.
9. Material weights, specific gravity, and absolute volumes.
10. Basis of testing.
11. Water/cement ratio.
12. Slump.
13. Minimum Compressive Strength.
14. Micro-reinforcement.
15. Waterproofing admixtures.

E. Concrete Mix Revisions: Documentation of revised mix proportions when characteristics of materials, Project conditions, weather, test results or other factors warrant mix adjustments.

F. Test Reports: Compressive strength of concrete test cylinders taken upon delivery of concrete.

G. Field quality-control reports.

1.6 QUALITY ASSURANCE

A. Installer:
1. Installer that has completed in the last two years a minimum three concrete installations similar in material, complexity, and finish quality as indicated for this Project which produced concrete work with a documented record of successful service performance.
2. Employs adequate numbers of skilled workers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the Work of this Section.

B. Manufacturer: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94/C 94M requirements for production facilities and equipment.
1. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities" (Quality Control Manual - Section 3, "Plant Certification Checklist").

C. Regulatory Requirements: Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work.

D. Concrete Testing Service: Engage a qualified testing agency to perform material evaluation tests and to design concrete mixtures.

E. General Concrete Mock-up Requirements:
1. Construct as many mock-ups as necessary to achieve an accepted finish over the entire surface of each mock-up.
2. Mock-ups which are completely or partially finished incorrectly will be rejected.
3. Remove rejected mock-ups immediately from the site.
4. The mock-up, when accepted, shall become the Project standard for tolerances and appearance.

F. Pedestrian Concrete Pavement Mock-up: Construct one section of Pedestrian Concrete Pavement, minimum 5’ x 5’ to be reviewed before commencement of further work. Include control joints, at least one expansion joint with fill material and sealant, micro-reinforcement, color admixture, curing compound, and water repellent.
1. Re-work mock-up as required until approved by Landscape Architect.
2. Do not proceed with work until mock-up is approved.
3. Mock-up may be installed and remain as part of the permanent construction assembly if found acceptable by the Landscape Architect.

1.7 DELIVERY, STORAGE AND HANDLING

A. Ready Mixed Concrete:
   1. Ready-mixed concrete shall be mixed and delivered to the point designated as specified in ASTM C94.
   2. Do not add water on the job unless authorized by the Construction Manager. The amount of water, if added, shall be recorded on the delivery ticket. If water is permitted to be added to mixed concrete upon arrival at the job, an additional mixing of 20 revolutions of the drum shall be required.
   3. Furnish duplicate delivery tickets with each load of concrete delivered to the job, one for the Contractor and one for the Owner's Representative. Delivery tickets shall provide the following information:
      a. Date
      b. Name of ready-mix concrete plant
      c. Job location
      d. Contractor
      e. Type and brand name of cement
      f. Class and specified cement contents in bags per cubic yard of concrete
      g. Truck number
      h. Time dispatched and time unloaded
      i. Amount of concrete in load in cubic yards
      j. Admixtures in concrete, if any
      k. Maximum size of aggregate and amount of aggregate of each size per cubic yard
      l. Water added at job, if any

1.8 SITE CONDITIONS

A. Environmental Requirements:
   1. Protect concrete against extreme cold and heat, frost, rapid drying, and damage by rain.
   2. In hot dry weather, erect temporary wind breaks to reduce the wind velocity over the concrete surface.
   3. In hot dry weather, erect temporary sun shades to help control concrete surface temperature.

1.9 WARRANTY

A. General Description: In addition to manufacturer's warranties, warrant Work for a period of one year from the Date of Final (Total) Completion against defects in materials and workmanship.

B. Additional Items Covered: Warranty shall also cover repair of damage to other materials and workmanship resulting from defects in materials and workmanship.

C. Exceptions: Contractor shall not be held responsible for failures due to ordinary wear, neglect by the Owner, vandalism, or other causes beyond the Contractor's control.

PART 2 — PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS AND SUPPLIERS

A. Expansion Joint Material:
   1. Williams Products, www.williamsproducts.net.

B. Micro-reinforcement:
   1. Nycon, Inc., www.nycon.com.
   2. The Euclid Chemical Company, www.euclidchemical.com.

C. Integral Color Admixture: Davis Colors, www.daviscolors.com.

D. Dowel Aligners and Rectangular Dowel Sleeves for Square Dowels:
   1. PNA Construction Technologies, Inc., www.pna-inc.com.
   2. Sika Corporation, usa.sika.com.

E. Plate Dowels:
   1. PNA Construction Technologies, Inc., www.pna-inc.com.

2.2 MATERIALS

A. Cement: ASTM C 150, Type II gray Portland Cement.

B. Course Aggregate for Concrete Mix: ASTM C 33.

C. Fine Aggregate for Concrete Mix: ASTM C 33.

D. Micro-reinforcement: ASTM C 1116, 3/4-inch long 100-percent pure virgin nylon fibers. Larger Fibers will not be accepted.

E. Reinforcing Bars: ASTM A 615, grade 60, deformed billet-steel bars, clean and free from rust, scale, or coating that will reduce bond.

F. Tie Wire:16 gauge or heavier, black annealed wire.

G. Supports for Reinforcement:
   1. Meet requirements of CRSI-MSP-1.
   2. For exposed-to-view concrete surfaces, where legs of supports are in contact with forms, provide supports with legs which are plastic, plastic-protected, or stainless steel.

H. Round Expansion Joint Dowels: ASTM A 615, Grade 60, smooth, billet-steel bars, clean and free of rust and scale.

I. Square Dowels: ASTM A 36, carbon steel square bar, sizes as indicated on the Drawings.

J. Water: Clean, potable, concrete mixing water free from injurious amounts of salts, oils, acids, alkalis, organic materials, iron, rust or other deleterious substances which would cause staining.

K. Air Entrainment: ASTM C 260, non-staining.

L. Expansion Joint Fill Material: ASTM D 1752 Type II cork, or ASTM D 1752 Type I, sponge rubber with 30 to 40 pounds per cubic foot density, 95 percent minimum recovery and compatible with joint sealant to be used.

M. Form Release Agent: Non-staining material.

N. Curing Compound: ASTM C 309, non-staining, all-resin type, clear except white-pigmented at concrete surfaces to be sand-blasted, compatible with color admixture.

O. Round Dowel Caps: plastic Greenstreak Speed Dowel sleeves sized to fit dowel: or accepted substitute.

P. Rectangular Dowel Sleeves for Square Dowels: PNA plastic square dowel clips or Greenstreak plastic Speed Dowel sleeves for square dowels.

Q. Aligners for Round and Square Dowels: PNA Dowel Aligners, or Greenstreak Speed Dowel Bases, size to fit dowels.

R. Integral Color Admixture: ASTM C 979, Davis Mix-In powdered pigment, Premium Color Group, color to be chosen from manufacturer's full range of silver/grey standard colors by the Landscape Architect.

S. Chemical Admixtures: ASTM C 494.For colored concrete mix, consult color admix manufacturer to verify compatibility with color admixture.

T. High Range Water Reducing Admixture: ASTM 494, Type F or G.

U. Fly Ash: ASTM C 618, Class F, limited to 25 percent of cementitious material by weight.

V. Plate Dowels: PNA Diamond Dowel System including steel load plates and plastic pocket former sleeves, plate sizes as indicated on the Drawings.

2.3 MIXES

A. Mix Design:
1. Employ commercial testing laboratory to design each concrete mix taking into account requirements specified for each mix, material characteristics, specified finish, use of concrete, project conditions, weather, method of delivery and conveyance, test results, and other factors that could affect mix design.
2. Concrete mixtures except for lean concrete shall be signed by a testing laboratory approved by the Owner's Representative. Mixes shall be verified by actual tests on cylinders prior to placing concrete, and compression test shall show values at least 25 percent greater than the minimum strength indicated or specified. Mixes shall conform to governing building code requirements and to the most recent ACI Standards' publication and shall be approved by the Owner's Representative. Contractor shall pay the testing laboratory for cost incurred for the mix design.
3. The amount of fine and coarse aggregates shall be proportioned with respect to each other and with respect to the water content, so that the concrete may be placed without segregation, but in no case shall the volume of the fine aggregates be less than 35 percent of the sum of volumes of fine and coarse aggregates before combining shall not exceed 6 ½ cubic feet per each sack of cement.
4. Water, including moisture contained in the aggregate, shall not exceed the amounts specified in Table 502 (a) of the ACI Building code 318.
5. Submit mix design data to Landscape Architect for review and acceptance.

B. Concrete Mix for Pedestrian Paving, Sub-Slabs Under Vehicular Concrete Pavers, and Concrete Curbs:
1. 4,000-psi minimum strength at 28 days, maximum 4-inch slump, maximum 0.45 water-cement ratio, and with micro-reinforcement at concrete paving to receive sand-blast finish.
2. Do not use calcium chloride or other accelerating admixtures containing calcium chloride, fly ash, or any admixtures that will affect color of concrete.
3. Meet color admixture manufacturer's requirements for dosage rate and mixing color admixture.

C. Concrete for Pedestrian Concrete Unit Paver Sub-slabs and Stone Paving Sub-slabs:3,000 psi strength at 28 days, maximum 4-inch slump.

D. Concrete Mix of Retaining Walls, Wall Footings, and Pole Light Foundations: See Structural Drawings for specific mix requirements.

E. Mixing Concrete: Mix concrete in accordance with ASTM C 94.

PART 3 — EXECUTION

3.1 EXAMINATION

A. General: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.

B. Substrate Verification: Verify that substrate is at correct elevations.

3.2 PREPARATION

A. Protection:
1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, plant materials and walks on or adjacent to the site of the Work.
2. Provide barricades, fences or other barriers to protect existing conditions to remain from damage during construction.
3. Use every possible precaution to prevent excessive compaction of planting area soil within or adjacent to the areas of Work.
4. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
5. Submit written notification of damaged plants and structures to the Owner.

B. Substrate Preparation: Remove water and other materials which could be absorbed by concrete.

3.3 FORMWORK

A. General:
1. Construct, erect, shore, brace and maintain formwork in accordance with ACI 301.
2. Construct forms accurately to dimensions, plumb and true to line and grade.
3. Use forms that are strong, mortar tight, braced and tied so as to maintain position and shape during placing of reinforcing and concrete.
4. Construct formwork so that straight lines are perfectly tangent to radii, curves are smooth and flowing, and transitions between changes in vertical gardens of curbs, walls and paving are smooth and gradual with not abrupt or sharp changes unless indicated otherwise on the Drawings.
5. Wavy surfaces and bulged walls or slab surfaces resulting from settlement or springing of formwork will be rejected.
6. Carefully verify and check forms for alignment and level as the Work proceeds.
7. Make needed adjustments or add additional bracing prior to pouring concrete.
8. Install formwork so that forms can remain in place a minimum 24 hours after concrete placement.

B. Formwork Material at Exposed Vertical Surfaces: Smooth metal, resin-coated plywood, or high-density overlay plywood that will provide an ultra-smooth surface without visible wood grain marks.

C. Tolerances for Exposed Concrete:
1. Top of form units shall not vary more than 1/8 inch from a 10 feet long straight edge.
2. Vertical faces shall not vary more than 1/8 inch from a 10 feet long straight edge.

D. Joints:
1. Construct forms and assemble them in such a manner so that joints occur at accepted locations.
2. Seal joints to prevent leakage and provide exposed finish surfaces free of joint marks or any indication of where the form joints occurred.

E. Corners:
1. Form intersecting planes to provide true, clean-cut corners, with edge grain of plywood not exposed to face of concrete.
2. Form exposed corners to produce square smooth, solid unbroken lines, unless indicated otherwise.

F. Other Trade Requirements:

1. Construct chases, slots and recesses as required.
2. Locate inserts, anchor plates and other items to be embedded in concrete where required, properly place and securely anchor.

G. Recesses and Openings: Provide as shown on the Drawings.

H. Prior to Pouring Concrete:
1. Thoroughly clean out forms to be used.
2. Thoroughly wet wood forms where form coatings are not used.

I. Removal of Forms:
1. Do not remove supporting forms or shoring until concrete has sufficient strength to carry its own weight and other loads upon it.
2. Remove forms only after concrete has attained at least 50% of its design compressive strength.
3. Leave formwork on each wall pour an equal amount of time before removing so that possibility of color variation is minimized.
4. Submit time the forms will remain on concrete before removing.

J. Re-use of Forms:
1. Do not reuse if there is any evidence of surface wear or tear which would impair quality of exposed finishes.
2. Store formwork and form materials in such a manner as to prevent damage or distortion.
3. Clean forms after each use, and coat with form release agent as often as required to ensure separation from concrete without damage to concrete finish.

3.4 REINFORCEMENT

A. ACI and AWS Requirements: Meet applicable requirements of ACI 315 and AWS D1.4.

B. Coordination with Other Trades: Coordinate other trades' schedules to avoid disturbing or moving Work already installed by one trade to admit the Work of another.

C. Supports:
1. Accurately and securely fasten or support reinforcements to prevent displacement before or during pouring.
2. Hang footing bars from forms.

D. Reinforcement Splices:
1. Overlap welded wire fabric one mesh minimum.
2. Reinforcing bar splices shall be ACI Class A lap splices, except where indicated.

E. Round and Square Expansion Joint Dowels:
1. Center vertically in slab, unless indicated otherwise.
2. Center longitudinal position of each dowel horizontally on joint, except where indicated otherwise.
3. Install at same spacing as slab bar unless indicated otherwise on Drawings.
4. Install sleeve on one end of each dowel as indicated on the Drawings.
5. Cut holes in expansion joint fill material accurately to fit tightly around dowels so that concrete will not leak into gaps between the dowels and the expansion joint material.
6. Install dowels 90 degrees horizontally and vertically to expansion joint using dowel aligners to help maintain this alignment.
7. Install the dowel aligners in accordance with the manufacturer's current printed instructions.

F. Plate Dowels:
1. Install at positions and spacing indicated on the Drawings in accordance with manufacturer's current printed installation instructions.

2. On curved formwork, caulk small gaps between pocket formers and formwork with sealant to prevent mortar leakage into pocket former.

G. Clearances:
1. Provide 2-inch clearance between bar and concrete top and formed side surfaces, except where indicated otherwise.
2. Provide 3-inch concrete cover between bar and bottom of concrete at un-formed surfaces of footings and foundations, except where indicated otherwise.

3.5 CONCRETE PLACING

A. Inspection Prior to Mix Placement:
1. Verify formwork is secured firmly in position so that is will not be displaced during pour.
2. Verify reinforcement and dowels are properly spaced and positioned to provide cover indicated.

B. Dampening Substrate and Reinforcement: Immediately prior to placing concrete, thoroughly dampen reinforcement and the substrate on which concrete is to be placed.

C. Placement of Mix:
1. Meet applicable requirements of ACI 304R for measuring, mixing, transporting and placing concrete.
2. Do not add water to mix during delivery, at Project site, or during placement.
3. Deposit concrete in a continuous operation between expansion joints, or accepted cold construction joints.

D. Hot Weather Placement: Meet applicable requirements of ACI 305.1.

E. Cold Weather Placement: Meet applicable requirements of ACI 306.1.

F. Paving Pour Sequence and “Checkerboard” Pattern: First place every other paving panel and let harden to provide solid straight hardened concrete surfaces on which to install expansion joint material followed by infilling the remaining panels.

3.6 FINISHES

A. Broom Finish:
1. Prior to brooming, provide a floated finish.
2. While the surface is still plastic, provide a uniform, broom-texture finish by pulling a fiber-bristle broom uniformly over the surface.
3. Provide texture to match the accepted mock-up finish.

B. Floated Finish for Horizontal Surfaces:
1. After the concrete has been placed, consolidated, struck off, and leveled, do not work the concrete further until ready for floating.
2. Begin floating when the water sheen has disappeared and when the surface has stiffened sufficiently to permit the operation.
3. During or after the first floating, check the planeness of the surface with a ten foot straightedge applied at not less than two different angles.
4. Cut down high spots and fill low spots, and produce a surface with a Class B tolerance throughout.
5. Re-float the slab immediately to a uniform sandy texture.
6. Do not float concrete excessively so that an excessive concentration of cement paste and fines are brought to the surface.
7. Do not use a jitterbug.

3.7 SAW-CUT CONTROL JOINTS

A. Location, Width and Depth: As detailed on the Drawings

B. Saw-Cutting: Cut as soon as concrete is hard enough that cutting operation will not damage the concrete surface and groove edges and before shrinkage cracking occurs.

3.8 TOOLED CONTROL JOINTS

A. Location, Width and Radius: As detailed on the Drawings.

B. Striking: Form in fresh concrete using a jointer to cut the groove so that a smooth uniform impression is obtained.

3.9 EXPANSION JOINT FILL MATERIAL

A. Locations and Widths: Provide joint material as shown on the Drawings, and where concrete paving abuts walls, curbs, or other structures.

B. Installation:
1. Place joint materials with top edges below the paving surface as shown on the Drawings to provide the correct depth for sealant and for backer rod where backer rod is shown to be installed.
2. Secure expansion joint fill to sides of concrete and other surfaces using contact adhesive or other suitable means to prevent displacement during concrete pour.
3. Install fill material plumb and down to surface of base material so that no concrete will leak under fill material.
4. Cut holes in expansion joint fill material accurately to fit tightly around dowels so that concrete will not leak into gaps between the dowels and the expansion joint material.

C. Forming: Form edges of joints in the fresh concrete using an edging tool to provide a smooth uniform impression with the radius indicated on the Drawings.

3.10 TOLERANCES

A. Top of Concrete Paving: Plus or minus 1/8-inch from elevations indicated on the Drawings.

B. Expansion Joint and Control Joint Alignment: Plus or minus 1/16-inch from a straight line.

3.11 CURING

A. Curing Concrete:
1. Apply to exposed surface of concrete as soon as manufacturer recommends with an airless sprayer.
2. Apply to sides of concrete paving upon removal of form boards.
3. Meet requirements of manufacturer’s current printed application instructions.
4. Apply compound to form a continuous, uniform, coherent film that will not check, crack, or peel.
5. Do not apply to concrete that is still bleeding or has a visible water sheen on the surface.
6. Protect paving surfaces from foot traffic with scuff-proof paper.
7. Immediately re-coat damaged areas of curing compound.

3.12 PATCHING

A. Projections: Remove projecting fins, bolts, wire, nails, etc., not necessary for the Work, or cut them back 1 inch from the surface and patch in an inconspicuous manner.

B. Voids:

1. Fill holes with an accepted patching material the same color and texture as the adjoining concrete.
2. Mix and place patching material and finish flush with the adjacent surface.

C. Corrective Patching:
1. Correct defects in concrete Work.
2. Chip voids to a depth of at least 1 inch with the edges perpendicular to the surface and parallel to form markings.
3. Fill voids, surface irregularities, or honey-combing by patching or rubbing.
4. Insure that concrete surfaces so repaired duplicate the color and texture of the un-patched Work.

D. Defective Work: Remove in its entirety and replace defective concrete Work which after corrective patching fails to duplicate the appearance of un-patched Work as determined by the Landscape Architect and fails to meet the requirements of these Specifications.

E. Sack Finish: A sack finish will not be accepted as means to repair or patch concrete work.

3.13 FIELD QUALITY CONTROL

A. Testing Concrete upon Delivery:
1. Provide minimum three 6 inch by 12 inch cylinders for each 20 cubic yards or 5,000 square feet of pour for testing of compressive strength.
2. Test 1 cylinder at 7 days, test second cylinder at 28 days, and test third cylinder only if needed for confirmation of compressive strength.
3. Meet requirements of ASTM C 39 and ASTM C 172.
4. Testing should be provided by a testing lab employed by the Owner.

3.14 CLEANING

A. Concrete Work:
1. Prior to final review, remove stains, dirt and other materials using water and mild detergents.
2. Do not use other methods of cleaning unless accepted by the Landscape Architect.

3.15 PROTECTION

A. Concrete Work: Protect Work against damage and defacement during subsequent construction operations until date of Final (Total) Completion by installing fencing, barriers and protective coverings.

END OF SECTION

SECTION 32 14 40

SAND-SET UNIT PAVING

PART 1 — GENERAL

1.1 SUMMARY

A. Section Includes:
1. Concrete Pavers - Pedestrian
2. Concrete Pavers - Vehicular

B. Related Sections:
1. Section 055901, METAL EDGING
2. Section 321313 ,LANDSCAPE CONCRETE
3. Section 321442, MORTAR SET UNIT PAVING

REFERENCES

C. ASTM - ASTM International:
1. C33 Concrete Aggregates
2. C39 Concrete Compressive Strength
3. C144 Aggregate for Masonry Mortar
4. C136 Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates
5. C150 Portland cement
6. C448 Classification for Sizes of Aggregate for Road and Bridge Construction.
7. C642 Water Absorption, Density, Voids in Hardened Conc
8. C666 Rapid Freeze/Thaw Resistance of Conc
9. C979 Pigments for Integrally Colored Concrete
10. C1028 Coefficient of Friction

1.2 DEFINITIONS

A. Approved, Approval, Acceptance, Acceptable, or Accepted: Acceptance by the Landscape Architect in writing, unless indicated otherwise.

B. Excessive Compaction: Planting area soil or soil mix compaction greater than 80 percent of maximum dry density as determined by ASTM D 1557.

1.3 ACTION SUBMITTALS

A. Product Data:
1. Concrete Paving Units.
2. Polymeric Sand Joint.
3. Sand for Cement-Stabilized Sand Setting Bed Mix.
4. Cement for Cement-Stabilized Sand Setting Bed Mix.
5. Geotextile Fabric for Sand-Stop Strips.
6. Sealer.

B. Samples:
1. Concrete Unit Pavers: Provide two full size samples of each precast paver to show the full range of color and texture of unit for selection and approval. If sealer is to be applied to precast concrete paving slab, apply sealer on one sample.
2. Polymer Joint Sand: One pint size sample in heavy duty plastic freezer bags of each color.

3. Bedding Sand: One pint size sample in heavy duty plastic freezer bags.

C. Shop Drawings: Provide layout drawings showing pattern of pavers for each paved area, indicate pavers requiring cutting, indicate setting bed methods in each area, and indicate drainage. Include details of setting beds. Indicate details at curbs and vertical surfaces as applicable.

D. Warranty: Provide certified copies of manufacturer's product warranties.

1.4 INFORMATIONAL SUBMITTALS

A. Test Reports: Setting bed sand sieve analysis per ASTM C 136, with test date less than 4 weeks old.

B. Manufacturer's Instructions: Polymer Joint Sand Installation.

1.5 QUALITY ASSURANCE

A. Installer Qualifications:
1. Successfully Installed sand-set unit paving projects similar to the quality specified and equal to or greater than the paving area indicated for a period of not less than 5 years.
2. Employs adequate numbers of skilled workers who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the Work of this Section.

B. Supplier Qualifications: Company specializing in the manufacture of precast concrete paving units with a minimum of 10 continuous years of documented experience.

C. Source: Obtain each type of paver, joint fill and setting bed material from a single source with resources to provide materials and products of consistent quality in physical properties and with a consistent finish appearance for exposed surfaces.

