- G. Field quality-control test reports.
- H. Operation and Maintenance Data: For air-mounting systems to include in operation and maintenance manuals.

## 1.5 QUALITY ASSURANCE

- A. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.
- B. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.
- C. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- D. Seismic-restraint devices shall have horizontal and vertical load testing and analysis and shall bear anchorage preapproval OPA number from OSHPD, preapproval by ICC-ES, or preapproval by another agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are not available, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified professional engineer.

## PART 2 - PRODUCTS

### 2.1 VIBRATION ISOLATORS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Ace Mountings Co., Inc.
  - 2. Amber/Booth Company, Inc.
  - 3. California Dynamics Corporation.
  - 4. Isolation Technology, Inc.
  - 5. Kinetics Noise Control.
  - 6. Mason Industries.
  - 7. Vibration Eliminator Co., Inc.
  - 8. Vibration Isolation.
  - 9. Vibration Mountings & Controls, Inc.
- B. Mounts Double-deflection type, with molded, oil-resistant rubber, hermetically sealed compressed fiberglass, or neoprene isolator elements with factory-drilled, encapsulated top plate for bolting to equipment and with baseplate for bolting to structure. Color-code or otherwise identify to indicate capacity range.
  - 1. Materials: Cast-ductile-iron or welded steel housing containing two separate and opposing, oil-resistant rubber or neoprene elements that prevent central threaded element and attachment hardware from contacting the housing during normal operation.
  - 2. Neoprene: Shock-absorbing materials compounded according to the standard for bridge-bearing neoprene as defined by AASHTO.

- C. Restrained Spring Isolators Freestanding, steel, open-spring isolators with seismic or limit-stop restraint.
  - 1. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to weight being removed; factory-drilled baseplate bonded to 1/4-inch- thick, neoprene or rubber isolator pad attached to baseplate underside; and adjustable equipment mounting and leveling bolt that acts as blocking during installation.
  - 2. Restraint: Seismic or limit stop as required for equipment and authorities having jurisdiction.
  - 3. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
  - 4. Minimum Additional Travel: 50 percent of the required deflection at rated load.
  - 5. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
  - 6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
  
- D. Pipe Riser Resilient Support: All-directional, acoustical pipe anchor consisting of 2 steel tubes separated by a minimum of 1/2-inch- thick neoprene. Include steel and neoprene vertical-limit stops arranged to prevent vertical travel in both directions. Design support for a maximum load on the isolation material of 500 psig and for equal resistance in all directions.
  
- E. Resilient Pipe Guides: Telescopic arrangement of 2 steel tubes or post and sleeve arrangement separated by a minimum of 1/2-inch- thick neoprene. Where clearances are not readily visible, a factory-set guide height with a shear pin to allow vertical motion due to pipe expansion and contraction shall be fitted. Shear pin shall be removable and reinsertable to allow for selection of pipe movement. Guides shall be capable of motion to meet location requirements.

## 2.2 SEISMIC-RESTRAINT DEVICES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Amber/Booth Company, Inc.
  - 2. California Dynamics Corporation.
  - 3. Cooper B-Line, Inc.; a division of Cooper Industries.
  - 4. Hilti, Inc.
  - 5. Kinetics Noise Control.
  - 6. Loos & Co.; Cableware Division.
  - 7. Mason Industries.
  - 8. TOLCO Incorporated; a brand of NIBCO INC.
  - 9. Unistrut; Tyco International, Ltd.
  
- B. General Requirements for Restraint Components: Rated strengths, features, and applications shall be as defined in reports by an agency acceptable to authorities having jurisdiction.
  - 1. Structural Safety Factor: Allowable strength in tension, shear, and pullout force of components shall be at least four times the maximum seismic forces to which they will be subjected.

- C. Snubbers: Factory fabricated using welded structural-steel shapes and plates, anchor bolts, and replaceable resilient isolation washers and bushings.
  - 1. Anchor bolts for attaching to concrete shall be seismic-rated, drill-in, and stud-wedge or female-wedge type.
  - 2. Resilient Isolation Washers and Bushings: Oil- and water-resistant neoprene.
  - 3. Maximum 1/4-inch air gap, and minimum 1/4-inch- thick resilient cushion.
- D. Channel Support System: MFMA-3, shop- or field-fabricated support assembly made of slotted steel channels with accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; and rated in tension, compression, and torsion forces.
- E. Restraint Cables: ASTM A 603 galvanized -steel cables with end connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for restraining cable service; and with a minimum of two clamping bolts for cable engagement.
- F. Hanger Rod Stiffener: Reinforcing steel angle clamped to hanger rod.
- G. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.
- H. Mechanical Anchor Bolts: Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488. Minimum length of eight times diameter.

## 2.3 FACTORY FINISHES

- A. Finish: Manufacturer's standard prime-coat finish ready for field painting.
- B. Finish: Manufacturer's standard paint applied to factory-assembled and -tested equipment before shipping.
  - 1. Powder coating on springs and housings.
  - 2. All hardware shall be galvanized. Hot-dip galvanize metal components for exterior use.
  - 3. Baked enamel or powder coat for metal components on isolators for interior use.
  - 4. Color-code or otherwise mark vibration isolation and seismic-control devices to indicate capacity range.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Examine areas and equipment to receive vibration isolation and seismic-control devices for compliance with requirements for installation tolerances and other conditions affecting performance.

- B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.2 APPLICATIONS

- A. Multiple Pipe Supports: Secure pipes to trapeze member with clamps approved for application by an agency acceptable to authorities having jurisdiction.
- B. Hanger Rod Stiffeners: Install hanger rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods due to seismic forces.
- C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static and seismic loads within specified loading limits.

### 3.3 VIBRATION-CONTROL AND SEISMIC-RESTRAINT DEVICE INSTALLATION

- A. Comply with requirements in Division 07 Section "Roof Accessories" for installation of roof curbs, equipment supports, and roof penetrations.
- B. Equipment Restraints:
  - 1. Install resilient bolt isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch.
  - 2. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction providing required submittals for component.
- C. Piping Restraints:
  - 1. Comply with requirements in MSS SP-127.
  - 2. Space lateral supports a maximum of 40 feet o.c., and longitudinal supports a maximum of 80 feet o.c.
  - 3. Brace a change of direction longer than 12 feet.
- D. Install cables so they do not bend across edges of adjacent equipment or building structure.
- E. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction providing required submittals for component.
- F. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.
- G. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.
- H. Drilled-in Anchors:
  - 1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or

drilling. Notify the structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.

2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
4. Adhesive Anchors: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.
5. Set anchors to manufacturer's recommended torque, using a torque wrench.
6. Install zinc-coated steel anchors for interior and stainless-steel anchors for exterior applications.

### 3.4 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION

- A. Install flexible connections in piping where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where the connections terminate with connection to equipment that is anchored to a different structural element from the one supporting the connections as they approach equipment. Comply with requirements in Division 22 Section "Hydronic Piping" for piping flexible connections.

### 3.5 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Perform tests and inspections.
- C. Tests and Inspections:
  1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.
  2. Schedule test with Owner, through Architect, before connecting anchorage device to restrained component (unless postconnection testing has been approved), and with at least seven days' advance notice.
  3. Obtain Architect's approval before transmitting test loads to structure. Provide temporary load-spreading members.
  4. Test at least four of each type and size of installed anchors and fasteners selected by Architect.
  5. Test to 90 percent of rated proof load of device.
  6. Measure isolator restraint clearance.
  7. Measure isolator deflection.
  8. Verify snubber minimum clearances.
  9. If a device fails test, modify all installations of same type and retest until satisfactory results are achieved.
- D. Remove and replace malfunctioning units and retest as specified above.

- E. Prepare test and inspection reports.

### 3.6 ADJUSTING

- A. Adjust isolators after piping system is at operating weight.
- B. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.
- C. Adjust active height of spring isolators.
- D. Adjust restraints to permit free movement of equipment within normal mode of operation.

END OF SECTION 230548

## **SECTION 230553 - IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### **1.2 SUMMARY**

- A. Section Includes:
  - 1. Equipment labels.
  - 2. Pipe labels.
  - 3. Duct labels.
  - 4. Valve tags.

#### **1.3 SUBMITTALS**

- A. Product Data: For each type of product indicated.
- B. Samples: For color, letter style, and graphic representation required for each identification material and device.
- C. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.
- D. Valve numbering scheme.
- E. Valve Schedules: For each piping system to include in maintenance manuals.

#### **1.4 COORDINATION**

- A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.
- B. Coordinate installation of identifying devices with locations of access panels and doors.
- C. Install identifying devices before installing acoustical ceilings and similar concealment.

## **PART 2 - PRODUCTS**

### 2.1 EQUIPMENT LABELS

- A. Metal Labels for Equipment:
  - 1. Material and Thickness: Brass, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.
  - 2. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
  - 3. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
  - 4. Fasteners: Stainless-steel rivets
  - 5. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- B. Label Content: Include equipment's Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Specification Section number and title where equipment is specified.
- C. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2-by-11-inch bond paper. Tabulate equipment identification number and identify Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

### 2.2 PIPE LABELS

- A. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.
- B. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.
- C. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings, pipe size, and an arrow indicating flow direction.
  - 1. Flow-Direction Arrows: Integral with piping system service lettering to accommodate both directions, or as separate unit on each pipe label to indicate flow direction.
  - 2. Lettering Size: At least 1-1/2 inches high.

### 2.3 DUCT LABELS

- A. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.
- B. Letter Color: Black.
- C. Background Color: White.

- D. Maximum Temperature: Able to withstand temperatures up to 160 deg F.
- E. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
- F. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
- G. Fasteners: Stainless-steel rivets.
- H. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- I. Duct Label Contents: Include identification of duct service using same designations or abbreviations as used on Drawings, duct size, and an arrow indicating flow direction.
  - 1. Flow-Direction Arrows: Integral with duct system service lettering to accommodate both directions, or as separate unit on each duct label to indicate flow direction.
  - 2. Lettering Size: At least 1-1/2 inches high.

## 2.4 VALVE TAGS

- A. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers.
  - 1. Tag Material: Brass, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.
  - 2. Fasteners: Brass wire-link or beaded chain; or S-hook.
- B. Valve Schedules: For each piping system, on 8-1/2-by-11-inch bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.
  - 1. Valve-tag schedule shall be included in operation and maintenance data.

## PART 3 - EXECUTION

### 3.1 PREPARATION

- A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

### 3.2 EQUIPMENT LABEL INSTALLATION

- A. Install or permanently fasten labels on each major item of mechanical equipment.

- B. Locate equipment labels where accessible and visible.

### 3.3 PIPE LABEL INSTALLATION

- A. Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:
  - 1. Near each valve and control device.
  - 2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
  - 3. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.
  - 4. At access doors, manholes, and similar access points that permit view of concealed piping.
  - 5. Near major equipment items and other points of origination and termination.
  - 6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.
  - 7. On piping above removable acoustical ceilings. Omit intermediately spaced labels.
- B. Pipe Label Color Schedule:
  - 1. Refrigerant Piping:
    - a. Background Color: Blue.
    - b. Letter Color: Black.
  - 2. Hot Water Piping:
    - a. Background Color: Red.
    - b. Letter Color: Black.
  - 3. Chilled water Piping:
    - a. Background Color: Blue.
    - b. Letter Color: Black.
  - 4. Condenser water piping:
    - a. Background Color: Green.
    - b. Letter Color: Black.
  - 5. Condensate piping
    - a. Background Color: Light Green.
    - b. Letter Color: Black.

### 3.4 DUCT LABEL INSTALLATION

- A. Install self-adhesive duct labels with permanent adhesive on air ducts in the following color codes:
  - 1. Blue: For cold-air supply ducts.

2. Yellow: For hot-air supply ducts.
  3. Green: For exhaust-, outside-, relief-, return-, and mixed-air ducts.
  4. ASME A13.1 Colors and Designs: For hazardous material exhaust.
- B. Stenciled Duct Label Option: Stenciled labels, showing service and flow direction, may be provided instead of plastic-laminated duct labels, at Installer's option, if lettering larger than 1 inch high is needed for proper identification because of distance from normal location of required identification.
- C. Locate labels near points where ducts enter into concealed spaces and at maximum intervals of 50 feet in each space where ducts are exposed or concealed by removable ceiling system.

### 3.5 VALVE-TAG INSTALLATION

- A. Install tags on valves and control devices in piping systems, except check valves; valves within factory-fabricated equipment units; shutoff valves; faucets; convenience and lawn-watering hose connections; and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.
- B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:
1. Valve-Tag Size and Shape:
    - a. All: 1-1/2 inches round.
    - b. Select contrasting valve-tag color and letter color in two subparagraphs below for each service. Retain "Natural" option for brass or stainless-steel valve tags.
  2. Valve-Tag Color:
    - a. Refrigerant: Blue
    - b. Hot Water: Red
    - c. Chilled Water: Blue
    - d. Condenser Water: Green
    - e. Condensate: Light Green
  3. Letter Color:
    - a. Refrigerant: Black
    - b. Hot Water: Black
    - c. Chilled Water: Black
    - d. Condenser Water: Black
    - e. Condensate: Black

END OF SECTION 230553

## **SECTION 230593 - TESTING, ADJUSTING, AND BALANCING FOR HVAC**

### **PART 1 - GENERAL**

#### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. Section Includes:
  - 1. Balancing Air Systems:
    - a. Constant-volume air systems.
  - 2. Balancing Hydronic Piping Systems:
    - a. Constant-flow hydronic systems.

#### 1.3 DEFINITIONS

- A. AABC: Associated Air Balance Council.
- B. NEBB: National Environmental Balancing Bureau.
- C. TAB: Testing, adjusting, and balancing.
- D. TABB: Testing, Adjusting, and Balancing Bureau.
- E. TAB Specialist: An entity engaged to perform TAB Work.

#### 1.4 SUBMITTALS

- A. LEED Submittal:
  - 1. Air-Balance Report for LEED Prerequisite EQ 1: Documentation of work performed for ASHRAE 62.1-2019, Section 7.2.2, "Air Balancing."
- B. Qualification Data: Within 30 days of Contractor's Notice to Proceed, submit documentation that the TAB contractor and this Project's TAB team members meet the qualifications specified in "Quality Assurance" Article.
- C. Contract Documents Examination Report: Within 30 days of Contractor's Notice to Proceed, submit the Contract Documents review report as specified in Part 3.

- D. Strategies and Procedures Plan: Within **60** days of Contractor's Notice to Proceed, submit TAB strategies and step-by-step procedures as specified in "Preparation" Article.
- E. Certified TAB reports.
- F. Sample report forms.
- G. Instrument calibration reports, to include the following:
  - 1. Instrument type and make.
  - 2. Serial number.
  - 3. Application.
  - 4. Dates of use.
  - 5. Dates of calibration.

#### 1.5 QUALITY ASSURANCE

- A. TAB Contractor Qualifications: Engage a TAB entity certified by NEBB or TABB.
  - 1. TAB Field Supervisor: Employee of the TAB contractor and certified by NEBB or TABB.
  - 2. TAB Technician: Employee of the TAB contractor and who is certified by NEBB or TABB as a TAB technician.
- B. TAB Conference: Meet with Architect on approval of the TAB strategies and procedures plan to develop a mutual understanding of the details. Require the participation of the TAB field supervisor and technicians. Provide seven days' advance notice of scheduled meeting time and location.
  - 1. Agenda Items:
    - a. The Contract Documents examination report.
    - b. The TAB plan.
    - c. Coordination and cooperation of trades and subcontractors.
    - d. Coordination of documentation and communication flow.
- C. Certify TAB field data reports and perform the following:
  - 1. Review field data reports to validate accuracy of data and to prepare certified TAB reports.
  - 2. Certify that the TAB team complied with the approved TAB plan and the procedures specified and referenced in this Specification.
- D. TAB Report Forms: Use standard TAB contractor's forms approved by Architect
- E. Instrumentation Type, Quantity, Accuracy, and Calibration: As described in ASHRAE 111, Section 5, "Instrumentation."

## 1.6 PROJECT CONDITIONS

- A. Full Owner Occupancy: Owner will occupy the site and existing building during entire TAB period. Cooperate with Owner during TAB operations to minimize conflicts with Owner's operations.
- B. Partial Owner Occupancy: Owner may occupy completed areas of building before Substantial Completion. Cooperate with Owner during TAB operations to minimize conflicts with Owner's operations.

## 1.7 COORDINATION

- A. Notice: Provide seven days' advance notice for each test. Include scheduled test dates and times.
- B. Perform TAB after leakage and pressure tests on air and water distribution systems have been satisfactorily completed.

## **PART 2 - PRODUCTS (Not Applicable)**

## **PART 3 - EXECUTION**

### 3.1 EXAMINATION

- A. Examine the Contract Documents to become familiar with Project requirements and to discover conditions in systems' designs that may preclude proper TAB of systems and equipment.
- B. Examine systems for installed balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers. Verify that locations of these balancing devices are accessible.
- C. Examine the approved submittals for HVAC systems and equipment.
- D. Examine design data including HVAC system descriptions, statements of design assumptions for environmental conditions and systems' output, and statements of philosophies and assumptions about HVAC system and equipment controls.
- E. Examine equipment performance data including fan and pump curves.
  - 1. Relate performance data to Project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.
  - 2. Calculate system-effect factors to reduce performance ratings of HVAC equipment when installed under conditions different from the conditions used to rate equipment performance. To calculate system effects for air systems, use tables and charts found in AMCA 201, "Fans and Systems," or in SMACNA's "HVAC Systems - Duct Design." Compare results with the design data and installed conditions.

- F. Examine system and equipment installations and verify that field quality-control testing, cleaning, and adjusting specified in individual Sections have been performed.
- G. Examine test reports specified in individual system and equipment Sections.
- H. Examine HVAC equipment and filters and verify that bearings are greased, belts are aligned and tight, and equipment with functioning controls is ready for operation.
- I. Examine strainers. Verify that startup screens are replaced by permanent screens with indicated perforations.
- J. Examine three-way valves for proper installation for their intended function of diverting or mixing fluid flows.
- K. Examine heat-transfer coils for correct piping connections and for clean and straight fins.
- L. Examine system pumps to ensure absence of entrained air in the suction piping.
- M. Examine operating safety interlocks and controls on HVAC equipment.
- N. Report deficiencies discovered before and during performance of TAB procedures. Observe and record system reactions to changes in conditions. Record default set points if different from indicated values.

### 3.2 PREPARATION

- A. Prepare a TAB plan that includes strategies and step-by-step procedures.
- B. Complete system-readiness checks and prepare reports. Verify the following:
  - 1. Permanent electrical-power wiring is complete.
  - 2. Hydronic systems are filled, clean, and free of air.
  - 3. Automatic temperature-control systems are operational.
  - 4. Equipment and duct access doors are securely closed.
  - 5. Balance, smoke, and fire dampers are open.
  - 6. Isolating and balancing valves are open and control valves are operational.
  - 7. Ceilings are installed in critical areas where air-pattern adjustments are required and access to balancing devices is provided.
  - 8. Windows and doors can be closed so indicated conditions for system operations can be met.

### 3.3 GENERAL PROCEDURES FOR TESTING AND BALANCING

- A. Perform testing and balancing procedures on each system according to the procedures contained in ASHRAE 111 and in this Section.
  - 1. Comply with requirements in ASHRAE 62.1-2004, Section 7.2.2, "Air Balancing."
- B. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary for TAB procedures.

1. After testing and balancing, patch probe holes in ducts with same material and thickness as used to construct ducts.
  2. After testing and balancing, install test ports and duct access doors that comply with requirements in Division 23 Section "Air Duct Accessories."
  3. Install and join new insulation that matches removed materials. Restore insulation, coverings, vapor barrier, and finish according to Division 23 Section "HVAC Insulation."
- C. Mark equipment and balancing devices, including damper-control positions, valve position indicators, fan-speed-control levers, and similar controls and devices, with paint or other suitable, permanent identification material to show final settings.
- D. Take and report testing and balancing measurements in inch-pound (IP) units.

### 3.4 GENERAL PROCEDURES FOR BALANCING AIR SYSTEMS

- A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.
- B. Prepare schematic diagrams of systems' "as-built" duct layouts.
- C. Determine the best locations in main and branch ducts for accurate duct-airflow measurements.
- D. Check airflow patterns from the outdoor-air louvers and dampers and the return- and exhaust-air dampers through the supply-fan discharge and mixing dampers.
- E. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.
- F. Verify that motor starters are equipped with properly sized thermal protection.
- G. Check dampers for proper position to achieve desired airflow path.
- H. Check for airflow blockages.
- I. Check condensate drains for proper connections and functioning.
- J. Check for proper sealing of air-handling-unit components.
- K. Verify that air duct system is sealed as specified in Division 23 Section "Metal Ducts."

### 3.5 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS

- A. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.
  1. Measure total airflow.
    - a. Where sufficient space in ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow.

2. Measure fan static pressures as follows to determine actual static pressure:
    - a. Measure outlet static pressure as far downstream from the fan as practical and upstream from restrictions in ducts such as elbows and transitions.
    - b. Measure static pressure directly at the fan outlet or through the flexible connection.
    - c. Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from the flexible connection, and downstream from duct restrictions.
    - d. Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.
  3. Measure static pressure across each component that makes up an air-handling unit, rooftop unit, and other air-handling and -treating equipment.
    - a. Report the cleanliness status of filters and the time static pressures are measured.
  4. Measure static pressures entering and leaving other devices, such as sound traps, heat-recovery equipment, and air washers, under final balanced conditions.
  5. Review Record Documents to determine variations in design static pressures versus actual static pressures. Calculate actual system-effect factors. Recommend adjustments to accommodate actual conditions.
  6. Obtain approval from Architect for adjustment of fan speed higher or lower than indicated speed. Comply with requirements in Division 23 Sections for air-handling units for adjustment of fans, belts, and pulley sizes to achieve indicated air-handling-unit performance.
  7. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload will occur. Measure amperage in full-cooling, full-heating, economizer, and any other operating mode to determine the maximum required brake horsepower.
- B. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows within specified tolerances.
1. Measure airflow of submain and branch ducts.
    - a. Where sufficient space in submain and branch ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow for that zone.
  2. Measure static pressure at a point downstream from the balancing damper, and adjust volume dampers until the proper static pressure is achieved.
  3. Remeasure each submain and branch duct after all have been adjusted. Continue to adjust submain and branch ducts to indicated airflows within specified tolerances.
- C. Measure air outlets and inlets without making adjustments.
1. Measure terminal outlets using a direct-reading hood or outlet manufacturer's written instructions and calculating factors.

- D. Adjust air outlets and inlets for each space to indicated airflows within specified tolerances of indicated values. Make adjustments using branch volume dampers rather than extractors and the dampers at air terminals.
  - 1. Adjust each outlet in same room or space to within specified tolerances of indicated quantities without generating noise levels above the limitations prescribed by the Contract Documents.
  - 2. Adjust patterns of adjustable outlets for proper distribution without drafts.

### 3.6 PROCEDURES FOR VARIABLE-AIR-VOLUME SYSTEMS

- A. Compensating for Diversity: When the total airflow of all terminal units is more than the indicated airflow of the fan, place a selected number of terminal units at a minimum set-point airflow with the remainder at maximum-airflow condition until the total airflow of the terminal units equals the indicated airflow of the fan. Select the reduced-airflow terminal units so they are distributed evenly among the branch ducts.
- B. Pressure-Independent, Variable-Air-Volume Systems: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
  - 1. Set outdoor-air dampers at minimum, and set return- and exhaust-air dampers at a position that simulates full-cooling load.
  - 2. Select the terminal unit that is most critical to the supply-fan airflow and static pressure. Measure static pressure. Adjust system static pressure so the entering static pressure for the critical terminal unit is not less than the sum of the terminal-unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge system losses.
  - 3. Measure total system airflow. Adjust to within indicated airflow.
  - 4. Set terminal units at maximum airflow and adjust controller or regulator to deliver the designed maximum airflow. Use terminal-unit manufacturer's written instructions to make this adjustment. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
  - 5. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow the same as described for constant-volume air systems.
    - a. If air outlets are out of balance at minimum airflow, report the condition but leave outlets balanced for maximum airflow.
  - 6. Remeasure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow.
    - a. Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.
  - 7. Measure static pressure at the most critical terminal unit and adjust the static-pressure controller at the main supply-air sensing station to ensure that adequate static pressure is maintained at the most critical unit.
  - 8. Record final fan-performance data.

- C. Pressure-Dependent, Variable-Air-Volume Systems without Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
1. Balance variable-air-volume systems the same as described for constant-volume air systems.
  2. Set terminal units and supply fan at full-airflow condition.
  3. Adjust inlet dampers of each terminal unit to indicated airflow and verify operation of the static-pressure controller. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
  4. Readjust fan airflow for final maximum readings.
  5. Measure operating static pressure at the sensor that controls the supply fan if one is installed, and verify operation of the static-pressure controller.
  6. Set supply fan at minimum airflow if minimum airflow is indicated. Measure static pressure to verify that it is being maintained by the controller.
  7. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow the same as described for constant-volume air systems.
    - a. If air outlets are out of balance at minimum airflow, report the condition but leave the outlets balanced for maximum airflow.
  8. Measure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow.
    - a. Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.
- D. Pressure-Dependent, Variable-Air-Volume Systems with Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
1. Set system at maximum indicated airflow by setting the required number of terminal units at minimum airflow. Select the reduced-airflow terminal units so they are distributed evenly among the branch ducts.
  2. Adjust supply fan to maximum indicated airflow with the variable-airflow controller set at maximum airflow.
  3. Set terminal units at full-airflow condition.
  4. Adjust terminal units starting at the supply-fan end of the system and continuing progressively to the end of the system. Adjust inlet dampers of each terminal unit to indicated airflow. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
  5. Adjust terminal units for minimum airflow.
  6. Measure static pressure at the sensor.
  7. Measure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow. Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.

### 3.7 GENERAL PROCEDURES FOR HYDRONIC SYSTEMS

- A. Prepare test reports with pertinent design data, and number in sequence starting at pump to end of system. Check the sum of branch-circuit flows against the approved pump flow rate. Correct variations that exceed plus or minus 5 percent.
- B. Prepare schematic diagrams of systems' "as-built" piping layouts.
- C. Prepare hydronic systems for testing and balancing according to the following, in addition to the general preparation procedures specified above:
  - 1. Open all manual valves for maximum flow.
  - 2. Check liquid level in expansion tank.
  - 3. Check makeup water-station pressure gage for adequate pressure for highest vent.
  - 4. Check flow-control valves for specified sequence of operation, and set at indicated flow.
  - 5. Set differential-pressure control valves at the specified differential pressure. Do not set at fully closed position when pump is positive-displacement type unless several terminal valves are kept open.
  - 6. Set system controls so automatic valves are wide open to heat exchangers.
  - 7. Check pump-motor load. If motor is overloaded, throttle main flow-balancing device so motor nameplate rating is not exceeded.
  - 8. Check air vents for a forceful liquid flow exiting from vents when manually operated.

### 3.8 PROCEDURES FOR CONSTANT AND VARIABLE FLOW HYDRONIC SYSTEMS

- A. Measure flow at all pressure-independent characterized control valves, with valves in fully open position, to verify that valves are functioning as designed.
- B. Set calibrated balancing valves, if installed, at calculated presettings.
- C. Measure flow at all stations and adjust, where necessary, to obtain first balance.
  - 1. System components that have Cv rating or an accurately cataloged flow-pressure-drop relationship may be used as a flow-indicating device.
- D. Adjust balancing stations to within specified tolerances of indicated flow rate as follows:
  - 1. Determine the balancing station with the highest percentage over indicated flow.
  - 2. Adjust each station in turn, beginning with the station with the highest percentage over indicated flow and proceeding to the station with the lowest percentage over indicated flow.
  - 3. Record settings and mark balancing devices.
- E. Measure the differential-pressure-control-valve settings existing at the conclusion of balancing.
- F. Check settings and operation of each safety valve. Record settings.

### 3.9 PROCEDURES FOR MOTORS

A. Motors, 1/2 HP and Larger: Test at final balanced conditions and record the following data:

1. Manufacturer's name, model number, and serial number.
2. Motor horsepower rating.
3. Motor rpm.
4. Efficiency rating.
5. Nameplate and measured voltage, each phase.
6. Nameplate and measured amperage, each phase.
7. Starter thermal-protection-element rating.

### 3.10 PROCEDURES FOR TESTING, ADJUSTING, AND BALANCING EXISTING SYSTEMS

A. Perform a preconstruction inspection of existing equipment that is to remain and be reused.

1. Measure and record the operating speed, airflow, and static pressure of each fan.
2. Measure motor voltage and amperage. Compare the values to motor nameplate information.
3. Check the refrigerant charge.
4. Check the condition of filters.
5. Check the condition of coils.
6. Check the operation of the drain pan and condensate-drain trap.
7. Check bearings and other lubricated parts for proper lubrication.
8. Report on the operating condition of the equipment and the results of the measurements taken. Report deficiencies.

B. Before performing testing and balancing of existing systems, inspect existing equipment that is to remain and be reused to verify that existing equipment has been cleaned and refurbished. Verify the following:

1. New filters are installed.
2. Coils are clean and fins combed.
3. Drain pans are clean.
4. Fans are clean.
5. Bearings and other parts are properly lubricated.
6. Deficiencies noted in the preconstruction report are corrected.

C. Perform testing and balancing of existing systems to the extent that existing systems are affected by the renovation work.

1. Compare the indicated airflow of the renovated work to the measured fan airflows, and determine the new fan speed and the face velocity of filters and coils.
2. Verify that the indicated airflows of the renovated work result in filter and coil face velocities and fan speeds that are within the acceptable limits defined by equipment manufacturer.
3. If calculations increase or decrease the air flow rates and water flow rates by more than 5 percent, make equipment adjustments to achieve the calculated rates. If increase or decrease is 5 percent or less, equipment adjustments are not required.
4. Balance each air outlet.

### 3.11 TOLERANCES

- A. Set HVAC system's air flow rates and water flow rates within the following tolerances:
  - 1. Supply, Return, and Exhaust Fans and Equipment with Fans: Plus or minus 10 percent
  - 2. Air Outlets and Inlets: Plus or minus 10 percent.
  - 3. Heating-Water Flow Rate: Plus or minus 10 percent

### 3.12 REPORTING

- A. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in "Examination" Article, prepare a report on the adequacy of design for systems' balancing devices. Recommend changes and additions to systems' balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices.
- B. Status Reports: Prepare monthly progress reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced. Prepare a separate report for each system and each building floor for systems serving multiple floors.

### 3.13 FINAL REPORT

- A. General: Prepare a certified written report; tabulate and divide the report into separate sections for tested systems and balanced systems.
  - 1. Include a certification sheet at the front of the report's binder, signed and sealed by the certified testing and balancing engineer.
  - 2. Include a list of instruments used for procedures, along with proof of calibration.
- B. Final Report Contents: In addition to certified field-report data, include the following:
  - 1. Pump curves.
  - 2. Fan curves.
  - 3. Manufacturers' test data.
  - 4. Field test reports prepared by system and equipment installers.
  - 5. Other information relative to equipment performance; do not include Shop Drawings and product data.
- C. General Report Data: In addition to form titles and entries, include the following data:
  - 1. Title page.
  - 2. Name and address of the TAB contractor.
  - 3. Project name.
  - 4. Project location.
  - 5. Architect's name and address.
  - 6. Engineer's name and address.
  - 7. Contractor's name and address.

8. Report date.
  9. Signature of TAB supervisor who certifies the report.
  10. Table of Contents with the total number of pages defined for each section of the report. Number each page in the report.
  11. Summary of contents including the following:
    - a. Indicated versus final performance.
    - b. Notable characteristics of systems.
    - c. Description of system operation sequence if it varies from the Contract Documents.
  12. Nomenclature sheets for each item of equipment.
  13. Notes to explain why certain final data in the body of reports vary from indicated values.
  14. Test conditions for fans and pump performance forms including the following:
    - a. Settings for outdoor-, return-, and exhaust-air dampers.
    - b. Conditions of filters.
    - c. Cooling coil, wet- and dry-bulb conditions.
    - d. Fan drive settings including settings and percentage of maximum pitch diameter.
    - e. Inlet vane settings for variable-air-volume systems.
    - f. Settings for supply-air, static-pressure controller.
    - g. Other system operating conditions that affect performance.
- D. System Diagrams: Include schematic layouts of air and hydronic distribution systems. Present each system with single-line diagram and include the following:
1. Quantities of outdoor, supply, return, and exhaust airflows.
  2. Water and steam flow rates.
  3. Duct, outlet, and inlet sizes.
  4. Pipe and valve sizes and locations.
  5. Terminal units.
  6. Balancing stations.
  7. Position of balancing devices.
- E. Air-Handling-Unit Test Reports: For air-handling units with coils, include the following:
1. Unit Data:
    - a. Unit identification.
    - b. Location.
    - c. Make and type.
    - d. Model number and unit size.
    - e. Manufacturer's serial number.
    - f. Unit arrangement and class.
    - g. Discharge arrangement.
    - h. Sheave make, size in inches (mm), and bore.
    - i. Center-to-center dimensions of sheave, and amount of adjustments in inches (mm).
    - j. Number, make, and size of belts.
    - k. Number, type, and size of filters.
  2. Motor Data:

- a. Motor make, and frame type and size.
  - b. Horsepower and rpm.
  - c. Volts, phase, and hertz.
  - d. Full-load amperage and service factor.
  - e. Sheave make, size in inches, and bore.
  - f. Center-to-center dimensions of sheave, and amount of adjustments in inches.
3. Test Data (Indicated and Actual Values):
- a. Total air flow rate in cfm
  - b. Total system static pressure in inches wg
  - c. Fan rpm.
  - d. Discharge static pressure in inches wg
  - e. Filter static-pressure differential in inches wg
  - f. Preheat-coil static-pressure differential in inches wg.
  - g. Cooling-coil static-pressure differential in inches wg.
  - h. Heating-coil static-pressure differential in inches wg.
  - i. Outdoor airflow in cfm .
  - j. Return airflow in cfm .
  - k. Outdoor-air damper position.
  - l. Return-air damper position.
  - m. Vortex damper position.

F. Apparatus-Coil Test Reports:

1. Coil Data:
  - a. System identification.
  - b. Location.
  - c. Coil type.
  - d. Number of rows.
  - e. Fin spacing in fins per inch o.c.
  - f. Make and model number.
  - g. Face area in sq. ft.
  - h. Tube size in NPS (DN).
  - i. Tube and fin materials.
  - j. Circuiting arrangement.
2. Test Data (Indicated and Actual Values):
  - a. Air flow rate in cfm
  - b. Average face velocity in fpm.
  - c. Air pressure drop in inches wg.
  - d. Outdoor-air, wet- and dry-bulb temperatures in deg F .
  - e. Return-air, wet- and dry-bulb temperatures in deg F .
  - f. Entering-air, wet- and dry-bulb temperatures in deg F.
  - g. Leaving-air, wet- and dry-bulb temperatures in deg F.
  - h. Water flow rate in gpm .
  - i. Water pressure differential in feet of head or psig .
  - j. Entering-water temperature in deg F .
  - k. Leaving-water temperature in deg F .

- l. Refrigerant expansion valve and refrigerant types.
- m. Refrigerant suction pressure in psig.
- n. Refrigerant suction temperature in deg F .
- o. Inlet steam pressure in psig

G. Fan Test Reports: For supply, return, and exhaust fans, include the following:

1. Fan Data:

- a. System identification.
- b. Location.
- c. Make and type.
- d. Model number and size.
- e. Manufacturer's serial number.
- f. Arrangement and class.
- g. Sheave make, size in inches, and bore.
- h. Center-to-center dimensions of sheave, and amount of adjustments in inches.

2. Motor Data:

- a. Motor make, and frame type and size.
- b. Horsepower and rpm.
- c. Volts, phase, and hertz.
- d. Full-load amperage and service factor.
- e. Sheave make, size in inches and bore.
- f. Center-to-center dimensions of sheave, and amount of adjustments in inches.
- g. Number, make, and size of belts.

3. Test Data (Indicated and Actual Values):

- a. Total airflow rate in cfm.
- b. Total system static pressure in inches wg.
- c. Fan rpm.
- d. Discharge static pressure in inches wg.
- e. Suction static pressure in inches wg.

H. Instrument Calibration Reports:

1. Report Data:

- a. Instrument type and make.
- b. Serial number.
- c. Application.
- d. Dates of use.
- e. Dates of calibration.

### 3.14 INSPECTIONS

#### A. Initial Inspection:

1. After testing and balancing are complete, operate each system and randomly check measurements to verify that the system is operating according to the final test and balance readings documented in the final report.
2. Check the following for each system:
  - a. Measure airflow of at least 10 percent of air outlets.
  - b. Measure water flow of at least 5 percent of terminals.
  - c. Measure room temperature at each thermostat/temperature sensor. Compare the reading to the set point.
  - d. Verify that balancing devices are marked with final balance position.
  - e. Note deviations from the Contract Documents in the final report.

#### B. Final Inspection:

1. After initial inspection is complete and documentation by random checks verifies that testing and balancing are complete and accurately documented in the final report, request that a final inspection be made by Architect
2. The TAB contractor's test and balance engineer shall conduct the inspection in the presence of Architect
3. Architect shall randomly select measurements, documented in the final report, to be rechecked. Rechecking shall be limited to either 10 percent of the total measurements recorded or the extent of measurements that can be accomplished in a normal 8-hour business day.
4. If rechecks yield measurements that differ from the measurements documented in the final report by more than the tolerances allowed, the measurements shall be noted as "FAILED."
5. If the number of "FAILED" measurements is greater than 10 percent of the total measurements checked during the final inspection, the testing and balancing shall be considered incomplete and shall be rejected.

#### C. TAB Work will be considered defective if it does not pass final inspections. If TAB Work fails, proceed as follows:

1. Recheck all measurements and make adjustments. Revise the final report and balancing device settings to include all changes; resubmit the final report and request a second final inspection.
2. If the second final inspection also fails, Owner may contract the services of another TAB contractor to complete TAB Work according to the Contract Documents and deduct the cost of the services from the original TAB contractor's final payment.

#### D. Prepare test and inspection reports.

3.15 ADDITIONAL TESTS

- A. Within 90 days of completing TAB, perform additional TAB to verify that balanced conditions are being maintained throughout and to correct unusual conditions.
- B. Seasonal Periods: If initial TAB procedures were not performed during near-peak summer and winter conditions, perform additional TAB during near-peak summer and winter conditions.

END OF SECTION 230593

## **SECTION 230700 - MECHANICAL: INSULATION**

### **PART 1 – GENERAL**

#### 1.1 DESCRIPTION

- A. The work required under this Section shall conform to the requirements of “General Conditions of Contractor for Construction”, “Supplementary General Conditions”, and “Supplementary Conditions for Mechanical and Electrical Trades”.

#### 1.2 WORK INCLUDED

- A. All labor, materials, equipment, and services shall be provided. All operations required for complete installation of insulation and related work, as indicated on the Drawings or specified herein, shall be performed. The execution of the work shall be in strict accordance with the insulation manufacturer’s recommendations and the best practice of the trade.

#### 1.3 GENERAL REQUIREMENTS

- A. Clean and dry all surfaces to be insulated of rust, scale, dirt, oil, water, and other foreign matter.
- B. Apply insulation to completely cover metal surfaces. Apply surface finish to present a tight, smooth appearance.
- C. Apply insulation to permit expansion or contraction of metal without causing damage to insulation or surface finish.
- D. Do not apply seal or cement until all previous application of cements and adhesives have thoroughly dried.
- E. Fill surface imperfections in the insulation such as chipped edges, small joints or cracks, and small voids or holes with insulation material and smooth with a skim coat of insulating cement.
- F. Extend the surface finish to protect all insulation surfaces. No raw edges or ends shall be exposed.
- G. Do not staple through vapor barrier finishes.
- H. Contractor shall submit for approval the name of the manufacturer, type, and conductivity together with samples of insulation material.

#### 1.4 PIPING INSULATION

- A. Fit inside diameter of insulation sections or segments to outside curvature of pipe.
- B. Where standard insulation shapes are not available, cut, score or miter segmental, or flat block to fit contour of pipe. Stagger joints of adjoining segments. Fit insulation carefully and secure with wire. Smooth with insulating cement.
- C. Insulate valves, strainers, fittings, and flanges with identical material density, thickness and surface finish as the piping insulation. Use pre-molded insulation material where available, otherwise use shape block segments wired on with all edges filled with insulated cements or filler.
- D. Insulate the entire surface of fittings and strainers. Insulate valves up to end including bonnets.
- E. Bevel the ends of pipe insulation adjacent to flanges to permit bolt removal. Provide a collar of sectional block insulation over the flanges and extend a minimum of 2" over the adjacent pipe insulation. Fasten with wire or bands to permit easy removal. Fill annular spaces with loose insulation.
- F. Insulate strainers to permit removal of the basket without disturbing the insulation of the strainer body.
- G. Where pipelines pass through floor slab sleeves, interrupt the insulation at the sleeve for all piping services except chilled water and cold water.
- H. Where pipelines pass through interior masonry walls or floor, completely fill the space between outside of pipe or insulation and the inside of the sleeve or frames opening with loose insulation.
- I. Where insulation saddles are used, fill with insulating cement similar to the cement used with the piping insulation.
- J. When in direct contact with the pipe, hangers and supports shall be insulated separately and sealed from the pipe in the same manner as the fittings. The vapor barrier shall be continuous and its integrity maintained throughout.

#### 1.5 DUCTWORK INSULATION

- A. Cut, score, or miter insulation to fit shape and contour of equipment. Where surfaces are flat, cylindrical or regularly curved, use pre-molded blocks or segments. Apply insulation in single layers up to 3" thickness; over 3" thick apply in multiple layers. Stagger the insulation joints.
- B. Provide permanently fastened angles or plates, where required, to support insulation.
- C. Apply insulation on cover plates, heads, and access openings as separate sections, with insulation cut back for access to bolt heads and other fasteners.

- D. Do not insulate over nameplates. Cut back the insulation and line the insulation edges with 24 gauge galvanized steel.

## 1.6 FIRE AND SMOKE REQUIREMENTS

- A. Insulation Materials: All insulations to be of non-combustible materials. All insulations, coverings, vapor barriers, and adhesive to have a flame-spread rating no higher than 25, a fuel contributed rating no higher than 50, and a smoke developed rating no higher than 50. Ratings as determined by the “Method of Test Surface Burning Characteristics of Buildings Materials”, NFPA No. 255, ASTM E84-70, Underwriters’ Laboratories, Inc. Standard.

## PART 2 – PRODUCTS

### 2.1 ACCEPTABLE MANUFACTURERS

- A. The insulation shall be the product of Owens Corning (whose product numbers are specified herein), KNAUF, or Certain Teed Corp. All insulation and adhesives shall have a flame-spread rating no higher than 25 and a smoke developed rating no higher than 50 as determined by test method ASTM E84.

### 2.2 PIPE INSULATION – INDOOR PIPE

- A. Insulation P-1
  - 1. Fiberglass SSL-II heavy density with ASJ/SSL jacket.
  - 2. Maximum K-factor: 0.25 at 75°F mean.
  - 3. Temperature Range: 0°F to 850°F.
- B. Factory Applied Jacket
  - 1. White, flame retardant, all service, vapor barrier jacket of minimum .001” aluminum foil laminated to kraft paper with a flame retardant snuffer type adhesive, reinforced with glass fibers and self-sealing lap.
  - 2. Permeability: .02 perm.
  - 3. Provide 2” longitudinal lap and 4” circumferential sealing strips.
- C. Application
  - 1. Pipe: Fit insulation to pipe, staggering longitudinal joints. Seal laps and sealing strips applied on circumferential joints per manufacturer’s recommendations.

2. Fittings, Valves, and Flanges: Apply fabricated segments of insulation or pre-molded PVC fitting covers equal in thickness to adjoining pipe insulation.

D. Surface Finish

1. Piping – Exposed and Concealed: None.

2.3 PIPE INSULATION – OUTDOOR PIPE

A. Insulation P-2

1. Fiberglass SSL-II heavy density with ASJ/SSL jacket.
2. Maximum K-factor: 0.25 at 75°F mean.
3. Temperature Range: 0°F to 850°F.

B. Factory Applied Jacket

1. White, flame retardant, all service, vapor barrier jacket of minimum .001” aluminum foil laminated to kraft paper with a flame retardant snuffer type adhesive, reinforced with glass fibers and self-sealing lap.
2. Permeability: .02 perm.
3. Provide 2” longitudinal lap and 4” circumferential sealing strips.