D. Regulatory Requirements: Comply with requirements of state and local building codes and with rules and regulations relating to building accessibility.

E. General Mock-up Requirements:
1. Construct as many mock-ups as necessary to achieve an accepted finish over the entire surface of each mock-up.
2. Mock-ups which are completely or partially finished incorrectly will be rejected.
3. Remove rejected mock-ups immediately from the site.
4. Mock-ups may be installed and remain as part of the permanent installation if acceptable by the Landscape Architect.
5. The mock-up, when accepted, shall become the Project standard for tolerances and appearance.

F. Paving Mock-ups:
1. Construct mock-ups for each type of paving as indicated in the Paving Schedule on the Drawings.
2. Mock-up area to be used to determine joint sizes, lines, laying pattern, color(s) and texture of the job.
3. Include aggregate base, concrete slab where applicable, setting bed, paver edge restraints, and polymeric sand joints.
4. Compact pavers on setting bed in the specified pattern, install polymeric joint sand, and apply sealer.

G. Pre-installation Meeting:

1. Prior to commencement of concrete unit paving mock-up installation, schedule and conduct an on-site meeting with the Landscape Architect, Project Paving Engineer, and the polymer joint sand manufacturer's representative to review the critical aspects of consolidating the cement-stabilized sand setting bed, installing and wetting the joint sand, required tolerances and other requirements of this Section.
2. Require paver and retention angle installers to attend.
3. Document meeting and submit notes for record purposes.

1.6 DELIVERY, STORAGE AND HANDLING

A. Loading and Shipment:
1. Carefully pack the unit pavers for shipment free from stains, saw mud, and other deleterious material.
2. Exercise precautions against damage in transit.

B. Storage:
1. Store unit pavers on non-staining wood skids or pallets at least 4 inches above grade.
2. Place and stack skids and unit pavers to distribute weight evenly and to prevent breakage or cracking of pavers.
3. Store and protect unit pavers from weather and soiling with waterproof non-staining covers or enclosures but allow air to circulate around unit pavers.
4. Store aggregates where size grading and other required characteristics can be maintained.
5. Store cement in a dry location on elevated platforms under cover and protected from moisture.

C. Handling:
1. Handle unit pavers to prevent chipping, breakage, soiling or other damage.
2. Do not use pinch or wrecking bars without protecting edges of unit pavers with wood or other rigid materials.
3. Lift with wide-belt type slings wherever possible.
4. Do not use wire rope or ropes containing tar or other substances which might cause staining.
5. Use wood rollers and provide cushion at end of wood slides.

1.7 SITE CONDITIONS

A. Environmental Requirements: Meet requirements of polymer joint sand manufacturer's installation instructions.

1.8 WARRANTY

A. General Description: Warrant work for a period of one year from date of Final (Total) Completion against defects in materials and workmanship.

B. Additional Items Covered: Warranty shall also cover repair of damage to other materials and workmanship resulting from defects in materials and workmanship.

C. Exceptions: Contractor shall not be held responsible for failures due to ordinary wear, neglect by Owner, vandalism, and other causes outside the Contractor's control.

1.9 MAINTENANCE

A. Extra Pavers:
1. Deliver to the Owner full size extra unit pavers of an amount equal to one percent of the area of each color and standard size unit paver indicated on the Drawings.
2. Deliver extra pavers to a location within the Project site designated by the Owner's Representative.

B. Maintenance Service:
1. At mid-point of warranty period, unless directed to do so at another time by the Owners representative, and within two weeks of end of maintenance period inspect paver joints for voids and contaminated polymer sand.
2. Within one week, or as soon as weather conditions permit perform Work necessary to replace contaminated sand and fill voids with polymer sand in accordance with the polymer sand manufacturer's instructions.
3. Contractor shall not be held responsible for replacing joint material contaminated or displaced by improper pavement cleaning operations performed by the Owner's maintenance personnel or due to vandalism.

PART 2 — PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS AND SUPPLIERS

A. Concrete Unit Pavers:
1. Stepstone Inc, www.stepstoneinc.com, 17025 South Main Street Gardena, CA 90248; tel: (310) 327-7474, (800) 572-9029
a. Refer to Drawings Paving Schedule for paver unit size and style.
2. Alternate: Hanover Architectural Products, www.hanoverpavers.com, 5000 Hanover Road, Hanover, PA 17331; tel: (717) 637-0500, or approved equal.
a. A: Prest 24x36x3; Matrix #1875, Heavy Tudor or Ground Tudor Finish
b. B, C: Plankstone 3x9x3; Matrix #1025, Tudor Finish
c. D1: Plankstone 3x9x3; Super Black, Ground Finish or Matrix #1428, Ground Finish
d. D2: Plankstone 3x9x4; Super Black, Ground Finish or Matrix #1428, Ground Finish
e. E: Plankstone 3x9x4; Matrix #1025, Tudor Finish
f. H: Detectable Warning Paver 12x12; Limestone Grey, Tudor Finish

B. Polymer Joint Sand: Alliance Designer Products, www.alliancegator.com.

C. Geotextile Fabric for Sand-Stop Strips: Carthage Mills, carthagemills.com.

2.2 MATERIALS

A. Concrete Unit Pavers shall be precast concrete, consisting of Portland cement, aggregate and color admixtures.
1. Portland Cement: ASTM C 150, Type III, high early strength.
2. Aggregate: ASTM C 33.
3. Color Admixture: ASTM C979, by Davis Colors, or equal, as required to achieve color as selected. Integral color shall be throughout entire product. Finish color shall not be added as a face mix.
4. Compressive strength: Minimum 5,000 psi.
5. Freeze thaw testing per ASTM C67

B. Geotextile Fabric for Sand-Stop Strips: Carthage 30%.

C. Sand for Setting Bed: ASTM C 33, naturally occurring, angular, silica sand.

D. Polymer Joint Sand: Alliance Gator Super Sand Bond, to be selected from the manufacturer's full range of colors.

E. Portland Cement: ASTM C 150, Type II.

F. Water: Clean, potable.

G. Sealer: Water or acrylic based. Exterior durable and UV light stable. For use if concrete pavers are not factory sealed.
1. Test sealer on sample pavers and mockup to confirm finish. Sealer should not significantly alter appearance of concrete pavers.

2.3 PAVER FABRICATION TOLERANCE

A. Maximum Variation from Thickness: 1/8-inch.

B. Maximum Variation from Face Size: 1/16-inch.

C. Maximum Variation from Flat: 1/16-inch.

2.4 MIXES

A. Cement-Stabilized Sand Setting Bed Mix for Vehicular Concrete Pavers (Types D2 and E):
1. Uniformly blend 1-part cement with 8 parts moist sand using a motorized mortar mix, or other acceptable mixing machine.
2. Blending manually or using a rototiller to mix a pile of sand and cement will not be acceptable because these methods will likely not blend the entire pile of materials uniformly and contamination is more likely.
3. Do not blend more than 1-part cement per 8 parts moist sand because this will make the setting bed too rigid and impervious.

2.5 COLORS AND FINISHES

A. Paver colors: Davis Colors (or equal), integral color admixture. Integral color shall be throughout entire product. Finish color shall not be added as a face mix.
1. Refer to Drawings and Paving Schedule for paver colors.

B. Paver finishes:
1. All finishes shall be sandblasted.
g. Refer to Drawings and Paving Schedule for paver finishes.
2. Walking surfaces of precast concrete paving units shall have minimum coefficient of friction of 0.60, wet and dry.

PART 3 — EXECUTION

3.1 EXAMINATION

A. General: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.

B. Substrate: Certify that sub-grade preparation, compacted density and elevations conform to the specifications. Compaction of the soil sub-grade to at least 98% Standard Proctor Density per ASTM D 698 is recommended. Stabilization of the sub-grade and/or base may be necessary with weak or saturated sub-grade soils. Inspect sub-grade preparation, elevations and conduct density tests for conformance to specifications.

C. Verify that geotextiles, if applicable, have been placed according to specifications.

D. Verify that aggregate base materials, thickness, compaction, surface tolerances, and elevations conform to the specifications.

E. Verify location, type, installation and elevations of edge restraints around perimeter of area to be paved. Perimeter containment must surround the entire paving area.

F. Verify base is dry, uniform, even and ready to support sand, precast concrete paving units, and imposed loads.

G. Notification of Unsuitable Conditions: Before proceeding with Work, notify Owner's Representative and construction manager in writing of unsuitable conditions.

3.2 PREPARATION

A. Protection:
1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, plant materials and walks on or adjacent to the site of the Work.
2. Provide barricades, fences or other barriers as necessary to protect existing conditions to remain from damage during construction.
3. Use every possible precaution to prevent excessive compaction of planting area soil or soil mixes within or adjacent to the areas of Work.
4. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
5. Submit written notification of damaged plants and structures.

B. Surface Preparation: Remove from concrete base surface plaster, cement, gravel and other materials which would conflict with the sand setting bed thickness and compaction.

3.3 PAVER INSTALLATION

A. Sand-Stop Strips:
1. Install continuous geotextile strips over joints and drain holes, as shown on the Drawings.
2. Lap end edges 2 inches minimum.
3. Protect strips from damage and displacement until covered with pavers.
4. At the gaps between the paver retention angle piece ends, install 4-inch by 4-inch pieces of sand-stop strips under the setting bed and against the vertical leg of the vertical legs of the paver retention angles.
5. Center the sand-stop fabric on the angle end gaps and extend upper edge up to top of polymer joint sand.

B. Spreading Setting Bed:
1. Install straight sand for setting bed of Pedestrian Concrete Pavers (Types A, B, C, D1) and install cement-stabilized sand setting bed mix for setting bed of Vehicular Concrete Pavers (Types D2 and E).
2. Making allowances for compaction, screed un-compacted setting bed material to a consistent thickness which will bring the finish surface of the pavers to the elevations and slopes indicated on the Drawings after compaction.
3. Check and verify effect of setting bed material compaction in a sample panel to determine the screeded bed thickness needed to bring the pavers to the elevations and slopes indicated on the Drawings after compaction.
4. Do not use the setting bed material for leveling.
5. Maintain setting bed in a moist and loose condition and protected against pre-compaction both prior to and following screeding.
6. Screed setting bed material slightly ahead of the laying the unit pavers.

7. Do not screed bedding material in advance of the laying-face to an extent to which paving will not be completed that day.
8. Fully protect screeded setting bed fully against pre-compaction, including compaction by rain or dew.

C. Laying Paver Units:
1. Place unit pavers on the un-compacted and screeded bedding material in the running pattern indicated on the Drawings.
2. Place pavers so that joints are aligned and installed in the pattern with joint widths indicated on the Drawings.
3. Use string lines to hold pattern lines and elevations true.
4. Lay rows of full units first.
5. Cut off and fit closure units subsequently.
6. Cut paver units with power diamond blade masonry saw where partial pavers abut straight surfaces.
7. Cut smooth radial paver edges with a diamond-blade masonry saw by kerfing and grinding, or via other accepted method, where pavers abut round elements such as manholes, bollards and columns to achieve smooth curved edges parallel with the abutting surfaces with maximum 1/4-inch wide polymer sand joints.
8. Do not allow other construction traffic on pavement during the paver installation until pavers have been compacted.

D. Compaction of Larger Pavers:
1. Achieve consolidation of the cement-stabilized bedding material and bring paver surfaces to design levels by using beating block and rubber mallet.
2. Continue beating and leveling pavers until lippage is within the specified tolerance and pavers are at proper elevations.
3. Immediately remove and replace pavers which are damaged during installation.

E. Compaction of Smaller Pavers:
1. Achieve consolidation of bedding material and bring surfaces of pavers to design levels and profiles by not less than 3 passes of a plate compactor.
2. Use a high-frequency, low amplitude mechanical flat plate vibrator capable of minimum 4000 pounds of centrifugal compaction force to a minimum 80 hz. Pass vibrator across the short dimension of the paving units.
3. Install a protective cover on the vibrator plate to protect pavers from damage.
4. Proceed with compaction as closely as possible following laying of pavers and prior to acceptance of pedestrian or vehicular traffic.
5. Do not compact within 3 feet of laying face.
6. Continue compaction until lippage between adjoining paving units is within the specified tolerance and the pavers are solidly seated.
7. Leave work to within 3 feet of the laying face fully compacted at the complete of each work day.
8. Immediately remove pavers damaged by compaction operations and replace.

F. Filling Sand Joints:
1. Install polymer joint sand in accordance with the polymer joint sand manufacturer’s current printed installation instructions.
2. Wet polymer joint sand in accordance with the polymer joint sand manufacturer’s current printed installation instructions.
3. Take special care to remove excess polymer sand from paver surfaces prior to wetting polymer sand in joints.

3.4 TOLERANCES

A. Paver Finished Surface: Do not permit finished paving surfaces to vary more than 1/8-inch measured with a 10-foot long metal straightedge, except at grade changes.

B. Thickness of Setting Bed Over Concrete Base Slab (Sub-slab) after Compaction of Pavers: 1-inch average, 3/4-inch minimum, 1-1/4-inch maximum.

C. Lippage Between Adjacent Pavers: 1/16-inch maximum after compaction of pavers.

D. Polymer Sand Joint Width for Pedestrian Pavers: 1/8-inch average, 1/16-inch minimum and 3/16-inch maximum.

E. Polymer Sand Joint width for Vehicular Pavers: 1/16 inch minimum, 1/8 inch maximum.

3.5 CLEANING

A. Paving Units:
1. Prior to Final Inspection, clean exposed surfaces of paving units with clean water and stiff bristle brush. Acid based cleaners will alter finish and color.
2. Remove and replace permanently stained pavers.
3. Add additional polymer sand to joints where cleaning has dislodged sand and re-wet joints.

3.6 SEALING

A. Field-apply sealing to the entire paving area, including joints, after installation and prior to Final Inspection. Follow sealer manufacturer's instructions for application and maintenance of the sealer.

3.7 PROTECTION

A. Damage and Defacement: Protect paving units against damage and defacement during subsequent construction operations until date of Final (Total) Completion by covering paving with 3/4-inch thick exterior plywood or other acceptable material where subject to traffic damage.

B. After installation and before completion, inspect precast concrete paving units for construction damage and obtain new precast concrete paving units if required.

END OF SECTION

SECTION 32 14 42

MORTAR-SET UNIT PAVING

PART 1 — GENERAL

1.1 SUMMARY

A. Section Includes:
1. Concrete Unit Pavers – Vehicular Mortar Set
2. Linear Stone Paving
3. Stone Treads for Monolithic Stone Steps

B. Related Sections:
1. Section 057300, EXTERIOR METAL RAILING; Handrails to be embedded in Stone Treads
2. Section 079201, EXTERIOR JOINT SEALANTS- SITEWORK
3. Section 321313, LANDSCAPE CONCRETE; Foundations and footings.
4. Section 341440, SAND SET UNIT PAVING

1.2 REFERENCES

A. ASTM - ASTM International:
1. C33 Concrete Aggregates
2. C39 Concrete Compressive Strength
3. C144 Aggregate for Masonry Mortar
4. C136 Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates
5. C150 Portland cement
6. C448 Classification for Sizes of Aggregate for Road and Bridge Construction.
7. C642 Water Absorption, Density, Voids in Hardened Conc
8. C666 Rapid Freeze/Thaw Resistance of Conc
9. C979 Pigments for Integrally Colored Concrete
10. C1028 Coefficient of Friction

B. ANSI - American National Standards Institute:
1. A118.4 Latex Portland Cement Mortar.

1.3 DEFINITIONS

A. Approval, Approved, Acceptance, Acceptable, or Accepted: Acceptance by the Landscape Architect in writing, except when indicated otherwise.

B. Excessive Compaction: Planting area soil or soil mix compaction greater than 80 percent of maximum dry density per ASTM D 1557.

1.4 ACTION SUBMITTALS

A. Product Data:
1. Concrete Paver Unit.
2. Granite Sawn Thins at Linear Stone Paving.
3. Mortar Mixes.
4. Joint Grout.

B. Shop Drawings: Cutting and setting drawings of Stone Treads shall be submitted. Drawings shall indicate sizes, dimensions, layout, finishes, arrangement and provisions for jointing, anchoring, cut-out and holes, and other necessary details for reception of the work of other Sections.

C. Samples:
1. Concrete Unit Pavers: Three actual full size pavers representing color range, and finishes of exposed face, sides, and bottoms. Factory sealed or with concrete sealant applied.

2. Granite Sawn Thins at Linear Stone Paving: Four pieces representing color range, shape and size variation, and finishes of exposed face and sides

3. Stone tread sample: provide a 6 in. x 12 in sample that fully demonstrates color, shade, veining, texture, range, and finish.

4. Grout: Three applied grout color samples selected by the Landscape Architect.

1.5 INFORMATIONAL SUBMITTALS

A. Test Data:
1. Stone Properties Test Data for Each Stone Type, including ASTM C 97 absorption, ASTM C 99 modulus of rupture, ASTM C 170 compressible strength, ASTM C 880 flexural strength, and ASTM C 1353 abrasion resistance.
2. Sound Test Documentation.

B. Manufacturer's Instructions:
1. Mortar Installation.
2. Grout Installation.

C. Purchase Documentation.

D. Purchase and Delivery Invoices for Mortar Mixes and Grout.

1.6 QUALITY ASSURANCE

A. Installer Qualifications:
1. Employs adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the Work of this Section.

B. Regulatory Requirements:
1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work.

C. Source:
1. Stone shall be supplied by a source approved by the Landscape Architect or Owner's Representative.

2. Provide each type of stone from only one quarry to ensure consistent color range and texture. Do not change source during the course of the work.

D. Stone shall be standard grade, free of cracks, seams, starts, or other defects which may impair its strength, durability or appearance. Exposed surfaces shall be free from spots, spalls, chips, stains, discoloration, or other defects which would affect its appearance.

E. General Mock-up Requirements:
1. Construct as many mock-ups as necessary to achieve an accepted finish over the entire surface of each mock-up.
2. Mock-ups which are completely or partially finished incorrectly will be rejected.
3. Remove rejected mock-ups immediately from the site.
4. The mock-up, when accepted, shall become the Project standard for tolerances and appearance.

F. Concrete Paver Mock-ups:
1. Construct mock-up as indicated in the Paving Schedule on the Drawings
2. Include concrete base slab, mortar setting bed, and mortared joints.
3. Compact pavers on setting bed in the specified pattern,
4. Mock-ups may be installed and remain as part of the permanent installation if found acceptable by the Landscape Architect.

G. Linear Stone Paving Mock-ups:
1. Construct mock-up as indicated in the Paving Schedule on the Drawings
2. Include concrete base slab, mortar setting bed, paver edge restraint, and mortared joints.
3. Mock-up may be installed and remain as part of the permanent installation if found acceptable by the Landscape Architect.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Loading and Shipment:
1. Carefully pack the unit pavers for shipment free from stains, saw mud, and other deleterious material.
2. Exercise precautions against damage in transit.

B. Storage:
1. Store unit pavers on non-staining wood skids or pallets at least 4 inches above grade.
2. Place and stack skids and unit pavers to distribute weight evenly and to prevent breakage or cracking of pavers.
3. Store and protect unit pavers from weather and soiling with waterproof non-staining covers or enclosures but allow air to circulate around unit pavers.
4. Store aggregates where size grading and other required characteristics can be maintained.
5. Store mortar and grout in a dry location.

C. Handling:
1. Handle unit pavers to prevent chipping, breakage, soiling or other damage.
2. Do not use pinch or wrecking bars without protecting edges of unit pavers with wood or other rigid materials.
3. Lift with wide-belt type slings wherever possible.
4. Do not use wire rope or ropes containing tar or other substances which might cause staining.
5. Use wood rollers and provide cushion at end of wood slides.

1.8 SITE CONDITIONS

A. Environmental Requirements:
1. Protect mortar against frost, rapid drying and damage by rain.
2. Maintain substrate materials and surrounding air to a minimum of 50 degrees Fahrenheit prior to, during, and through curing periods and for a minimum period of 7 days after stone installation.
3. Maintain paver backing and pavers below 90 degrees Fahrenheit prior to, during, and through curing periods and for a minimum period of 7 days after stone installation.

4. Heat materials and surrounding air or erect shade structures if required to maintain specified temperatures.
5. Do not apply setting materials to surfaces that contain frost or ice.
6. Protect mortar and grout from direct sunlight, radiant heat, forced ventilation, and drafts until cured to prevent premature evaporation of moisture.

1.9 WARRANTY

A. General Description: Warrant for a period of one year from the date of Final (Total) Completion against defects in materials and workmanship.

B. Additional Items Covered: Warranty shall also cover repair of damage to other materials and workmanship resulting from defects in materials and workmanship.

C. Exceptions: Contractor shall not be held responsible for failures due to ordinary wear, neglect by Owner, vandalism and other causes outside the Contractor's control.

1.10 MAINTENANCE

A. Extra Paving Units:
1. Deliver to the Owner extra paving units with a combined face area equal to one percent of the respective paving areas indicated on the Drawings.
2. Deliver (1) extra stone stair tread units to a location within the Project site designated by the Owner's Representative.

PART 2 — PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS AND SUPPLIERS

A. Concrete Unit Pavers:
1. Stepstone Inc, Gardena CA; tel: 1-800-572-9029; www.stepstoneinc.com
   a. Refer to Paving Schedule on the Drawings for paver unit size, color and style.
2. Alternate: Hanover Architectural Products, www.hanoverpavers.com, 5000 Hanover Road, Hanover, PA 17331; tel: (717) 637-0500, or approved equal.
   a. F: Plankstone 3x9x4; Matrix #1025, Tudor Finish

B. Granite Sawn Thins at Linear Stone Paving: Champlain Stone, Ltd, Warrensburg, NY; tel 518-623-2902; info@champlainstone.com.
1. Color: Corinthian Granite
2. Size: ¾ - 1" thin veneer sized per Drawings in random lengths.

C. Bluestone shall be sourced from Johnston & Rhodes Bluestone Co, East Branch, NY; tel 607-363-7595; info@johnstonandrhodes.com or approved equal.
1. Color range: Blue/Blue
2. Dimensions: As shown in drawings
3. Finish: Split face finish on exposed vertical surfaces, flamed finish on exposed tread. All other surfaces to be sawn.

D. Mortar Setting Bed Mix: Custom Building Products, www.custombuildingproducts.com.

2.2 MATERIALS

A. Concrete Unit Pavers shall be precast concrete, consisting of Portland cement, aggregate and color admixtures.
   1. Portland Cement: ASTM C 150, Type III, high early strength.
   2. Aggregate: ASTM C 33.
   3. Color Admixture: By Davis Colors, or equal, as required to achieve color as selected.
   4. Aggregate for exposed aggregate surface: As selected.'

B. Linear Stone Paving units shall be solid granite.

C. Stone Treads shall be Solid Bluestone
   1. Bluestone shall be cut accurately to required shapes and dimensions.

   2. Holes, cut-outs, sinkages and openings in bluestone work for anchors, cramps, dowels, supports, and lifting devices, shall be accurately cut or drilled to required dimensions, as shown on approved shop drawing and as necessary to secure stone in place to insure correct location and accurate fit of all fixtures. Setting beds shall be shaped to fit supports.

D. Expansion Joint Fill Material: ASTM D 1752 Type II cork, or ASTM D 1752 Type I closed-cell neoprene sponge rubber with 30 - 40 pounds per cubic foot density, compatible with joint sealant.

E. Mortar Mix: Spec Mix Polymer Modified Setting Bed Mortar; or accepted equal.

F. Mortar Colorant:
   1. Color to be selected from full range of manufacturer's standard colors by Landscape Architect.

G. Non-shrink grout
   1. Refer to Section 057300; EXTERIOR METAL RAILING.

H. Water: Clean, potable.

I. Sealer: Water or acrylic based. Exterior durable and UV light stable. For use if concrete pavers are not factory sealed.
   1. Test sealer on sample pavers to confirm finish. Sealer should not significantly alter appearance of concrete pavers.

2.3 PAVER FABRICATION TOLERANCE

A. Maximum Variation from Thickness: 1/8-inch.

B. Maximum Variation from Face Size: 1/16-inch.

C. Maximum Variation from Flat: 1/16-inch.

2.4 MIXES

A. Mortar Setting Bed:
   1. Mix powdered mortar bed mix with water.
   2. Mix in accordance with manufacturer's current printed instructions.

B. Slurry Bond Coat:
   1. Mix powdered mortar bed mix with water.
   2. Mixing: Mix in accordance with manufacturer's current printed instructions for slurry bond coat.

C. Joint Grout: Mix grout mix with water in accordance with manufacturer's current printed installation instructions.

PART 3 — EXECUTION

3.1 EXAMINATION

A. General: Examine site and verify that conditions are suitable to receive Work and that no defects or errors are present which would cause defective installation of products or cause latent defects in workmanship and function.

B. Concrete Base:
1. Contractor shall examine the concrete substrates to determine its adequacy to Work of this section. Evidence of inadequate condition shall be brought to the immediate attention of the Landscape Architect.

2. Allow new concrete substrates to cure 28 days at 70 degrees Fahrenheit (21 degrees Celsius) prior to installation of setting materials.

3. Start of work of this Section shall constitute acceptance of the concrete foundation.

C. Notification: Before proceeding with Work, notify construction manager and Owner's Representative in writing of unsuitable conditions.

3.2 PREPARATION

A. Protection:
1. Use every possible precaution to prevent damage to existing conditions to remain such as structures, utilities, plant materials and walks on or adjacent to the site of the Work.
2. Use every possible precaution to prevent excessive compaction of planting area soil or soil mixes within or adjacent to the areas of Work.
3. Provide barricades, fences or other barriers to protect existing conditions to remain from damage and excessive compaction during construction.
4. Do not store materials or equipment, permit burning, or operate or park equipment under the branches of existing plants to remain.
5. Submit written notification of damaged plants and structures to the Owner's Representative.

B. Surface Preparation:
1. Clean dirt, oil, grease, plaster, sealers, curing compounds, form oil, loose plaster, paint, scale, and other materials from substrate.

3.3 INSTALLATION

A. Manufacturer's Requirements: Meet requirements of the mortar mix manufacturer's installation and curing instructions, except apply slurry bond coat to sub-slab surface and cure thin-set mortar as required by this Section.

B. Mortar Setting Bed:
1. Just prior to installing mortar setting bed to concrete sub-slab dampen slab with water without causing puddling and uniformly coat surface of base slab with slurry bond coat.
2. Do not install mortar bed on puddled water.

3. While slurry bond coat is still wet and sticky place mortar on slurry bond coated substrate and then screed and compact mortar surface to elevation required to bring finished surfaces to elevations indicated on the Drawings.
4. For mortar beds under the stair tread units install lower half of mortar bed on slurry coated concrete sub-slab first and immediately place WWF sheet over it, followed by placing remainder of mortar over the WWF.
5. Maintain WWF in vertical center of mortar bed.
6. No cold joints will be permitted in the mortar setting bed.
7. Cover mortar bed with plastic until mortar bed is fully cured to prevent rapid moisture loss and curling of the mortar bed.
8. Do not install thin-set mortar on mortar setting bed until mortar bed is fully cured and will accept water penetration.

C. Unit Pavers:
1. Cut and fit pavers neatly and precisely to pattern and layout on the approved shop drawings.
2. Just prior to installing pavers apply a skim coat of thin-set mortar over the surface the mortar bed in accordance to the manufacturer's instructions.
3. Just prior to installing each paver on the skim coat evenly trowel a small quantity of thin-set mortar over the entire clean back of the paver before setting.
4. Clean back of each paver before back-buttering.
5. While the thin-set skin coat on the mortar bed is still wet and sticky and the thin-set mortar coating on the back of each paver is wet and sticky set unit pavers in place and beat with a beating block or rubber mallet to ensure 100-percent full bedding with no voids and with a true surface before the thin-set mortar takes initial set.
6. Install unit pavers with finish surfaces as even as possible with 1/8-inch maximum variation measured from a 10-foot long straight edge and a 1/16-inch maximum lippage between stone units.
7. Make joints straight and of uniform width.

D. Stone Tread:
1. Stone units with chips, cracks, stains, or other defects which might be visible in the finished work shall not be used.
2. Before setting, stone shall be clean and free of dirt, and foreign matter on all sides. Stone shall be dry before setting.
3. Stone shall be set true to the required lines and grades. Joints shall be uniform in thickness.
4. Exposed surfaces shall be kept free from mortar at all times. Any mortar smears shall be immediately removed with a clean sponge and clean water before mortar can set.

E. Expansion Joint Fill:
1. Install expansion joint fill material as detailed on the Drawings.
2. Install expansion joint materials where stone abuts restraining surfaces such as perimeter walls, curbs, columns, wall corners, other types of hard paving and at other locations shown on Drawings.
3. Install expansion joint material while mortar is wet, to separate mortar beds thoroughly and continuously.
4. Where expansion joint fill material is indicated without backer rod, install top of joint fill material at elevation to provide sealant depth recommended by sealant manufacturer and the surface profile indicated on the Drawings.
5. Do not cut-in expansion joints after mortar bed dries.
6. Do not install reinforcing mesh through expansion joints.

F. Curing:
1. After installation, prior to grouting, allow thin-set mortar to cure for a minimum of 48 hours by covering joints and stone surfaces with plastic film at a temperature of 70 degrees Fahrenheit.

2. After 48 hours, pull up representative unit pavers to verify thin-set mortar is fully cured and is not damp or soft.
3. Do not installation joints until thin-set mortar is fully cured.
4. Protect open joints from dirt, chemicals and other contamination while thin-set mortar is curing.
5. Allow mortar setting bed and thin-set mortar to cure at least 14 days before allowing heavy traffic on paving and stairs.

3.4 TOLERANCES

A. Mortar Setting Bed Thicknesses: Plus 1/4-inch to minus 1/4-inch thickness indicated on the Drawings.

B. Thin-set Mortar Bed Thickness: 1/8-inch average, plus or minus a 1/16-inch.

C. Maximum Finished Surface Variation from a 10-Foot Straight Edge: 1/8-inch.

D. Maximum Lippage Between Stone Slab Edges: 1/16-inch.

E. 1/4 Inch Wide Expansion Joint and Grout Joint Width Variation: 1/4 inch average. 3/16-inch minimum, 5/16-inch maximum.

F. Vertical Location of WWF in Mortar Setting Bed: Vertical center of mortar bed plus or minus 1/8-inch.

3.5 FIELD QUALITY CONTROL

A. Mortar Bedding Coverage Inspection:
1. During installation check paver back bedding coverage periodically by removing an installed paver and inspecting bedding mortar transfer onto back of paver.
2. If inspected thin-set mortar is skimmed over (not sticky) remove and replace with fresh thin-set mortar coat.

B. Mortar Curing Inspection:
1. Twenty four hours after installation and prior to installing grout pull up representative stone paver units to verify thin-set mortar is fully cured and not soft or damp.
2. Do not install grout until thin-set mortar is fully cured.

3.6 CLEANING

A. Clean exposed surfaces of paving units, stone treads, grout joints, and expansion joint sealant with clean water and stiff bristle brush.
1. Wire brushes, steel wool, and acids or other solutions which may cause discoloration are expressly prohibited.

B. Remove and replace permanently stained paving units.

C. Do not use wire brushes, acid type cleaning agents, cleaning compounds with caustic or harsh fillers, or other materials, tools or methods which could damage finish and color of paving units, stone and joint materials.

3.7 SEALING

A. Unit Pavers:

1. Field-apply sealing to unit pavers over the the entire paving area, including joints, after installation and prior to Final Inspection. Follow sealer manufacturer's instructions for application and maintenance of the sealer.

3.8 PROTECTION

A. Damage and Defacement:
   1. Keep traffic off unit paving for at least 72 hours at 70 degrees Fahrenheit after installation.
   2. Extend period of protection at temperatures below 60 degrees Fahrenheit and at relative humidity above 70 percent.
   3. Protect unit pavers and joint materials against damage and defacement during subsequent construction operations until date of Final (Total) Completion.

END OF SECTION

SECTION 32 14 48

CRUSHED STONE SURFACING

PART 1 — GENERAL

1.1 SUMMARY

A. Section includes:
   1. Crushed Stone Maintenance Strip.

1.2 WORK INCLUDED

A. Provide all equipment and materials, and do all work necessary to construct the crushed stone maintenance strip as indicated on the Drawings and as specified.

1.3 RELATED WORK

A. Examine Contract Documents for requirements that affect work of this Section. Other Specification Sections that directly relate to work of this Section include, but are not limited to:
   1. 055901, METAL EDGING.

1.4 REFERENCES

A. Comply with applicable requirements of the following standards. Where these standards conflict with other specified requirements, the most restrictive requirement shall govern.
   1. American Society for Testing and Materials (ASTM):

D 1557	Moisture-Density Relations of Soils and Soil Aggregate Mixtures Using 10-lb. (4.54-kg) Rammer and 18-in. (475-mm) Drop
C 136	Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates.

1.5 SUBMITTALS

A. Product data including aggregate source, aggregate size chart including sieve analysis that complies with ASTM D 448 and ASTM C 136.

B. A 1 lb. sample of crushed stone shall be submitted for the Landscape Architect's approval of material gradation and color. Samples shall be "range samples" provided from the source stone will be supplied from.

1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain crushed stone material from one source with resources to provide materials and products of consistent quality in appearance and physical properties.

1.7 DELIVERY, HANDLING, AND STORAGE

A. Stone shall be carefully packed and banded by the supplier for shipment. Following shipping stone shall be stored covered with non-staining, waterproof membrane and protected from the weather.

PART 2 — PRODUCTS

2.1 CRUSHED STONE

A. Stone shall be an angular, washed, durable, uniformly graded, 1-1.5" diameter. Gradation shall be submitted to the Landscape Architect for review and approval and shall match approved sample.
1. Stone to be granite or basalt, light gray in color.

2.2 NON-WOVEN GEOTEXTILE

A. Geotextile Fabric shall be Carthage 30% by Carthage Mills, carthagemills.com.

2.3 METAL EDGE

A. Refer to Section 055901, METAL EDGING.

PART 3 — EXECUTION

3.1 GRADING

A. Areas to receive crushed stone surfacing will be compacted and brought approximately to subgrade elevation before work of this section is performed. Final fine grading, filling, and compaction of subgrade to receive surfacing, as required to form a firm, uniform, accurate, and unyielding subgrade at required elevations and to required lines, shall be done under this Section.

B. Existing subgrade material which will not readily compact shall be removed and replaced with satisfactory materials.

C. Subgrade of areas to be paved shall be compacted to bring top 8 in. of material to a compaction of at least 90% of maximum density, as determined by ASTM D 1557, Method D. Subgrade compaction shall extend for a distance of at least 6". beyond stone surfacing edge.

D. Excavation required in pavement subgrade shall be completed before fine grading and final compaction of subgrade are performed.

E. Areas being graded or compacted shall be kept shaped and drained during construction. Ruts greater than or equal to 2 in. deep in subgrade, shall be graded out, reshaped, and recompacted before placing pavement.

3.2 METAL EDGING

A. Flat vertical steel edging shall be installed at locations indicated on the Drawings. Where required, edging shall be cut square and accurately to required length.
1. Refer to Section 055901, METAL EDGING.

3.3 NON-WOVEN GEOTEXTILE

A. Geotextile fabric shall be installed over compacted base course in accordance with manufacturer's printed instructions. Edges of fabric shall overlap a minimum of 12 in.

3.4 STONE SURFACING

A. Stone surfacing shall be done only after excavation and construction work which might injure it has been completed. Damage caused during construction shall be repaired before acceptance.

B. Contractor shall inspect drainage columns and strips and verify that they are free of debris and are draining as intended before installing crushed stone surfacing.

C. Crushed stone shall be placed evenly over the non-woven geotextile in 2 in. lifts to depth indicated on the Drawings. Level and smooth surface to lines and grades required.

D. Water shall be added to crushed stone surfacing as required to achieve a dense, hard packed surface conforming to the finish grades indicated.

E. Upon completion of stone surfacing, adjacent surfaces shall be left in a clean, unsoiled condition, acceptable to the Owner's Representative.

3.5 CONSTRUCTION WASTE MANAGEMENT

A. Comply with the requirements of Division 01, GENERAL REQUIREMENTS for removal and disposal of construction debris and waste.

END OF SECTION

SECTION 32 16 40

GRANITE CURBING

PART 1 — GENERAL

1.1 SUMMARY

A. The work includes furnishing all labor, materials, equipment, and supervision to construct the granite curbing, including the upright granite curb and the flush granite curb in accordance with the Drawings and Specifications.

1.2 RELATED WORK

A. Examine Contract Documents for requirements that affect work of this Section. Other Specification Sections that directly relate to work of this Section include, but are not limited to:

1. Section 321313, LANDSCAPE CONCRETE; Concrete footings, bases and foundations.

1.3 REFERENCES

A. Comply with applicable requirements of the following standards. Where these standards conflict with other specified requirements, the most restrictive requirements shall govern.

1. American Society for Testing and Materials (ASTM):
   C 131 Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
   C 615 Structural Granite

2. New York State Department of Transportation (NYSDOT):
   Specifications Standard Specifications for Highway and Bridges

1.4 SUBMITTALS

A. Samples:
   1. New off-site granite curb: Furnish one 1 ft. length of granite curb, showing color, texture and finish.

B. Submit complete shop drawings of granite curb, including sizes and radial segments for Landscape Architect's approval.

1.5 QUALITY ASSURANCE

A. Unless otherwise indicated, granite curb materials and construction shall conform to the applicable portions of the following:

1. NYDOT Section 714-01, "Stone Curb."

1.6 DELIVERY, STORAGE, AND HANDLING

A. Granite curb units shall be delivered to the job adequately protected from damage during transit.

B. Curb shall be protected against staining, chipping, and other damage. Cracked, badly chipped, or stained units will be rejected and shall not be employed in the work.

PART 2 — PRODUCTS

2.1 NEW GRANITE CURB

A. New, off-site granite curb shall be a structural granite conforming to ASTM C 615, Class I Engineering Grade, suitable for curbstone use. Granite curb shall match existing granite curbs used on Campus, or shall be similar to that produced by Swenson Granite Works 10 Main Street, Rt 109, Medway, MA 02053 Ph (508) 533-2882; Fax (508) 533-3441, Granite of America, 15 Branch Pike Smithfield, RI 02917; Tel. 401-232-2040; H.E. Fletcher Company, West Chelmsford, MA 01863, or other approved supplier.

1. Curb shall be light grey, free from seams which impair structural integrity, and with percentage of wear less than 32%, as determined by ASTM C 131.

B. Curb materials shall conform to NYSDOT Specifications Section 714 and shall meet requirements specified in the following subsection:

Item	Section	Type
Stone Curb	714-01	C

C. Provide depth(s) of granite curb as indicated on the Drawings.

D. Provide sawn head joints on both sides for all curb sizes. Provide split face on exposed vertical faces and thermal finish on top.

2.2 SETTING BED MORTAR – THICK SET

A. Setting bed mortar shall be equal to "Laticrete 3701 Fortified Mortar Bed", a polymer fortified blend of carefully selected polymers, portland cement and graded aggregates, manufactured by Laticrete International, Inc., One LATICRETE Park North, Bethany, CT 06524-3423 USA · 1.800.243.4788 · +1.203.393.0010, or approved equal. Mix with water according to manufacturer's instructions.

2.3 THIN SET BED AND/OR BOND COAT

A. High strength bond coat between concrete base slab and setting bed mortar, and between setting bed mortar and stone, or thin set mortar bed, shall be equal to "Laticrete 254 Platinum", one-step, polymer fortified, thin-set mortar bond coat, manufactured by Laticrete International, Inc., One LATICRETE Park North, Bethany, CT 06524-3423 USA · 1.800.243.4788 · +1.203.393.0010, or approved equal.

2.4 MORTAR GROUT FOR POINTING

A. Sanded Grout: shall be 1500 Sanded Grout, a premium, factory prepared grout designed to be mixed with water. 1500 Sanded Grout is formulated from a blend of high strength portland cement, graded aggregates, polymers and color-fast pigments and provides a grout joint that is dense, hard and durable, manufactured by Laticrete International, Inc., One LATICRETE Park North, Bethany, CT 06524-3423 USA · 1.800.243.4788 · +1.203.393.0010, or approved equal.

1. For grout joint widths of 1/16" (1.5 mm) up to 3/8" (9 mm).
2. Color shall match color of granite.

2.5 CONCRETE

A. Concrete for continuous haunch shall conform to Section 321313 LANDSCAPE CONCRETE.

2.6 EXPANSION JOINT

A. Expansion joint to occur in place of mortar joints every 80 feet. If curb section is less than 80 feet long, insert one expansion joint within the section. Expansion Joints shall conform to Section 321313 LANDSCAPE CONCRETE.

PART 3 — EXECUTION

3.1 GRADING

A. Areas to receive granite curb will be compacted and brought approximately to subgrade elevation under Section 312000, EARTHWORK before work of this section is performed. Final fine grading, filling, and compaction of subgrade to receive curbing, as required to form a firm, uniform, accurate, and unyielding subgrade at required elevations and to required lines, shall be done under this Section.

B. Existing subgrade material which will not readily compact as required shall be removed and replaced with satisfactory materials. Additional materials needed to bring subgrade to required line and grade and to replace unsuitable material removed shall be Granular Fill material conforming to Section 312000, EARTHWORK.

C. Subgrade of areas to receive curbing shall be recompacted as required to bring top 8 in. of material immediately below gravel base course to a compaction of at least 90% of maximum density, as determined by ASTM D 1557, Method D. Subgrade compaction shall extend for a distance of at least 1 ft. beyond curb edge.

D. Excavation required in subgrade shall be completed before fine grading and final compaction of subgrade are performed. Where excavation must be performed in completed subgrade or subbase subsequent backfill and compaction shall be performed as directed by the Landscape Architect as specified in Section 312000, EARTHWORK. Completed subgrade after filling such areas shall be uniformly and properly graded.

E. Areas being graded or compacted shall be kept shaped and drained during construction. Ruts greater than or equal to 2 in. deep in subgrade, shall be graded out, reshaped as required, and recompacted before placing granite curb.

F. Materials shall not be stored or stockpiled on subgrade.

G. Disposal of debris and other material excavated and/or stripped under this section, and material unsuitable for or in excess of requirements for completing work of this Section shall be legally disposed of off-site.

H. Prepared subgrade will be inspected by the Landscape Architect. Subgrade shall be approved by the Landscape Architect, Client or Owner's Representative before installation of aggregate base course. Disturbance to subgrade caused by inspection procedures shall be repaired under this Section of the specification.

3.2 AGGREGATE BASE COURSE

A. Aggregate base course for paving and the spreading, grading, and compaction methods employed shall conform to standard requirements for usual base course of this type for first class road work, and the following:

1. MHD Specifications Section 405, "Gravel Base Course".

B. Compaction of aggregate base course shall be to 95% of maximum density as determined by ASTM D 1557, Method D. Stone greater than 2-1/2 in. shall be excluded from course.

C. Width of base course shall be greater than or equal to the width of curb surface, if continuous lateral support is provided during rolling, and shall extend at least 2 x base thickness beyond edge of the course above, if not so supported.

D. Aggregate material shall be applied in lifts less than or equal to 6 in. thick, compacted measure. Each lift shall be separately compacted to specified density, using a 6 ton steel wheel roller or vibratory roller equivalent to a 6 ton static roller, or an approved equivalent.

1. Material shall be placed adjacent to wall, manhole, catch basin, and other structures only after they have been set to required grade and level.
2. Rolling shall begin at sides and progress to center of crowned areas, and shall begin on low side and progress toward high side of sloped areas. Rolling shall continue until material does not creep or wave ahead of roller wheels.
3. Surface irregularities which exceed 1/2 in. measured by means of a 10 ft. long straightedge shall be replaced and properly compacted.

E. Portions of subgrade or of construction above which become contaminated, softened, or dislodged by passing of traffic, or otherwise damaged, shall be cleaned, replaced, and otherwise repaired to conform to the requirements of this specification before proceeding with next operation.

3.3 SETTING CURB

A. Curb shall be set in continuous concrete footing, with trench bottom at minimum 6 in. below bottom of curb. Excavation shall be filled to required level with base course material as specified above.

B. Vertical face of vertical curb shall be plumb, with curb top parallel to adjacent surface.

C. Curb shall be set accurately to line and grade in continuous haunch. Curb units shall be fitted together as closely as possible. Curb shall not be field cut.

D. Joints, between curb units shall be carefully filled with a cement mortar, and neatly pointed on the top and front exposed portions. After pointing, excess mortar shall be cleaned from curb surface.

E. Backfill material on each side of curb shall be as specified for adjacent surface and shall be thoroughly compacted by means of power tampers. Extreme care shall be taken not to destroy alignment. Curb sections disturbed during backfilling or otherwise shall be reset to line and grade, and properly backfilled.

END OF SECTION

SECTION 328400

PLANTING IRRIGATION

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. The scope of work includes all labor, materials, appliances, tools, equipment, facilities, transportation and services necessary for, and incidental to performing all operations in connection with furnishing, delivery, and installation an irrigation system shown on the drawings and as specified herein.

B. The scope of work in this section includes, but is not limited to, the following:

1. Automatic irrigation system with electric control including piping, fittings and accessories.
2. Drip irrigation.
3. Rain Sensor with related wiring.
4. Moisture sensors with related wiring.
5. Booster pump with related electrical wiring and pipe.
6. Hydrometer with related piping and wiring
7. Controller with related wiring and conduit, electrical wiring.
8. Grounding of Irrigation System.
9. Testing and instruction.
10. Excavating and backfilling irrigation system work.
11. Maintenance and warranty

C. Related Documents and Sections: Examine Contract Documents for requirements that directly affect or are affected by Work of this Section. A list of those Documents and Sections include, but is not limited to the following:

1. Division 26, Electrical
2. Division 22, Plumbing
3. Section 32 91 00, Planting Soil.
4. Section 32 92 19, Seeding and Sodding.