C. Application

1. Pipe: Fit insulation to pipe, staggering longitudinal joints. Seal laps and sealing strips applied on circumferential joints per manufacturer’s recommendations.
2. Fittings, Valves, and Flanges: Apply fabricated segments of insulation or pre-molded PVC fitting covers equal in thickness to adjoining pipe insulation.
3. All outdoor piping shall be provided with aluminum jacket over insulation installed with seams down.

D. Surface Finish

1. Piping – Exposed and Concealed: None.

2.4 DUCT INSULATION – FLEXIBLE BLANKET – TYPE D-2

A. Insulation

1. Flexible fibrous glass blanket.

2. Minimum Density: 1 ½ pounds per cubic foot.
  3. Maximum K-factor: 0.27 at 75°F mean.
  4. Temperature Range: 40°F to 250°F.
- B. Factory Applied Facing: Vapor barrier facing of minimum 0.7 mil aluminum foil laminated to fire-resistant Kraft paper and reinforced with glass fibers. Permeability -- 0.02 perm.
- C. Installation
1. Prepare metal surface to receive adhesive in accordance with the requirements of the adhesive manufacturer.
  2. Cement insulation to duct with fire-resistive adhesive of brush consistency and secure with annealed copper wires spaces not more than 12” on center.
  3. Seal all insulation joints with pressure-sensitive tape matching the facing to maintain vapor barrier
  4. Provide 1” acoustic lining of first 10 feet from self-contained rooftop units. Duct sizes on drawings are free area sizes. Acoustic lining on switch area systems are limited to 10 feet upstream of return fans only.
- D. Alternate Manufacturers
1. Certain Teed: “Duct Wrap”
  2. KNAUF Fiberglass: “Duct Wrap”

2.5 INSULATION SCHEDULE

A. Pipe

<u>Service</u>	<u>Pipe Size</u>	<u>Spec. Type</u>	<u>Thickness</u>
Chilled Water, Indoor	All	P-1	1”
Condenser water, indoor	All	P-1	1”
Condenser water, outdoor	All	P-2	1”
Hot Water, Indoor	0 - 1 1/2”	P-1	1 1/2”
	>1 1/2”	P-1	2”
Refrigerant	All	P-1	1 1/2”

Condensate Drain Piping at HVAC Units	All	P-2	1"
---------------------------------------	-----	-----	----

- B. Ductwork and plenums shall be insulated per the schedule below unless otherwise noted on the drawings.

<u>Service</u>	<u>Description</u>	<u>Type</u>	<u>Thickness</u>
Outdoor Air	All	D-2	1 1/2"
AC Supply and return 15 feet from units	All	Interior lining	1"
AC Supply (other)	All	D-2	1 1/2"

**PART 3 – EXECUTION**

3.1 INSTALLATION AND WORKMANSHIP

- A. No insulation shall be applied until all tests have been completed. Only insulation and finish materials including adhesives, cements, and mastics, which conform to the requirements of all governing codes and ordinances, shall be used.

END OF SECTION

## **SECTION 230923 - DIRECT DIGITAL CONTROL SYSTEM FOR HVAC**

### **PART 1 GENERAL**

#### **1.1 SECTION INCLUDES**

- A. Building Management System (BMS), utilizing direct digital controls. (WEBsN4)

#### **1.2 RELATED WORK SPECIFIED ELSEWHERE**

- A. Products Supplied but Not Installed Under This Section:
  - 1. Control valves.
  - 2. Flow switches.
  - 3. Wells, sockets and other inline hardware for water sensors (temperature, pressure, flow).
  - 4. Automatic control dampers, where not supplied with equipment.
  - 5. Airflow measuring stations.
  - 6. Terminal unit controllers and actuators, when installed by terminal unit manufacturer.
  - 7. Variable frequency drives. (This does not include VFDs integral to machinery such as chillers or boilers).
- B. Products Installed but Not Supplied Under This Section:
  - 1. None.
- C. Products Not Furnished or Installed but Integrated with the Work of This Section:
  - 1. Chiller control systems.
  - 2. Boiler control systems.
  - 3. Pump control packages.
  - 4. In-line meters (gas, water, power).
  - 5. Refrigerant monitors.
  - 6. Chemical water treatment.
  - 7. Smoke detectors (through alarm relay contacts).
- D. Work Required Under Other Divisions Related to This Section:
  - 1. Power wiring to line side of motor starters, disconnects or variable frequency drives.
  - 2. Provision and wiring of smoke detectors and other devices relating to fire alarm system.
  - 3. Campus LAN (Ethernet) connection adjacent to JACE network management controller.

#### **1.3 RELATED SECTIONS**

- A. Section 23 05 00 - Common Work Results for HVAC.

#### **1.4 SYSTEM DESCRIPTION**

Scope: Furnish all labor, materials and equipment necessary for a complete and operating Building Management System (BMS), utilizing Direct Digital Controls as shown on the drawings and as described herein. Drawings are diagrammatic only. All controllers furnished in this section shall communicate on a peer-to-peer bus over an open protocol bus (Examples: LonTalk, BACnet, MODBUS). The BMS system for the new addition shall be interconnected with the existing

Andover control system in the existing building. All graphics and control logic shall be incorporated into the new system.

1. The intent of this specification is to provide a system that is consistent with BMS systems throughout the owner's facilities running the Niagara 4 Framework.
  2. System architecture shall fully support a multi-vendor environment and be able to integrate third party systems via existing vendor protocols including, as a minimum, LonTalk, BACnet and MODBUS.
  3. System architecture shall provide secure Web access using any of the current versions of Microsoft Internet Explorer, Mozilla Firefox, or Google Chrome browsers from any computer on the owner's LAN.
  4. All control devices furnished with this Section shall be programmable directly from the Niagara 4 Workbench embedded toolset upon completion of this project. The use of configurable or programmable controllers that require additional software tools for post-installation maintenance shall not be acceptable.
  5. Any control vendor that shall provide additional BMS server software shall be unacceptable. Only systems that utilize the Niagara 4 Framework shall satisfy the requirements of this section.
  6. The BMS server shall host all graphic files for the control system. All graphics and navigation schemes for this project shall match those that are on the existing campus NiagaraAX or Niagara 4 Framework server.
  7. A laptop computer including engineering/programming software to modify Operating System Server BMS programs and graphics shall be included.
  8. Owner shall receive all Administrator level login and passwords for engineering toolset at first training session. The Owner shall have full licensing and full access rights for all network management, operating system server, engineering and programming software required for the ongoing maintenance and operation of the BMS.
  9. OPEN NIC STATEMENTS - All Niagara 4 software licenses shall have the following NiCS: "accept.station.in=\*"; "accept.station.out=\*"and "accept.wb.in=\*"and "accept.wb.out=\*". All open NIC statements shall follow Niagara Open NIC specifications.
  10. All JACE hardware licenses and certificates shall be stored on local MicroSD memory card employing encrypted "safe boot" technology.
  11. To ensure quality, any JACE 3E, 6E, or 7 hardware products used on this project shall come through the Tridium Richmond, VA shipping facility. JACE hardware products not meeting this requirement will not be allowed.
- B. All products of the BMS shall be provided with the following agency approvals. Verification that the approvals exist for all submitted products shall be provided on request, with the submittal package. Systems or products not currently offering the following approvals are not acceptable.
1. Federal Communications Commission (FCC), Rules and Regulations, Volume II -July 1986 Part 15 Class A Radio Frequency Devices.
  2. FCC, Part 15, Subpart B, Class B
  3. FCC, Part 15, Subpart C
  4. FCC, Part 15, Subpart J, Class A Computing Devices.
  5. UL 504 - Industrial Control Equipment.
  6. UL 506 - Specialty Transformers.
  7. UL 910 - Test Method for Fire and Smoke Characteristics of Electrical and Optical-Fiber Cables Used in Air-Handling Spaces.

8. UL 916 - Energy Management Systems All.
9. UL 1449 - Transient Voltage Suppression.
10. Standard Test for Flame Propagation Height of Electrical and Optical - Fiber Cables Installed Vertically in Shafts.
11. EIA/ANSI 232-E - Interface Between Data Technical Equipment and Data Circuit Terminal Equipment Employing Serial Binary Data Interchange.
12. EIA 455 - Standard Test Procedures for Fiber Optic Fibers, Cables, Transducers, Connecting and Terminating Devices.
13. IEEE C62.41- Surge Voltages in Low-Voltage AC Power Circuits.
14. IEEE 142 - Recommended Practice for Grounding of Industrial and Commercial Power Systems.
  - a. NEMA 250 - Enclosures for Electrical Equipment.
15. NEMA ICS 1 - Industrial Controls and Systems.
16. NEMA ST 1 - Specialty Transformers.
17. NCSBC Compliance, Energy: Performance of control system shall meet or surpass the requirements of ASHRAE/IESNA 90.1-1999.
18. CE 61326.
19. C-Tick.
20. cUL.

## 1.5 SPECIFICATION NOMENCLATURE

- A. Acronyms used in this specification are as follows:
1. Actuator: Control device that opens or closes valve or damper in response to control signal.
  2. AI: Analog Input.
  3. AO: Analog Output.
  4. Analog: Continuously variable state over stated range of values.
  5. AUC: Advanced Unitary Controller.
  6. BCT: BACnet Touchscreen Communicating Thermostat.
  7. BMS: Building Management System.
  8. DDC: Direct Digital Control.
  9. Discrete: Binary or digital state.
  10. DI: Discrete Input.
  11. DO: Discrete Output.
  12. FC: Fail Closed position of control device or actuator. Device moves to closed position on loss of control signal or energy source.
  13. FO: Fail open (position of control device or actuator). Device moves to open position on loss of control signal or energy source.
  14. GUI: Graphical User Interface.
  15. HMI: Human Machine Interface.
  16. HVAC: Heating, Ventilating and Air Conditioning.
  17. IDC: Interoperable Digital Controller.
  18. ILC: Interoperable Lon Controller.
  19. LAN: Local Area Network.
  20. Modulating: Movement of a control device through an entire range of values, proportional to an infinitely variable input value.
  21. Motorized: Control device with actuator.
  22. NAC: Network Area Controller.
  23. NC: Normally closed position of switch after control signal is removed or normally

- closed position of manually operated valves or dampers.
24. NO: Normally open position of switch after control signal is removed; or the open position of a controlled valve or damper after the control signal is removed; or the usual position of a manually operated valve.
  25. OSS: Operating System Server, host for system graphics, alarms, trends, etc.
  26. Operator: Same as actuator.
  27. PC: Personal Computer.
  28. Peer-to-Peer: Mode of communication between controllers in which each device connected to network has equal status and each shares its database values with all other devices connected to network.
  29. P: Proportional control; control mode with continuous linear relationship between observed input signal and final controlled output element.
  30. PI: Proportional-Integral control, control mode with continuous proportional output plus additional change in output based on both amount and duration of change in controller variable (reset control).
  31. PICS: BACnet Product Interoperability Compliance Statement.
  32. PICU: Programmable IP Control Unit.
  33. PID: Proportional-Integral-Derivative control, control mode with continuous correction of final controller output element versus input signal based on proportional error, its time history (reset) and rate at which it's changing (derivative).
  34. Point: Analog or discrete instrument with addressable database value.
  35. PPCU: Programmable Plant Control Unit.
  36. UICU: Unitary IP Control Unit.
  37. WAN: Wide Area Network.

## 1.6 SUBMITTALS

- A. Submit under provisions of Section 01 30 00 - Administrative Requirements.
- B. Product Data: Manufacturer's data sheets on each product to be used, including:
  1. Preparation instructions and recommendations.
  2. Storage and handling requirements and recommendations.
  3. Installation methods.
- C. Submit documentation of vendor qualifications, including those indicated in "Quality Assurance" if requested by the A-E.
- D. Five copies of shop drawings of the entire control system shall be submitted and shall consist of a complete list of equipment and materials, including manufacturers' catalog data sheets and installation instructions. Submit in printed electronic format. Samples of written Controller Checkout Sheets and Performance Verification Procedures for applications similar in scope shall be included for approval.
- E. Shop drawings shall also contain complete wiring and schematic diagrams, sequences of operation, control system bus layout and any other details required to demonstrate that the system has been coordinated and will properly function as a system. Terminal identification for all control wiring shall be shown on the shop drawings.
- F. Upon completion of the work, provide 5 complete sets of 'as-built' drawings and other project-specific documentation in 3-ring hard-backed binders and on Flash media.
- G. Any deviations from these specifications or the work indicated on the drawings shall be

clearly identified in the Submittals.

H. LEED Submittals:

1. Product Data for Prerequisite EQ 1: Documentation indicating that units comply with ASHRAE 62.1.

1.7 QUALITY ASSURANCE

- A. The Control System Vendor shall have a full service DDC office within 50 miles of the job site. The office shall be staffed with applications engineers, software engineers and field technicians. This office shall maintain parts inventory and shall have all testing and diagnostic equipment necessary to support this work, as well as staff trained in the use of this equipment.
- B. Single Source Responsibility of Supplier: The Control System Vendor shall be responsible for the complete installation and proper operation of the control system. The Control System Vendor shall exclusively be in the regular and customary business of design, installation and service of computerized building management systems similar in size and complexity to the system specified. The Control System Vendor shall be the manufacturer of the primary DDC system components or shall have been the authorized representative for the primary DDC components manufacturer for at least 5 years. All control panels shall be assembled by the Control System Vendor in a UL-Certified 508A panel shop.
- C. Equipment and Materials: Equipment and materials shall be cataloged products of manufacturers regularly engaged in the production and installation of HVAC control systems. Products shall be manufacturer's latest standard design and have been tested and proven in actual use.

1.8 PRE-INSTALLATION MEETINGS

- A. Convene minimum two weeks prior to starting work of this section.

1.9 DELIVERY, STORAGE AND HANDLING

- A. Maintain integrity of shipping cartons for each piece of equipment and control device through shipping, storage and handling as required to prevent equipment damage. Store equipment and materials inside and protected from weather.

1.10 JOB CONDITIONS

- A. Cooperation with Other Trades: Coordinate the Work of this section with that of other sections to insure that the Work will be carried out in an orderly fashion. It shall be this Contractor's responsibility to check the Contract Documents for possible conflicts between his Work and that of other crafts in equipment location, pipe, duct and conduit runs, electrical outlets and fixtures, air diffusers and structural and architectural features.

1.11 SEQUENCING

- A. Ensure that products of this section are supplied to affected trades in time to prevent interruption of construction progress.

## **PART 2 PRODUCTS**

### **2.1 MANUFACTURERS**

- A. Basis of Design: Honeywell Building Technologies, which is located at: 715 PeachtreeSt. NE, Atlanta, GA30308; Toll Free Tel: 888-793-8193; Email:[request info \(buildingcontrols@honeywell.com\)](mailto:requestinfo@honeywell.com); Web:[buildingcontrols.honeywell.com](http://buildingcontrols.honeywell.com). Only Honeywell registered WEBS Vendors are acceptable as defined as:
  - 1. Authorized Controls Integrator (ACI Direct, ACI Elite or ACI)
  - 2. Building Control Specialist (BCS)
  - 3. WEBS Vendor
- B. Requests for substitutions will be considered in accordance with provisions of Specifications

### **2.2 GENERAL**

- A. The Building Management System (BMS) shall be comprised of a network of interoperable, stand-alone digital controllers, a network area controller, graphics and programming and other control devices for a complete system as specified herein.
- B. The installed system shall provide secure password access to all features, functions and data contained in the overall BMS.

### **2.3 OPEN, INTEROPERABLE, INTEGRATED ARCHITECTURE**

- A. The intent of this specification is to provide a peer-to-peer networked, stand-alone, distributed control system utilizing Open protocols in one open, interoperable system.
- B. The supplied computer software shall employ object-oriented technology (OOT) for representation of all data and control devices within the system. Physical connection of any BACnet control equipment, such as chillers, shall be via Ethernet or IP.
- C. All components and controllers supplied under this contract shall be true "peer-to-peer" communicating devices. Components or controllers requiring "polling" by a host to pass data shall not be acceptable.
- D. The supplied system shall incorporate the ability to access all data using HTML5 enabled browsers without requiring proprietary operator interface and configuration programs or browser plug-ins. An Open Database Connectivity (ODBC) or Structured Query Language (SQL) compliant server database is required for all system database parameter storage. This data shall reside on the Operating System Server located in the Facilities Office on the LAN. Systems requiring proprietary database and user interface programs shall not be acceptable.
- E. A hierarchical topology is required to assure reasonable system response times and to manage the flow and sharing of data without unduly burdening the customer's internal Intranet network. Systems employing a "flat" single tiered architecture shall not be acceptable.
  - 1. Maximum acceptable response time from any alarm occurrence (at the point of origin) to the point of annunciation shall not exceed 5 seconds for network connected user interfaces.

2. Maximum acceptable response time from any alarm occurrence (at the point of origin) to the point of annunciation shall not exceed 60 seconds for remote or dial-up connected user interfaces.

#### 2.4 BAS SERVER HARDWARE

- A. Minimum Computer Configuration (Hardware Independent).
  1. Central Server. Owner shall provide a dedicated BAS server with configuration that includes the following components as a minimum:
  2. Processor: Intel Xeon CPU E5-2640 x64 (or better), compatible with dual- and quad-core processors.
  3. Memory: 2 GB or more recommended for large systems, 8 GB or more recommended for the Windows 64-bit version.
  4. Hard Drive: 256 GB minimum, more recommended depending on archiving requirements.
  5. Display: Video card and monitor capable of displaying 1024 x 768 pixel resolution or greater.
  6. Network Support: Ethernet adapter (10/100 Mb with RJ-45 connector).
  7. Connectivity: Full-time high-speed ISP connection recommended for remote site access (i.e. T1, ADSL, cable modem).
- B. Standard Client: The thin-client Web Browser BAS GUI shall be Microsoft Internet Explorer (10.0 or later) running on Microsoft 7+. No special software shall be required to be installed on the PCs used to access the BAS via a web browser.

#### 2.5 SYSTEM NETWORK CONTROLLER (SNC)

- A. These controllers are designed to manage communications between the Programmable IP Control Units (PICU), Programmable Plant Control Units (PPCU), Unitary IP Control Unit (UICU), Advanced Unitary Controllers (AUC), and BACnet Touchscreen Communication Thermostats (BCT) which are connected to its communications trunks or directly on the IP network, manage communications between itself and other system network controllers (SNC), PICUs, PPCUs, UICUs, and with any operator workstations (OWS) that are part of the BAS, and perform control and operating strategies for the system based on information from any controller connected to the BAS.
- B. The controllers shall be fully programmable to meet the unique requirements of the facility it shall control.
- C. The controllers shall be capable of peer-to-peer communications with other SNC's, PICUs, PPCUs, UICUs, and with any OWS connected to the BAS, whether the OWS is directly connected, connected via cellular modem or connected via the Internet.
- D. The communication protocols utilized for peer-to-peer communications between SNC's will be Niagara 4 FoxS, BACnet TCP/IP and SNMP. Use of a proprietary communication protocol for peer-to-peer communications between SNC's is not allowed.
- E. The SNC shall employ a device count capacity license model that supports expansion capabilities.
- F. The SNC shall be enabled to support and shall be licensed with the following Open protocol drivers (client and server) by default:

1. BACnet
  2. Lon
  3. MODBUS
  4. SNMP
  5. KNX
- G. The SNC shall be capable of executing application control programs to provide:
1. Calendar functions.
  2. Scheduling.
  3. Trending.
  4. Alarm monitoring and routing.
  5. Time synchronization.
  6. Integration of LonWorks, BACnet, and MODBUS controller data.
  7. Network management functions for all SNC, PICU, PPCU, UICU, AUC and BCT based devices.
- H. The SNC shall provide the following hardware features as a minimum:
1. Two 10/100 Mbps Ethernet ports.
  2. Two Isolated RS-485 ports with biasing switches.
  3. 1 GB RAM
  4. 4 GB Flash Total Storage / 2 GB User Storage
  5. Wi-Fi (Client or WAP)
  6. USB Flash Drive
  7. High Speed Field Bus Expansion
  8. -20-60 degrees C Ambient Operating Temperature
  9. Integrated 24 VAC/DC Global Power Supply
  10. MicroSD Memory Card Employing Encrypted Safe Boot Technology
- I. The SNC shall support standard Web browser access via the Intranet/Internet. It shall support a minimum of 16 simultaneous users.
- J. The SNC shall provide alarm recognition, storage, routing, management and analysis to supplement distributed capabilities of equipment or application specific controllers.
- K. The SNC shall be able to route any alarm condition to any defined user location whether connected to a local network or remote via cellular modem, or wide-area network.
1. Alarm generation shall be selectable for annunciation type and acknowledgement requirements including but not limited to:
    - a. Alarm.
    - b. Return to normal.
    - c. To default.
  2. Alarms shall be annunciated in any of the following manners as defined by the user:
    - a. Screen message text.
    - b. Email of complete alarm message to multiple recipients.
    - c. Pagers via paging services that initiate a page on receipt of email message.
    - d. Graphics with flashing alarm object(s).
  3. The following shall be recorded by the SNC for each alarm (at a minimum):
    - a. Time and date.
    - b. Equipment (air handler #, access way, etc.).
    - c. Acknowledge time, date, and user who issued acknowledgement.

- L. Programming software and all controller "Setup Wizards" shall be embedded into the SNC.
- M. The SNC shall support the following security functions.
  - 1. Module code signing to verify the author of programming tool and confirm that the code has not been altered or corrupted.
  - 2. Role-Based Access Control (RBAC) for managing user roles and permissions.
  - 3. Require users to use strong credentials.
  - 4. Data in Motion and Sensitive Data at Rest be encrypted.
  - 5. LDAP and Kerberos integration of access management.
- N. The SNC shall support the following data modeling structures to utilize Search; Hierarchy; Template; and Permission functionality:
  - 1. Metadata: Descriptive tags to define the structure of properties.
  - 2. Tagging: Process to apply metadata to components
  - 3. Tag Dictionary
- O. The SNC shall employ template functionality. Templates are a containerized set of configured data tags, graphics, histories, alarms... that are set to be deployed as a unit based upon manufacturer's controller and relationships. All lower level communicating controllers (PICU, PPCU, UICU, AUC) shall have an associated template file for reuse on future project additions.
- P. The SNC shall be provided with a 3Year Software Maintenance license. Labor to implement not included.