1.3 REFERENCES

A. Standards and Codes that apply to the Work of this Section:

1. RE NEC — National Electric Code, current edition.
2. UPC — Uniform Plumbing Code, current edition.
3. ASTM — ASTM International:
   a. B 3 — Specification for Soft or Annealed Copper Wire.

b. D 698 — Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort.

c. D 1557 — Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort.

d. D 1784 — Specification for Rigid PVC Compounds and CPVC Compounds.

e. D 1785 — Specification for PVC Plastic Pipe, Schedule 40.

f. D 2287 — Specification for Nonrigid Vinyl Chloride Polymer and Copolymer Molding and Extrusion

g. Compounds.

h. D 2241 — Specification for PVC Pressure-Rated Pipe (SDR Series).

i. D 2464 — Specification for Threaded PVC Plastic Pipe Fittings, Schedule 80.

j. D 2466 — Specification for PVC Plastic Pipe Fittings, Schedule 40.

k. D 2564 — Specification for Solvent Cements for PVC Plastic Piping Systems.

l. D 2672 —F 690 — Practice for Underground Installation of Thermoplastic Pressure Piping Irrigation Systems.

4. ANSI — American National Standards Institute: NSF 14— Plastics Piping Components and Related Materials.

1.4 PRE-INSTALLATION MEETING

A. Arrange for a pre-installation meeting. Meeting to be held at a time requested by the construction manager to coordinate all trades and requirements of this Section. Representatives from Architect, Landscape Architect, Construction Manager, Irrigation Design Consultant, the Owner and Contractors are to attend.

1.5 DEFINITIONS

A. The following are industry abbreviations for irrigation materials.

1. Acceptance, Acceptable, or Accepted: Acceptance by the Landscape Architect in writing.
2. Excessive Compaction: Planting area soil or soil mix compaction greater than 75 percent of maximum dry density as determined by ASTM D 1557.
3. PVC: Polyvinyl Chloride.
4. HDPE: High Density Polyethylene.
5. SDR: Standard Dimensional Ratio.
6. AWG: American Wire Gauge.

1.6 SUBMITTALS

A. Refer to and comply with Section 013300, “Submittals Procedures”, for procedure and additional submittal criteria.

B. Product Data: Manufacturer or supplier's descriptive literature including installation instructions, for each specified product.

C. Submit all product warranties to Owner's representative.

D. Credentials: Name and qualifications of the irrigation contractor including at least three (3) comparable projects of similar work and scope that the Contractor has completed within the last three (3) years with job locations, names of owners and architects, their phone numbers, and dates on which the work on each project was started and completed.

E. Certified Irrigation Contractor: Submit proof of current Irrigation Association Certified Irrigation Contractor (CIC) status.

F. Certifications: Written certification from each product manufacturer or supplier stating that their product conforms to the specified requirements and that all products do not contain hazardous materials.

G. Shop Drawings:

1. Shop drawings showing all piping, conduit, and irrigation equipment for point of connection.
2. Show layouts of system(s) relate to and adjusted together with layouts of on-site design conditions and plantings.

H. Samples: When requested by the Owner's Representative submit each irrigation system component and other item(s) related to the work to confirm product characteristics.

I. Operating and Maintenance Manual: Three (3) manuals describing in detail the step-by-step procedures required for system start-up, operation and shut down of the entire irrigation system. Operating manuals shall include the manufacturer's name, model number, parts list and brief description of all equipment and their basic operating features. Maintenance manuals shall list routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Index and arrange the manuals in proper order; include copies of all product literature and their warranties.

J. Warranty: On company letterhead submit a written warranty in the following format:

1. Warranty for ** NAME OF PROJECT** irrigation system we hereby guarantee that the irrigation system we have furnished and installed for **NAME OF PROJECT** is free from defects in materials and workmanship, and the work has been completed in accordance with the Contract Drawings and Specifications, ordinary wear and tear and unusual abuse, or neglect expected. We agree to repair or replace any defects in material or workmanship which may develop during the period of one year from date of the rendition of Certificate of Final Completion and to repair or replace any damage resulting from repairing or replacing of such defects at no additional cost.
   Contractor Name
   Signature: Title:
   Date:

K. GPS Construction Record Drawing:

1. GPS As-Built Drawings to consist of the following: Controllers, Sprinklers, Spray heads, Quick coupling valves, Isolation valves, Automatic valve assemblies, mainline pipe routing, lateral pipe routing, splice boxes, grounding locations with OHM readings, communication cable routing, 2-wire path with decoder numbers. All pipe and wire to have size indicated.
2. Submit two (2) CD-ROM disks with digital drawing (.dwg) file(s) and PDF's suitable for reproduction.
3. Submit "Construction Record Drawings" prior to final review and acceptance.
4. Refer to and comply with additional Record Document requirements in Section 017000 "Execution and Closeout Requirements".

L. Controller Drawings:

1. Controller drawings shall be a reproduction of the construction record drawing reduced and printed on 8½" x 11" 24lb bond paper. Drawings shall be legible. If necessary, use multiple sheets of paper and place drawings back to back.
2. Drawings shall show all irrigation zones highlighted in a different color solid hatch pattern with the designated valve schedule.
3. Seal controller drawings in 10 mil plastic laminate. When multiple drawings are required punch a hole in the upper left had corner of the laminate and connect with a key chain loop.
4. Submit two (2) drawings for each controller.

M. Irrigation Schedule:

1. Using data obtained from the water audit the Certified Landscape Irrigation Auditor shall create a typewritten schedule on 8 ½" x 11" white paper listing each valve number, type of sprinkler (rotor, spray, drip), description of that zone, days to water and daily runtimes for each irrigation month. Irrigation run times based on historical evapotranspiration and rainfall data.

2. Example:

Zone	Type	Days	Description	April	May	June	Jul	Aug	Sept	Oct
1	Drip	MWF	Front Bed	15:00	17:00	25:00	25:00	30:00	18:00	8:00
2	Spray	MWF	Rear Lawn	5:00	6:00	8:00	12:00	13:00	9:00	6:00

3. Schedule shall include the following note: Irrigation runtimes are based on Historical data and should be used only as a guide. All irrigation runtimes should be adjusted accordingly based on actual climatic conditions.
4. Seal irrigation schedule in 10 mil plastic laminate.
5. Submit two (2) irrigation schedules for each controller.

1.7 COORDINATION

A. Thoroughly coordinate and schedule the work of this Section with all trades involved to prevent interferences, and to allow adequate time at the proper stage of construction to properly perform all work of this Section.

B. Coordinate location of all piping and sleeves to be installed under walkway and driveway pavements.

1.8 QUALITY ASSURANCE

A. It is the intent of these Specifications and Drawings to provide for a complete installation. Therefore, any items not specifically noted but, reasonably necessary for a complete installation, shall be furnished. The system is to efficiently and uniformly irrigate all areas and perform as required by the Contract Documents. The irrigation system shall be fully automatic with an electric control.

B. Obtain and pay for all required inspections, permits, and fees. Provide notices required by governmental authorities.

C. Qualifications:

1. Experienced Contractors are required who are thoroughly trained and experienced in the skills required to install irrigation systems. Contractors to have a minimum of five (5) years' experience in the installation of site irrigation and be regularly engaged in and which maintains a regular work force in the installation of site irrigation.
2. A qualified superintendent shall be present during the installation.
3. Irrigation Contractor shall be a current Irrigation Association Certified Irrigation Contractor (CIC).
4. Materials, equipment, and methods of installation will comply with the applicable requirements of the authorities having jurisdiction including the following codes and standards:
    a. City of Poughkeepsie/State of New York Building Codes
    b. National Fire Protection Association, (NFPA): National Electrical Code.
    c. American Society for Testing and Materials, (ASTM).
    d. National Sanitation Foundation, (NSF).
    e. American Society of Agricultural Engineers, (ASAE).

D. Licenses:

1. A licensed Plumber shall make all plumbing connections. A licensed Electrician shall perform connections to 120 VAC power supplies.

1.9 SITE CONDITIONS

A. Locate and identify installed and existing underground and overhead services and utilities within the contract limits. Install adequate means of protection of utilities and services designated to

remain. Repair utilities damaged during work operations of this Section at the Contractor's expense.

B. When uncharted or incorrectly charted underground piping or other utilities and services are encountered during site work operations, notify the Owner's Representative and applicable utility company immediately to obtain procedural directions.

C. Cooperate with the applicable utility company in maintaining active services in operation.

D. Locate, protect, and maintain bench marks, monuments, control points and project engineering reference points. Re-establish disturbed or destroyed items at Contractor's expense.

E. Protect existing and newly installed trees, plants, lawn areas, and other features designated to remain as part of the landscape work.

F. Examine the areas and conditions under which site work is to be performed. Promptly notify the Owner's Representative of unexpected sub-surface conditions. Do not proceed with the work until unsatisfactory conditions are corrected.

G. Perform work operations and the removal of debris and waste materials to assure minimum interference with walks and other adjacent site features.

H. Protect existing paving and other services or facilities on site from damage caused by work operations of this Section. Repair and restore damaged items to original condition.

I. Obtain governing authorities written permission when required to close or obstruct streets, walks and adjacent facilities. Provide alternate routes around closed or obstructed streets, walks and adjacent facilities. Provide alternate routes around closed or obstructed traffic ways when required by governing authorities.

J. Failure on part of the Landscape Architect to reject work in the course of operations or during inspection of work is to not be interpreted as acceptance of work not in conformance with these specifications. Correct improper work or materials whenever discovered.

1.10 WARRANTY

A. Warranty the entire irrigation system and all related equipment and accessories for a period of one (1) year from the date of rendition of the Certificate of Final Completion against all defects in workmanship and material.

B. The warranty period will commence upon final acceptance by the Owner for a complete system and/or any portion thereof has been put into operation and acceptable to the Owner's Representative.

1.11 MAINTENANCE

A. During the warranty period, maintain the irrigation system to ensure complete operation of the entire irrigation system. Adjust and repair all settled piping, trenches and sprinkler heads. Correct all defective or damaged work as soon as possible.

B. Return to the site during the subsequent fall season(s) (before October 30th) and winterize the entire system. Drain all water from the system via compressed air and demonstrate to the Owner’s personnel the proper procedures for the system winterization.

C. Return to the site during the subsequent spring season(s) (before April 15th) and start-up the system. Demonstrate to the Owner the proper procedures for the system start-up, operation, and maintenance.

D. System maintenance to begin immediately upon Substantial Completion. Provide continuing maintenance of the irrigation system, as necessary, throughout the installation of the irrigation system.

1.12 DELIVERY, STORAGE, AND HANDLING

A. Deliver the irrigation system components in the manufacturer's original undamaged and unopened containers with labels intact and legible.

B. Deliver plastic piping in bundles, packaged to provide adequate protection of pipe ends, both threaded or plain.

C. Handle materials to prevent damage.

D. Store materials to protect from sunlight, temperature variation and weather.

E. Provide secure, locked storage for valves, sprinkler heads, and similar components that cannot be immediately replaced, to prevent installation delays.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Apollo Ball Valve, Pageland South Carolina

B. Ashcroft Gauges, Stratford, Connecticut

C. Crispin Valves, Berwick, Pennsylvania

D. Creative Sensor Technology, Inc. Rochester, Massachusetts

E. Dura Plastic Products; Beaumont, California

F. Elchen Industries, Inc. (Turf-Tite), Dallas, Texas

G. Goodall Rubber Company, Trenton, New Jersey

H. Harrington Corporation, Lynchburg, Virginia

I. Hunter Industries, San Marcos, California

J. IPEX Inc Beverly, Massachusetts

K. IPS Corporation, Compton, California

L. JM Eagle, Livingston, New Jersey

M. Lasco Industries, Anaheim, California

N. Maclean Highline Access Boxes, Fort Mill, South Carolina

O. Netafim Irrigation Fresno, California

P. Nibco Inc; Elkhart, Indiana

Q. Oldcastle Enclosure Solutions. Auburn, Washington

R. Paige Electric Corp., Union, New Jersey

S. Rainbird, Glendora, California

T. Storm Manufacturing Group, Torrance, California

U. The Toro Company, Riverside, California

V. Watertronics, Hartland Wisconsin

W. Watts Industries, Inc., Andover, Massachusetts

X. 3M Corporation, Electrical Products Division, St. Paul, Minnesota

2.2 MATERIALS

A. All irrigation equipment shall be provided by an authorized distributor.

B. Water Service, Piping and Fittings:

1. See plumbing drawings.

C. Booster Pump System:

1. Booster pump package shall be a prefabricated system, pre-piped, pre-wired and mounted on a steel skid base minimum three inch (3") welded angle iron or channel brackets, hot dipped galvanized, with a minimum 9/16-inch holes at each corner for bolting to concrete with anchors.
2. Field assembled pump systems are not acceptable.
3. Booster pump station shall be a variable speed packaged pump station rated for 60 GPM @ 25 PSIG boost at station discharge; 3600 RPM 480/3/60 FV, horizontal NEMA faced ODP motors, model SCSUL083CDGXLX5XX as manufactured by Munro or approved equal.
4. Pump Station shall be completely skid mounted with locking enclosure with flanged fittings.

D. Controller:

1. The field satellite shall use solid-state control technology and be capable of automatic, semi-automatic and manual operations
2. The field satellite shall be programmable by the on-board keyboard with rotary dial with back-lit LCD.
3. The field satellite shall have built-in diagnostics indicating specific field satellite or field alarms, network settings and testing of field stations
4. The field satellite shall be in a locking stainless steel, powder-coated metal wall mount, stainless steel pedestal or plastic pedestal
5. Access to high voltage and field wire shall be through a front door panel with a keyed lock.

6. The field satellite shall be capable of operating up to 204 stations.
7. The field satellite shall be capable of connecting either a short-range and/or long-range spread spectrum radio for activation of wireless output remote modules.
8. The field satellite shall have a built-in Ethernet port for optional network connectivity.
9. The field satellite shall have a built-in wireless soil moisture sensing port for optional Wireless Soil Moisture Sensing Base Station connection.
10. The field satellite shall have a built-in USB port for field firmware updates and program back-up.
11. The field satellite shall have (2) built-in nine pin serial ports.
12. The field satellite shall have the ability to communicate and control up to a total of 204 field decoders.
13. The field satellite shall operate 24VAC solenoids and be able to activate (8) decoders, and (8) individual valves simultaneously.
14. The field satellite shall have non-volatile memory and self-diagnostics to identify decoder communication and open circuits.
15. The field satellite shall be able to run all decoders on #14 AWG cable up to 5000' in a straight run.
16. The field satellite shall have the ability to read (2) flow inputs connected directly to a data-retrieval terminal connection inside the field satellite cabinet and read, display and record real-time gallons per minute.
17. The field satellite shall have the ability to read an additional (14) flow inputs via optional wireless output remote modules.
18. The field satellite shall have the capability to activate (16) separate master valves via mirrored master valve designation
19. The field satellite shall come standard with a backup battery for real-time clock retention in the event of a power failure. The field satellite shall maintain the time-of-day, day-of-week.
20. The field satellite control module components shall be enclosed in a stainless-steel enclosure.
21. The field satellite shall be Sentinel model SBAWS5U with 5-year warranty as manufactured by The Toro Company.
22. Control system to include hand-held radio remote for on-site access to irrigation program
23. Include at no additional cost to the Owner two (2) instructional meetings with the Owners designated personnel and the Authorized Representative of The Toro Company. These meetings are to occur upon completion of the irrigation system installation.

E. Maintenance Radio:

1. Sentinel hand held remote shall be model SHHR as manufactured by The Toro Company.

F. 2-Wire Path:

1. Communication wire shall be double jacketed #14-2 conductor cable specially designed for use with Toro two-wire control systems, suitable for direct burial. The conductors shall be tin coated, soft drawn, annealed, solid copper conforming to ASTM 33 with 4/64" thick PVC (polyvinyl chloride) insulation, conforming to UL Standard #493 for thermoplastic-insulated style UF (Underground Feeder), rated at 60- degree C. Wire shall be Paige electric model # P7350D or approved equal.
2. Each two-wire path shall have an outer jacket of a different color.

G. Valve Decoders:

1. Line decoder shall be a fully programmable, direct bury decoder that provides an interface between the 2-wire controller and automatic valve. The output of the decoder shall be 24 VAC. Approved valve decoders shall be models SB-DAC-1 and SB-DAC-2 as manufactured by The Toro Company or approved equal.

H. 24V Electrical Equipment:

1. Low voltage (24 VAC) wire-splice kits shall be UL listed Paige DBM or 3M DBR/Y-6 or approved equal.
2. Conduit for Low Voltage Wiring:
   a. Conduit for 2-wire path (low voltage wiring) shall be rigid Schedule 40 non-metallic conduit and fittings conforming to NEMA TC-2, Federal specification WC1O94A and UL 651 specifications. Fittings are manufactured to NEMA TC-3, Federal specification WC1094A and UL514B. Conduit shall be rated for use for underground, encased or exposed applications in accordance with the National Electrical Code (Article 347). Conduit shall be model Plus 40 as manufactured by Carlon or approved equal.
3. Conduit sealant shall be model FST-Mini duct sealant as manufactured by American Polywater Corporation or approved equal.

I. Grounding/Surge Protection:

1. Grounding plates for grounding decoders and 2-Wire circuits shall be 4” x 3’ x 0.0625” (101.6 mm x 2.44 m x 0.9 mm). A 10-foot (3.05 m) continuous length of 10 AWG, green insulated, with extruded yellow stripe, solid bare copper wire is welded to the plate. Grounding plate shall be Paige Electric model #182201IC.
2. Earth grounding wire shall be 6/1 AWG, green insulated, solid bare copper wire. Paige Electric model #150854.
3. All grounding connectors shall be of the Cadweld "One Shot" fuse type – Model GR1161GPLUS (Paige Electric model #1820037P) and Model GT1161GPLUS (Paige Electric model #1820039P). Connections shall be made utilizing the Cadweld Battery Control Unit, Paige Electric model # PLUSCU. Screw type clamps are not acceptable.
4. Earth contact material for each grounding plate shall be two (2) 50lb bags of “PowerSet” for loose soils, Paige Electric model #1820058 or “PowerFill“ for clay soils, Paige Electric model #1820059.
5. Primary 120 VAC power lightning surge arrestor with visible green LED indicator shall be Paige Electric model #250090LED. Furnish and install Paige Electric model #250090BRKT mounting bracket or approved equal
6. Decoder cable fuse device shall be Paige Electric #DCFD.
7. Field Surge Suppression Device shall be model SB-BLA as manufactured by The Toro Company.

J. Sleeves:

1. Sleeves shall be Schedule 40 PVC pipe w/solvent weld coupling as manufactured by Ipex or approved equal.
2. Furnish and install separate sleeve for piping and wire.
3. Furnish and install PVC sleeves two times (2x) the diameter of the pipe or conduit.

K. Pipes and Tubes:

1. All pipe shall be continuously and permanently marked with manufacturer's name or trademark, materials size and schedule or type of pipe, working pressure at 73 degrees F. and National Sanitation Foundation (NSF) approval.
2. The pipe shall contain no recycled compounds except that generated in the manufacturer's own plant from resin of the same specification from the same raw materials.
3. Pipe homogenous throughout and free from visible cracks, holes, foreign materials, blisters, wrinkles, and dents.
4. Main line pipe shall be PVC (polyvinyl chloride) SDR-21 (200 psi) solvent weld piping. Pipe shall be manufactured from virgin rigid PVC vinyl compounds with a Cell Class of 12454 as identified in ASTM D-1784. PVC SDR-21 pipe shall be Iron Pipe Size (IPS) conforming to ASTM D-1785. Pipe shall be manufactured with solvent weld bell end joints. Pipe shall be as manufactured by Cresline Plastic Pipe, CertainTeed, JM Eagle or approved equal.
5. Lateral piping shall be POLY (polyethylene) PE 3408/3608 SIDR-15 - 100 psi Non-NSF pipe conforming to ASTM-2239. Pipe shall be as manufactured by Oil Creek Plastics, Inc., Centenial Plastics or Charter Plastics or approved equal.

L. Pipe Fittings:

1. Fittings used on mainline pipe and valve assemblies shall be Schedule 80 PVC (polyvinyl chloride) fittings shall conform to ASTM D 2467. PVC (polyvinyl chloride). Schedule 80 threaded fittings shall conform to ASTM D 2464. All PVC (POLYVINYL CHLORIDE) nipples shall be Schedule 80 with molded threads. Close nipples to not be allowed. Fittings and nipples shall be as manufactured by Spears Manufacturing or approved equal.
2. Fittings used with lateral pipes in the landscape areas shall be PVC insert fittings as manufactured by Spears or approved equal. Clamps shall be stainless steel, worm gear hose clamps with stainless steel screws, series 6800 as manufactured by Ideal or stainless steel "ear" type clamps, series 210 as manufactured by Oetiker.

M. Dielectric Fittings:

1. ASTM F 441/F 441M, Schedule 80, CPVC threaded pipe nipples, 4-inch length.

N. Spray Heads:

1. 6" pop-up spray head shall be model MPR40-6-CV as manufactured by Hunter Industries or approved equal.

2. Plastic nozzles shall be MP Rotator series 1000, 2000 and 3000 as manufactured by Hunter Industries or approved equal.

O. Swing Joints:

1. Swing joint used for pop-up spray heads shall be model SJ-512 as manufactured by Hunter Industries or approved equal.
2. Swing joint used for quick coupling valves shall be PVC (polyvinyl chloride) snap-loc with brass MIPT, model G13S-212 as manufactured by Lasco Fittings, Inc. or approved equal.

P. Drip Irrigation Equipment:

1. Dripper Line: Drip irrigation piping (for plant material) shall be Techline Tubing, model TLCV6-12 as manufactured by Netafim Industries or approved equal.
2. Dripper Line: Drip irrigation piping (for trees) shall be Techline Tubing, model TLCV9-12 as manufactured by Netafim Industries or approved equal.
3. Male Adaptor, model TL075MA, as manufactured by Netafim.
4. Combination Tee, model TL075FTEE, s manufactured by Netafim or approved equal.
5. Soil Staple, model TLS6. As manufactured by Netafim or approved equal..
6. One-inch (1") drip control zone kit shall be model, ICZ-101-25 as manufactured by Hunter Industries or approved equal.
7. Line flushing valve shall be Adapter model H3412P 3/4" MPT x 3/4" MGHT, Shut Off Valve model G3434V 3/4" FGHT x 3/4" MGHT and Cap model N 3400P 3/4" FGHT as manufactured by GreenLeaf Inc or approved equal.
8. Tree drip identifier shall be 1/4" Tubing Stake, 1/4" Distribution Tubing, model XQ , 1/4" Self-Piercing Barbed Connector, model SPB and 1 GPH barbed emitter, model XB-10PC as manufactured by Rainbird or approved equal.
9. Insert fittings for use with Techline tubing, as manufactured by Netafim Irrigation or approved equal.
10. Operation/Pressure Indicator stakes shall be model OPERIND, as manufactured by Rainbird Irrigation or approved equal.