## 2.6 PROGRAMMABLE IP CONTROL UNIT (PICU)

- A. HVAC PICU controllers shall be fully programmable to meet the unique requirements of the facility it shall control. The controller platform shall provide options and advanced system functions, programmable and configurable using Niagara 4 Framework, that allow standard and customizable control solutions required in executing the "Sequence of Operation". PICU shall be BACnet BTL; AWS/C, WSP listed. PICU shall meet the BACnet Building Controller (B-BC) Profile.
- B. All PICUs shall be application programmable and shall always maintain their certification. All control sequences within or programmed into the PICU shall be stored in non-volatile memory, which is not dependent upon the presence of a battery to be retained.
- C. The controllers shall be capable of daisy-chain IP communications with other PICU's and peer-to-peer communications with SNC's and with any OWS connected to the BAS, whether the OWS is directly connected, connected via cellular modem or connected via the Internet.
  - 1. Daisy Chain IP connectivity Integrated Fail-safe utilizing Rapid Spanning Tree Protocol 802.1w.
- D. The communication protocols utilized for peer-to-peer communications between PICU's will be Niagara 4 FoxS or BACnet TCP/IP. Use of a proprietary communication protocol for peer-to-peer communications between PICU's is not allowed.
- E. The PICU shall be licensed and enabled to support four (4) devices and shall be licensed with the following Open protocol drivers by default:
  - 1. BACnet IP

- F. The PICU shall be provided with Lifetime Software Maintenance license. Labor to implement not included.
- G. The PICU shall be capable of executing application control programs to provide:
  - 1. Calendar functions.
  - 2. Scheduling.
  - 3. Trending.
  - 4. Alarm monitoring and routing.
  - 5. Time synchronization.
  - 6. Integration of all daisy-chain PICU's.
  - 7. Network management functions for all daisy-chain PICU's.
- H. Programming software shall be embedded into the PICU. The PICU shall not require any external configuration tool or programming tool. All configuration and programming tasks shall be accomplished and accessible from within the embedded Niagara 4 environment.
- I. The PICU shall support the following security functions.
  - 1. Module code signing to verify the author of programming tool and confirm that the code has not been altered or corrupted.
  - 2. Role-Based Access Control (RBAC) for managing user roles and permissions.
  - 3. Require users to use strong credentials.
  - 4. Data in Motion and Sensitive Data at Rest be encrypted.
  - 5. Encrypted (PKI) Secure IP Stack Communication Security.
  - 6. FIPS 140-2 Level 1 Cryptographic Module Compliant.
- J. The minimum controller Environmental ratings.
  - 1. Operating Temperature Ambient Rating: -4 degrees to 131 degrees F (-20 degrees to 55 degrees C).
  - 2. Storage Temperature Ambient Rating: -4 degrees to 150 degrees F (-20 degrees to 65 degrees C).
  - 3. Relative Humidity: 5% to 95% non-condensing
- K. The controller shall have the additional approval requirements, listings, and approvals:
  - 1. UL 60730-1.
  - 2. Meets FCC Part 15, Subpart B, Class B (radiated emissions) requirements.
  - 3. Conforms requirements European Consortium standard EN 61000-6-1; 2001 (EU Immunity).
  - 4. Conforms requirements European Consortium standard EN 61000-6-3; 2001 (EU Emission).
  - 5. The controller housing shall be UL plenum rated mounting to either a panel or DIN rail (2.3" x 5.3" x 4.3"; 57.4mm x 135mm x 110mm).
- L. The PICU shall provide the following hardware features as a minimum:
  - 1. The PICU shall provide LED indication of Power, Fault, Ethernet TX/RX/Traffic/Speed without cover removal.
  - 2. Four 10/100/1000 Mbps Ethernet unmanaged switch, RJ-45 ports.
  - 3. ARM 9 32-bit processor, 800MHz
  - 4. 1 GB RAM
  - 5. 512 KB MRAM
  - 6. 2 GB Flash Memory

7. One USB 2.0 port.
  8. 2.0 A fast-acting Overcurrent Protection.
  9. Integrated 20-30 VAC Global Power Supply
  10. Real Time Clock, 24 hour, 365 day, multi-year calendar +/- 1 minute per month at 77F (25C).
  11. RTC Power Failure Backup, 24 hours at 32 degrees to 100 degrees F (0 degrees to 38 degrees C)
  12. Power Output: 20 VDC +/- 10% at 7 mA maximum.
  13. AC power consumption at 9VA, max 100VA.
  14. Removable Terminal Blocks.
  15. Sensor, Actuator, and I/O Module Expandability via a 2-wire, polarity insensitive local PICU communication bus.
  16. 150 Point Base License (Expandable).
  17. LED for each hardware I/O point.
  18. Output H-O-A Switches.
  19. VAV PICU shall include an internal differential pressure sensor.
    - a. Operating Range: 0 to 2 inch WC (0 to 374 Pa).
    - b. Accuracy: +/- 2% of full scale at 32 degrees to 122 degrees F (0 degrees to 50 degrees C).
- M. The PICU shall support standard Web browser access via the Intranet/Internet.
- N. The PICU shall be able to route any alarm condition to any defined user location whether connected to a local network or wide-area network.
1. Alarm generation shall be selectable for annunciation type and acknowledgement requirements including but not limited to:
    - a. Alarm.
    - b. Return to normal.
    - c. To default.
  2. Alarms shall be annunciated in any of the following manners as defined by the user:
    - a. Screen message text.
    - b. Email of complete alarm message to multiple recipients.
    - c. Pagers via paging services that initiate a page on receipt of email message.
    - d. Graphics with flashing alarm object(s).
  3. The following shall be recorded by the PICU for each alarm (at a minimum):
    - a. Time and date.
    - b. Equipment (air handler #, access way, etc.).
    - c. Acknowledge time, date, and user who issued acknowledgement.
- O. PICU Controllers shall support at minimum the following control techniques:
1. General-purpose control loops that can incorporate Demand Limit Control strategies, Set point reset, adaptive intelligent recovery, and time of day bypass.
  2. General-purpose, non-linear control loops.
  3. Start/stop Loops.
  4. If/Then/Else logic loops.
  5. Math Function loops (MIN, MAX, AVG, SUM, SUB, SQRT, MUL, DIV, ENTHALPY).
  6. Analytic calculations.
- P. The following six [6] integral Universal Inputs/Outputs shall be supported per each PICU:
1. UI/O as Analog Inputs; 16 Bit resolution (Thermistor or RTD configurable from 100

- to 100K Ohm, 0-10 VDC, 4-20 mA).
  - 2. UI/O as Digital Inputs; Dry Contact / Totalizer.
    - a. Dry Contact to detect Open / Closed Circuit (Voltage Rating: 0-30 VDC Open Circuit: Resistance Rating; Open Circuit >3,000 Ohms, Closed Circuit <500 Ohms).
    - b. Totalizer – Dry Contact (100 Hz, 360,000 pulses per hour maximum frequency: Minimum Duty Cycle 5 ms ON / 5 ms OFF).
  - 3. UI/O as Analog Outputs ([3] UI/O can be configured as AO)
    - a. 0-10.0 Vdc, 10.0mA maximum.
    - b. 0-20.0 mA, 550 Ohms maximum.
  - 4. LED for each hardware I/O point.
- Q. The following six [6] integral Digital Outputs (Triac) shall be supported per each PICU:
- 1. Solid State Relay normally open contacts, 20-30 VAC @ 50/60 Hz, at 1.0 A Continuous, 3.5 A Inrush.
  - 2. LED for each hardware I/O point.
  - 3. Output H-O-A Switches.
- R. The PICU shall employ a 150 Point Base License (expandable) device count capacity license model that supports I/O expansion capabilities.
- S. Each PICU shall have expansion ability to support additional I/O requirements through the use of remote input/output modules and a local communication bus. Each PICU shall be able to support a maximum of 15 Expansion I/O Modules for a maximum of 312 physical I/O points.
- 1. Mixed Expansion I/O Modules (UI/O & DO) shall communicate with PICU via a 2-wire bus and include removable terminals for field device wires.
  - 2. Mixed Expansion I/O Modules shall be available in the following configurations:
    - a. 3 UI/O, 2 AO, and 2 DO (7 Points).
    - b. 14 UI/O (5 can be configured as AO), and 6 DO (20 Points).
  - 3. Universal Inputs/Outputs shall be supported per each Expansion I/O Module:
    - a. UI/O as Analog Inputs; 16 Bit resolution (Thermistor or RTD configurable from 100 to 100K Ohm, 0-10 VDC, 4-20 mA).
    - b. UI/O as Digital Inputs; Dry Contact / Totalizer.
      - 1) Dry Contact to detect Open / Closed Circuit (Voltage Rating: 0-30 VDC Open Circuit: Resistance Rating; Open Circuit >3,000 Ohms, Closed Circuit <500 Ohms).
      - 2) Totalizer – Dry Contact (100 Hz, 360,000 pulses per hour maximum frequency: Minimum Duty Cycle 5 ms ON / 5 ms OFF).
    - c. UI/O as Analog Outputs (UI/O can be configured as AO)
      - 1) 0-10.0 Vdc, 10.0mA maximum.
      - 2) 0-20.0 mA, 550 Ohms maximum.
    - d. LED for each hardware I/O point.
  - 4. Digital Outputs (Triac) shall be supported per each Expansion I/O Module:
    - a. Solid State Relay normally open contacts, 20-30 VAC @ 50/60 Hz, at 1.0 A Continuous, 3.5 A Inrush.
    - b. LED for each hardware I/O point.
    - c. Output H-O-A Switches.
- T. The PICU shall not include an integrated Local Operator Interface but shall be capable of utilizing a standard browser-based device such as a Tablet, Touch Screen Device, etc.

## 2.7 PROGRAMMABLE PLANT CONTROL UNIT (PPCU)

- A. HVAC PPCU controllers shall be fully programmable to meet the unique requirements of the facility it shall control. The controller platform shall provide options and advanced system functions, programmable and configurable using Niagara 4 Framework, that allow standard and customizable control solutions required in executing the "Sequence of Operation".
- B. All PPCUs shall be application programmable and shall always maintain their certification. All control sequences within or programmed into the PPCU shall be stored in non-volatile memory, which is not dependent upon the presence of a battery to be retained.
- C. The PPCUs shall be capable of daisy-chain IP communications with other PPCU's and peer-to-peer communications with SNC's and with any OWS connected to the BAS, whether the OWS is directly connected, connected via cellular modem or connected via the Internet.
- D. The communication protocols utilized for peer-to-peer communications between PPCU's will be Niagara 4 FoxS or BACnet TCP/IP. Use of a proprietary communication protocol for peer-to-peer communications between PPCU's is not allowed.
- E. The PPCU shall be licensed and enabled to support five (5) devices and shall be licensed with the following Open protocol drivers by default:
  - 1. BACnet (MS/TP and IP [ISO 16484-5])
  - 2. LonTalk (ISO 14908)
  - 3. MODBUS (RTU and TCP)
- F. The PPCU shall be provided with a 1Year Software Maintenance license. Labor to implement not included if greater than 1 year is required.
- G. The PPCU shall provide LED indication of communication and controller performance to the technician, without cover removal.
- H. The PPCU shall be capable of executing application control programs to provide:
  - 1. Calendar functions.
  - 2. Scheduling.
  - 3. Trending.
  - 4. Alarm monitoring and routing.
  - 5. Time synchronization.
  - 6. Integration of all daisy-chain PPCU's.
  - 7. Network management functions for all daisy-chain PPCU's.
- I. Programming software shall be embedded into the PPCU. The PPCU shall not require any external configuration tool or programming tool. All configuration and programming tasks shall be accomplished and accessible from within the embedded Niagara 4 environment.
- J. The PPCU shall support the following security functions.
  - 1. Module code signing to verify the author of programming tool and confirm that the code has not been altered or corrupted.
  - 2. Role-Based Access Control (RBAC) for managing user roles and permissions.
  - 3. Require users to use strong credentials.
  - 4. Data in Motion and Sensitive Data at Rest be encrypted.

- K. The PPCU shall provide the following hardware features as a minimum:
1. Two 10/100 Mbps Ethernet ports.
  2. Two RS-485 ports, one isolated and one non-isolated, with biasing switches.
  3. ARM 9 32-bit processor, 1 GHz
  4. 1 GB RAM
  5. 512 KB MRAM
  6. 4 GB Flash Memory
  7. Two USB 2.0 ports
  8. One HMI port to connect onboard or remote HMI.
  9. 0-50 degrees C Ambient Operating Temperature
  10. Integrated 24 VAC/DC Global Power Supply
  11. Real Time Clock
- L. The PPCU shall support standard Web browser access via the Intranet/Internet.
- M. The PPCU shall be able to route any alarm condition to any defined user location whether connected to a local network or remote via cellular modem, or wide-area network.
1. Alarm generation shall be selectable for annunciation type and acknowledgement requirements including but not limited to:
    - a. Alarm.
    - b. Return to normal.
    - c. To default.
  2. Alarms shall be annunciated in any of the following manners as defined by the user:
    - a. Screen message text.
    - b. Email of complete alarm message to multiple recipients.
    - c. Pagers via paging services that initiate a page on receipt of email message.
    - d. Graphics with flashing alarm object(s).
  3. The following shall be recorded by the PPCU for each alarm (at a minimum):
    - a. Time and date.
    - b. Equipment (air handler #, access way, etc.).
    - c. Acknowledge time, date, and user who issued acknowledgement.
- N. PPCU Controllers shall support at minimum the following control techniques:
1. General-purpose control loops that can incorporate Demand Limit Control strategies, Set point reset, adaptive intelligent recovery, and time of day bypass.
  2. General-purpose, non-linear control loops.
  3. Start/stop Loops.
  4. If/Then/Else logic loops.
  5. Math Function loops (MIN, MAX, AVG, SUM, SUB, SQRT, MUL, DIV, ENTHALPY).
- O. The following twenty-six [26] integral Inputs/Outputs shall be supported per each PPCU:
1. Six integral 12 Bit resolution Universal Inputs (configurable as 20K NTC, 10K NTC, 0/2-10V, 0/4-20mA, 0.4Hz Dry Contact).
  2. Four integral dry contact / totalizer Digital Inputs. Totalizer: 15Hz (25ms on, 25ms off, 5ms bounce).
  3. Four integral 8 Bit 0-10 Vdc Analog Outputs with configurable safety position selections.
  4. Eight integral Digital Outputs.
    - a. Four Relay normally open contact at 3A, 250Vac, 30Vdc.

- b. One Relay normally open contact at 10A, 250Vac, 30Vdc with configurable safety position selections.
  - c. Three Relay normally open contact with common feed at 3A, 250Vac, 30Vdc with configurable safety position selections.
- P. The PPCU shall employ a device count capacity license model that supports I/O expansion capabilities.
- Q. Each PPCU shall have expansion ability to support additional I/O requirements through the use of remote input/output modules and a local communication bus. Each PPCU shall be able to support a maximum of 1,200+ physical I/O points.
- 1. I/O-specific modules (UI, BI, AO, BO) shall require a Terminal Socket Module that includes screw or push-in terminals for field device wires, communication, and port to accept pluggable I/O-specific Module. I/O-specific Modules shall be hot pluggable and shall be replaceable without rewiring.
  - 2. Remote Universal Input Module (8 UI).
    - a. Eight Universal Inputs; 0/2-10V, 0/4-20mA, 20K NTC, 10K NTC, PT1000-1, PT1000-2, NI1000TK5000, PT3000, BALCO500, Binary Input (0 / 10V with pull-up).
  - 3. Remote Binary Input Module (12 BI).
    - a. Twelve Binary Inputs; Dry contact or Totalizer (20Hz)
    - b. Each Binary Input shall include a configurable status LED (Alarm: red/green; Status: yellow/off).
  - 4. Remote Analog Output Module (8 AO).
    - a. Eight Analog Outputs with configurable safety position selections. 8 Bit Analog Outputs; 0-10V, Floating Actuator, Binary Output (0V / 10V).
    - b. Each Analog Output shall include a RED status LED that varies brightness based on signal level & flashes in override mode (with manual override Module).
    - c. Optional version with manual override potentiometer per output.
  - 5. Remote Relay Output Module (6 BO).
    - a. Six Relay Outputs with configurable safety position selections.
    - b. Each Relay Output shall include a yellow status LED.
    - c. Optional version with manual override switch per output (Auto, 0, 1).
  - 6. Remote Floating Output Module (3 FO).
    - a. Three Floating Outputs with configurable safety position selections. 2 Relays per Floating Output.
    - b. Each Floating Output shall include a RED status LED (opening) and a GREEN status LED (closing).
    - c. Manual override potentiometer per output.
  - 7. Remote Mixed I/O Module (8 UI, 12 BI, 8 AO, 6 BO)
    - a. Eight Universal Inputs; 0/2-10V, 20K NTC, Binary Input (dry contact).
    - b. Twelve Binary Inputs; Dry contact or Totalizer (15Hz)
      - 1) Each Binary Input shall include a yellow status LED.
    - c. Eight Analog Outputs with configurable safety position selections. 10 Bit Analog Outputs; 0-10V, Binary Output (0V / 10V).
    - d. Six Relay Outputs.
      - 1) Each Relay Output shall include a yellow status LED.
- R. The PPCU shall be provided with an integrated Local Operator Interface.
- 1. Local Operator Interface shall allow for User-ID and password protected access.

2. Local Operator Interface shall provide a backlit display, with automatic backlight time-out.
  - a. The display backlight shall automatically light upon press of a key or operation of the push & turn wheel. The display backlight will extinguish if operating keys or push & turn wheel is not used for two minutes.
3. Local Operator Interface shall provide full display of long text information.
  - a. Automatic left and right scrolling shall ensure that text information longer than the display width can be viewed.
4. Local Operator Interface shall provide configurable screens for viewing and adjusting data points and parameters, including the following operations.
  - a. Automatics and visual notification of all critical alarms.
  - b. Read and write access to all data points.
  - c. Full length names of data points, schedules, calendars, parameters, alarm texts, state texts and alarms.
  - d. Read and write access to all application parameters.
  - e. Read and write access to all schedules and calendars.
  - f. Read access to the onboard alarm buffer.
  - g. Overview of all data points in manual override.
  - h. Overview of all data points in alarm.
5. Local Operator Interface shall allow user access to text information via a push & turn operation wheel.
  - a. Scrolling through a list of information shall be accomplished by turning the operation wheel.
  - b. Selecting and acknowledging information shall be accomplished by pushing the operation wheel.
6. Changing information shall be accomplished by turning the operation wheel.

## 2.8 UNITARY IP CONTROL UNIT (UICU)

- A. HVAC UICU controllers shall be fully programmable to meet the unique requirements of the HVAC equipment it shall control. The controller platform shall provide options and advanced system functions, programmable and configurable using Niagara 4 Framework, that allow standard and customizable control solutions required in executing the "Sequence of Operation".
- B. All UICUs shall be application programmable and shall always maintain their certification. All control sequences within or programmed into the UICU shall be stored in non-volatile memory, which is not dependent upon the presence of a battery to be retained.
- C. The controllers shall be capable of daisy-chain IP communications with other UICU's and peer-to-peer communications with SNC's and with any OWS connected to the BAS, whether the OWS is directly connected, connected via cellular modem or connected via the Internet.
- D. The communication protocols utilized for peer-to-peer communications between UICU's will be Niagara 4 FoxS or BACnet TCP/IP. Use of a proprietary communication protocol for peer-to-peer communications between UICU's is not allowed.
- E. The UICU shall be licensed and enabled to support three (3) devices and shall be licensed with the following Open protocol drivers by default:
  1. BACnet IP and BACnet MSTP
  2. Modbus TCP and Modbus RTU

3. SNMP
- F. The UICU shall be provided with Lifetime Software Maintenance license. Labor to implement not included.
- G. The UICU shall be capable of executing application control programs to provide:
  1. Calendar functions.
  2. Scheduling.
  3. Trending.
  4. Alarm monitoring and routing.
  5. Time synchronization.
  6. Integration of all daisy-chain UICU's.
  7. Network management functions for all daisy-chain UICU's.
- H. Programming software shall be embedded into the UICU. The UICU shall not require any external configuration tool or programming tool. All configuration and programming tasks shall be accomplished and accessible from within the embedded Niagara 4 environment.
- I. The UICU shall support the following security functions.
  1. Module code signing to verify the author of programming tool and confirm that the code has not been altered or corrupted.
  2. Role-Based Access Control (RBAC) for managing user roles and permissions.
  3. Require users to use strong credentials.
  4. Data in Motion and Sensitive Data at Rest be encrypted.
  5. Encrypted (PKI) Secure IP Stack Communication Security.
  6. FIPS 140-2 Level 1 Cryptographic Module Compliant.
- J. The minimum controller Environmental ratings.
  1. Operating Temperature Ambient Rating: -4 degrees to 140 degrees F (-20 degrees to 60 degrees C).
  2. Storage Temperature Ambient Rating: -40 degrees to 185 degrees F (-40 degrees to 85 degrees C).
  3. Relative Humidity: 5% to 95% non-condensing
- K. The controller shall have the additional approval requirements, listings, and approvals:
  1. Meets FCC Part 15, Class B (radiated emissions) requirements.
  2. C-UL
  3. CE
  4. UL916, Open Energy Management Class 2
  5. RoHS2
  6. REACH
  7. WEEE
  8. CAN/CSA-C22.2 No. 205-12
  9. The controller housing shall be UL plenum rated mounting to either a panel or DIN rail (2.40" x 7.04" x 4.53"; 61mm x 179mm x 115mm).
- L. The UICU shall provide the following hardware features as a minimum:
  1. The UICU shall provide LED indication of Power, Fault, Ethernet TX/RX/Traffic/Speed without cover removal.
  2. ARM Cortex-A9/M4 9, 800 MHz
  3. 512 MB DDR SDRAM

4. 2 GB Flash Memory
  5. Powered from 24VAC/DC source
  6. Two 10/100 MB Ethernet ports capable of daisy chaining
  7. 1 RS-485 Serial Port
  8. Real Time Clock
  9. Secure Boot
  10. Ten [10] onboard IO points
  11. Supports up to 3 devices or 50 Points
- M. The UICU shall support standard Web browser access via the Intranet/Internet.
- N. The UICU shall be able to route any alarm condition to any defined user location whether connected to a local network or wide-area network.
1. Alarm generation shall be selectable for annunciation type and acknowledgement requirements including but not limited to:
    - a. Alarm.
    - b. Return to normal.
    - c. To default.
  2. Alarms shall be annunciated in any of the following manners as defined by the user:
    - a. Screen message text.
    - b. Email of complete alarm message to multiple recipients.
    - c. Pagers via paging services that initiate a page on receipt of email message.
    - d. Graphics with flashing alarm object(s).
  3. The following shall be recorded by the UICU for each alarm (at a minimum):
    - a. Time and date.
    - b. Equipment (air handler #, access way, etc.).
    - c. Acknowledge time, date, and user who issued acknowledgement.
- O. UICU Controllers shall support at minimum the following control techniques:
1. General-purpose control loops that can incorporate Demand Limit Control strategies, Set point reset, adaptive intelligent recovery, and time of day bypass.
  2. General-purpose, non-linear control loops.
  3. Start/stop Loops.
  4. If/Then/Else logic loops.
  5. Math Function loops (MIN, MAX, AVG, SUM, SUB, SQRT, MUL, DIV, ENTHALPY).
- P. The following five [5] Universal Inputsshall be supported per each UICU:
1. Type 3 10K Thermistor
  2. 0-100K ohm
  3. 0-10 VDC
  4. 0-20mA with external resistor
  5. Dry Contact
- Q. The following two [2] Analog Outputs shall be supported per each UICU:
1. 0-10VDC, 4mAmax output current
- R. The following three [3] Digital Outputsshall be supported per each UICU:
1. Triac, 24VAC @ 0.5 amp
- S. The UICU shall employ a 50 Point Base License that supports one [1] IO-R-34 expansion

module over a shielded RS-485 bus or three [3] devices via the embedded protocols.

- T. Each UICU shall have expansion ability to support additional I/O requirements through the use of a remote input/output module connected to an RS-485 local communication bus. Each UICU shall be able to support a maximum of one [1] 34 Point Expansion I/O Modules for a maximum of 44 physical I/O points.
1. 34 Point Mixed Expansion I/O Module shall communicate with UICU via a 2-wire RS-485m bus.
  2. Sixteen [16] Universal Inputs shall be supported via 34 Point Expansion I/O Module:
    - a. Type 3 10K Thermistor
    - b. 0-100K ohm
    - c. 0-10 VDC
    - d. 0-20mA with external resistor
  3. Eight [8] Analog Outputs shall be supported via 34 Point Expansion I/O Module:
    - a. 0-10.0 Vdc
  4. Ten [10] Digital Outputs (Relay) shall be supported via 34 Point Expansion I/O Module:
    - a. Form A Contacts, 24VAC at 0.5 A rated
- U. The UICU shall not include an integrated Local Operator Interface.

## 2.9 ADVANCED UNITARY CONTROLLER (AUC)

- A. The advanced unitary controller (AUC) platform shall be designed specifically to control HVAC - ventilation, filtration, heating, cooling, humidification, and distribution. Equipment includes: constant volume air handlers, VAV air handlers, packaged RTU, heat pumps, unit vents, fan coils, natural convection units and radiant panels. The control shall use BACnet based devices where the application has a LonMark profile or BTL Listed PICS defined. Where LonMark devices are not available for a particular application, devices based on LonWorks shall be acceptable. For each LonWorks device that does not have LonMark certification, the device supplier shall provide an XIF file for the device. The controller platform shall provide options and advanced system functions, programmable and configurable, using Niagara 4 Framework, that allow standard and customizable control solutions required in executing the "Sequence of Operation".
- B. Minimum Requirements:
1. The controller shall be fully programmable or configurable with full functionality on any Niagara 4 brand platform.
    - a. Support downloads to the controller in Niagara 4 platform.
    - b. Support uploads from the controller to Niagara 4 platform.
    - c. Support simulation/debug mode of the controller.
    - d. Maintain native GUI.
    - e. Native function-block programming software and all controller "Setup Wizards" shall be embedded within the Niagara 4 environment.
  2. The AUC shall be capable of either integrating with other devices or stand-alone operation.
  3. For VAV box applications, the AUC shall have an internal velocity pressure sensor.
    - a. Sensor Type: Microbridge air flow sensor with dual integral restrictors.
    - b. Operating Range: 0 to 1.5 inch H<sub>2</sub>O (0 to 374 Pa).
    - c. Accuracy: +/- 2% of full scale at 32 degrees to 122 degrees F (0 degrees to 50 degrees C); +/- 1% of full scale at null pressure.

4. The AUC shall have two microprocessors. The Host processor contains on-chip FLASH program memory, FLASH information memory, and RAM to run the main HVAC application. The second processor for network communications. Controller memory minimum requirements include:
  - a. FLASH Memory Capacity: 60 Kilobytes with 8 Kilobytes for application program.
  - b. FLASH Memory settings retained for ten years.
  - c. RAM: 2 Kilobytes.
5. The AUC shall have an internal time clock with the ability to automatically revert from a master time clock on failure.
  - a. Operating Range: 24 hour, 365 day, multi-year calendar including day of week and configuration for automatic day-light savings time adjustment to occur on configured start and stop dates.
  - b. Accuracy: +/- 1 minute per month at 77 degrees F (25 degrees C).
  - c. Power Failure Backup: 24 hours at 32 degrees to 122 degrees F (0 degrees to 50 degrees C).
6. The AUC shall have Significant Event Notification, Periodic Update capability, and Failure Detect when network inputs fail to be detected within their configurable time frame.
7. The AUC shall have an internal DC power supply to power external sensors.
  - a. Power Output: 20 VDC +/- 10% at 75 mA.
8. The AUC shall have a visual indication (LED) of the status of the device:
  - a. Controller operating normally.
  - b. Controller in process of download.
  - c. Controller in manual mode under control of software tool.
  - d. Controller lost its configuration.
  - e. No power to controller, low voltage, or controller damage.
  - f. Processor and/or controller are not operating.
9. The minimum AUC Environmental ratings.
  - a. Operating Temperature Ambient Rating: -40 degrees to 150 degrees F (-40 degrees to 65.5 degrees C) for an AUC in unconditioned space.
  - b. Storage Temperature Ambient Rating: -40 degrees to 150 degrees F (-40 degrees to 65.5 degrees C) for an AUC in unconditioned space.
  - c. Operating Temperature Ambient Rating: 32 degrees to 122 degrees F (0 degrees to 50 degrees C) for an AUC in conditioned space.
  - d. Storage Temperature Ambient Rating: 32 degrees to 122 degrees F (0 degrees to 50 degrees C) for an AUC in conditioned space.
  - e. Relative Humidity: 5% to 95% non-condensing.
10. The AUC shall have the additional approval requirements, listings, and approvals:
  - a. UL/cUL (E87741) listed under UL916 (Standard for Open Energy Management Equipment) with plenum rating.
  - b. CSA (LR95329-3) Listed.
  - c. Meets FCC Part 15, Subpart B, Class B (radiated emissions) requirements.
  - d. Meets Canadian standard C108.8 (radiated emissions).
  - e. Conforms requirements European Consortium standard EN 61000-6-1; 2001 (EU Immunity).
  - f. Conforms requirements European Consortium standard EN 61000-6-3; 2001 (EU Emission).
11. The AUC housing shall be UL plenum rated mounting to either a panel or DIN rail (standard EN50022; 7.5mm x 35mm).

12. For VAV box applications, the AUC shall provide an integrated actuator option.
  - a. Actuator type: Series Floating.
  - b. Rotation stroke: 95 degrees +/- 177;3 degrees for CW or CCW opening dampers.
  - c. Torque rating: 44 lb-inch (5 Nm).
  - d. Run time for 90 degree rotation: 90 seconds at 60 Hz.
13. The AUC shall have a mix of Universal Inputs (UI), Digital Inputs (DI), Analog Outputs (AO), and Digital Triac Outputs (DO), as well as a 2-wire, polarity insensitive, AUC communication bus providing Sensor, Actuator, and I/O expandability.
  - a. Analog outputs (AO) shall be capable of being configured as digital outputs (DO).
  - b. Input and Output wiring terminal strips shall be removable from the controller without disconnecting wiring.
  - c. Input and Output wiring terminals shall be designated with color coded labels.
  - d. Universal inputs shall be capable of being configured as binary inputs, resistive inputs, voltage inputs (0-10 VDC), or current inputs (4-20 mA).
14. The AUC shall provide "continuous" automated loop tuning with an Adaptive Integral Algorithm Control Loop.
15. The AUC platform shall have standard HVAC application programs that are modifiable to support both the traditional and specialized "sequence of operations" as outlined in Section 4.
  - a. Discharge air control and low limit.
  - b. Pressure-dependent dual duct without flow mixing.
  - c. Variable air volume with return flow tracking.
  - d. Economizer with differential enthalpy.
  - e. Minimum airflow coordinated with CO2.
  - f. Unit ventilator cycle (1, 2, 3) 2-pipe.
  - g. Unit ventilator cycle (1, 2, 3) 2-pipe with face/bypass.
  - h. Unit ventilator cycle (1, 2, 3) 4-pipe.
  - i. Unit ventilator cycle (1, 2, 3) 4-pipe with EOC valve.
  - j. VAV terminal unit.
  - k. VAV terminal unit fan speed control.
  - l. Series fan.
  - m. Parallel fan.
  - n. Regulated air volume (room pressurization/de-pressurization).
  - o. CV dual-duct.
  - p. Room CO2 control.
  - q. Room Humidity.
  - r. TOD occupancy sensor stand-by set points.

## 2.10 BACNET TOUCHSCREEN COMMUNICATING THERMOSTAT (BCT)

- A. BACnet Conformance
  1. Touchscreen communicating thermostats shall be approved by the BTL as meeting the BACnet Application Specific Controller requirements.
  2. Touchscreen Communicating Thermostats shall, at a minimum, support MS/TP BACnet LAN types. They shall communicate directly through this BACnet LAN at 9.6, 19.2, 38.4 and 76.8 Kbps, as a native BACnet device.
  3. Standard BACnet object types supported shall include, as a minimum, Analog Input,

Analog Output, Analog Value, Binary Input, Binary Output, Binary Value, Device, File, and Program Object Types.

4. All proprietary object types, if used in the system, shall be thoroughly documented and provided as part of the submittal data. All necessary tools shall be supplied for working with proprietary information.

B. BCT hardware shall:

1. Include a 32 Bit processor
2. Include a backlit touchscreen for the user interface, buttons are not allowed.
3. Include Three (3) universal inputs with 12-bit resolution that can accept 3K and 10K Type II thermistors, 0-10VDC, 0- 5 VDC, 4-20mA, and dry contact signals. Inputs on controller may be either analog or digital.
4. Include built-in temperature sensor.
5. Include built-in humidity sensor.
6. Include Six (6) relay outputs on board.
7. Include Two (2) analog outputs with 12-bit resolution. Each auto-detecting for 0-10 V or 4-20 mA control signals.
8. Meet the requirements of Listed Underwriters Laboratory for Open Energy Management Equipment (PAZX) under the UL Standard for Safety 916.
9. Meet the requirements of EMC Directive (European CE Mark) EN 60950.
10. Meet the requirements for FCC Part 15, Class B.
11. Be powered by 24VAC power.

## 2.11 OTHER CONTROL SYSTEM HARDWARE

- A. Motorized control dampers that will not be integral to the equipment shall be furnished by the Control System Vendor. Control damper frames shall be constructed of galvanized steel, formed into channels and welded or riveted. Dampers shall be galvanized, with nylon bearings. Blade edge seals shall be vinyl. Blade edge and tip seals shall be included for all dampers. Blades shall be 16-gauge minimum and 6 inches wide maximum and frame shall be of welded channel iron. Damper leakage shall not exceed 10 CFM per square foot, at 1.5 inches water gauge static pressure. Honeywell is basis of design.
- B. Control damper actuators shall be furnished by the Control System Vendor. Two-position or proportional electric actuators shall be direct-mount type sized to provide a minimum of 5 in-lb torque per square foot of damper area. Damper actuators shall be spring return type. Operators shall be heavy-duty electronic type for positioning automatic dampers in response to a control signal. Motor shall be of sufficient size to operate damper positively and smoothly to obtain correct sequence as indicated. All applications requiring proportional operation shall utilize truly proportional electric actuators. Honeywell is basis of design.
- C. Control Valves: Control valves shall be 2-way or 3-way pattern as shown and constructed for tight shutoff at the pump shut-off head or steam relief valve pressure. Control valves shall operate satisfactorily against system pressures and differentials. Two-position valves shall be 'line' size. Proportional control valves shall be sized for a maximum pressure drop of 5.0 psi at rated flow (unless otherwise noted or scheduled on the drawings). Valves with sizes up to and including 2 inches (51 mm) shall be "screwed" configuration and 2-1/2 inches (63.5 mm) and larger valves shall be "flanged" configuration. All control valves, including terminal unit valves, less than 2 inches (51 mm) shall be globe valves. Electrically-actuated control valves shall include spring return type actuators sized for tight shut-off against system pressures (as specified above) and, when specified, shall be furnished with

integral switches for indication of valve position (open-closed). Pneumatic actuators for valves, when utilized, shall be sized for tight shut-off against system pressures (as specified above). Honeywell is basis of design.

- D. Control Valve Actuators: Actuators for VAV terminal unit heating coils shall be "drive-open; drive-closed" type. All actuators shall have inherent current limiting motor protection. Valve actuators shall be 24-volt, electronic type, modulating or two-position as required for the correct operating sequence. Actuators on valves needing 'fail-safe' operation shall have spring return to Normal position. Modulating valves shall be positive positioning in response to the signal. All valve actuators shall be UL listed. Honeywell is basis of design.
- E. All control valves 2-1/2 inches (63.5 mm) or larger shall have position indication. All hot water control valves shall be Normally-Open arrangement; all chilled water control valves shall be Normally-Closed arrangement. Honeywell is basis of design.
- F. Wall Mount Room Temperature sensors: Each room temperature sensor shall provide temperature indication to the digital controller, provide the capability for a software-limited occupant set point adjustment (warmer-cooler slider bar or switch) and limited operation override capability. Room Temperature Sensors shall be 20,000-ohm thermistor type with a temperature range of -40 to 140 degrees F (-38 to 60 degrees C). The sensor shall be complete with a decorative cover and suitable for mounting over a standard electrical utility box. These devices shall have an accuracy of 0.5 degrees F (.024 degrees C) over the entire range. Honeywell is basis of design.
- G. Duct-mounted and Outside Air Temperature Sensors: 20,000-ohm thermistor temperature sensors with an accuracy of  $\pm 0.2$  degrees C. Outside air sensors shall include an integral sun shield. Duct-mounted sensors shall have an insertion measuring probe of a length appropriate for the duct size, with a temperature range of -40 to 160 degrees F (-38 to 71 degrees C) The sensor shall include a utility box and a gasket to prevent air leakage and vibration noise. For all mixed air and preheat air applications, install bendable averaging duct sensors with a minimum 8 feet (2438 mm) long sensor element. These devices shall have accuracy of 0.5 degrees F (.024 degrees C) over the entire range. Honeywell is basis of design.
- H. Humidity sensors shall be thin-film capacitive type sensor with on-board nonvolatile memory, accuracy to plus or minus two percent (2%) at 0 to 90% RH, 12 - 30 VDC input voltage, analog output (0 - 10 VDC or 4 - 20mA output). Operating range shall be 0 to 100% RH and 32 to 140 degrees F (0 to 60 degrees C). Sensors shall be selected for wall, duct or outdoor type installation as appropriate. Honeywell is basis of design.
- I. Carbon Dioxide Sensors (CO<sub>2</sub>): Sensors shall utilize Non-dispersive infrared technology (N.D.I.R.), repeatable to plus or minus 20 PPM. Sensor range shall be 0 - 2000 PPM. Accuracy shall be plus or minus five percent (5%) or 75 PPM, whichever is greater. Response shall be less than one minute. Input voltage shall be 20 to 30 VAC or DC. Output shall be 0 - 10 VDC. Sensor shall be wall or duct mounted type, as appropriate for the application, housed in a high impact plastic enclosure. Honeywell is basis of design.
- J. Current Sensitive Switches: Solid state, split core current switch that operates when the current level (sensed by the internal current transformer) exceeds the adjustable trip point. Current switch to include an integral LED for indication of trip condition and a current level below trip set point. Honeywell is basis of design.

- K. Differential Analog (duct) Static Pressure Transmitters Provide a pressure transmitter with integral capacitance type sensing and solid-state circuitry. Accuracy shall be plus or minus 1% of full range; range shall be selected for the specific application. Provide zero and span adjustment capability. Device shall have integral static pickup tube. Honeywell is basis of design.
- L. Differential Air Pressure Switches: Provide SPDT type, UL-approved, and selected for the appropriate operating range where applied. Switches shall have adjustable set points and barbed pressure tips. Honeywell is basis of design.
- M. Water Flow Switches: Provide a SPST type contact switch with bronze paddle blade, sized for the actual pipe size at the location. If installed outdoors, provide a NEMA-4 enclosure. Flow switch shall be UL listed.
- N. Temperature Control Panels: Furnish temperature control panels of code gauge steel with locking doors for mounting all devices as shown. All electrical devices within a control panel shall be factory wired. Control panel shall be assembled by the BMS in a UL-Certified 508A panel shop. A complete set of 'as-built' control drawings (relating to the controls within that panel) shall be furnished within each control panel.
- O. Pipe and Duct Temperature sensing elements: 20,000-ohm thermistor temperature sensors with an accuracy of  $\pm 1\%$  accuracy. Their range shall be -5 to 250 degrees F (-20 to 121 degrees C). Limited range sensors shall be acceptable provided they are capable of sensing the range expected for the point at the specified accuracy. Thermal wells with heat conductive gel shall be included. Honeywell is basis of design.
- P. Low Air Temperature Sensors: Provide SPST type switch, with 15 to 55 degrees F (-9 to 13 degrees C), range, vapor-charged temperature sensor. Honeywell model L482A, or approved equivalent.
- Q. Variable Frequency Drives: The variable frequency drive (VFD) shall be designed specifically for use in Heating, Ventilation, and Air Conditioning (HVAC) applications in which speed control of the motor can be applied. The VFD, including all factory installed options, shall have UL & CSA approval. VFD's shall include communications capability with DDC BMS via built-in interface card (MODBUS or BACnet). Honeywell SmartVFD is basis of design.
- R. Relays: Start/stop relay model shall provide either momentary or maintained switching action as appropriate for the motor being started. All relays shall be plugged in, interchangeable, mounted on a sub base and wired to numbered terminals strips. Relays installed in panels shall all be DPDT with indicating lamp. Relays installed outside of controlled devices shall be enclosed in a NEMA enclosure suitable for the location. Relays shall be labeled with UR symbol. RIB-style relays are acceptable for remote enable/disable.
- S. Emergency Stop Switches: Provide toggle-type switch with normally-closed contact. Switch shall be labeled "AIR HANDLER EMERGENCY SHUTOFF, NORMAL - OFF."
- T. Transducers: Differential pressure transducers shall be electronic with a 4-20 mA output signal compatible to the Direct Digital Controller. Wetted parts shall be stainless steel. Unit shall be designed to operate in the pressure ranges involved.

- U. Control Power Transformers: Provide step-down transformers for all DDC controllers and devices as required. Transformers shall be sized for the load, but shall be sized for 50 watts, minimum. Transformers shall be UL listed Class 2 type, for 120 VAC/24 VAC operation. Honeywell is basis of design.
- V. Line voltage protection: All DDC system control panels that are powered by 120 VAC circuits shall be provided with surge protection. This protection is in addition to any internal protection provided by the manufacturer. The protection shall meet UL, ULC 1449, IEEE C62.41B. A grounding conductor, (minimum 12 AWG), shall be brought to each control panel.

## 2.12 BAS SERVER & WEB BROWSER GUI - SYSTEM OVERVIEW

- A. The BAS Vendor shall provide system software based on server/thin-client architecture, designed around the open standards of web technology. The BAS server shall communicate using Ethernet and TCP. Server shall be accessed using a web browser over Owner intranet and remotely over the Internet.
- B. The intent of the thin-client architecture is to provide the operator(s) complete access to the BAS system via a web browser. The thin-client web browser Graphical User Interface (GUI) shall be browser and operating system agnostic, meaning it will support HTML5 enabled browsers without requiring proprietary operator interface and configuration programs or browser plug-ins. Microsoft, Firefox, and Chrome browsers (current released versions), and Windows as well as non-Window operating systems.
- C. The BAS server software shall support at least the following server platforms (Windows 7, 8.1, Server 12). The BAS server software shall be developed and tested by the manufacturer of the system stand-alone controllers and network controllers/routers.
- D. The web browser GUI shall provide a completely interactive user interface and shall provide a HTML5 experience that supports the following features as a minimum:
  - 1. Trending.
  - 2. Scheduling.
  - 3. Electrical demand limiting.
  - 4. Duty Cycling.
  - 5. Downloading Memory to field devices.
  - 6. Real time 'live' Graphic Programs.
  - 7. Tree Navigation.
  - 8. Parameter change of properties.
  - 9. Set point adjustments.
  - 10. Alarm / event information.
  - 11. Configuration of operators.
  - 12. Execution of global commands.
  - 13. Add, delete, and modify graphics and displayed data.
- E. Software Components: All software shall be the most current version. All software components of the BAS system software shall be provided and installed as part of this project. BAS software components shall include:
  - 1. Server Software, Database and Web Browser Graphical User Interface.
  - 2. 3 Year Software Maintenance license. Labor to implement not included.
  - 3. Embedded System Configuration Utilities for future modifications to the system and

- controllers.
  - 4. Embedded Graphical Programming Tools.
  - 5. Embedded Direct Digital Control software.
  - 6. Embedded Application Software.
- F. BAS Server Database: The BAS server software shall utilize a Java Database Connectivity (JDBC) compatible database such as: MS SQL 8.0, Oracle 8i or IBM DB2. BAS systems written to Non -Standard and/or Proprietary databases are NOT acceptable.
- G. Thin Client - Web Browser Based: The GUI shall be thin client or browser based and shall meet the following criteria:
- 1. Web Browser's for PC's: Only the current released browser (Explorer/Firefox/Chrome) will be required as the GUI and a valid connection to the server network. No installation of any custom software shall be required on the operator's GUI workstation/client. Connection shall be over an intranet or the Internet.
  - 2. Secure Socket Layers: Communication between the Web Browser GUI and BAS server shall offer encryption using 128-bit encryption technology within Secure Socket Layers (SSL). Communication protocol shall be Hyper-Text Transfer Protocol (HTTP).