Q. Valves:

1. Valves on the pressure side of the automatic valves shall be SCH 80 PVC body manual ball valves gray in color (150 p.s.i. rated) with NPT connections. Size shall be the same as the automatic valve it serves. Valves shall be series #491 ball valve as manufactured by Lasco or approved equal.
2. Bronze gate valves with NPT 2 ½" and smaller shall be model T-113 or T-113K as manufactured by NIBCO or model 102T or 102T-K as manufactured by Apollo or approved equal.
3. Quick-coupling valves shall be one-piece bronze bodies, double slot, 1" IPS with lock top. Supply four (4) keys. Valves shall be model #5RC as manufactured by Rainbird or approved equal. Coupler shall be model #55K-1 as manufactured by Rainbird; supply four (4) couplers. Brass hose swivels shall be 1" X 3/4" model #SH-1 as manufactured by Rainbird: supply four (4) swivels.

4. Automatic valves shall be plastic globe type, normally closed, electric solenoid-actuated and diaphragm-operated with flow stem. Solenoid shall be epoxy impregnated 24 VAC-60 Hz (18 to 30 VAC), 5.8 VA and shall be suitable for direct burial. Valves shall be capable of manual operation by means of an internal bleed. Sizes shall be as noted on the drawings. Valves shall be ICV series as manufactured by Hunter Industries or approved equal.
5. Master valve shall be brass globe type, normally open, electric solenoid-actuated and diaphragm- operated with flow stem. Solenoid shall be epoxy impregnated 24 VAC-60Hz (18 to 30 VAC), 5.8 VA and shall be suitable for direct burial. Valves shall be capable of manual operation by means of an internal bleed. Valve shall be series 3100 as manufactured by Storm Manufacturing Group, or approved equal.
6. Air release valves shall be Combination Air Release Valve, having a 1" NPT inlet and a 1" Air & Vacuum outlet with a 3/32" Pressure Air Release orifice, for operating pressures of 0-150 psi. The valve shall be Cast Iron Body, Stainless Steel Internals, Stainless Steel Float, and Buna-N seating material. The valve to exhaust large quantities of air on system starts up and allows air to re-enter the pipeline when the line is being emptied or drained. The valve to also vent air that accumulates while the system is under pressure. Valves shall be model IC10 as manufactured by Crispin or approved equal.
7. Identification tags shall be manufactured from polyurethane Behr Desopan, incorporating an integral attachment neck and reinforced attachment hole and will be capable of withstanding 180LBS. pull out resistance. The identification tag shall be approximately 2.25” X 2.75” in size. All lettering shall be hot-stamped in black and capable of withstanding outdoor usage. The standard alpha-numeric designations shall incorporate alpha-numeric lettering 1-1/8” in height. The tag color shall be YELLOW. The marking tag will be single sided stamped with the following identification sequence A1, A2, A3 etc. to match the controller number. The marking tag shall be model ID-STD-Y1. The valve identification tags shall be manufactured by T. Christy Enterprises or approved equal.

R. Valve Boxes:

1. Valve boxes for drip irrigation flush valves shall be 6" diameter valve box. Valve boxes shall be model #708 with snap down black cover as manufactured by Oldcastle Enclosure Solutions or approved equal.
2. Valve boxes for quick coupling valves shall be 10" diameter. Valve boxes shall be model #910 with bolt down option black T-cover as manufactured by Oldcastle Enclosure Solutions or approved equal.
3. Valve boxes used with automatic valve assemblies (other than drip irrigation) shall be 12" x 17" x 12" deep valve boxes: black in color. Valve boxes shall be model #1419-12" with black T- cover and L-Bolt down option as manufactured by Oldcastle Enclosure Solutions.
4. Valve boxes used with drip irrigation valve assemblies shall be 15” x 21" x 12" deep valve boxes: Black in color. Valve boxes shall be model #1220-12" with L-Bolt down option BLACK T-cover as manufactured by Oldcastle Enclosure Solutions or approved equal.
5. Valve box extensions, as required, shall be of the same size, color and manufacturer as the box on which it is used.

S. Rain Sensor and Conduit:

1. Rain sensor shall be wired rain sensor, model TRS with conduit mount as manufactured by The Toro Company or approved equal.
2. Allow for the installation of 100' of ½" rigid conduit to install rain sensor.

T. Hydrometer

2" hydrometer shall be model LHM2TG0053-ME (Normally Open Configuration) with 100' of cable, Photo Diode (PDH) Register - high frequency pulse (open collector) for functions such as rate of flow and recording total volume.as manufactured by Netafim or approved equal.

U. Moisture Sensors/Controls:

1. Moisture sensor shall be Turf Guard model TG-S2-R with Toro Pro receiver model TPS-RX and External mount repeater model TG-R-EXT as manufactured by The Toro Company or approved equal.

2.3 ACCESSORY MATERIALS

A. Pressure Gauges:

1. Pressure gauges shall be stainless steel (0-100 PSI) 2 "diameter x 1/4" NPT, model 20-W-1005S-H-02-L- 100# steel as manufactured by Ashcroft or approved equal.

B. Drainage Stone for Valve Boxes:

1. One-half inch (½") to three-quarter (3/4") size, washed, graded crushed stone.

C. Fabric:

1. Soil separation fabric at valve boxes shall be Mirafi 140N, non-woven, spun bound, polyester geotextile fabric or approved equal.

D. Warning Tape:

1. Three-inch (3") 5mil Non-Detectable Blue Marking tape with the words "Caution Buried Irrigation Line Below" as manufactured by T. Christy Enterprises or approved equal.

E. Brick:

1. Common, grade SW, per ASTM C42.

F. Reinforcing Rods:

1. Steel, galvanized. #4 x 30"

G. Bedding for Piping Material:

1. Coarse, mason sand conforming to ASTM C-33.

H. Trench Backfill in Lawn and Planting Areas:

1. Conform to requirements of soil mixtures as specified in Section 329100.

I. Suitable excavated materials removed to accommodate the irrigation system work are shall be used as fill materials provided it conforms to the requirements of fill as noted above.

1. Soils on site are to consist of sub grade materials and planting soil mix. Materials placed at different levels and thicknesses depending upon planting types and locations. Separation of materials shall be maintained.

J. PVC Cement:

1. PVC (polyvinyl chloride) cement shall be Low-VOC.
2. PVC cement for Schedule 40 PVC shall be Weld-on #721 or Weld-On #725 Wet “R” Dry as manufactured by IPS Corporation.
3. PVC cement for Schedule 80 pipes and nipples shall be Weld-on #711 as manufactured by IPS Corporation.
4. PVC primer shall be Weld-on #P-70 (purple).

K. ADDITIONAL EQUIPMENT:

1. The following materials shall be left with the Owner prior to completion of the work shall be utilized in repair and maintenance.
   a. 60' - 2" PVC pipe - 200 psi solvent weld.
   b. 20' – 1 1/2" PVC pipe - 200 psi solvent weld.
   c. 500’ – 1” poly pipe
   d. 20 – 1” insert tees
   e. 20 - 1” insert elbows
   f. 20 – 1” insert tees (IxIxFNPT)
   g. 25 – 1” couplings
   h. 500’ – 1 1/4” poly pipe
   i. 20 – 1 1/4” insert tees
   j. 20 – 1 1/4” insert elbows
   k. 20 – 1 1/4” insert tees (IxIxFNPT)
   l. 20 – 1 1/4” x 1” reducer (IxI)
   m. 300’ 1 1/2” poly pipe
   n. 20 – 1 1/2” insert tees
   o. 20 – 1 1/2” insert elbows
   p. 20 – 1 1/2” insert tees (IxIxFNPT)
   q. 20 – 1 1/2” x 1 1/4” reducer
   r. 20 – 1 1/2” x 1” reducer
   s. 1000’ - TLCV6-12 Brown (.6gph @ 12” spacing) drip line
   t. 50 – Drip insert couplings
   u. 20 – Drip 1/2” male adapters
   v. 50 – Drip insert elbows
   w. 50 – Drip insert tees
   x. 50 – Drip shut-off valves

y. 500 – 6" soil staple
z. 18 – 4" pop-up rotors spray heads
aa. 6 - 1" valve assemblies (ball valve, automatic valve, valve box, fittings etc.)
bb. 6 - 1" drip irrigation valve assemblies (ball valve, automatic valve, filter, regulator, valve box, fittings etc.)
cc. 6 - 6" valve box with black cover
dd. 6 - Standard valve box with black "T" cover

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine the areas and conditions where irrigation is to be installed. Notify the Owner's Representative, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to the Owner's Representative.

3.2 PREPARATION AND LAYOUT

A. The location of sprinkler heads, valves and piping, noted on the Contract Drawings, are generally diagrammatic to the extent that swing joints, off sets and all pipe fittings are not shown; exact locations of piping, sprinkler heads, valves, and other components shall be approved by the Owner's Representative in the field prior to the time of installation.

B. Pipe routing is shall be in accordance with the Contract Drawings, however, the Owner's Representative to have the right to change the route and/or depth of the pipe from that shown in cases where rock or other obstacles may interfere with the intended path or depth of the piping.

C. Stake all pipe and wire routes, sprinkler, valve and controller locations in accordance with the locations noted on the Contract Drawings; furnish and install staking prior to the commencement of Work in any area of installation.

D. Notify the Owner Representative a minimum of five (5) days prior to the scheduled staking.

E. Coordinate the irrigation work with planting and lawn work, to have irrigation available at time of the turf and plant material establishment.

F. Coordinate irrigation work with plumbing, electrical and sleeve work.

G. Final system layout shall be acceptable to the Owner's Representative.

3.3 CUTTING AND PATCHING

A. Methods and materials used for cutting and patching shall be acceptable to the Architect.

B. Cut through concrete and masonry with core drills. Jack hammers not permitted.

C. Seal all openings in exterior walls water tight with link seals.

3.4 CONDUIT:

A. Install all electrical conduits for 24V control wiring.

B. Backfill and thoroughly compact around all conduit.

C. All conduits to have a minimum cover of eighteen inches (18").

3.5 SLEEVES:

A. Coordinate and install sleeves for all piping and conduit/24V control wire passing through concrete curbing, concrete or masonry walls and floors while the same are under construction.

B. Install ends of sleeves six to twelve-inches (6”-12") beyond the edge of all pavement and curbs.

C. Backfill and thoroughly compact around all sleeves.

D. All sleeve locations shall be staked or permanently marked.

3.6 INSTALLATION

A. Plumbing:

1. See plumbing drawings for point(s) of connection.

B. Winterization Assembly:

1. Install winterization assemblies as detailed on the Contract Drawings.

C. Main Line Isolation Valve(s):

1. Install main line Isolation valves as detailed on the Contract Drawings.

D. Booster Pump Package:

1. The Irrigation Contractor shall be responsible for providing all materials, equipment and labor necessary to install all items associated with the packaged pump station.
2. Setting of the pump station shall be supervised by the pump station manufacturer's representative. The crane shall be supplied by the contractor.
3. When discharge piping, electrical connections and electrical inspection have been completed and the irrigation system can deliver 100% of the total system demand, the pump station manufacturer shall be contacted for startup. A minimum one-week notice shall be given to the manufacturer prior to start-up date. During start up the complete pumping system shall be given a running test of normal start and stop and fully loaded operating conditions. During this test, the pump to demonstrate its ability to operate without undue vibration or overheating and to demonstrate without question its general fitness for service. All defects shall be corrected, and adjustments made.
4. After the startup has been completed, but before leaving the job site, a training session will be given.
5. The training session will be given to the Owner and the Owner's representative to familiarize them with the pumping system operation, maintenance and adjustments.

E. Booster Pump Power Supply:

1. Booster pump power supply shall be supplied from a dedicated circuit and brought to the booster pump location (installed as work of other section(s) and separate contract).
2. The Contractor shall be responsible for all wiring and associated equipment to connect power supply to the booster pump.
3. All wiring is shall be in accordance with all state and local codes.

F. Master Valve:

1. Install master valve on mainline and connect to the master valve terminal of the irrigation controller. See detail drawings.

G. Excavating and Backfilling:

1. Provide all excavation, backfilling and compaction required for the proper installation of all piping.
2. All main line piping is shall be trenched by hand or machine. Pipe pulling method is not shall be used.
3. Minimum trench width shall be three inches (3") on each side of the main line pipe and one and one-half inches (1½") on each side of lateral pipe to allow for proper compaction of backfill material.
4. Prior to excavation of trenches carefully lift existing sod at the location of all piping, connections, sprinklers, quick couplers and valve boxes. After components are installed, cut the sod to fit and replace it.
5. Excavate to the depths required to allow a four-inch (4") depth of sand bedding material for piping when unsuitable bearing materials are encountered.
6. Minimum depth of cover:
   a. Main line piping: - eighteen inches (18") of cover.
   b. Lateral piping: - fourteen inches (12") of cover.
   c. Control wire: - eighteen inches (18") of cover.
7. The trench bottom should be smooth and free of rocks greater than one and one-half inches (1 1/2") diameter, large dirt clods or any frozen material. Excavation at bells (bell holes) should be provided to allow pipe shall be fully supported along its length.
8. Bed pipe to provide uniform longitudinal support under the pipe to prevent low spots.
9. Backfill material shall be free from rock, large stones, or other unsuitable substances to prevent damage to pipe during backfilling operations. Refer to section 312000 "Earthmoving".
10. Install a four-inch (4") depth of sand bedding material where pipe settles on rock, shale or where the pipe cannot be fully supported along its entire length.
11. Initial four inches (4") of backfill shall be properly compacted continuously above the bedding and around the pipe as well as between the pipe and undisturbed trench walls. Initial backfill is shall be done by hand.
12. Backfill trenches to match adjacent grade elevations with approved trench backfill material. Place and compact fill in layers not greater than six-inch (6") depth to ninety-five percent (95%) maximum dry density at optimum moisture content under all paving areas and eighty five percent (85%) maximum under lawn and planting areas.

13. Install warning tape directly above pressure piping, 12 inches (12") below finished grades, except 6 inches (6") below subgrade under pavement and slabs.
14. Throughout the duration of the Contract refill any trenches that may have settled.
15. Excavate trenches; install piping and backfill during the same working day. Do not leave open trenches or partially filled trenches overnight.

H. Pipe Laying:

1. Inspect the pipe for defects before installation. Defective, damaged or unsound pipe will be rejected.
2. Install PVC piping in dry weather when temperature is above 40 degrees Fahrenheit. Allow joints to cure at least twenty-four (24) hours at temperatures above 40 dig F before testing.
3. Make solvent weld joints in strict accordance with ASTM D2855 and the manufacturers printed instructions. Color primer shall be used.
4. Allow joints to set at least twenty-four (24) hours before pressure is applied to the system.
5. Maintain pipe interiors free of dirt and debris. Close open ends of pipe by acceptable methods when pipe installation is not in progress.
6. Install all wall penetrations through planter walls where required to make plumbing and/or electrical wiring connections. All penetrations shall be watertight.
7. Insert type fittings on laterals one and one quarter inches (1¼") and larger shall be double clamped.

I. Clearances:

1. Minimum horizontal clearances between pipes: four-inches (4") for two-inch (2") pipe and less; twelve-inches (12") for two-inch (2") pipe and more.
2. Minimum vertical clearances between pipes: Two-inches (2").

J. Dielectric Fittings:

1. Where pipes of dissimilar metal are joined, make connection with dielectric fitting.
2. Provide dielectric fittings between copper and ferrous metal piping and materials in accordance with Section 220500.

K. Sprinklers, Spray Heads, Quick Coupling Valves, Fittings, and Accessories:

1. Sprinklers and Quick Coupling Valves shall be connected to the piping system by installing factory assembled PVC swing joints. Swing joint size shall be the same size as that of the IPS inlet of the sprinkler, or as otherwise shown. The long nipple of the swing joint shall be set between 20 and 60 degrees from the horizontal. Install quick coupling valve in six-inch (6") valve box and set within one inch (1") of the bottom of the box cover. See detail drawings.
2. All sprinklers and quick-coupling valves shall be set flush to grade.
3. Install fittings, valves, sprinkler heads, risers and accessories in accordance with manufacturer's printed instructions, except as otherwise indicted or as detailed on the Contract Drawings.
4. Install all pop-up spray heads with flex pipe swing joints as shown on the drawings.

L. Valve Boxes and Valve Assemblies:

1. All valve box locations shall be staked prior to installation and approved by the Landscape Architect prior to starting construction.
2. Valve boxes shall be installed as shown in the Contract Drawings with adequate space for operation, service and removal of the equipment in the box.
3. A minimum of six-inches (6") of one half-inch (½") gravel shall be placed under, in and around each valve box for both drainage and leveling the box. Gravel installed inside valve box is not acceptable.
4. Where necessary to properly fit the pipe, boxes shall be neatly cut to provide a firm fit to the pipe. Do not allow soil or gravel to enter the box through these cut-outs.
5. Install filter fabric under gravel and around valve box as detailed on the Contract Drawings. Duct tape fabric to valve box.
6. Do not group more than two (2) irrigation valve boxes together in one location. When grouping two valve boxes together allow twelve-inches (12") of space between boxes.
7. All boxes shall be mounted plumb and flush to grade - extensions shall be used as required for proper installation and setting. Surrounding grade shall be established with the use of a leveling board not less than four feet (4') in length. Box shall be set to the underside of this board.
8. Do not install more than two (2) valve assemblies per valve access box.
9. Install all valve boxes in planters in a location approved by the Owner's representative.
10. Seal threaded connections on pressure side of control valves with Teflon tape.
11. Automatic valve assemblies shall be as per Contract Drawings using standard brass nipples, Heavy Duty brass fittings and PVC Schedule 80 nipples.
12. Ball valves shall be installed in the "closed" position and to not be opened until the main line piping system has been pressurized and flushing has been completed through the blow-out valve assembles.
13. Assemble threaded PVC to PVC, or brass to PVC, with the use of two (2) wraps of Teflon tape.
14. Assemble threaded connections so that thread sealant or Teflon tape does not enter the pipe or fitting.
15. Automatic valve manual bleeds to not be used for continual operation. For extended use without 24VAC, the manual bleed shall be left in the open position and the flow to the zone controlled (on-off) by the manual ball valve.
16. Install valve identification tag on each valve assembly as shown on the drawings.

M. Drip Irrigation:

1. Install drip irrigation as detailed on the Contract Drawings. Do not install dripper line in a serpentine fashion.
2. Install dripper line two-inches (2") below finish grade (not below mulch) in shrub beds.
3. Install low flow pressure regulator on irrigation zones under 5 gpm.
4. Install high flow pressure regulator on irrigation zones over 5 gpm.
5. Connect dripper line to header and exhaust manifold as detailed.
6. Install flush valve on exhaust manifold as detailed.

7. Staples shall be spaced a maximum of five feet (5') and at every fitting to hold the dripper line in place.
8. Install indicator stake at all drip irrigation zones in a location approved by the Architect.
9. All drip irrigation zones shall be tested, in the presence of the Landscape Architect, for proper coverage prior to installing mulch. Provide three (3) days' notice prior to testing.

N. Controller:

1. Controller shall be wall mounted in the mechanical room in a location approved by the Architect. Install the controller in accordance with manufacturer's printed instructions and connected to form an operational system. Diagrammatic location shown on the drawings.
2. Controller shall be connected to its individual ground to obtain 15 OHM readings, or less.
3. Install controller in accordance with all state and local codes.

O. Controller Power Supply:

1. Power to the controller shall be supplied from a dedicated circuit and brought to the controller location (Installed as part of work of other section(s) and contract).
2. Controller to have one circuit with full time 120 VAC GFCI outlet and 120 VAC to the controller with on/off switch.
3. Install lightning surge arrestor with mounting bracket on the 120 VAC power supply to the controller.
4. The irrigation Contractor shall be responsible for all wiring and associated equipment to connect power supply from dedicated circuit to the controller.
5. The controller shall be grounded to the building ground by connecting the ground lug of the controller directly to the building ground using a bare #6 AWG wire as per the National Electric Code (NEC). Refer to section Grounding/Surge Protection:
6. The controller shall be grounded to the building ground by connecting the ground lug of the controller directly to the building ground using a bare #6 AWG wire as per the National Electric Code (NEC).
7. All wiring is shall be done by a licensed professional in accordance with all State and local codes. Refer to and comply with Electrical work requirements specified in Division 26.

P. 2-Wire Path:

1. Install two-wire path(s) in conduit without any damage including nicks, cuts or abrasions to the outer jacket. Conduit should be laid in the same trench adjacent to the irrigation mainline. Install wire with slack to allow of thermal expansion and contraction.
2. Seal all wire conduits with duct sealant.
3. Install two-wire path with a thirty-six (36") slack loop at each remote-control valve box to allow raising the valve bonnet to the surface without disconnecting the wires when repair is required.
4. Install an expansion curl on each wire conductor at all wire connections of all valves and splices. Expansion curls shall be formed by wrapping each wire conductor six (6) turns of wire around a one-inch (1") diameter pipe, then withdrawing pipe.
5. Connect each remote-control value to decoder and connect to two-wire path. All connections to be done using a waterproof connector.

6. Make all wire splices by baring a three-quarters inch (3/4") of copper conductor, twisting the leads together. Wire nuts are shall be used over the connection. Make wire splice completely waterproof using approved connector kits in strict accordance with the manufacturer's printed instructions and local codes.

Q. Sleeves

1. Sleeves to extend two (2) feet beyond pavement, road or culvert and shall be plugged with duct seal.

R. Waterproof Connectors:

1. All connectors shall be installed per manufacturer's written specifications.
2. Verify that no loose, unshielded wiring shall touch the ground, water, or other copper conductor causing a leakage of current to the ground or a short circuit across wires.
3. Score the outer jacket of the wire 12 inches from each end without scoring conductor insulation.
4. The installer shall strip 1 inch (2.54 cm) of insulation from conductor without scoring the conductor.
5. Install an expansion curl on each wire conductor at all wire connections of all valves and splices.
6. Expansion curls shall be formed by wrapping each wire conductor six (6) turns of wire around a one-inch (1") diameter pipe, then withdrawing pipe.
7. Installer shall bundle like conductors, twist them together, and trim off ½ inch of conductors.
8. Installer shall twist a wire connector in a clockwise direction, and then place a moisture-proof DBR/Y-6 tube over the top making sure connector is fully seated at the top of the tube. Snap the cover completely closed.
9. Installer shall ensure that all connections are mounted in a vertical orientation to eliminate standing water inside the connector.
10. All splices shall be made inside a valve box.

S. Valve Decoders:

1. The valve decoder shall be connected to each automatic valve and two-wire path in accordance with manufacturer's printed instructions.
2. The valve decoders shall be attached to the valve wire and 2-wire path using waterproof connector.
3. The valve decoders shall not share valve wires or common wires between valve decoders.
4. The maximum wire run between the valve decoder and the solenoid shall be 150 feet (150').
5. The contractor is shall be responsible for accurately recording on the as-built drawings, as each decoder is being installed, the address number of the decoder at that location. It is also necessary that it be indicated which remote controls valves controlled by each specified decoder.