### 2.13 WEB BROWSER GRAPHICAL USER INTERFACE

- A. Web Browser Navigation: The Thin Client web browser GUI shall provide a comprehensive user interface. Using a collection of web pages, it shall be constructed to "feel" like a single application, and provide a complete and intuitive mouse/menu driven operator interface. It shall be possible to navigate through the system using a web browser to accomplish requirements of this specification. The Web Browser GUI shall (as a minimum) provide for navigation, and for display of animated graphics, schedules, alarms/events, live graphic programs, active graphic set point controls, configuration menus for operator access, reports and reporting actions for events.
- B. Login: On launching the web browser and selecting the appropriate domain name or IP address, the operator shall be presented with a login page that will require a login name and strong password. Navigation in the system shall be dependent on the operator's role-based application control privileges.
- C. Navigation: Navigation through the GUI shall be accomplished by clicking on the appropriate level of a navigation tree (consisting of an expandable and collapsible tree control like Microsoft's Explorer program) and/or by selecting dynamic links to other system graphics. Both the navigation tree and action pane shall be displayed simultaneously, enabling the operator to select a specific system or equipment and view the corresponding graphic. The navigation tree shall as a minimum provide the following views: Geographic, Network, Groups and Configuration.
- 1. Geographic View shall display a logical geographic hierarchy of the system including: cities, sites, buildings, building systems, floors, equipment and objects.
  - 2. Groups View shall display Scheduled Groups and custom reports.
  - 3. Configuration View shall display all the configuration categories (Operators, Schedule, Event, Reporting and Roles).
- D. Action Pane: The Action Pane shall provide several functional views for each subsystem specified. A functional view shall be accessed by clicking on the corresponding button:

1. Graphics: Using graphical format suitable for display in a web browser, graphics shall include aerial building/campus views, color building floor-plans, equipment drawings, active graphic set point controls, web content and other valid HTML elements. The data on each graphic page shall automatically refresh.
  2. Dashboards: User customizable data using drag and drop HTML5 elements. Shall include Web Charts, Gauges, and other custom developed widgets for web browser. User shall have ability to save custom dashboards.
  3. Search: User shall have multiple options for searching data based upon Tags. Associated equipment, real time data, Properties, and Trends shall be available in result.
  4. Properties: Shall include graphic controls and text for the following: Locking or overriding objects, demand strategies, and any other valid data required for setup. Changes made to the properties pages shall require the operator to depress an 'accept/cancel' button.
  5. Schedules: Shall be used to create, modify/edit and view schedules based on the systems hierarchy (using the navigation tree).
  6. Alarms: Shall be used to view alarm information geographically (using the navigation tree), acknowledge alarms, sort alarms by category, actions and verify reporting actions.
  7. Charting: Shall be used to display associated trend and historical data, modify colors, date range, axis and scaling. User shall have ability to create HTML charts through web browser without utilizing chart builder. User shall be able to drag and drop single or multiple data points, including schedules, and apply status colors for analysis.
  8. Logic - Live Graphic Programs: Shall be used to display 'live' graphic programs of the control algorithm, (micro block programming) for the mechanical/electrical system selected in the navigation tree.
  9. Other actions such as Print, Help, Command, and Logout shall be available via a drop-down window.
- E. Color Graphics: The Web Browser GUI shall make extensive use of color in the graphic pane to communicate information related to set points and comfort. Animated .gifs or .jpg, vector scalable, active set point graphic controls shall be used to enhance usability. Graphics tools used to create Web Browser graphics shall be non-proprietary and conform to the following basic criteria:
1. Display Size: The GUI workstation software shall graphically display in a minimum of 1024 by 768 pixels 24 bit True Color.
  2. General Graphic: General area maps shall show locations of controlled buildings in relation to local landmarks.
  3. Color Floor Plans: Floor plan graphics shall show heating and cooling zones throughout the buildings in a range of colors, as selected by Owner. Provide a visual display of temperature relative to their respective set points. The colors shall be updated dynamically as a zone's actual comfort condition changes.
  4. Mechanical Components: Mechanical system graphics shall show the type of mechanical system components serving any zone through the use of a pictorial representation of components. Selected I/O points being controlled or monitored for each piece of equipment shall be displayed with the appropriate engineering units. Animation shall be used for rotation or moving mechanical components to enhance usability. .
  5. Minimum System Color Graphics: Color graphics shall be selected and displayed via a web browser for the following:

- a. Each piece of equipment monitored or controlled including each terminal unit.
  - b. Each building.
  - c. Each floor and zone controlled.
- F. Hierarchical Schedules: Utilizing the Navigation Tree displayed in the web browser GUI, an operator (with proper access credentials) shall be able to define a Normal, Holiday or Override schedule for an individual piece of equipment or room, or choose to apply a hierarchical schedule to the entire system, site or floor area. For example, Independence Day 'Holiday' for every level in the system would be created by clicking at the top of the geographic hierarchy defined in the Navigation Tree. No further operator intervention would be required and every control module in the system with would be automatically downloaded with the 'Independence Day' Holiday. All schedules that affect the system/area/equipment highlighted in the Navigation Tree shall be shown in a summary schedule table and graph.
1. Schedules: Schedules shall comply with the LonWorks and BACnet standards, (Schedule Object, Calendar Object, Weekly Schedule property and Exception Schedule property) and shall allow events to be scheduled based on:
    - a. Types of schedule shall be Normal, Holiday or Override.
    - b. A specific date.
    - c. A range of dates.
    - d. Any combination of Month of Year (1-12, any), Week of Month (1-5, last, any), Day of Week (M-Sun, Any).
    - e. Wildcard (example, allow combinations like second Tuesday of every month).
  2. Schedule Categories: The system shall allow operators to define and edit scheduling categories (different types of "things" to be scheduled; for example, lighting, HVAC occupancy, etc.). The categories shall include: name, description, icon (to display in the hierarchy tree when icon option is selected) and type of value to be scheduled.
  3. Schedule Groups: In addition to hierarchical scheduling, operators shall be able to define functional Schedule Groups, comprised of an arbitrary group of areas/rooms/equipment scattered throughout the facility and site. For example, the operator shall be able to define an 'individual tenant' group - who may occupy different areas within a building or buildings. Schedules applied to the 'tenant group' shall automatically be downloaded to control modules affecting spaces occupied by the 'tenant group'.
  4. Intelligent Scheduling: The control system shall be intelligent enough to automatically turn on any supporting equipment needed to control the environment in an occupied space. If the operator schedules an individual room in a VAV system for occupancy, for example, the control logic shall automatically turn on the VAV air handling unit, chiller, boiler and/or any other equipment required to maintain the specified comfort and environmental conditions within the room.
  5. Partial Day Exceptions: Schedule events shall be able to accommodate a time range specified by the operator (ex: board meeting from 6 pm to 9 pm overrides Normal schedule for conference room).
  6. Schedule Summary Graph: The schedule summary graph shall clearly show Normal versus Holiday versus Override Schedules and the net operating schedule that results from all contributing schedules. Note: In case of priority conflict between schedules at the different geographic hierarchy, the schedule for the more detailed geographic level shall apply.
- G. Alarms: Alarms associated with a specific system, area, or equipment selected in the

Navigation Tree, shall be displayed in the Action Pane by selecting an ' Alarms' view. Alarms, and reporting actions shall have the following capabilities:

1. Alarms View: Each Alarm shall display an Alarms Category (using a different icon for each alarm category), date/time of occurrence, current status, alarm report and a bold URL link to the associated graphic for the selected system, area or equipment. The URL link shall indicate the system location, address and other pertinent information. An operator shall easily be able to sort events, edit event templates and categories, acknowledge or force a return to normal in the Events View as specified in this section.
2. Alarm Categories: The operator shall be able to create, edit or delete alarm categories such as HVAC, Maintenance, Fire, or Generator. An icon shall be associated with each alarm category, enabling the operator to easily sort through multiple events displayed.
3. Alarm Templates: Alarm template shall define different types of alarms and their associated properties. As a minimum, properties shall include a reference name, verbose description, severity of alarm, acknowledgement requirements, and high/low limit and out of range information.
4. Alarm Areas: Alarm Areas enable an operator to assign specific Alarm Categories to specific Alarm Reporting Actions. For example, it shall be possible for an operator to assign all HVAC Maintenance Alarm on the 1st floor of a building to email the technician responsible for maintenance. The Navigation Tree shall be used to setup Alarm Areas in the Graphic Pane.
5. Alarm Time/Date Stamp: All events shall be generated at the DDC control module level and comprise the Time/Date Stamp using the standalone control module time and date.
6. Alarm Configuration: Operators shall be able to define the type of Alarm generated per object. A ' network' view of the Navigation Tree shall expose all objects and their respective Alarm Configuration. Configuration shall include assignment of Alarm, type of Acknowledgement and notification for return to normal or fault status.
7. Alarm Summary Counter: The view of Alarm in the Graphic Pane shall provide a numeric counter, indicating how many Alarms are active (in alarm), require acknowledgement and total number of Alarms in the BAS Server database.
8. Alarm Auto-Deletion: Alarms that are acknowledged and closed shall be auto-deleted from the database and archived to a text file after an operator defined period.
9. Alarm Reporting Actions: Alarm Reporting Actions specified shall be automatically launched (under certain conditions) after an Alarm is received by the BAS server software. Operators shall be able to easily define these Reporting Actions using the Navigation Tree and Graphic Pane through the web browser GUI. Reporting Actions shall be as follows:
  - a. Print: Alarm information shall be printed to the BAS server's PC or a networked printer.
  - b. Email: Email shall be sent via any POP3-compatible e-mail server (most Internet Service Providers use POP3). Email messages may be copied to several email accounts. Note: Email reporting action shall also be used to support alphanumeric paging services, where email servers support pagers.
  - c. File Write: The ASCII File write reporting action shall enable the operator to append operator defined alarm information to any alarm through a text file. The alarm information that is written to the file shall be completely definable by the operator. The operator may enter text or attach other data point information (such as AHU discharge temperature and fan condition upon a high room

- d. temperature alarm).
  - d. Write Property: The write property reporting action updates a property value in a hardware module.
  - e. SNMP: The Simple Network Management Protocol (SNMP) reporting action sends an SNMP trap to a network in response to receiving an alarm.
  - f. Run External Program: The Run External Program reporting action launches specified program in response to an event.
- H. Trends: As system is engineered, all points shall be enabled to trend. Trends shall both be displayed and user configurable through the Web Browser GUI. Trends shall comprise analog, digital or calculated points simultaneously. A trend log's properties shall be editable using the Navigation Tree and Graphic Pane.
- 1. Viewing Trends: The operator shall have the ability to view trends by using the Navigation Tree and selecting a Trends button in the Graphic Pane. The system shall allow y- and x-axis maximum ranges to be specified and shall be able to simultaneously graphically display multiple trends per graph.
  - 2. Local Trends: Trend data shall be collected locally by Multi-Equipment/Single Equipment general-purpose controllers, and periodically uploaded to the BAS server if historical trending is enabled for the object. Trend data, including run time hours and start time date shall be retained in non-volatile module memory. Systems that rely on a gateway/router to run trends are NOT acceptable.
  - 3. Resolution. Sample intervals shall be as small as one second. Each trended point will have the ability to be trended at a different trend interval. When multiple points are selected for displays that have different trend intervals, the system will automatically scale the axis.
  - 4. Dynamic Update. Trends shall be able to dynamically update at operator-defined intervals.
  - 5. Zoom/Pan. It shall be possible to zoom-in on a particular section of a trend for more detailed examination and 'pan through' historical data by simply scrolling the mouse.
  - 6. Numeric Value Display. It shall be possible to pick any sample on a trend and have the numerical value displayed.
  - 7. Copy/Paste. The operator shall have the ability to pan through a historical trend and copy the data viewed to the clipboard using standard keystrokes (i.e. CTRL+C, CTRL+V).
- I. Security Access: Systems that are accessed from the web browser GUI to BAS server shall require a Login Name and Strong Password. Access to different areas of the BAS system shall be defined in terms of Role-Based Access Control privileges as specified:
- 1. Roles: Roles shall reflect the actual roles of different types of operators. Each role shall comprise a set of 'easily understood English language' privileges. Roles shall be defined in terms of View, Edit and Function Privileges.
    - a. View Privileges shall comprise: Navigation, Network, and Configuration Trees, Operators, Roles and Privileges, Alarm/Event Template and Reporting Action.
    - b. Edit Privileges shall comprise: Set point, Tuning and Logic, Manual Override, and Point Assignment Parameters.
    - c. Function Privileges shall comprise: Alarm/Event Acknowledgement, Control Module Memory Download, Upload, Schedules, Schedule Groups, Manual Commands, Print and Alarm/Event Maintenance.
  - 2. Geographic Assignment of Roles: Roles shall be geographically assigned using a similar expandable/collapsible navigation tree. For example, it shall be possible to

assign two HVAC Technicians with similar competencies (and the same operator defined HVAC Role) to different areas of the system.

## 2.14 GRAPHICAL PROGRAMMING

- A. The system software shall include a Graphic Programming Language (GPL) for all DDC control algorithms resident in all control modules. Any system that does not use a drag and drop method of graphical icon programming shall not be accepted. All systems shall use a GPL method used to create a sequence of operations by assembling graphic microblocks that represent each of the commands or functions necessary to complete a control sequence. Microblocks represent common logical control devices used in conventional control systems, such as relays, switches, high signal selectors etc., in addition to the more complex DDC and energy management strategies such as PID loops and optimum start. Each microblock shall be interactive and contain the programming necessary to execute the function of the device it represents.
- B. Graphic programming shall be performed while on screen and using a mouse; each microblock shall be selected from a microblock library and assembled with other microblocks necessary to complete the specified sequence. Microblocks are then interconnected on screen using graphic "wires," each forming a logical connection. Once assembled, each logical grouping of microblocks and their interconnecting wires then forms a graphic function block which may be used to control any piece of equipment with a similar point configuration and sequence of operation.
- C. Graphic Sequence: The clarity of the graphic sequence shall be such that the operator has the ability to verify that system programming meets the specifications, without having to learn or interpret a manufacturer's unique programming language. The graphic programming shall be self-documenting and provide the operator with an understandable and exact representation of each sequence of operation.
- D. GPL Capabilities: The following is a minimum definition of the capabilities of the Graphic Programming software:
  1. Function Block (FB): Shall be a collection of points, microblocks and wires which have been connected together for the specific purpose of controlling a piece of HVAC equipment or a single mechanical system.
  2. Logical I/O: Input/Output points shall interface with the control modules in order to read various signals and/or values or to transmit signal or values to controlled devices.
  3. Microblocks: Shall be software devices that are represented graphically and may be connected together to perform a specified sequence.
  4. Wires: Shall be Graphical elements used to form logical connections between microblocks and between logical I/O.
  5. Reference Labels: Labels shall be similar to wires in that they are used to form logical connections between two points. Labels shall form a connection by reference instead of a visual connection, i.e. two points labeled 'A' on a drawing are logically connected even though there is no wire between them.
  6. Parameter: A parameter shall be a value that may be tied to the input of a microblock.
  7. Properties: Dialog boxes shall appear after a microblock has been inserted which has editable parameters associated with it. Default parameter dialog boxes shall contain various editable and non-editable fields, and shall contain 'push buttons' for the purpose of selecting default parameter settings.
  8. Icon: An icon shall be graphic representation of a software program. Each graphic

microblock has an icon associated with it that graphically describes its function.

9. Menu-bar Icon: Shall be an icon that is displayed on the menu bar on the GPL screen, which represents its associated graphic microblock.
10. Live Graphical Programs: The Graphic Programming software shall support a 'live' mode, where all input/output data, calculated data and set points shall be displayed in a 'live' real-time mode.

## 2.15 LONWORKS NETWORK MANAGEMENT

- A. Systems requiring the use of third-party LonWorks network management tools shall not be accepted.
- B. Network management shall include the following services: device identification, device installation, device configuration, device diagnostics, device maintenance and network variable binding.
- C. The Network configuration tool shall also provide diagnostics to identify devices on the network, to reset devices and to view health and status counters within devices.
- D. These tools shall provide the ability to "learn" an existing LonWorks network, regardless of what network management tool(s) were used to install the existing network, so that existing LonWorks devices and newly added devices are part of a single network management database.
- E. The network management database shall be resident in the Network Area Controller (NAC), ensuring that anyone with proper authorization has access to the network management database at all times. Systems employing network management databases that are not resident, at all times and within the control system shall not be accepted.

## PART 3 EXECUTION

### 3.1 EXAMINATION

- A. Do not begin installation until substrates have been properly prepared.
- B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

### 3.2 PREPARATION

- A. Clean surfaces thoroughly prior to installation.
- B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

### 3.3 GENERAL

- A. Install system and materials in accordance with manufacturer's instructions, and as detailed on the project drawing set.
- B. Line and low voltage electrical connections to control equipment shown specified or shown

on the control diagrams shall be furnished and installed by the Contractor in accordance with these specifications.

- C. Equipment furnished by the Mechanical Vendor that is normally wired before installation shall be furnished completely wired. Control wiring normally performed in the field will be furnished and installed by the Contractor.
- D. All control devices mounted on the face of control panels shall be clearly identified as to function and system served with permanently engraved phenolic labels.

### 3.4 WIRING

- A. All electrical control wiring to the control panels shall be the responsibility of the Control System Vendor.
- B. All wiring shall be in accordance with the Project Electrical Specifications (Division 16), the National Electrical Code and any applicable local codes. All control wiring shall be installed in raceways.
- C. Excess wire shall not be looped or coiled in the controller cabinet.
- D. Incorporate electrical noise suppression techniques in relay control circuits.
- E. There shall be no drilling on the controller cabinet after the controls are mounted inside.
- F. Careful stripping of wire while inside the cabinet is required to ensure that no wire strand fragments land on circuit boards.
- G. Use manufacturer-specified wire for all network connections.
- H. Use approved optical isolation and lightning protection when penetrating building envelope.
- I. Read installation instructions carefully. Any unavoidable deviations shall be approved by owner's rep prior to installation.

### 3.5 ACCEPTANCE TESTING

- A. Upon completion of the installation, the Control System Vendor shall load all system software and start-up the system. The Control System Vendor shall perform all necessary calibration, testing and de-bugging and perform all required operational checks to insure that the system is functioning in full accordance with these specifications.
- B. The Control System Vendor shall perform tests to verify proper performance of components, routines and points. Repeat tests until proper performance results. This testing shall include a point-by-point log to validate 100% of the input and output points of the DDC system operation.
- C. System Acceptance: Satisfactory completion is when the Control System Vendor has performed successfully all the required testing to show performance compliance with the requirements of the Contract Documents to the satisfaction of the Owner's Representative. System acceptance shall be contingent upon completion and review of all corrected deficiencies.

### 3.6 OPERATOR TRAINING

- A. During system commissioning and at such time acceptable performance of the Controls Vendor shall provide on-site operator instruction to the owner's operating personnel. Operator instruction shall be done during normal working hours and shall be performed by a competent representative familiar with the system hardware, software and accessories.
- B. The Control System Vendor shall provide 48 total hours of comprehensive training in multiple sessions for system orientation, product maintenance and troubleshooting, programming and engineering. These classes are to be spread out during the 1st year warranty period. The first class starting after final commissioning and the last class is to be in the last month of 1-year warranty period.

### 3.7 WARRANTY PERIOD SERVICES

- A. Equipment, materials and workmanship incorporated into the work shall be warranted for a period of one year from the time of system acceptance.
- B. Within this period, upon notice by the Owner, any defects in the BMS due to faulty materials, methods of installation or workmanship shall be promptly repaired or replaced by the Contractor at no expense to the Owner.
- C. Maintenance of Computer Software Programs: The Control System Vendor shall maintain all software during the standard first year warranty period. In addition, all factory or sub-vendor upgrades to software during the first year warranty period shall be added to the systems, when they become available, at no additional cost. In addition to first year standard warranty, software provided by Control System Vendor shall come with a 5 Year Software Maintenance license. All SNC and BAS Servers are included in this coverage. Labor to implement upgrades in years two through five are not included in standard warranty.
- D. Maintenance of Control Hardware: The Control System Vendor shall inspect, repair, replace, adjust, and calibrate, as required, the controllers, control devices and associated peripheral units during the warranty period. The Control System Vendor shall then furnish a report describing the status of the equipment, problem areas (if any) noticed during service work, and description of the corrective actions taken. The report shall clearly certify that all hardware is functioning correctly.
- E. Service Period: Calls for service by the Owner shall be honored within 24 hours and are not to be considered as part of routine maintenance.
- F. Service Documentation: A copy of the service report associated with each owner-initiated service call shall be provided to the owner.

### 3.8 WARRANTY ACCESS

- A. The Owner shall grant to the Control System Vendor reasonable access to the BMS during the warranty period. Remote access to the BMS (for the purpose of diagnostics and troubleshooting, via the Internet, during the warranty period) will be allowed.

### 3.9 OPERATION & MAINTENANCE MANUALS

- A. See Division 1 for requirements. O&M manuals shall include the following elements, as a

minimum:

1. As-built control drawings for all equipment.
2. As-built Network Communications Diagram.
3. General description and specifications for all components.
4. Completed Performance Verification sheets.
5. Completed Controller Checkout/Calibration Sheets.

### 3.10 PROTECTION

- A. Protect installed products until completion of project.
- B. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

## SECTION 230993 - SEQUENCE OF OPERATIONS FOR HVAC CONTROLS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. This Section includes control sequences for HVAC systems, subsystems, and equipment.
- B. Related Sections include the following:
  - 1. Division 230923 Section "Direct Digital Control System for HVAC" for control equipment and devices and for submittal requirements.

#### 1.3 DEFINITIONS

- A. DDC: Direct digital control.