T. Sensor Decoder:

1. Install sensor decoder on flow sensor and connect to the 2-wire path in accordance with manufacturer's printed instructions.

U. Grounding/Surge Protection:

1. All surge protection and grounding shall be installed in strict compliance with the manufacturer's printed instructions and in accordance with local, State and Federal codes and requirements.
2. The ground grid components shall be installed with the dimensional relationships shown on the details.
3. Wires, cables, and electronic equipment shall be installed outside “The sphere of Influence” of the grounding electrodes.
4. Install grounding plate at a minimum distance of eight feet (8’) at a right angle from the two-wire path.
5. The ground plates shall be installed to a minimum depth of thirty inches (30”), or below the frost line if it is lower than 30”.
6. Two 50-pound bags of “Earth Contact Material” shall be spread so that it surrounds and the copper plate evenly along its length within a six inch (6”) wide trench. Use one bag only for the installation of 3-foot ground plates. Salts, fertilizers, bentonite clay, cement, coke, carbon, and other chemicals are not to be used to improve soil conductivity because these materials are corrosive and will cause the copper electrodes to erode and become less effective with time. It is important that the Earth Contact material completely surrounds the ground plate and 6” (152 mm) of the insulation of the green wire, as shown in the detail, to minimize corrosion.
7. Connect 6/1 AWG earth grounding, green insulated, solid bare copper wire to the grounding plate with Cadweld connector. Screw type clamps are not acceptable.
8. Install all grounding circuit components in straight lines and simple geometry. No sharp bends or turns shall be allowed. When necessary to bend wires, make sweeping turns as detailed. All grounding and bonding wires of electronic equipment shall be fed through a dedicated one and one-half inch (1 1/2”) plastic sweep ell. “Sweep bends” shall follow the guidelines shown here. The 6/1 AWG bare copper wires shall be installed in as straight a line as possible, and if it is necessary to make a turn or a bend it shall be done in a sweeping curve with a minimum radius of eight inches (8”) and a minimum included angle of 90°. This type of installation, which utilizes a multi-position bus bar, allows for rapid connecting and disconnecting of desired wires to periodically take earth resistance readings of the individual grounding electrodes.
9. The earth-to-ground resistance shall be measured at the time of installation using a “Megger“, or other similar instrument, and the reading shall be no more than 10 Ohms. If the resistance is more than 10 ohms, additional ground plates and “Earth Contact Material” shall be installed using the 100-2002 (www.asic.org, “Design Guides”.) It is required that the soil surrounding copper electrodes, within the Sphere of Influence, be kept at a minimum moisture level of 15% (by weight) always as dry soil does not conduct electricity. ALL GROUNDING COMPONENTS SHALL BE CONNECTED TO THE EQUIPMENT BEFORE ANY OTHER CONNECTION IS MADE.

10. Surge suppression device shall be installed at every 500' of wire cable, located at the nearest line decoder and every line termination point. Install first surge suppression device within 100 feet of central control system. The surge suppression device ground wires shall be connected to a single grounding plate as detailed.
11. Measurement and Testing of Resistance
12. Earth resistance shall be measured and recorded after the installation of the grounding plates, and every three months thereafter for the first year. This data should be used to determine the most critical times of the year, based on soil moisture content and lightning frequency. The resistance shall be tested and recorded every six months thereafter, at these most critical dates, to ensure that proper contact with the soil is maintained always. Resistance measurement shall be made using commercially available instruments, in accordance with the latest requirements of NFPA 780. Follow instrument manufacturer's specific operating instructions.
13. Readings of 5 to 10 ohms are desirable. The effectiveness of the circuit is a function of its impedance, which cannot be measured in the field in a practical manner. Sound practices and proper installation are more important in assuring quality results than this reading.
14. The minimum requirements of the NEC shall be met, which are: A resistance reading of no more than 25 ohms, or a two-electrode ground grid
15. In installations with multiple equipment locations, the resistance readings of like grounding circuits should be compared for consistency. Large variances in readings point to different soil conditions, or soils with varying degrees of moisture content, or improper installation.
16. Record OHM (resistance) readings, date and location of all grounding locations on "Construction Record Drawings".

V. Rain Sensor:

1. Install rain sensor in a location approved by the Architect. Install all wire inside rigid metallic conduit.
2. Furnish and install galvanized metal conduit wherever wire is exposed.
3. Conduit shall not be attached to the outer face of any building wall without the approval of the Architect.

W. Hydrometer:

1. Prior to installation of the meter, the pipeline should be thoroughly flushed.
2. Install the hydrometer with a length of straight pipe before and after the flow sensor.
3. Do not install valves that will cause a restriction directly upstream or downstream of the hydrometer.
4. The hydrometer shall be connected to the controller in accordance with the manufacturer's written specifications.

X. Moisture Sensors:

1. Install moisture sensors in a location approved by the Landscape Architect.
2. The maximum wire run between soil moisture sensor and the controller shall be the same as stated in the two-wire specifications.

3. The soil moisture sensor shall be connected to the two-wire path.
4. The soil moisture sensor shall be buried in an area of average water distribution between two sprinkler heads and placed from the centerline that the sprinklers create.
5. The soil moisture sensor shall be installed in a location representative of the zones that the sensor is controlling.
6. The soil moisture sensor shall be installed two – three inches (2”-3”) below the plant or in the top 1/3 of the root zone.
7. The soil moisture sensor shall be buried with no air pockets around the sensor.
8. The soil moisture sensor shall be marked to avoid damage during aeration.
9. All splices shall be made inside the valve box with a direct burial waterproof connection.

3.7 PRESSURE TESTING

A. Use Hydrostatic pressure test only. Pressure test using air or compressed gas is not acceptable.

B. Approximate number of gallons of water required to fill one hundred feet (100’ for test of mainline pipe are noted below:

2”	20 Gallons

C. Testing should be performed at the lowest elevation along the pipe shall be tested.

D. Solvent weld piping - Cap all risers, bleed air from pipes and perform pressure test upon completion of the main line pipe installation. All main line piping shall be tested at 150 PSI for four (4) hours. During this time, a visual inspection will be made by the Owner’s Representative for leaks.

E. A pressure reading shall be taken after four (4) hours with an allowable pressure drop of 5 psi.

F. When main line pipe is installed in phases and/or segments pressure test each main line segment and/or phase. Pressure test should be performed on sections not longer than 2,500 feet.

G. All leaks shall be repaired by removing the section of pipe at the joint and installing a new section using coupling, mechanical joint or union. After repair, the piping shall be retested until approved by the Owner’s Representative.

H. All lateral piping shall be tested under working conditions and visual inspection made for leaks.

I. Notify the Irrigation Design Consultant and Owner's Representative seventy-two (72) hours prior to testing.

3.8 FLUSHING AND ADJUSTMENT

A. After piping is installed and before sprinklers and spray heads are installed, open control valves and flush out the system with full head of water until pipe is free of all foreign materials.

B. Adjustment of the sprinkler equipment will be done upon completion of the installation, to provide optimum performance and to assure that all sprinklers are properly set to grade.

C. Adjust all automatic valves by means of the flow control stem and verify sprinkler discharge pressure on each lateral zone, with a pitot tube and gauge, to obtain optimum sprinkler performance in accordance with manufacturer's printed instructions.

D. After the irrigation system, has been installed, test the entire system and demonstrate that the entire system meets coverage requirements and automatic controls function properly.

3.9 FINAL REVIEW AND ACCEPTANCE

A. When all irrigation work is completed and the "Construction Record Drawing" has been submitted a final review of the irrigation system will be made by the Owner's Representative, upon written notice requesting such a review. Submit the written notice at least ten (10) days prior to the anticipated review.

B. The Contractor shall have sufficient personnel and either remote control radio, cell phone or other two-way communication device to properly perform final review.

C. Upon final review and acceptance, the Owner's Representative will notify the Owner, in writing, as to final acceptance of the irrigation system. Date of the final acceptance by the Owner is the date beginning the Warranty period.

D. Any irrigation equipment item required under this Contract that is malfunctioning or in need of repair shall be removed and replaced. All replacements shall be of equipment and/or material originally specified.

E. The cost of replacement shall be borne by the Entity performing Work of this Section.

F. Upon acceptance of the entire irrigation system, instruct the Owner's designated personnel in the complete operation of the entire irrigation system.

3.10 CLEAN UP AND PROTECTION

A. Upon completion of all work of this Section, remove and legally dispose of all excess materials resulting from the work operations of this Section.

B. Accumulation of materials for disposal is not permitted. Disposal shall be made as fast as materials accumulate.

C. Adequately protect all paving, surfacing, lawn areas and plant material and restore to original condition all damages resulting from work operations of this Section.

END OF SECTION 328400

SECTION 32 91 00

PLANTING SOIL

PART 1 — GENERAL

1.1 SUMMARY

A. The scope of work includes all labor, materials, tools, supplies, equipment, facilities, transportation and services necessary for, and incidental to performing all operations in connection with furnishing, delivery, and installation of Planting Soil and/or the modification of existing site soil for use as Planting Soil, complete as shown on the drawings and as specified herein.

B. The scope of work in this section includes, but is not limited to, the following:
1. Modify existing stockpiled native soil.
   a. Modify stockpiled native soil per soil test results.
   b. Blend stockpiled native soil and amendments into Planting Soil Mixes.
   c. Install modified soil for use as Planting Soil.
2. Locate, purchase, deliver and install Imported Topsoil and soil amendments.
3. Fine grade Planting Soil.
4. Install Compost into Planting Soil.
5. Clean up and disposal of all excess and surplus material.

C. Where possible, existing soils shall be prepared to serve at a minimum as either fill soil or horticultural subsoils. If not present in sufficient quantity, fill soil or horticultural subsoil will be imported from an acceptable soil source.

1.2 RELATED WORK

A. Examine Contract Documents for requirements that affect work of this Section. Other Specification Sections that directly relate to work of this Section include, but are not limited to:

1. Section 31 14 13, SOIL STRIPPING AND STOCKPILING.
2. Section 31 20 00, EARTH MOVING; Establishment of subgrade elevation; grading.
3. Section 32 84 00, PLANTING IRRIGATION.
4. Section 32 92 19, SEEDING AND SODDING.
5. Section 32 93 00, TREES, PLANTS AND GROUNDCOVERS.

E. Up by Roots: healthy soils and trees in the built environment. 2008. J. Urban. International Society of Arboriculture, Champaign, IL.

1.4 DEFINITIONS

A. Amendment: material added to Topsoil to produce Planting Soil Mixes, or to adjust chemical and biological properties of stockpiled native soil. Amendments are general soil amendments, fertilizers, biological, and pH amendments.

B. Compacted soil: soil where the density of the soil is greater than the threshold for root limiting, and further defined in this specification.

C. Compost: well decomposed stable organic material as defined by the US Composting Council and further defined in this specification.

D. Drainage: The rate at which soil water moves through the soil transitioning the soil from saturated condition to field capacity. Most often expressed as saturated hydraulic conductivity (Ksat; units are inches per hour).

E. Existing Soil: Mineral soil existing at the locations of proposed planting after the majority of the construction within and around the planting site is completed and just prior to the start of work to prepare the planting area for soil modification and/or planting, and further defined in this specification.

F. Fine grading: The final grading of the soil to achieve exact contours and positive drainage, often accomplished by hand rakes or drag rakes other suitable devices, and further defined in this specification, and further defined in this specification.

G. Finished grade: surface or elevation of Planting Soil after final grading and 12 months of settlement of the soil, and further defined in this specification.

H. Installed soil: Planting Soil and existing site soil that is spread and or graded to form a planting soil, and further defined in this specification.

I. Ped: a clump or clod of soil held together by a combination of clay, organic matter, and fungal hyphae, retaining the original structure of the harvested soil.

J. Scarify: Loosening and roughening the surface of soil and sub soil prior to adding additional soil on top, and further defined in this specification.

K. Soil Horizons: as defined in the USDA National Soil Survey Handbook http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/scientists/?cid=nrcs142p2_054242.

L. Soil Tilling: Loosening the surface of the soil to the depths specified with a **rotary tine tilling machine, roto tiller, (or spade tiller)**, and further defined in this specification**.**

M. Stockpiled Native Topsoil: Soil removed and stockpiled according to the requirements of Section 311413, SOIL STRIPPING AND STOCKPILING.

N. Subgrade: surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill, before placing Planting Soil.

O. Topsoil: naturally produced and harvested soil from the A horizon or upper layers or the soil as further defined in this specification.

1.5 SUBMITTALS

A. Submit all product submittals at least eight weeks prior to the start of soil work.

B. Product Data and Certificates: Submit product data and material certificates indicating that the product meets the requirements of the specification for approval.
   1. Compost: Submit the manufacturer's particle size and pH analyses and certificate of length of composting period to confirm product meets specified requirements.

   2. Coarse Sand: Submit the manufacturer's particle size and pH analyses confirming that product meets specified requirements.
      a. Particle size distribution (percent passing the following sieve sizes):
         3/8 inch (9.5 mm)
         No 4 (4.75 mm)
         No 8 (2.36 mm)
         No 16(1.18 mm)
         No 30 (.60 mm)
         No 50 (.30 mm)
         No 100 (.15 mm)
         No 200 (.075 mm)

C. Samples: Submit representative samples to the Landscape Architect for approval. Label samples to indicate product, specification number, and characteristics. Samples will be reviewed for appearance only. Delivered materials shall closely match samples. Samples of all products shall be submitted eight weeks before the installation of Planting Soil Mixes.
   1. Stockpiled Native Topsoil: Provide a representative sample with testing data that includes recommendations for amendments to adjust the soil biology and chemistry to meet specified requirements as necessary.

   2. Imported Topsoil (if using): Provide a representative sample with testing data that certifies that the product meets specified requirements.

   3. Coarse Sand: Provide a one-pound samples with manufacturer's literature and material certification that the product meets the requirements.

   4. Compost: Provide a one-pound sample with manufacturer's literature and material certification that the product meets the requirements.

D. Test reports: Submit certified test reports from an approved soil-testing laboratory.
   1. Submit Stockpiled Native Topsoil and Topsoil for testing at least 8 weeks before scheduled installation of Planting Soil Mixes. Do not proceed with mixing Planting Soil Mixes until Topsoil, Coarse Sand and Compost have been approved. Submit Base Planting Soil for testing no more than 2 weeks after approval of these materials.

   2. Provide a particle size analysis (% dry weight) and USDA soil texture analysis. Soil testing shall also include USDA gradation (percentage) of gravel, coarse sand, medium sand, and fine sand in addition to silt and clay.

   3. Provide the following other soil properties:
      a. pH and buffer pH.
      b. Percent organic content by oven dried weight.
      c. Nutrient levels by parts per million including: phosphorus, potassium, magnesium, manganese, iron, zinc and calcium. Nutrient test shall include the testing laboratory recommendations for supplemental additions to the soil for optimum growth of the plantings specified.
      d. Soluble salt by electrical conductivity of a 1:2 soil water sample measured in Milliohm per cm.

e. Cation Exchange Capacity (CEC).

4. If tests fail to meet the specifications, obtain other sources of material, retest and resubmit until accepted by the Owner's Representative. All soil testing will be at the expense of the Contractor.

1.6 PRE-CONSTRUCTION CONFERENCE

A. Schedule a pre-construction meeting with the Owner's Representative at least seven (7) days before beginning work to review any questions the Contractor may have regarding the work, administrative procedures during construction and project work schedule.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape contractor experienced with soil preparation for extensive landscapes with the capabilities/equipment for preparing site soils as directed in this specification. Use adequate numbers of skilled workers who are trained in the necessary crafts and who are completely familiar with the specified requirements and methods needed for the proper performance of the work of this Section:
1. Contractor shall submit written documentation of at least five years of contracting and landscape construction experience completing projects of similar scope, complexity and value.

B. Soil Testing Laboratory Qualifications: Laboratories shall be independent, with the experience and capability to conduct the testing indicated and specialize in USDA agricultural soil testing, Planting Soil Mixes, and the types of tests to be performed. The laboratory shall use the appropriate procedures for soils, sands and organic amendments as published in ASTM Methods, Chemical Soil Testing Procedures for the Northeastern Unites States (Bulletin #493) and/or The Composting Council Recommended Testing Procedures for Compost. Geotechnical engineering testing labs shall not be used.

C. Soil Compaction Testing: following installation or modification of soil, test soil compaction with a penetrometer as follows:
1. Maintain at the site at all times a soil cone penetrometer with pressure dial and a soil moisture meter to check soil compaction and soil moisture.
a. Penetrometer shall be AgraTronix Soil Compaction Meter distributed by Ben Meadows, www.benmeadows.com or approved equal.
b. Moisture meter shall be "general digital soil moisture meter" distributed by Ben Meadows, www.benmeadows.com or approved equal.

2. Penetrometer readings are impacted by soil moisture and excessively wet or dry soils will read significantly lower or higher than soils at optimum moisture.

3. The penetrometer readings shall be within 20% plus or minus approved compaction rates.

D. Regulatory Requirements: Comply with applicable requirements of laws, codes, and regulations of federal, State and local authorities having jurisdiction over Work.

1.8 SITE CONDITIONS

A. It is the responsibility of the Contractor to be aware of all surface and subsurface conditions, and to notify the Owner's Representative, in writing, of any circumstances that would negatively impact the health of plantings. Do not proceed with work until unsatisfactory conditions have been corrected.
1. Should subsurface drainage or soil conditions be encountered which would be detrimental to growth or survival of plant material, the Contractor shall notify the Owner's Representative in writing, stating the conditions and submit a proposal covering cost of corrections. If the Contractor fails to notify the Owner's Representative of such conditions, they shall remain responsible for plant material under the warrantee clause of the specifications.

2. This specification requires that all Planting Soil and Irrigation work be completed and accepted prior to the installation of any plants.

1.9 DELIVERY, STORAGE AND HANDLING

A. Weather: Do not mix, deliver, place or grade soils when frozen or with moisture above field capacity.

B. Protect all soil and soil stockpiles from wind, rain and washing that can erode soil or separate fines and coarse material, and contamination by chemicals, dust and debris that may be detrimental to plants or soil drainage. Cover stockpiles with plastic sheeting or fabric at the end of each workday.

C. Imported Topsoil shall be delivered at our near optimum compaction moisture content as determined by AASHTO T 99 (ASTM D 698). Do not deliver or place materials in an excessively moist condition (beyond 2 percent above optimum compaction moisture content).

D. Deliver all chemical amendments in original, unopened containers with original labels intact and legible, which state the guaranteed chemical analysis. Store all chemicals in a weather protected enclosure.

E. Bulk material: Coordinate delivery and storage with Owner's Representative and confine materials to neat piles in areas acceptable to Owner's Representative.

PART 2 — PRODUCTS

2.1 TOPSOIL

A. Topsoil shall be Stockpiled Native Topsoil salvaged prior to construction activities. Stockpiled Native Topsoil may be modified to meet the listed requirements. If sufficient quantities of Stockpiled Native Topsoil are unavailable, use an Imported Topsoil that meets the specified requirements.

B. Topsoil definition: Fertile, friable soil containing less than 5% total volume of the combination of subsoil, refuse, roots larger than 1 inch diameter, heavy, sticky or stiff clay, stones larger than 2 inches in diameter, noxious seeds, sticks, brush, litter, or any substances deleterious to plant growth. The percent (%) of the above objects shall be controlled by source selection not by screening the soil. Topsoil shall not contain weed seeds in quantities that cause noticeable weed infestations in the final planting beds.

C. Topsoil shall meet the following physical and chemical criteria:
1. Soil texture: USDA loam, sandy clay loam or sandy loam with clay content between 15 and 25%. And a combined clay/silt content of no more than 55%.
2. pH value shall be between 5.5 and 7.5.
3. Percent organic matter (OM): 2.0-5.0%, by dry weight.
4. Soluble salt level: Less than 2 mmho/cm.
5. Soil chemistry suitable for growing the plants specified.

D. Topsoil shall be a harvested soil from fields or development sites. The organic content and particle size distribution shall be the result of natural soil formation. Manufactured soils where Coarse Sand, Composted organic material or chemical additives has been added to the soil to meet the requirements of this specification section shall not be acceptable.

E. Topsoil shall NOT have been screened and shall retain soil peds or clods larger than 2 inches in diameter throughout the stockpile after harvesting.

F. Stockpiled Native Topsoil Testing: One composite soil sample will be collected from every 100 cubic yards of stockpiled soil. Samples will be collected using clean stainless steel implements (spoon) from six locations of

each stockpiled soil, from approximately 12 inches or deeper in the stockpile, and placed in plastic zip-lock bags labeled with a unique identifier for the soil material, and date of collection.

2.2 COMPOST

A. Compost shall be a stable, humus-like material produced from the aerobic decomposition and curing of organic vegetative residues derived from feedstock consisting of woody stems, leaves, grass cuttings, and livestock manure (up to 10 percent of the compost mix by volume). **Compost feedstock shall not include municipal or industrial waste sludges, food wastes, or treated lumber products.** The compost shall be a dark brown to black color and be capable of supporting plant growth with appropriate management practices with no visible free water or dust, with no unpleasant odor.

Compost shall be commercially prepared Compost and meet US Compost Council STA/TMECC criteria or equal for Class I or II stable, mature product. http://compostingcouncil.org/admin/wp-content/plugins/wp-pdfupload/pdf/191/LandscapeArch_Specs.pdf

B. Compost shall comply with the following parameters:
1. pH: 5.5 - 8.0.
2. Soil salt (electrical conductivity): maximum 5 dS/m (mmhos/cm).
3. Moisture content %, wet weight basis: 30 – 60.
4. Particle size, dry weight basis: 98% pass through 3/4 inch screen or smear.
5. Stability carbon dioxide evolution rate: mg CO_2-C/ g OM/ day < 2.
6. Solvita maturity test: > 6.
7. Physical contaminants (inerts), % dry weight basis: <1%.
8. Chemical contaminants, mg/kg (ppm): meet or exceed US EPA Class A standard, 40CFR § 503.13, Tables 1 and 3 levels.
9. Biological contaminants select pathogens fecal coliform bacteria, or salmonella, meet or exceed US EPA Class A standard, 40 CFR Part 503 rule, Table 3, page 9392, Vol. 58 No. 32.

2.3 COARSE SAND

A. Clean, washed, sand, free of toxic materials
1. Coarse concrete sand, ASTM C-33 Fine Aggregate, with a Fines Modulus Index of 2.8 and 3.2.

2. Coarse Sands shall be clean, sharp, natural Coarse Sands free of limestone, shale and slate particles. Manufactured Coarse Sand shall not be permitted.

3. pH shall be lower than 7.0.

4. Provide Coarse Sand with the following particle size distribution:

Sieve	Percent passing
3/8 inch (9.5 mm)	100
No 4 (4.75 mm)	95-100
No 8 (2.36 mm)	80-100
No 16 (1.18 mm)	50-85
No 30 (.60 mm)	25-60
No 50 (.30 mm)	10-30
No 100 (.15 mm)	2-10
No 200 (0.75 mm	2-5

2.4 LIME

A. Lime shall be added to Stockpiled Native Topsoil to adjust pH levels as required.

B. Lime shall be ASTM C 602, agricultural limestone containing a minimum 80 percent calcium carbonate equivalent and as follows:

1. Class: Class T, with a minimum 99 percent passing through No. 8 (2.36-mm) sieve and a minimum 75 percent passing through No. 60 (0.25-mm) sieve.
2. Provide lime in form of dolomitic limestone.

C. Provide manufacturer's literature and material certification that the product meets the requirements.

2.5 PLANTING SOIL MIXES

A. General requirements: Planting Soil Mixes comprise Topsoil, Coarse Sand and/or Compost blended to an even, homogenous mix. Blend prior to installation by mixing Coarse Sand and Compost together first and then adding to Topsoil. Mix with a loader bucket to loosely incorporate the Topsoil into the Coarse Sand/Compost Mix. Do not over mix. Do not mix with a soil blending machine. Do not screen the soil. Clumps of Soil, Compost and Coarse Sand will be permitted in the final mixes.

B. Base Planting Soil: Base Planting Soil shall be the primary soil that will be used for preparation of planting mixes.

1. The approximate Mix ratio shall be:

Mix component	% by moist volume
Topsoil	45-50%
Coarse sand	40-45%
Compost	10%

2. Base Planting Soil shall conform to the following qualities:
   a. Final tested organic matter of between 2.5 and 4.0% by dry weight.
   b. pH: 6.5 – 7.8.
   c. Total nitrogen (all forms): 500 to1500 mg/kg soil
   d. Available nitrogen (NH4 and NO3): 50 to 200 mg/kg soil
   e. Available P: 20 to 40 mg/kg

C. Tree & Shrub Soil: Tree & Shrub Soil shall consist of 4 parts Base Planting Soil blended with 1 part compost, by volume.

D. Bioretention Soil: Bioretention Soil shall consist of 3 parts Base Planting Soil blended with 1 part compost, by volume.

PART 3 — EXECUTION

3.1 EXAMINATION

A. Prior to installation of Planting Soil, examine site to confirm that existing conditions are satisfactory for the work of this section to proceed.

1. Confirm that the subgrade is at the proper elevation and compacted as required. Subgrade elevations shall slope toward the any under drain lines as shown on the drawings.

2. Confirm that all areas to be filled with Planting Soil are free of construction debris, refuse, compressible or biodegradable materials, stones greater than 2 inches diameter, soil crusting films of silt or clay that reduces or stops drainage from the Planting Soil into the subsoil; and/or standing water. Remove unsuitable material from the site.

3. Confirm that no adverse drainage conditions are present.

4. Confirm that no conditions are present which are detrimental to plant growth.

5. Confirm that utility work has been completed per the drawings.

6. Confirm that irrigation work, which is shown to be installed below prepared soil levels, has been completed.

B. If unsatisfactory conditions are encountered, notify the Owner's Representative immediately to determine corrective action before proceeding.

3.2 PREPARATION

A. Excavate to the proposed subgrade of all soil profiles. Do not over excavate compacted subgrades of adjacent pavement or structures. Maintain all required angles of repose of the adjacent materials as shown on the drawings.

B. Remove all construction debris and material including any construction materials from the subgrade.

C. Confirm that the subgrade is at the proper elevation and compacted as required. Subgrade elevations shall slope approximately parallel to the finished grade and/or toward the subsurface drain lines as shown on the drawings.

D. Protect adjacent walls, walks and utilities from damage or staining by the soil. Use 1/2 inch plywood and or plastic sheeting as directed to cover existing concrete, metal and masonry work and other items as directed during the progress of the work.
1. At the end of each working day, clean up any soil or dirt spilled on any paved surface.

2. Any damage to the paving or site features or work shall be repaired at the Contractor's expense.

3.3 SUBGRADE LOOSENING

A. Prior to the installation of any Planting Soil, till or scarify the subgrade by dragging the teeth of a loader bucket or backhoe across the soil surface in two directions. Till or scarify to the full depth indicated in the Soil Profile drawings.

B. Spread a layer of Compost over the area and till into the scarified profile.

C. Protect the loosened area from traffic. Do not allow the loosened subgrade to become compacted. In the event that the loosened area becomes overly compacted, till or scarify the area again prior to installing the Planting Soil.

D. Do not scarify within drip line of existing trees to be retained.

3.4 PLANTING SOIL INSTALLATION

A. All equipment utilized to install or grade Planting Soil shall be wide track or balloon tire machines rated with a ground pressure of 4 psi or less. All grading and soil delivery equipment shall have buckets equipped with 6 inch long teeth to scarify any soil that becomes compacted.

B. Install the Planting Soil in lifts less than 12" to the required depths. Apply compacting forces to each lift as required to attain the required compaction. Scarify the top of each lift prior to adding more Planting Soil.

C. Phase work such that equipment to deliver or grade soil does not have to operate over previously installed Planting Soil. Work in rows of lifts the width of the extension of the bucket on the loader. Install all lifts in one row before proceeding to the next. Work out from the furthest part of each bed from the soil delivery point to the edge of the each bed area.

D. Where possible place large trees first and fill Planting Soil around the root ball.

E. Installing soil with soil or mulch blowers or soil slingers shall not be permitted due to the over mixing and soil ped breakdown cause by this type of equipment.

F. Placement of soil by back-blading is not acceptable. Back-blading causes sealing of the soil surface and inhibits air and moisture from penetrating the planting soil mix.

G. Where travel over installed soil is unavoidable, limit paths of traffic to reduce the impact of compaction in Planting Soil. Each time equipment passes over the installed soil it shall reverse out of the area along the same path with the teeth of the bucket dropped to scarify the soil. Comply with the paragraph “Compaction Reduction” (section 3.9) in the event that soil becomes over compacted.

H. The depths and grades shown on the drawings are the final grades after settlement and shrinkage of the compost material. A minimum settlement of approximately 10 - 15% of the soil depth is expected. The Contractor shall install the Planting Soil at a higher level to anticipate this reduction of volume All grade increases are assumed to be as measured prior to addition of surface Compost till layer, mulch, or sod.

3.5 COMPACTION

A. Compact each lift with mechanical compaction equipment to the such that a penetrometer reads approximately 75 to 250 psi at soil moisture approximately the mid-point between wilt point and field capacity. This will be approximately between 75 and 82% of maximum dry density standard proctor.

B. Maintain moisture conditions within the Planting Soil during installation or modification to allow for satisfactory compaction. Suspend operations if the Planting Soil becomes wet. Apply water if the soil is overly dry. Do not place planting soils on wet or frozen subgrade.

C. Provide adequate equipment to achieve consistent and uniform compaction of the Planting Soils. Use the smallest equipment that can reasonably perform the task of spreading and compaction.

D. Do not pass motorized equipment over previously installed and compacted soil.
   1. If work after the installation and compaction of soil compacts the soil to levels greater than the above requirements, follow the requirements of the paragraph "Over Compaction Reduction" below.

3.6 OVER COMPACTION REDUCTION

A. Any soil that becomes compacted to a density greater than the specified density shall be dug up and reinstalled. This requirement includes compaction caused by other sub-contractors after the Planting Soil is installed and approved.

B. Surface roto tilling shall not be considered adequate to reduce over compaction at levels 6 inches or greater below finished grade.
   1. a rate of one test per 5,000 square feet for each type of material placed.

3.7 FINE GRADING

A. The Owner’s Representative shall approve all rough grading prior to the installation of Compost, fine grading, planting, and mulching.

B. Grade the finish surface of all planted areas to meet the grades shown on the drawings, allowing the finished grades to remain higher (10 – 15% of depth of soil modification) than the grades on the grading plan, as defined in paragraph Planting Soil Installation, to anticipate settlement over the first year.

C. Utilize hand equipment, small garden tractors with rakes, or small garden tractors with buckets with teeth for fine grading to keep surface rough without further compaction. Do not use the flat bottom of a loader bucket to fine grade, as it will cause the finished grade to become overly smooth and or slightly compressed.

D. Provide for positive drainage from all areas toward the existing inlets, drainage structures and or the edges of planting beds. Adjust grades as directed to reflect actual constructed field conditions of paving, wall and inlet elevations. Notify the Owner's Representative in the event that conditions make it impossible to achieve positive drainage.

E. Provide smooth, rounded transitions between slopes of different gradients and direction. Modify the grade so that the finish grade before adding mulch and after settlement is one or two inches below all paving surfaces or as directed by the drawings.

F. Fill all dips and remove any bumps in the overall plane of the slope. The tolerance for dips and bumps in shrub and ground cover planting areas shall be a 2 inch deviation from the plane in 10 feet. The tolerance for dips and bumps in lawn areas shall be a 1 inch deviation from the plane in 10 feet.

G. Restore all grades after the installation of plants.

3.8 INSTALLATION OF COMPOST TILL LAYER

A. After Planting Soil is installed and just prior to the installation of shrub or groundcover plantings, spread 3 inches of Compost over the beds and roto till into the top 4 inches of the Planting Soil.

B. This step will raise grades slightly above the grades required in paragraph "Fine Grading". This specification anticipates that the raise in grade due to this tilling will settle within a few months after installation as Compost breaks down. Additional settlement as defined in paragraph "Planting Soil installation" must still be accounted for in the setting of final grades.

3.9 CLEAN-UP

A. Once installation is complete, wash all soil from pavements and other structures. Ensure that mulch is confined to planting beds.
   1. Make all repairs to grades, ruts, and damage to work at the site.
   2. Remove and dispose of all excess Planting Soil, subsoil, mulch, packaging, and other material brought to the site by the Contractor.

3.10 PROTECTION

A. The Contractor shall protect installed Planting Soil from damage including contamination and over compaction due to other soil installation, planting operations, and operations by other Contractors or trespassers.

B. Maintain protection during installation until final acceptance. Utilize fencing and matting as required or directed to protect the finished soil work. Treat, repair or replace damaged Planting Soil immediately.

C. Within the installation warranty period repair and re-establish grades to the specified tolerances. Repair soil that has been eroded, rutted, settled or compacted due to construction traffic or weather conditions.

D. Where erosion or settling occurs before or after walkway or sidewalk construction occurs and final acceptance; backfill with approved planting soil type and compact to specified rates acceptable to the Landscape Architect.

3.11 FINAL REVIEW

A. At the end of the plant warranty and maintenance period, (see Specification section - Planting) the Owner's Representative shall observe the soil installation work and establish that all provisions of the contract are complete and the work is satisfactory.

1. Restore any soil settlement and or erosion areas to the grades shown on the drawings. When restoring soil grades remove plants and mulch and add soil before restoring the planting. Do not add soil over the root balls of plants or on top of mulch.

END OF SECTION

SECTION 32 92 19

SEEDING AND SODDING

PART 1 — GENERAL

1.1 SUMMARY

A. Provide seeded and sodded areas as shown and specified. This work includes:
   1. Sodding turgrass at areas to receive irrigation.
   2. Seeding turfgrass at non-irrigated areas.

1.2 RELATED WORK

A. Examine Contract Documents for requirements that affect work of this Section. Other Specification Sections that directly relate to work of this Section include, but are not limited to:

   1. Section 31 20 00, Earth Moving; Establishment of subgrade elevation; grading.
   2. Section 32 84 00, Planting Irrigation.
   3. Section 32 91 00, Planting Soil.

1.3 REFERENCES

A. AOSA — Association of Official Seed Analysis:
Rules for Testing Seeds, Journal of Seed Technology, Current Edition.

B. FSA — Federal Seed Act.

C. ASTM — American Society for Testing Materials:
D 698 Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort.

1.4 SUBMITTALS

A. Submit sod vendor's certification for required grass mixture.

B. Submit sod source for Landscape Architect’s approval.

C. Submit seed vendor's certification for required grass seed mixture, indicating percentage by weight, and percentages of purity, germination, and weed seed for each grass species.

1.5 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Meet requirements of applicable laws, codes, and regulations required by authorities having jurisdiction over Work, including the FSA.
   2. Provide for inspections and permits required by Federal, State and local authorities in furnishing, transporting, and installing materials.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Labeling:
   1. Furnish standard products in unopened manufacturer’s standard containers.

2. Seed analysis meeting requirements of the AOSA Rules for Testing Seeds shall be attached to outside as well as inside container, showing species, PLS percentage, germination, purity, inert seed, weed seed, other crop seed, name of certified testing agency and date of test.
3. No seed will be accepted unless test date is within 8 months of planting date.

B. Digging Sod:
1. Sod shall not be dug at the nursery or approved source until ready to transport sod to the site of the work or acceptable storage location.

2. Before stripping, sod shall be mowed at a uniform height of 2-1/2 inches.

3. Cut sod to specified thickness and to standard width and length desired.

C. Transportation of Sod:
1. Sod transported to the project in open vehicles shall be covered with tarpaulins or other suitable covers securely fastened to the body of the vehicle to prevent injury. Closed vehicles shall be adequately ventilated to prevent overheating of the sod.

2. Evidence of inadequate protection following the digging, carelessness while in transit, or improper handling or storage, shall be cause for rejection.

3. Sod shall be kept moist, fresh, and protected at all times. Such protection shall encompass the entire period during which the sod is in transit, being handled, or is in temporary storage.

4. Upon arrival at the temporary storage location or the site of the work, sod shall be inspected for proper shipping procedures. Should the sod be dried out, the Landscape Architect will reject the sod. When sod has been rejected, the Contractor shall at once remove it from the area of the work and replace it with acceptable material.

5. Unless otherwise authorized by the Landscape Architect, the Contractor shall notify the Landscape Architect and Owner's Representative at least two working days in advance of the anticipated delivery date of sod. Certificate of Inspection when required shall accompany each shipment.

D. Handling and Storage of Sod:
1. Sod shall be handled with extreme care to avoid breaking or tearing strips.

2. Sod shall not be stored for longer than 30 hours prior to installation. Sod shall be stored in a compact group and shall be kept moist. Sod shall be prevented from freezing.

3. Sod that has been damaged by poor handling or improper storage will be rejected by the Landscape Architect or Owner's Representative.

1.7 PROJECT CONDITIONS

A. Restrict traffic from seeded areas until grass is established. Erect signs and barriers as required.

B. Work notification: Notify Landscape Architect and Owner's Representative at least 7 working days prior to start of sodding operations.

C. Provide hose and lawn watering equipment as required.

D. Temporarily seed within 15 days any denuded areas which may not be at final grade, but which will remain dormant (undisturbed) for longer than 60 days.

1.8 WARRANTY

A. Warranty Period: Warrant that grasses shall be in a healthy and flourishing condition of active growth at the end of the next growing season following the date of Final Completion.

B. Condition: Free of dead or dying patches; areas shall show foliage of normal density, size and color.

C. Delays: Delays in completion of planting operations which extend the planting into more than one planting season shall extend the Warranty period correspondingly.

D. Coverage: Warrant growth and coverage of sodded or seeded planting to the effect that a minimum of 90 percent of the area planted shall be covered with specified planting after one full growing season with no bare spots greater than 1 square foot.

E. Replacement: As soon as weather conditions permit, replant at no additional cost to the Owner, areas of dead turfgrass and areas where turfgrass is not in a vigorous, thriving condition, during and at the end of the Warranty Period.

F. Requirements for Replacement Work: Apply requirements of this Specification to replacement Work.

PART 2 — PRODUCTS

2.1 MATERIALS

A. Turfgrass Sod:

1. Superior sod grown from certified, high quality seed of known origin or from plantings of certified grass seedlings or stolons. It shall be inspected by the certification agency of the state in which it is grown to assure satisfactory genetic identity and purity, overall high quality and freedom from noxious weeds as well as excessive quantities of other crop and weedy plants at time of harvest. All seed or original plant material in mixture must be certified. Turfgrass sod shall meet the published state standards for certification.

    a. Sod shall be a mixture of four or five current and improved bluegrass varieties found in the top 25% of the NTEP (National Turfgrass Evaluation Proceedings), with last two tests spanning over 8 years. Mixture shall contain approximately equal proportions of each hybrid component.

2. Sod shall be nursery grown on cultivated mineral agricultural soils. Sod shall have been mowed regularly and carefully, and otherwise maintained from planting to harvest.

3. Thickness of Cut: Sod shall be machine cut at a uniform soil thickness of 5/8 inch, plus or minus 1/4 inch, at the time of cutting. Measurement for thickness shall exclude top growth and thatch.

4. Strip Size: Individual pieces of sod shall be cut to the supplier's standard width and length. Maximum allowable deviation from standard widths and lengths shall be plus or minus 1/2 inch on width, and plus or minus 5% on length. Broken strips and torn and uneven ends will not be acceptable.

5. Strength of Sod Strips: Standard size sections of sod shall be strong enough to support their own weight and retain their size and shape if suspended vertically when grasped in the upper 10% of the section.

6. Moisture Content: Sod shall not be harvested or transplanted when moisture content (excessively dry or wet) may adversely affect its survival.

7. Time Limitations: Sod shall be harvested, delivered, and transplanted within a 36 hour period unless a suitable preservation method is approved prior to delivery. Sod not transplanted within this period shall be inspected and approved by the Landscape Architect prior to its installation.

8. Thatch: Sod shall be relatively free of thatch. A maximum of 1/2 inch (uncompressed) thatch will be permitted.

9. Diseases, Nematodes, and Insects: Sod shall be free of diseases, nematodes, and soil-borne insects. State Nursery and Plant Materials Laws require that all sod be inspected and approved for sale. The inspection and approval must be made by the State Agricultural Department, Office of the State Entomologist.

10. Weeds: Sod shall be free of objectionable grassy and broad leaf weeds.

B. Turfgrass seed: Fresh, clean, and new crop seed mixture.

1. Seed shall be composed of the following varieties, and mixed by an approved method to the specified proportions by weight and tested to minimum percentages of purity and germination.

Blend: 80% Tall Fescue - Category 1
20% Kentucky Blue grass - Category 1

Rate: Tall Fescue - 220 lbs per acre
Kentucky Bluegrass - 40 lbs per acre

2. Seed shall be free of Poa annua, bent grass, and noxious weed seed free

C. Water: Free of substances harmful to sod growth. Hoses or other methods of transportation furnished by Contractor.

2.2 PLANTING SOILS

A. Turf soil mixes shall be as specified in Section 32 91 00, PLANTING SOIL.

PART 3 — EXECUTION

3.1 PLANTING SEASON

A. Perform seeding and sodding work as follows:

Material	Planting Season	
	Spring	Fall
Sod	3/15 to 5/15	8/15 to 10/15
Seed	starting 3/15	ending 10/15

B. Planting shall only be performed when weather and soil conditions are suitable for planting the material specified in accordance with locally accepted practice.

C. Planting season may be extended with the written permission of the Landscape Architect.

3.2 EXAMINATION AND COORDINATION

A. Examine site and verify that conditions are suitable to receive Work and that no conditions are present which would cause defective installation of products or cause latent defects in workmanship and function.

B. Notification of Unsuitable Conditions: Before proceeding with Work, notify Owner's Representative in writing of unsuitable conditions.

C. Do not start sodding work until unsatisfactory conditions are corrected.

D. Coordinate with the work of Section 32 84 00, PLANTING IRRIGATION.

3.3 PREPARATION

A. Verify soil preparation Work is complete in accordance with Section 32 91 00, PLANTING SOIL, and in accordance with the Drawings.

B. Verify finish grading Work is complete and has been accepted by the Landscape Architect.

3.4 INSTALLATION

A. Sodding:

1. Edges of the sodded areas shall be smooth, and all sodded areas shall conform to the design cross sections and grade. At edges adjacent to curbs, paved areas, etc., top surface of earth in sod shall be 1/2 in. below adjacent hard surface.

2. Sod shall be placed and all sodding operations completed within 72 hours following stripping from sod source bed.

3. Surface of completed sodded area shall be smooth. Sod shall be laid edge-to-edge, with tight-butted, staggered joints. Sod shall be carefully placed to insure that it is neither stretched nor overlapped. After laying, sod shall be pressed firmly into contact with sod bed by tamping, to eliminate air pockets. Sod shall be laid off boards in order to prevent damage to finish grade or sod.

4. Immediately after sodding operations have been completed, entire surface shall be compacted with a cultipacker roller or other approved equipment weighing 100 to 160 lb./ft. of roller.

5. Completed sod areas shall immediately be watered sufficiently to uniformly wet the soil to at least 1 in. below the bottom of sod bed.

B. Seeding:

1. Seed immediately after preparation of bed and once the area is cleared of all vegetation, trash, debris and stones larger than 1/2" in diameter or length.

2. Seed indicated areas within limit of construction and areas adjoining contract limits disturbed as a result of construction operations.

3. Perform seeding operations when the soil is dry and when winds do not exceed 5 miles per hour velocity.

4. Apply seed with a rotary or drop type distributor. Install seed evenly by sowing equal quantities in 2 directions, at right angles to each other.

5. Sow grass seed at the specified rate for the type of seed being used.

6. After seeding, rake or drag surface of soil lightly to incorporate seed into top 1/8" of soil. Roll with a light lawn roller.

3.5 PROTECTION

A. Traffic:
1. Do not operate any equipment or allow any foot traffic over the seeded and sodded areas until grass is established enough to prevent soil from eroding.
2. Do not operate any equipment on seeded or sodded areas until ground is firm enough that ruts will not occur.

B. Utilize fencing as necessary or directed by the Landscape Architect or Owner's Representative to protect the finished seeding and sodding work. Treat, repair or replace damaged areas immediately.

3.6 MAINTENANCE

A. Except as otherwise specified below, maintenance shall include all operations required to produce an established lawn, including but not limited to:
Fertilizing
Mowing
Replanting
Watering
Weeding

B. Maintenance of seeded and sodded areas shall begin upon completion of seeding sodding and shall continue for 45 days thereafter, unless sodding is not completed until after September 15, in which case maintenance shall continue until the June 15 following.

C. Water daily to maintain adequate surface soil moisture for proper seed germination and root establishment. Continue daily watering for not less than 30 days. Thereafter apply 1/2" of water twice weekly until acceptable.

D. Mowing shall not be attempted until the sod is firmly rooted and securely in place. Mow lawn areas as soon as lawn top growth reaches three inches height. Cut back to two and one-half inches in height. Repeat mowing as required to maintain specified height. At no time shall more than 1/3" of the grass blade length be removed during mowing.

E. Weeds and growth other than varieties of grass named in grass seed formula shall be removed. Removal may be accomplished by use of suitable herbicides or by physical removal, in which case top growth and roots shall both be removed, and bare spots exceeding specified limits shall be reseeded.

3.7 ACCEPTANCE

A. Sodding:
1. Roots are thoroughly knit to the soil.
2. Absence of visible joints on sodded areas.

B. Seeding:
1. The Landscape Architect or Owner's Representative will inspect all work once there is a uniform, vigorous stand of weed free grass 2 1/2" tall, with 90% evenly distributed coverage and without bare areas.