#### 1.4 AIR-HANDLING-UNIT CONTROL SEQUENCES (HVAC UNITS)

- A. Start and Stop Supply and Return Fan(s):
  - 1. Initiate: Occupied Time Schedule:
    - a. Input Device: Time clock.
    - b. Output Device: Time clock to motor starter.
    - c. Action: Energize fan(s). Transducer shall monitor power draw on all supply and return fans.
    - d. Cycle two way hot water control valve or two way chilled water control valve to maintain setpoint. Temperature sensor shall be in supply ductwork for VAV systems or in space for constant volume systems. Provide CO monitors in similar location.
    - e. Motorized damper for outdoor air shall open to minimum position, return damper shall be open and spill damper shall be closed on fan start and outside air damper shall close when fan is off. Provide end switch on dampers. On the VAV units monitor the outdoor airflow rate and modulate the outdoor air damper to maintain outdoor air quantity at all supply rates.
  - 2. Initiate: Unoccupied Time Schedule:
    - a. Input Device: Room thermostat.
    - b. Output Device: Room thermostat to motor starter.

- c. Action: Energize fan(s) if temperature exceeds unoccupied setpoint. on cooling or below setpoint on heating.
  3. Unoccupied Ventilation:
    - a. Input Device: Time clock and room thermostat.
    - b. Output Device: Room thermostat.
    - c. Action: Cycle fan(s) during unoccupied periods as thermostats call for heating or cooling Outdoor air damper and spill damper shall be closed and return damper shall be open..
  4. Display: Supply-fan on-off indication.
  5. Cooling and Heating:
    - a. Input Device: Discharge air sensor
    - b. Output Device: chilled and heating control valves.
    - c. Action: Modulate chilled water control valve in cooling mode and heating control valve in heating mode to maintain space temperature based on supply air temperature.
    - d. When outside air enthalpy is adequate and cooling is required outside air and spill air damper shall modulate open and return air damper shall modulate closed to maintain setpoint on units HVAC-1 to 4.
    - e. Discharge air sensor shall shutdown unit upon detection of low air temperature and provide alarm.
    - f. Provide condensate overflow alarm upon detection of condensate in drain pan. Shut down unit and provide alarm.
- B. Operator Station Display: Indicate the following on operator workstation display terminal:
  1. Occupied/unoccupied mode.
  2. Outdoor-air-temperature indication.
  3. Supply-fan and return fan on-off indication.
  4. Room temperature indication.
  5. Room temperature set point.
  6. Chilled water and hot water valve position.
  7. CO concentration

## 1.6 TERMINAL UNIT OPERATING SEQUENCE

### A. VAV boxes

1. Occupancy:
  - a. Input Device: Timeclock.
  - b. Output Device: DDC system binary output.
  - c. Action: Report occupancy and enable occupied temperature set point or unoccupied setpoint.
2. Room Temperature:

- a. Input Device: Room thermostat. Room thermostat shall allow local adjustment by occupant.
  - b. Output Device: VAV box.
  - c. Action: Modulate airflow to the space to maintain temperature setpoint (occupied or unoccupied).
    - 1) Occupied Temperature: 75 deg F summer and 70 degrees winter (adjustable)
    - 2) Unoccupied Temperature: 80 degrees summer and 62 degrees winter (adjustable)
3. Hot Water Coil
- a. Input Device: Room thermostat and VAV position
  - b. Output Device: VAV box valve
  - c. Action: Modulate control valve to maintain temperature in the space
4. Display:
- a. Room/area served.
  - b. Room temperature indication.
  - c. Room temperature set point.
  - d. Room temperature set point, occupied.
  - e. Room temperature set point, occupied standby.
  - f. Room temperature set point, unoccupied.
  - g. Hot water coil valve position
5. Alarms:
- a. Room temperature 5% from set point
  - b. CO<sub>2</sub> concentration exceeds set point by 10%
  - c. Valve or damper failure (as sensed by end switch)
  - d. Motor failure alarms
  - e. Dirty filter

## 1.6 HEATING SYSTEM

### A. Boilers:

1. Heating temperature:
  - a. Input Device: Outdoor air sensor
  - b. Output Device: Boilers
  - c. Action: Maintain discharge temperature as determined by outdoor air sensor.
2. Boiler Sequence:
  - a. Primary boiler shall cycle to maintain discharge temperature. If primary boiler can't maintain discharge temperature secondary boiler shall turn on and units shall cycle together

### B. Secondary Pump:

1. Operation:
  - a. Input Device: Pressure sensor
  - b. Output Device: AFD
  - c. Action: Pump speed shall be determined by discharge pressure sensor to maintain preset discharge pressure. If primary pump can't maintain pressure secondary pump shall cycle on and pumps shall cycle together.

C. Primary Pump:

1. Operation:
  - a. Input Device: Boiler
  - b. Output Device: Motor starter
  - c. Action: Primary pump shall be in operation when boiler is in operation.

D. Operator Station Display: Indicate the following on operator workstation display terminal:

1. Outdoor air temperature
2. Discharge boiler temperature
3. Supply and return water temperatures and pressures
4. Primary pump on-off indication
5. Secondary pump speed.
6. Boiler on-off indication.
7. Failure alarms.

## 1.7 COOLING SYSTEM

A. Refrigeration Machine:

1. Chilled water temperature:
  - a. Input Device: Return water temperature
  - b. Output Device: Refrigeration machine
  - c. Action: Maintain discharge temperature as determined by return water temperature.
2. Refrigeration Machine Sequence:
  - a. Primary chiller shall cycle to maintain discharge temperature. If primary chiller can't maintain temperature secondary chiller shall turn on.

B. Chilled water Pump:

1. Operation:
  - a. Input Device: Pressure sensor
  - b. Output Device: AFD
  - c. Action: Pump speed shall be determined by discharge pressure sensor to maintain preset discharge pressure. Isolation valves shall be open to the primary pump and closed to the standby pump.

C. Condenser water Pump:

1. Operation:
  - a. Input Device: Chiller

- b. Output Device: Motor starter
- c. Action: Condenser water pump shall be in operation when chiller is in operation. . Isolation valves shall be open to the primary pump and closed to the standby pump.

D. Standby water Pump:

- 1. Operation:
  - a. Input Device: Pumps
  - b. Output Device: AFD
  - c. Action: When the primary chilled water pump fails the automatic valves shall close to the primary pump and open to the standby pump. AFD shall modulate pump to maintain preset discharge temperature. When primary condenser water pump fails the valves shall close to the primary condenser water pump and open to the standby pump. The AFD shall stay in full speed position.
  - d. Alarm: Send alarm on failure of either pump. Should both primary pumps fail the chillers shall turn off.

E. Operator Station Display: Indicate the following on operator workstation display terminal:

- 1. Supply and return chilled water temperatures and pressures
- 2. Supply and return condenser water temperatures and pressures
- 3. Condenser water pump on-off indication
- 4. Chilled water pump speed.
- 5. Refrigeration machine on-off indication.
- 6. Failure alarms.

## 1.8 UNIT HEATER CONTROL SEQUENCES

A. Operation:

- 1. Initiate: Thermostat:
- 2. Output Device: Heater fan operation
- 3. Action: Heater fan shall turn on when determined by remote thermostat

## 1.9 EXHAUST FANS

A. Start and Stop Exhaust Fan(s):

- 1. Initiate: Occupancy Sensor (for toilet exhaust fans):
  - a. Input Device: Local occupancy sensor.
  - b. Output Device: motor starter.
  - c. Action: Energize fan(s).
- 2. Initiate: Temperature sensor (for IT closets):
  - a. Input Device: Temperature sensor

- b. Output Device: Motor starter
- c. Action: Energize fan

1.10 SPLIT SYSTEM AIR CONDITIONING UNIT.

- A. The unit shall operate on its independent thermostat. Air cooled condensing unit shall cycle based on cooling load requirements. These controls shall be provided by the air conditioning unit supplier. Provide a high temperature alarm and unit failure alarm to the DDC system

1.11 ENERGY METERING

- A. Provide water meters on incoming water service, and water feeds to condenser water, chilled water and hot water heating system. Monitor water use. All data shall be transmitted to the BMS system.
- B. Provide energy consumption meters on the heating system, condenser water system and chilled water system to monitor flow and temperature difference. Monitor flow and temperature difference. All data shall be transmitted to the BMS system.
- C. Provide interface to utility provided gas and electric meters to record whole building energy use.

**PART 2 - PRODUCTS (Not Applicable)**

**PART 3 - EXECUTION (Not Applicable)**

END OF SECTION 230993

## **SECTION 232113 - HYDRONIC PIPING**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### **1.2 SUMMARY**

- A. This Section includes pipe and fitting materials, joining methods, special-duty valves, and specialties for the following:
  1. Hot-water heating piping.
  2. Chilled water piping.
  3. Condenser water piping.
  4. Makeup-water piping.
  5. Condensate-drain piping.
  6. Air-vent piping.
  7. Safety-valve-inlet and -outlet piping.
- B. Related Sections include the following:
  1. Division 23 Section "Hydronic Pumps" for pumps, motors, and accessories for hydronic piping.

#### **1.3 PERFORMANCE REQUIREMENTS**

- A. Hydronic piping components and installation shall be capable of withstanding the following minimum working pressure and temperature:
  1. Hot-Water Heating Piping: 125 psig at 200 deg F
  2. Chilled water piping: 125 psig at 100 deg F.
  3. Condenser water piping: 125 psig at 150 deg F.
  4. Makeup-Water Piping: 80 psig at 150 deg F.
  5. Condensate-Drain Piping: 150 deg F.
  6. Air-Vent Piping: 200 deg F.
  7. Safety-Valve-Inlet and -Outlet Piping: Equal to the pressure of the piping system to which it is attached.

#### **1.4 SUBMITTALS**

- A. Product Data: For each type of the following:
  1. Valves. Include flow and pressure drop curves based on manufacturer's testing for calibrated-orifice balancing valves and automatic flow-control valves.
  2. Air control devices.
  3. Hydronic specialties.

- B. LEED Submittal:
  - 1. Product Data for Credit EQ 4.1: For solvent cements and adhesive primers, including printed statement of VOC content.
- C. Shop Drawings: Detail, at 1/4 inch scale, the piping layout, fabrication of pipe anchors, hangers, supports for multiple pipes, alignment guides, expansion joints and loops, and attachments of the same to the building structure. Detail location of anchors, alignment guides, and expansion joints and loops.
- D. Welding certificates.
- E. Qualification Data: For Installer.
- F. Field quality-control test reports.
- G. Operation and Maintenance Data: For air control devices, hydronic specialties, and special-duty valves to include in emergency, operation, and maintenance manuals.
- H. Water Analysis: Submit a copy of the water analysis to illustrate water quality available at Project site.

#### 1.5 QUALITY ASSURANCE

- A. Installer Qualifications:
  - 1. Installers of Pressure-Sealed Joints: Installers shall be certified by the pressure-seal joint manufacturer as having been trained and qualified to join piping with pressure-seal pipe couplings and fittings.
  - 2. Fiberglass Pipe and Fitting Installers: Installers of RTRF and RTRP shall be certified by the manufacturer of pipes and fittings as having been trained and qualified to join fiberglass piping with manufacturer-recommended adhesive.
- B. Steel Support Welding: Qualify processes and operators according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- C. Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX.
  - 1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
  - 2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.
- D. ASME Compliance: Comply with ASME B31.9, "Building Services Piping," for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp air separators and expansion tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 01.

## **PART 2 - PRODUCTS**

### 2.1 COPPER TUBE AND FITTINGS

- A. Drawn-Temper Copper Tubing: ASTM B 88, Type L.
- B. Annealed-Temper Copper Tubing: ASTM B 88, Type K .
- C. Wrought-Copper Fittings: ASME B16.22.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Anvil International, Inc.
    - b. S. P. Fittings; a division of Star Pipe Products.
    - c. Victaulic Company of America.
  - 2. Grooved-End Copper Fittings: ASTM B 75, copper tube or ASTM B 584, bronze casting.
- D. Copper or Bronze Pressure-Seal Fittings:
  - 1. Housing: Copper.
  - 2. O-Rings and Pipe Stops: EPDM.
  - 3. Tools: Manufacturer's special tools.
  - 4. Minimum 200-psig working-pressure rating at 250 deg F.

### 2.2 STEEL PIPE AND FITTINGS

- A. Steel Pipe: ASTM A 53/A 53M, black steel with plain ends; type, grade, and wall thickness as indicated in Part 3 "Piping Applications" Article.
- B. Cast-Iron Threaded Fittings: ASME B16.4; Classes 125 and 250 as indicated in Part 3 "Piping Applications" Article.
- C. Malleable-Iron Threaded Fittings: ASME B16.3, Classes 150 and 300 as indicated in Part 3 "Piping Applications" Article.
- D. Malleable-Iron Unions: ASME B16.39; Classes 150, 250, and 300 as indicated in Part 3 "Piping Applications" Article.
- E. Cast-Iron Pipe Flanges and Flanged Fittings: ASME B16.1, Classes 25, 125, and 250; raised ground face, and bolt holes spot faced as indicated in Part 3 "Piping Applications" Article.
- F. Wrought-Steel Fittings: ASTM A 234/A 234M, wall thickness to match adjoining pipe.
- G. Steel Pipe Nipples: ASTM A 733, made of same materials and wall thicknesses as pipe in which they are installed.

## 2.3 JOINING MATERIALS

- A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
  - 1. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
    - a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
    - b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
- B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.
- C. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.
- D. Welding Filler Metals: Comply with AWS D10.12/D10.12M for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.
- E. Gasket Material: Thickness, material, and type suitable for fluid to be handled and working temperatures and pressures.

## 2.4 DIELECTRIC FITTINGS

- A. Description: Combination fitting of copper-alloy and ferrous materials with threaded, solder-joint, plain, or weld-neck end connections that match piping system materials.
- B. Insulating Material: Suitable for system fluid, pressure, and temperature.
- C. Dielectric Unions:
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Capitol Manufacturing Company.
    - b. Central Plastics Company.
    - c. Hart Industries International, Inc.
    - d. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
    - e. Zurn Plumbing Products Group; AquaSpec Commercial Products Division.
  - 2. Factory-fabricated union assembly, for 250-psig minimum working pressure at 180 deg F
- D. Dielectric Flanges:
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Capitol Manufacturing Company.
    - b. Central Plastics Company.
    - c. Watts Regulator Co.; a division of Watts Water Technologies, Inc.

2. Factory-fabricated companion-flange assembly, for 150- or 300-psig minimum working pressure as required to suit system pressures.

E. Dielectric-Flange Kits:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Advance Products & Systems, Inc.
  - b. Calpico, Inc.
  - c. Central Plastics Company.
  - d. Pipeline Seal and Insulator, Inc.
2. Companion-flange assembly for field assembly. Include flanges, full-face- or ring-type neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers.
3. Separate companion flanges and steel bolts and nuts shall have 150-psig minimum working pressure where required to suit system pressures.

F. Dielectric Couplings:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Calpico, Inc.
  - b. Lochinvar Corporation.
2. Galvanized-steel coupling with inert and noncorrosive thermoplastic lining; threaded ends; and 300-psig minimum working pressure at 225 deg F.

G. Dielectric Nipples:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Perfection Corporation; a subsidiary of American Meter Company.
  - b. Precision Plumbing Products, Inc.
  - c. Sioux Chief Manufacturing Company, Inc.
  - d. Victaulic Company of America.
2. Electroplated steel nipple with inert and noncorrosive, thermoplastic lining; plain, threaded, or grooved ends; and 300-psig minimum working pressure at 225 deg F.

## 2.5 VALVES

- A. Gate, Check, and Ball Valves: Comply with requirements specified in Division 23 Section "General-Duty Valves for HVAC Piping."
- B. Automatic Temperature-Control Valves, Actuators, and Sensors: Comply with requirements specified in Division 23 Section "Instrumentation and Control for HVAC."
- C. Bronze, Calibrated-Orifice, Balancing Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Armstrong Pumps, Inc.
  - b. Bell & Gossett Domestic Pump; a division of ITT Industries.
  - c. Flow Design Inc.
  - d. Gerand Engineering Co.
  - e. Griswold Controls.
  - f. Taco.
2. Body: Bronze, ball or plug type with calibrated orifice or venturi.
3. Ball: Brass or stainless steel.
4. Plug: Resin.
5. Seat: PTFE.
6. End Connections: Threaded or socket.
7. Pressure Gage Connections: Integral seals for portable differential pressure meter.
8. Handle Style: Lever, with memory stop to retain set position.
9. CWP Rating: Minimum 125 psig.
10. Maximum Operating Temperature: 250 deg F.

## 2.6 AIR CONTROL DEVICES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Amtrol, Inc.
  2. Armstrong Pumps, Inc.
  3. Bell & Gossett Domestic Pump; a division of ITT Industries.
  4. Taco.
- B. Manual Air Vents:
  1. Body: Bronze.
  2. Internal Parts: Nonferrous.
  3. Operator: Screwdriver or thumbscrew.
  4. Inlet Connection: NPS 1/2
  5. Discharge Connection: NPS 1/8
  6. CWP Rating: 150 psig.
  7. Maximum Operating Temperature: 225 deg F.
- C. Automatic Air Vents:
  1. Body: Bronze or cast iron.
  2. Internal Parts: Nonferrous.
  3. Operator: Noncorrosive metal float.
  4. Inlet Connection: NPS 1/2.
  5. Discharge Connection: NPS 1/4.
  6. CWP Rating: 150 psig
  7. Maximum Operating Temperature: 240 deg F

## 2.7 HYDRONIC PIPING SPECIALTIES

### A. Y-Pattern Strainers:

1. Body: ASTM A 126, Class B, cast iron with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for NPS 2 and smaller; flanged ends for NPS 2-1/2 and larger.
3. Strainer Screen: 40 -mesh startup strainer, and perforated stainless-steel basket with 50 percent free area.
4. CWP Rating: 125 psig.

### B. Stainless-Steel Bellow, Flexible Connectors:

1. Body: Stainless-steel bellows with woven, flexible, bronze, wire-reinforcing protective jacket.
2. End Connections: Threaded or flanged to match equipment connected.
3. Performance: Capable of 3/4-inch misalignment.
4. CWP Rating: 150 psig.
5. Maximum Operating Temperature: 250 deg F .

### C. Expansion fittings are specified in Division 23 Section "Expansion Fittings and Loops for HVAC Piping."

## PART 3 - EXECUTION

### 3.1 PIPING APPLICATIONS

#### A. Hydronic piping, aboveground, NPS 2 and smaller, shall be any of the following:

1. Type L, drawn-temper copper tubing, wrought-copper fittings, and soldered joints.
2. Schedule 40 steel pipe; Class 125, cast-iron fittings; cast-iron flanges and flange fittings; and threaded joints.

#### B. Hydronic piping, aboveground, NPS 2 1/2" and larger, shall be the following:

1. Schedule 40 steel pipe; Class 125, cast-iron fittings; cast-iron flanges and flange fittings; and welded joints.

#### C. Condensate-Drain Piping: Type M, drawn-temper copper tubing, wrought-copper fittings, and soldered joints.

#### D. Condensate-Drain Piping: Schedule 40 PVC plastic pipe and fittings and solvent-welded joints.

#### E. Air-Vent Piping:

1. Inlet: Same as service where installed with metal-to-plastic transition fittings for plastic piping systems according to the piping manufacturer's written instructions.
2. Outlet: Type K, annealed-temper copper tubing with soldered or flared joints.

#### F. Safety-Valve-Inlet and -Outlet Piping for Hot-Water Piping: Same materials and joining methods as for piping specified for the service in which safety valve is installed with metal-to-

plastic transition fittings for plastic piping systems according to the piping manufacturer's written instructions.

### 3.2 VALVE APPLICATIONS

- A. Install shutoff-duty valves at each branch connection to supply mains, and at supply connection to each piece of equipment.
- B. Install calibrated-orifice, balancing valves at each branch connection to return main.
- C. Install calibrated-orifice, balancing valves in the return pipe of each heating or cooling terminal.

### 3.3 PIPING INSTALLATIONS

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicate piping locations and arrangements if such were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
- B. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.
- C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- E. Install piping to permit valve servicing.
- F. Install piping at indicated slopes.
- G. Install piping free of sags and bends.
- H. Install fittings for changes in direction and branch connections.
- I. Install piping to allow application of insulation.
- J. Select system components with pressure rating equal to or greater than system operating pressure.
- K. Install groups of pipes parallel to each other, spaced to permit applying insulation and servicing of valves.
- L. Install drains, consisting of a tee fitting, NPS 3/4 ball valve, and short NPS 3/4 threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.
- M. Install piping at a uniform grade of 0.2 percent upward in direction of flow.
- N. Reduce pipe sizes using eccentric reducer fitting installed with level side up.

- O. Install branch connections to mains using mechanically formed tee fittings in main pipe, with the branch connected to the bottom of the main pipe. For up-feed risers, connect the branch to the top of the main pipe.
- P. Install valves according to Division 23 Section "General-Duty Valves for HVAC Piping."
- Q. Install unions in piping, NPS 2 and smaller, adjacent to valves, at final connections of equipment, and elsewhere as indicated.
- R. Install flanges in piping, NPS 2-1/2 and larger, at final connections of equipment and elsewhere as indicated.
- S. Install strainers on inlet side of each control valve, pressure-reducing valve, solenoid valve, in-line pump, and elsewhere as indicated. Install NPS 3/4 nipple and ball valve in blowdown connection of strainers NPS 2 and larger. Match size of strainer blowoff connection for strainers smaller than NPS 2.
- T. Install expansion loops, expansion joints, anchors, and pipe alignment guides as specified in Division 23 Section "Expansion Fittings and Loops for HVAC Piping."
- U. Identify piping as specified in Division 23 Section "Identification for HVAC Piping and Equipment."

### 3.4 HANGERS AND SUPPORTS

- A. Hanger, support, and anchor devices are specified in Division 23 Section "Hangers and Supports for HVAC Piping and Equipment." Comply with the following requirements for maximum spacing of supports.
- B. Seismic restraints are specified in Division 23 Section "Vibration and Seismic Controls for HVAC Piping and Equipment."
- C. Install the following pipe attachments:
  - 1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
  - 2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
  - 3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
  - 4. Spring hangers to support vertical runs.
  - 5. Provide copper-clad hangers and supports for hangers and supports in direct contact with copper pipe.
- D. Install hangers for steel piping with the following maximum spacing and minimum rod sizes:
  - 1. NPS 3/4: Maximum span, 7 feet; minimum rod size, 1/4 inch.
  - 2. NPS 1: Maximum span, 7 feet ; minimum rod size, 1/4 inch.
  - 3. NPS 1-1/2 : Maximum span, 9 feet; minimum rod size, 3/8 inch.
  - 4. NPS 2: Maximum span, 10 feet; minimum rod size, 3/8 inch (10 mm).
  - 5. NPS 2-1/2 (DN 65): Maximum span, 11 feet (3.4 m); minimum rod size, 3/8 inch.