2. Once seeding is in conformance with the contract documents, the project will be accepted on the date of inspection. Upon acceptance of the project, maintenance becomes the responsibility of the Owner.

3. If the seeding is not in conformance, the contractor shall complete non-conforming items prior to a follow-up inspection by the Landscape Architect or Owner's Representative. Acceptance will be confirmed in writing.

4. Acceptance of the seeding shall be for general conformance to quality and shall not relieve the Contractor of responsibility for full conformance to the Contract Documents, including correct species.

3.8 CLEANING

A. Perform cleaning during installation of the work and upon completion of the work. Remove from site all excess materials, debris, and equipment.

END OF SECTION

SECTION 32 93 00

TREES, PLANTS, AND GROUND COVERS

PART 1 — GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. The scope of work includes all labor, materials, appliances, tools, equipment, facilities, transportation and services necessary for, and incidental to performing all operations in connection with furnishing, delivery, and installation of plant material shown on the drawings and as specified herein.

B. The scope of work in this section includes, but is not limited to, the following:
1. Locate, purchase, deliver and install all specified plants.
2. Water all specified plants.
3. Mulch, fertilize, stake, and prune all specified plants.
4. Clean up and disposal of all excess and surplus material.

C. Related Sections: Examine Contract Documents for requirements that affect work of this Section. Other Specification Sections that directly relate to work of this Section include, but are not limited to:
1. Section 05 59 01, Metal Edging.
2. Section 31 20 00, Earth Moving; Establishment of subgrade elevation; grading.
3. Section 32 84 00, Planting Irrigation.
4. Section 32 91 00, Planting Soil.
5. Section 32 92 19, Seeding and Sodding.

1.3 REFERENCES

A. Comply with applicable requirements of the following standards. Where these standards conflict with other specified requirements, the most restrictive requirements shall govern.
1. American National Standards Institute, Inc. (ANSI):
a. Z60.1 American Standard for Nursery Stock (Sponsor: American Association of Nurserymen, Inc.)
b. A 300 – Standard Practices for Tree, Shrub and other Woody Plant Maintenance, most current edition and parts, with particular attention to:
a. A300 Part 5 *Construction Management*
b. *A300 Part 6 Planting and Transplanting*
c. A300 Part 8 *Root Management*

2. "Hortus Third", A Concise Dictionary of Plants Cultivated in the United States and Canada, Cornell University, L.H. Bailey Hortorium, MacMillian Publishing Co., New York, NY.

3. International Society of Arboriculture (ISA), Champaign IL:
a. Best Management Practices – Tree Planting, most current edition.
b. Glossary of Arboricultural Terms, most current edition.

1.4 DEFINITIONS

A. Defective plant: Any plant that fails to meet the plant quality requirement of this specification.

B. Field grown trees (B&B): Trees growing in field soil for at least 12 months prior to harvest.

C. Root ball: The mass of roots including any soil or substrate that is shipped with the tree within the root ball package.

D. Root ball package. The material that surrounds the root ball during shipping. The root package may include the material in which the plant was grown, or new packaging placed around the root ball for shipping.

E. Root collar (root crown, root flare, trunk flare, flare): The region at the base of the trunk where the majority of the structural roots join the plant stem, usually at or near ground level.

F. Stem: The trunk of the tree.

G. Stem girdling root: Any root more than ¼ inch diameter currently touching the trunk, or with the potential to touch the trunk, above the root collar approximately tangent to the trunk circumference or circling the trunk. Roots shall be considered as Stem Girdling that have, or are likely to have in the future, root to trunk bark contact.

H. Structural root: One of the largest roots emerging from the root collar.

1.5 SUBMITTALS

A. See contract general conditions for policy and procedure related to submittals.

B. Product data: Submit manufacturer product data and literature describing all products required by this section to the Client, Owner's Representative, or Landscape Architect for approval. Provide submittal eight weeks before the installation of plants.

C. Plant growers' certificates: Submit plant growers' certificates for all plants indicating that each meets the requirements of the specification, including the requirements of tree quality, to the Client, Owner's Representative, or Landscape Architect for approval. Provide submittal eight weeks before the installation of plants.

D. Close out submittals: Submit to the Client, Owner's Representative, or Landscape Architect for approval

1.6 SOURCE QUALITY CONTROL

A. Identification of plant materials shall be as named in "Hortus Third".

B. Selection of Plant Materials: Submit to the Landscape Architect the names and locations of nurseries proposed as sources of acceptable plant material. Inspect all nursery materials to determine that the materials meet the requirements of this section. Proposed materials shall be flagged at the nurseries by the Contractor prior to viewing by the Landscape Architect.

1. Schedule with the Landscape Architect and Client a time for viewing trees and shrubs at the nursery. Trips to nurseries shall be efficiently arranged to maximize viewing time. A minimum of six weeks shall be allowed for this viewing prior to time plants are to be dug.

2. Landscape Architect may choose to attach seal to each plant, or representative samples.

3. Where requested by the Client, Owner's Representative, or Landscape Architect, photographs of plant material or representative samples of plants shall be submitted.

4. Viewing and/or sealing of plant materials by the Landscape Architect at the nursery does not preclude the Client, Owner's Representative, or Landscape Architect's right to reject material at the site of planting.

1.7 SCHEDULING

A. Schedule a meeting with the Client, Owner's Representative, and Landscape Architect to review any questions the Contractor may have regarding the work, and to develop an agreed upon planting schedule.
   1. Planting Schedule: Planting may commence as soon as the ground has thawed at the nursery and at the site of planting, and weather conditions make it practical to work both at the nursery and at the site. Acceptable planting dates vary by plant material. As a general rule the following guidelines apply:
      a. Spring Planting End Date: June 15 for Evergreen Trees and Shrubs, June 30 for Deciduous Trees and Shrubs.
      b. Fall Planting Period: September 15 – December 1.
      c. Herbaceous Plants may be installed in summer months by approval by Client, Owner's Representative, or Landscape Architect.
   2. Regardless of the dates specified above, planting shall only be performed when weather and soil conditions are suitable for planting the material specified in accordance with locally accepted practice.
   3. Planting season may be extended only with the written permission of the Client, Owner's Representative, or Landscape Architect.

B. Document meeting and submit meeting notes for record purposes.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Digging Plant Material: Plants shall not be dug at the nursery or approved source until the Contractor is ready to transport them from their original locations to the site of the work or acceptable storage location.

B. Transportation of Plant Material: Plants transported to the project in open vehicles shall be covered with tarpaulins or other suitable covers securely fastened to the body of the vehicle to prevent injury to the plants. Closed vehicles shall be adequately ventilated to prevent overheating of the plants. Plants shall not remain in darkened enclosed trailer for more than 48 hours cumulative.
   1. Plants shall be kept moist, fresh, and protected at all times. Such protection shall encompass the entire period during which the plants are in transit, being handled, or are in temporary storage.
   2. Unless otherwise authorized by the Landscape Architect, notify the Client, Owner's Representative or Landscape Architect at least three working days in advance of the anticipated delivery date of any plant material. A legible copy of the bill of lading, showing the quantities, kinds, and sizes of materials included for each shipment shall be furnished to the Architect.

C. Storage: Unless specific authorization is obtained from the Landscape Architect, plants shall not remain on the site of work longer than three days prior to being planted.
   1. Plants that are not planted immediately shall be protected as follows:
      a. Earth balls shall be kept appropriately moist and their solidity carefully preserved.
      b. Plants shall not be allowed to dry out or freeze.
   2. Both the duration and method of storage of plant materials shall be subject to the approval of the Landscape Architect.

D. Handling of Plant Materials: Exercise care in handling plant materials to avoid damage or stress.

1.9 REJECTION OF MATERIALS

A. Evidence of inadequate protection following digging, carelessness while in transit, or improper handling or storage, shall be cause for rejection.

B. Upon arrival at the temporary storage location or the site of the work, plants shall be inspected for proper shipping procedures. Should the roots be dried out, large branches be broken, balls of earth broken or loosened, or areas of bark be torn, the Client, Owner's Representative or Landscape Architect will reject the injured plant.

C. When a plant has been rejected, remove it from the area of the work within 3 days and replace it with one of the required size and quality.

1.10 ACCEPTANCE

A. The Architect will inspect all work for Substantial Completion upon written notice of completion. The request shall be received at least ten calendar days before the anticipated date of inspection.

B. Acceptance of plant material by the Architect will be for general conformance to specified size, character, and quality, and shall not diminish responsibility for full conformance to the Contract Documents.

C. Upon completion and reinspection of all repairs or renewals necessary in the judgement of the Architect, the Architect will recommend to the Owner that acceptance of the work of this Section be given.

D. Acceptance in Part
1. The work may be accepted in parts when it is deemed to be in the Owner's best interest to do so, and when permission is given to the Contractor in writing to complete the work in parts.
2. Acceptance and use of such areas by the Owner shall not waive any other provisions of this Contract.

1.11 MAINTENANCE

A. Contractor shall maintain plant material until the completion of guarantee period and Final Acceptance of work, as described in Part 3 of this Section.

1.12 GUARANTEE

A. Guarantees:
1. Trees larger than 4 in. caliper shall be guaranteed for a period of two (2) years after the date of Acceptance by the Owner.
2. All other plants shall be guaranteed for a period of one (1) year after the date of Acceptance by the Owner.
3. When the work is accepted in parts, the guarantee periods shall extend from each of the partial acceptances to the terminal date of the last guarantee period. Thus, all guarantee periods terminate at one time.

B. Plants shall be healthy, free of pests and disease, and in flourishing condition at the end of the guarantee period. Plants shall be free of dead and dying branches and branch tips, and shall bear foliage of normal density, size, and color.

C. Replace dead plants and all plants not in a vigorous, thriving condition, as determined by the Architect during and at the end of the guarantee period, without cost to the Owner, as soon as weather conditions permit and within the specified planting period.

1. Replacements shall closely match adjacent specimens of the same species. Replacements shall be subject to all requirements stated in this Specification.

2. Make all necessary repairs due to plant replacements. Such repairs shall be done at no extra cost to the Owner.

3. The guarantee of all replacement trees larger than 4 in. caliper shall extend for an additional two (2) year period from the date of their acceptance after replacement. In the event that a replacement plant is not acceptable during or at the end of the said extended guarantee period, the Owner may elect one more replacement or credit for each item.

4. The guarantee of all other replacement plants shall extend for an additional one (1) year period from the date of their acceptance after replacement. In the event that a replacement plant is not acceptable during or at the end of the said extended guarantee period, the Owner may elect one more replacement or credit for each item.

D. Staking and guying materials, and tree wrap and ties shall be removed in accordance with Section

1.13 FINAL INSPECTION AND FINAL ACCEPTANCE

A. At the end of the guarantee period, the Landscape Architect will, upon written notice of end of guarantee period inspect the work for Final Acceptance. Request shall be received at least ten calendar days before the anticipated date for Final Inspection.

B. Upon completion and reinspection of full repairs or replacements necessary in the judgment of the Landscape Architect at that time, the Landscape Architect will recommend to the Owner that Final Acceptance of the Work of this Section be given.

PART 2 — PRODUCTS

2.1 PLANTS

A. Except as otherwise specified, size and grade of plant materials shall conform to ANSI Z60.1. In no case shall ball size be less than 11 in. in diameter for each inch of caliper.

B. Plants shall be healthy and vigorous, free of disease, insect pests and their eggs, and larvae.

C. Plants shall be free of physical damage such as scrapes, broken or split branches, scars, bark abrasions, sunscalds, fresh limb cuts, disfiguring knots, or other defects. These defects shall not interrupt more than 10% of the circumference of the plant cambium.

D. All trees shall comply with federal and state laws and regulations requiring observation for plant disease, pests, and weeds. Observation certificates required by law shall accompany each shipment of plants.

E. Plants shall meet the sizes indicated on the Plant List. Plants larger or smaller than specified may be used only if accepted by the Landscape Architect.

F. Where a size or caliper range is stated, at least 50% of the material shall be closer in size to the top of the range stated.

G. Plants shall not be pruned before delivery.

H. No species shall be substituted without written approval of the Landscape Architect.

I. Trees and shrubs shall have outstanding form; symmetrical, heavily branched with an even branch distribution, densely foliated and/or budded, and a strong, straight, distinct leader where this is characteristic of species. Plants shall possess a normal balance between height and spread. The Client, Owner's Representative, or Landscape Architect will be the final arbiter of acceptability of plant form.

J. All trees and shrubs shall be labeled. Labels shall be durable and legible, stating the correct plant name and size in weather-resistant ink or embossed process. Labels shall be securely attached to plants prior to delivery to the site, being careful not to restrict growth.

K. Plants indicated as "B&B" shall be balled and burlapped. Burlap and twine material shall be biodegradable and shall completely cover the root ball.

L. Root system quality: Plant roots shall be normal to the plant type specified. Root observations shall take place without impacting plant health.
1. Plants shall have a well-developed fibrous root system. Root distribution shall be uniform throughout the root ball.

2. The root collar shall be within the upper 2 inches of the substrate/soil.

3. The root system shall be reasonably free of stem girdling roots over the root collar or kinked roots from nursery production practices.

4. Container grown plants shall have a well-established root system reaching the sides of the container to maintain a firm ball, but shall not have excessive root growth encircling the inside of the container.

M. Landscape Plugs
1. Plants specified as "LP" shall be supplied in flats with a minimum cell depth of 4", cell width of 2" and a minimum cell volume of $10in^3$

2. Supplier to be Northcreek Nurseries, 388 North Creek Road, Landenberg, PA 19350
Tel.: (610) 255-010; or approved equal.

N. Vines and ground covers: Provide healthy, field-grown plants from a commercial nursery, of species and variety shown or listed.

2.2 PLANTING SOILS

A. Refer to Section 32 91 00 PLANTING SOIL.

2.3 COMPOST, FERTILIZER AND SOIL AMENDMENTS

A. Refer to Section 32 91 00 PLANTING SOIL.

2.4 WATER

A. Water shall be suitable for irrigation and shall be free from ingredients harmful to plant life.

2.5 MULCH

A. Chipped or tub-ground hardwood that has been composted at least six months prior to application in a manner to sufficiently suppress disease organisms and weed seeds and provide visual indications that it has begun to decay, maximum 1-inch by 3-inch size pieces and no more than 25 percent of the pieces less than 1/4-inch by 1/4-inch.

2.6 GUYING MATERIALS – (TREES)

A. Wood Stakes: Straight, sound, rough sawn lumber 2 in. x 2 in., if square, or 2-1/2 in. diameter, if round. Stakes shall be stained dark green.

B. Webbed Strapping for Stakes: Flat woven polypropylene material, 3/4 inch wide, and 900 lb. break strength. Color to be Green. Product to be ArborTie manufactured by Deep Root Partners, L.P. or approved equal. Secure to stake with 1" galvanized roofing nail.

C. Submit manufacturer's product data for approval.

2.7 EDGING

A. Refer to Section 05 59 01, METAL EDGING.

PART 3 — EXECUTION

3.1 EXAMINATION OF SUBGRADE

A. Examine subgrade and rough grading before planting. Alert Landscape Architect to unacceptable rough grading or subgrade.

3.2 DRAINAGE OF SOILS

A. Test drainage of five plant beds and pits chosen by the Landscape Architect shall be done by filling with water twice in succession. The time at which water is put into the pit or bed for a second filling shall be noted. Landscape Architect shall then be notified of the time it takes for pit or bed to drain completely. Planting operations shall not proceed until Landscape Architect has reviewed test drainage results.

B. Notify the Landscape Architect in writing of all soil or drainage conditions that he considers detrimental to growth of plant material. Submit proposal and cost estimate for correction of the conditions for Landscape Architect's approval before starting work.

3.3 LAYOUT OF PLANTING AREAS

A. Individual trees shall be located in the field as indicated on the Drawings for Landscape Architect's approval prior to planting. Contractor shall provide one foreman, one loader with operator and two laborers to work in the field to determine the final location and orientation of each tree prior to planting. It is anticipated that this process may take several days to complete. Contractor shall plan to have this layout crew available to work Landscape Architect at a slow and deliberate pace in order to achieve the desired results.

B. Individual shrub locations and outlines of shrub and ground cover areas to be planted shall be staked by the Contractor in ample time to allow inspection by the Landscape Architect.

C. Individual vines and groundcovers to be planted shall be laid out in plant beds by the Contractor in ample time to allow inspection by the Landscape Architect.

D. Digging shall not begin until locations are approved by the Landscape Architect.

E. Location of trees shall be staked using color coded stakes. A different stake color shall be used for each tree species.

3.4 PLANT PIT EXCAVATION

A. Planting pits for trees and shrubs shall be excavated to the angle, depth and dimension indicated on the Drawings. Do NOT overdig the planting pits.

B. Excavation shall not begin until locations are approved by the Landscape Architect.

3.5 PREPARATION OF SUBGRADE

A. Refer to Section 32 91 00, PLANTING SOIL.

3.6 SPREADING OF PLANTING SOIL

A. Planting soil shall be spread and placed to required depths. Refer to Section 32 91 00, PLANTING SOIL.

B. Surfaces shall be graded and smoothed, eliminating all sharp breaks by rounding, scraping off bumps and ridges, and filling in holes and cuts.

3.7 PLANTING

A. Conduct installation so as to protect new and existing landscaping, site electric, drainage systems, paving, structures, walls, footings and foundations, waterproofing, and other work and utilities, from damage. Report damage to work of other trade(s) to Client, Owner's Representative, or Landscape Architect immediately. Make or arrange repairs to satisfaction of Client, Owner's Representative, or Landscape Architect.

B. Containerized plants shall be removed from container taking care not to damage roots. For trees and shrubs, the side of the root ball shall be scarified to prevent root-bound condition. Any wire baskets shall be completely cut away from sides of root ball and removed from pit. Bottom of baskets may remain.

C. The root system of each plant, regardless of root ball package type, shall be observed by the Contractor, at the time of planting to confirm that the roots meet the requirements for plant root quality in Part 2: Products.
   1. The Contractor shall undertake at the time of planting, all modifications to the root system required by the Owner's Representative or Client to meet these quality standards.

   2. The amount of excess soil above buttress roots to be removed should be determined in advance by the Landscape Architect. The planting hole should then be dug to a depth that will result in the root ball aligning with finished grade.

D. Set top outer edge of the root ball at the average elevation of the proposed finish. Set the plant plumb and upright in the center of the planting hole. The tree graft, if applicable, shall be visible above the grade. Do not place soil on top of the root ball.

E. Plants shall be turned to the desired orientation when required by the Client, Owner's Representative or Landscape Architect.

F. Planting shall be positioned in center of planting pit, set plumb, and rigidly braced in position until all planting soil has been tamped solidly around the ball.

G. Brace root ball of trees by tamping Planting Soil around the lower portion of the root ball. Place additional Planting Soil around base and sides of ball in six-inch (6") lifts. Lightly tamp each lift using foot pressure or hand tools to settle backfill, support the tree and eliminate voids. DO NOT over compact the backfill or use mechanical or pneumatic tamping equipment.

H. Set plants shall have same relationship to finished grade as in the nursery. Root collars/flares shall be exposed as noted in the Drawings.

I. Planting soil/growth media shall be placed as specified in Section 32 91 00 PLANTING SOILS. Soil shall be worked carefully into voids and pockets, compacting lightly between lifts.
   1. When pit is two-thirds full, plants shall be watered thoroughly, and water left to soak in before proceeding. Do not flood the planting space. If the soil is above field capacity, allow the soil to drain to below field capacity before finishing the planting. Air pockets shall be eliminated and backfill continued until the planting soil is brought to grade level.

   2. At this time, ropes or strings on top of ball shall be cut and shall be pulled back. Burlap or cloth wrapping shall be left intact around ball except that portions of wrap that are exposed at top of ball shall be turned under and buried. Non-biodegradable ball wrapping and support wire shall be totally removed from ball and planting pit.

   3. Remove nursery plant identification tags.

J. Backfilling and tamping shall then be finished and a saucer formed around plant pits as indicated on the Drawings.

K. Saucer shall be filled with water and water left to soak in. Saucer shall then be filled with water again.

L. Avoid walking and using heavy equipment in all planted areas.

3.8 PERENNIALS, GRASSES AND GROUND COVERS

A. Water all plants in original containers prior to layout.

B. Set out and space plants as indicated on the Drawings and Schedule.

C. Dig a planting hole equal to the depth of the root ball.
   1. Recommended planting tools for Landscape Plugs: earth augur or power drill with 3” augur attachment, hand trowel, weeding knife, trenching spade or pick axe

D. Place plant evenly in planting hole and work soil around roots to eliminate air pockets and leave a slight saucer indentation around plants to hold water.

E. Water thoroughly after planting, taking care not to cover plant crowns with wet soil.

F. Protect plants from hot sun and wind; remove protection if plants show evidence of recovery from transplanting shock.

3.9 STAKING AND GUYING

A. All evergreen and deciduous trees 4” caliper or larger to be staked and guyed. Consult Owner’s Representative and/or Client to confirm the need for stakes for each tree after planting. If confirmed, each tree shall be staked or guyed immediately following planting.

B. Tree guying shall utilize the tree staking and guying materials specified. Guying to be tied in such a manner as to create a minimum 12-inch loop to prevent girdling. Refer to manufacturer’s recommendations and the Drawings for installation.
   1. Plants shall stand plumb after staking or guying.
   2. Stakes shall be driven to sufficient depth to hold the tree rigid.
   3. Set vertical stakes and space to avoid penetrating root balls or root masses.
   4. Allow enough slack to avoid rigid restraint of tree.

3.10 STEEL EDGING

A. Refer to Section 05 59 01 METAL EDGING.

3.11 MULCHING

A. Apply 2 inches of mulch, covering the entire planting bed area. Install no more than 1 inch of mulch over the top of the root balls of all plants. Taper when abutting pavement.

B. Lift all leaves, low hanging stems and other green portions of small plants out of the mulch if covered.

3.12 PRUNING

A. Pruning shall be undertaken at the direction of the Landscape Architect. Each tree and shrub shall be pruned to preserve the natural character of the plant. Pruning shall be done after delivery of plants and after plants have been inspected and approved by the Landscape Architect. Pruning procedures shall be reviewed with Landscape Architect before proceeding.

3.13 MAINTENANCE OF PLANTING

A. Maintenance shall begin immediately after each plant is planted and shall continue through guarantee period until Final Acceptance.

B. Maintenance shall consist of pruning, watering, cultivating, weeding, mulching, removal of dead material, repairing and replacing of tree stakes, tightening and repairing of guys, repairing and replacing of damaged tree wrap material, resetting plants to proper grades and upright position, and furnishing and applying such sprays as are necessary to keep plantings free of insects and disease, and in a healthy growing condition.

C. Planting areas shall be kept free of weeds, grass, and other undesired vegetative growth.

3.14 CONSTRUCTION WASTE MANAGEMENT

A. Comply with the requirements of Division 01, GENERAL REQUIREMENTS for removal and disposal of construction debris and waste.