6. NPS 3: Maximum span, 12 feet; minimum rod size, 3/8 inch.
  7. NPS 4: Maximum span, 14 feet; minimum rod size, 1/2 inch.
  8. NPS 6: Maximum span, 17 feet ; minimum rod size, 1/2 inch.
- E. Install hangers for drawn-temper copper piping with the following maximum spacing and minimum rod sizes:
1. NPS 3/4 Maximum span, 5 feet ; minimum rod size, 1/4 inch.
  2. NPS 1 Maximum span, 6 feet ; minimum rod size, 1/4 inch.
  3. NPS 1-1/2 Maximum span, 8 feet; minimum rod size, 3/8 inch.
  4. NPS 2: Maximum span, 8 feet; minimum rod size, 3/8 inch.
  5. NPS 2-1/2: Maximum span, 9 feet; minimum rod size, 3/8 inch.
  6. NPS 3 : Maximum span, 10 feet; minimum rod size, 3/8 inch.
- F. Support vertical runs at roof, at each floor, and at 10-foot intervals between floors.

### 3.5 PIPE JOINT CONSTRUCTION

- A. Join pipe and fittings according to the following requirements and Division 23 Sections specifying piping systems.
- B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
- C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
- D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.
- E. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
  2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
- F. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

### 3.6 HYDRONIC SPECIALTIES INSTALLATION

- A. Install manual air vents at high points in piping, at heat-transfer coils, and elsewhere as required for system air venting.
- B. Install automatic air vents at high points of system piping in mechanical equipment rooms only. Manual vents at heat-transfer coils and elsewhere as required for air venting.

### 3.7 TERMINAL EQUIPMENT CONNECTIONS

- A. Sizes for supply and return piping connections shall be the same as or larger than equipment connections.
- B. Install control valves in accessible locations close to connected equipment.
- C. Install ports for pressure gages and thermometers at coil inlet and outlet connections according to Division 23 Section "Meters and Gages for HVAC Piping."

### 3.8 FIELD QUALITY CONTROL

- A. Prepare hydronic piping according to ASME B31.9 and as follows:
  - 1. Leave joints, including welds, uninsulated and exposed for examination during test.
  - 2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
  - 3. Flush hydronic piping systems with clean water; then remove and clean or replace strainer screens.
  - 4. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
  - 5. Install safety valve, set at a pressure no more than one-third higher than test pressure, to protect against damage by expanding liquid or other source of overpressure during test.
- B. Perform the following tests on hydronic piping:
  - 1. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.
  - 2. While filling system, use vents installed at high points of system to release air. Use drains installed at low points for complete draining of test liquid.
  - 3. Isolate expansion tanks and determine that hydronic system is full of water.
  - 4. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the system's working pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength or 1.7 times "SE" value in Appendix A in ASME B31.9, "Building Services Piping."
  - 5. After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.
  - 6. Prepare written report of testing.
- C. Perform the following before operating the system:
  - 1. Open manual valves fully.
  - 2. Inspect pumps for proper rotation.
  - 3. Set makeup pressure-reducing valves for required system pressure.

4. Inspect air vents at high points of system and determine if all are installed and operating freely (automatic type), or bleed air completely (manual type).
5. Set temperature controls so all coils are calling for full flow.
6. Inspect and set operating temperatures of hydronic equipment, such as boilers, chillers, cooling towers, to specified values.
7. Verify lubrication of motors and bearings.

END OF SECTION 232113

## **SECTION - 232123 BASE-MOUNTED, CENTRIFUGAL HYDRONIC PUMPS**

### **PART 1 – GENERAL**

#### 1.1 DESCRIPTION OF WORK

- A. Provide pumps and required system trim for heating, chilled water, condenserwater and dual temperature water systems including all related appurtenances for a complete and operating systems.

#### 1.2 SECTION INCLUDES

- A. End Suction, Long Coupled Pump (Base Mounted)

#### 1.3 RELATED SECTIONS

- A. Drawings and general provisions of the Contract, including General and supplementary Conditions and Division 1 Specification Sections, apply to these Sections.
  - Section 230500 - Mechanical General Requirements
  - Section 230553 - Mechanical Identification
  - Section 230548 - Vibration Isolation
  - Section 230700 - Piping Insulation
  - Section 232113 - Hydronic Piping and Specialties
  - Section 230593 - Testing, Adjusting, and Balancing
  - Section 230519 - Meters and Gauges

#### 1.4 REFERENCES

- A. HI - Hydraulic Institute.
- B. ANSI - American National Standards Institute.
- C. OSHA - Occupational Safety & Health Administration.
- D. ASHRAE – American Society of Heating, Refrigeration and Air-Conditioning Engineers.
- E. NEMA - National Electrical Manufacturers Association.
- F. UL - Underwriters Laboratories.
- G. ETL - Electrical Testing Laboratories.
- H. CSA - Canadian Standards Association.
- I. NEC - National Electric Codes.
- J. ISO - International Standards Organization.
- K. IEC - International Electrotechnical Commission.
- L. ASME – American Society of Mechanical Engineers.

## 1.5 SUBMITTAL

- A. Submit each item in this article according to the Conditions of the Contract and Division 1 Specification Sections.
- B. Submit manufacturer's installation instructions under provisions of General Conditions and Division 1.
  - Operation and Maintenance Data: Include installation instructions, assembly views, lubrication instructions, and replacement parts lists.
  - Under provisions of commissioning documentation, testing of pumps, as well as training of owner's operation and maintenance personnel may be required in cooperation with the commissioning consultant.
- C. Product Data including certified performance curves and rated capacities of selected model, weights (shipping, installed, and operating), furnished specialties, and accessories. Indicate pump's operating point on curves.
- D. Complete Package information Product Data including:
  - System summary sheet (where applicable)
  - Sequence of Operation
  - Shop drawing indicating dimensions, required clearances and location and size of each field connection
  - Power and control wiring diagram
  - System profile analysis including pump curves, system curve, and variable speed pump curves (where applicable)
  - Pump data sheets - Rated capacities of selected models and indication of pump's operating point on curves.
  - Submittals on furnished specialties and accessories
  - Submittals must be specific to this project. Generic submittals will not be accepted
- E. A detailed weighted average pump efficiency-Part Load Efficiency Value (PLEV)- Pump Rating Report shall be submitted for each pump. Pump PLEV shall be based on the standard load profile developed in AHRI 550/590-1998 also known as IPLV or Integrated Part Load Value. The pump PLEV Rating shall be expressed with load weighting  $PLEV = 1 / (0.01/A + 0.42/B + 0.45/C + 0.12/D)$  & shall be based points on A: 100%, B:75%, C:50% and D:25%. Each Pump Efficiency ratings shown with flow matched to load percentage and Specified Control Head. Actual job specific load profile weighting may be substituted for standard IPLV weighting.
- F. Pump and motor must meet minimum Department of Energy requirements and have a PEICL value less than 1
- G. Specified Control Head shall be 30% TDH or calculated minimum control head specified within the equipment schedule
- H. Hanging and supporting requirements should follow the recommendations in the manufacturer's installation instructions
- I. Submittals that are "rejected" as being "non-compliant" will be re-reviewed once with all time for subsequent reviews back charged to the contractor in accordance with the engineer's current prevailing rate schedule. If a rate schedule for additional services is included, as part of the contract with the owner that rate schedule shall be used in lieu of the "current prevailing" rate schedule.

## 1.6 QUALITY ASSURANCE

- A. All equipment or components of this specification section shall meet or exceed the requirements and quality of the items herein specified, or as denoted on the drawings.

- B. Ensure pump operation at specified system fluid temperatures without vapor binding and cavitation, is non-overloading in parallel or individual operation, and operates to ANSI/HI 9.6.3.1 standard for Preferred Operating Region (POR) unless otherwise approved by the engineer.
- C. Ensure pump pressure ratings are at least equal to system's maximum operating pressure at point where installed but not less than specified.
- D. Equipment manufacturer shall be a company specializing in manufacture, assembly, and field performance of provided equipment with a minimum of 20 years experience.
- E. Equipment provider shall be responsible for providing certified equipment start-up and, when noted, an in the field certified training session. New pump start-up shall be for the purpose of determining pump alignment, lubrication, voltage, and amperage readings. All proper electrical connections, pump's balance, discharge and suction gauge readings, and adjustment of head, if required. A copy of the start-up report shall be made and sent to both the contractor and to the Engineer.

#### 1.7 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to the site in such a manner as to protect the materials from shipping and handling damage. Provide materials on factory provided shipping skids and lifting lugs if required for handling. Materials damaged by the elements should be packaged in such a manner that they could withstand short-term exposure to the elements during transportation.
- B. Store materials in clean, dry place and protect from weather and construction traffic. Handle carefully to avoid damage.
- C. Use all means necessary to protect equipment before, during, and after installation.
- D. All scratched, dented, and otherwise damaged units shall be repaired or replaced as directed by the Architect Engineer.

#### 1.8 WARRANTY:

- A. Provide a minimum One (1) year warranty on materials and installation under provision of Section 01 78 36.

### **PART 2 – PRODUCTS**

#### 2.1 MANUFACTURERS

- A. The specifying engineer reserves the right to specify a primary supplier / lead spec manufacturer on all supplied schedule and specification documents. These primary suppliers have led their respective industry in research and development and their products have had proven track records in the field. These primary suppliers, in the opinion of this engineering firm, produce a superior product to the alternately listed manufacturers. The contractor may choose to supply equivalent equipment as manufactured by the alternately specified manufacturer based on the approval of the supplied alternate manufacturer's equipment is subject to approval of the submittals.
- B. Contractor shall furnish and install new end suction long coupled pumps for chilled water, condenser water and hot water heating systems as indicated on the drawings. Pumps shall be condenser water as manufactured by Bell & Gossett or approved equal. Pumps shall meet types, sizes, capacities, and characteristics as scheduled on the Equipment Schedule drawings. Pump substitutions shall be provided with connection sizes equal to those scheduled. Pump connections shall not be downsized. Pump substitutions shall not be provided at efficiencies less than those scheduled.

## 2.2 COMPONENTS

- A. The pumps shall be long coupled, base mounted, single stage, end suction, vertical split case design, in cast iron stainless steel fitted, specifically designed for quiet operation. Suitable standard operations at 225°F and 175 PSIG working pressure or optional operations at up to 250°F and 250 PSIG working pressures. Working pressures shall not be de-rated at temperatures up to 250F. The pump internals shall be capable of being services without disturbing piping connections, electrical motor connections or pump to motor alignment.
- B. The pumps shall be composed of three separable components a motor, bearing assembly, and pump end (wet end). The motor shaft shall be connected to the pump shaft via a replaceable flexible coupling.
- C. A bearing assembly shall support the shaft via two heavy-duty regreaseable ball bearings. Bearing assembly shall be replaceable without disturbing the system piping and shall have foot support at the coupling end. Pump bearings shall be regreaseable without removal of the bearings from the bearing assembly. Thermal expansion of the shaft toward the impeller shall be prevented via an inboard thrust bearing.
- D. The bearing assembly shall have a solid SAE1144 steel shaft. A stainless steel shaft sleeve shall be employed to completely cover the wetted area under the seal.
- E. Pump shall be equipped with an internally-flushed mechanical seal assembly installed in an enlarged tapered seal chamber. Application of an internally flushed mechanical seal shall be adequate for seal flushing without requiring external flushing lines. Seal assembly shall have Buna bellows and seat gasket, stainless steel spring, and be of a carbon ceramic design with the carbon face rotating against a stationary ceramic face.
- F. Bearing assembly shaft shall connect to a stainless steel impeller. Impeller shall be both hydraulically and dynamically balanced to ANSI/HI 9.6.4-2016, balance grade G6.3 and secured by a stainless steel locking capscrew or nut.
- G. Pump should be designed to allow for true back pull-out allowing access to the pump's working components, without disturbing motor or piping, for ease of maintenance.
- H. A center drop-out type coupling, capable of absorbing torsional vibration, shall be employed between the pump and motor. Pumps for variable speed application shall be provided with a suitable coupling sleeve. Coupling shall allow for removal of pump's wetted end without disturbing pump volute or movement of the pump's motor and electrical connections. On variable speed applications the coupling sleeve should be constructed of an neoprene material to maximize performance life.
- I. An ANSI and OSHA rated coupling guard shall shield the coupling during operation. Coupling guard shall be dual rated ANSI B15.1 and OSHA 1910.219 compliant coupling guard and contain viewing windows for inspection of the coupling. No more than .25 inches of either rotating assembly shall be visible beyond the coupling guard.
- J. Pump volute shall be of a cast iron design for heating systems with integrally cast pedestal volute support, rated for 175 PSIG with integral cast iron flanges drilled for 125# ANSI companion flanges. (Optional 250 PSIG working pressures are available and are 250# flange drilled.) Volute shall include gauge ports at nozzles, and vent and drain ports.
- K. Motors shall meet scheduled horsepower, speed, voltage, and enclosure design. Pump and motors shall be factory aligned, and shall be realigned after installation by the manufacturer's representative. Motors shall be non-overloading at any point on the pump curve and shall meet NEMA specifications and conform to standards outlined in EISA 2007.
- L. Base plate shall be of structural steel or fabricated steel channel configuration fully enclosed at sides and ends, with securely welded cross members and fully open grouting area (for field grouting). The minimum base plate stiffness shall conform to ANSI/HI 1.3.8.2.1-2019 for grouted Horizontal Baseplate Design standards.

- M. Pump shall be of a maintainable design and, for ease of maintenance, should use machine fit parts and not press fit components.
- N. The pump(s) vibration limits shall conform to Hydraulic Institute ANSI/HI 9.6.4-2016 for recommended acceptable unfiltered field vibration limits (as measured per ANSI/HI 9.6.4-2016 Figure 9.6.4.2.3.1) for pumps with rolling contact bearings.
- O. Pump manufacturer shall be ISO-9001 certified.
- P. Each pump shall be hydrostatically tested 1.5 times the maximum rated working pressure and name-plated before shipment.
- Q. Pump shall conform to ANSI/HI 9.6.3.1-2012 standard for Preferred Operating Region (POR) unless otherwise approved by the engineer.

## 2.3 ACCESSORIES

- A. Where noted on the schedule provide one mechanical seal for each model type of primary pump.
- B. Where noted on schedule pumps shall be provided with internal volute wear rings, galvanized drip pan, or special spacer couplings.
- C. Where noted on schedule an EPR/Carbon-Tungsten Carbide seal (250° F maximum operating temperature), or EPR/Silicon Carbide-Silicon Carbide seal should be used in lieu of the Buna standard seal (225° F maximum operating temperature).
- D. Where noted on schedule a stuffing box design may be used in lieu of the traditional internally flushed mechanical seal design. Pump shall be flushed single seal or packing gland type seal arrangements.
- E. Where noted on schedule, pumping equipment may require a Hydraulic Performance Test per ANSI/HI-14.6-2011, witnessed or non-witnessed test.

## PART 3 – EXECUTION

### 3.1 INSTALLATION

- A. All components shall be installed in accordance with manufacturer's installation instructions.
- B. Reduction from line size to pump connection size shall be made with eccentric reducers attached to the pump with tops flat to allow continuity of flow.
- C. Furnish and install triple duty valves on the discharge side of all pumps and furnish and install a line size shut-off valve on the suction side of all pumps. Anywhere that 5 straight pipe diameters of pipe cannot be provided on the inlet side of a pump a suction diffuser shall be used to provide appropriate flow distribution into the eye of the pump's impeller.
- D. Provide temperature and pressure gauges where and as detailed or directed.
- E. On systems where pump seals require flushing water or cooling water for a heat exchanger kit, provide cooling water supply piping and connections as well as the return piping, if required. Piping should be of adequate size to pass required flow rate.
- F. Proper access space around a device should be left for servicing the component. No less than the minimum recommended by the manufacturer.
- G. Provide an adequate number of isolation valves for service and maintenance of the system and its components.
- H. Circulating pump shall have sufficient capacity to circulate the scheduled GPM against the scheduled external head (feet) with the horsepower and speed as scheduled and/or as denoted on the drawings. Motors shall be of electrical characteristics as scheduled, denoted and/or as indicated on the electrical plans and specifications. Pump characteristics shall be such that the head of the pump under varying conditions shall not exceed the rated horsepower of the drive motor.

- I. On systems where the final balancing procedure requires the triple duty valve to be throttled more than 25% to attain design flow (on a constant speed pumping system), and no future capacity has been built into the pump, the pump impeller must be trimmed to represent actual system head resistance. The pump provider and engineer of record, based on the balancing contractor's reports, shall determine the final impeller trim diameter.
- J. Install foot mounted and base mounted pumps on vibration isolation pad or house keeping pad, via anchor bolts. Set and level and grout in place.
- K. All piping shall be brought to equipment and pump connections in such a manner so as to prevent the possibility of any loads or stresses being applied to the connections or piping. All piping shall be fitted to the pumps even though piping adjustments may be required after the pipe is installed.
- L. On components that require draining, contractor must provide piping to and discharging into appropriate drains.
- M. Provide drains for bases and seals, piped to and discharging into floor drains.
- N. Power wiring, as required, shall be the responsibility of the electrical contractor. All wiring shall be performed per manufacturer's instruction and applicable state, federal, and local codes.
- O. Control wiring for remote mounted switches and sensor / transmitters shall be the responsibility of this contractor. All wiring shall be performed per manufacturer's instructions and applicable state, federal, and local codes.

END OF SECTION

## **SECTION 232523 - GENERAL-DUTY VALVES FOR HYDRONIC PIPING**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### **1.2 SUMMARY**

- A. Section Includes:
  - 1. Brass ball valves.
  - 2. Bronze ball valves.
  - 3. Bronze lift check valves.
  - 4. Bronze swing check valves.
  - 5. Bronze gate valves.
  - 6. Lubricated plug valves.
- B. Related Sections:
  - 1. Division 23 Section "Identification for hVAC Piping and Equipment" for valve tags and schedules.

#### **1.3 DEFINITIONS**

- A. CWP: Cold working pressure.
- B. EPDM: Ethylene propylene copolymer rubber.
- C. NBR: Acrylonitrile-butadiene, Buna-N, or nitrile rubber.
- D. NRS: Nonrising stem.
- E. OS&Y: Outside screw and yoke.
- F. RS: Rising stem.
- G. SWP: Steam working pressure.

#### **1.4 SUBMITTALS**

- A. Product Data: For each type of valve indicated.

## 1.5 QUALITY ASSURANCE

- A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.
- B. ASME Compliance:
  - 1. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria.
  - 2. ASME B31.1 for power piping valves.
  - 3. ASME B31.9 for building services piping valves.
- C. NSF Compliance: NSF 61 for valve materials for potable-water service.

## 1.6 DELIVERY, STORAGE, AND HANDLING

- A. Prepare valves for shipping as follows:
  - 1. Protect internal parts against rust and corrosion.
  - 2. Protect threads, flange faces, grooves, and weld ends.
  - 3. Set angle, gate, and globe valves closed to prevent rattling.
  - 4. Set ball and plug valves open to minimize exposure of functional surfaces.
  - 5. Block check valves in either closed or open position.
- B. Use the following precautions during storage:
  - 1. Maintain valve end protection.
  - 2. Store valves indoors and maintain at higher than ambient dew point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.

## **PART 2 - PRODUCTS**

### 2.1 GENERAL REQUIREMENTS FOR VALVES

- A. Refer to valve schedule articles for applications of valves.
- B. Valve Pressure and Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.
- C. Valve Sizes: Same as upstream piping unless otherwise indicated.
- D. Valve Actuator Types:
  - 1. Handwheel: For valves other than quarter-turn types.
  - 2. Handlever: For quarter-turn valves NPS 6 and smaller except plug valves.
  - 3. Wrench: For plug valves with square heads. Furnish Owner with 1 wrench for every 5 plug valves, for each size square plug-valve head.
- E. Valves in Insulated Piping: With 2-inch stem extensions and the following features:
  - 1. Gate Valves: With rising stem.

2. Ball Valves: With extended operating handle of non-thermal-conductive material, and protective sleeve that allows operation of valve without breaking the vapor seal or disturbing insulation.

F. Valve-End Connections:

1. Flanged: With flanges according to ASME B16.1 for iron valves.
2. Grooved: With grooves according to AWWA C606.
3. Solder Joint: With sockets according to ASME B16.18.
4. Threaded: With threads according to ASME B1.20.1.

G. Valve Bypass and Drain Connections: MSS SP-45.

## 2.2 BRASS BALL VALVES

A. Two-Piece, Full-Port, Brass Ball Valves with Brass Trim:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Crane Co.; Crane Valve Group; Crane Valves.
  - b. Crane Co.; Crane Valve Group; Jenkins Valves.
  - c. DynaQuip Controls.
  - d. Flow-Tek, Inc.; a subsidiary of Bray International, Inc.
  - e. Hammond Valve.
  - f. Jamesbury; a subsidiary of Metso Automation.
  - g. Jomar International, LTD.
  - h. Kitz Corporation.
  - i. Legend Valve.
  - j. Marwin Valve; a division of Richards Industries.
  - k. Milwaukee Valve Company.
  - l. NIBCO INC.
  - m. Red-White Valve Corporation.
  - n. RuB Inc.
2. Description:
  - a. Standard: MSS SP-110.
  - b. SWP Rating: 150 psig.
  - c. CWP Rating: 600 psig.
  - d. Body Design: Two piece.
  - e. Body Material: Forged brass.
  - f. Ends: Threaded.
  - g. Seats: PTFE or TFE.
  - h. Stem: Brass.
  - i. Ball: Chrome-plated brass.
  - j. Port: Full.

## 2.3 BRONZE BALL VALVES

### A. Two-Piece, Full-Port, Bronze Ball Valves with Bronze Trim:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. American Valve, Inc.
  - b. Conbraco Industries, Inc.; Apollo Valves.
  - c. Crane Co.; Crane Valve Group; Crane Valves.
  - d. Hammond Valve.
  - e. Lance Valves; a division of Advanced Thermal Systems, Inc.
  - f. Legend Valve.
  - g. Milwaukee Valve Company.
  - h. NIBCO INC.
  - i. Red-White Valve Corporation.
  - j. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
  
2. Description:
  - a. Standard: MSS SP-110.
  - b. SWP Rating: 150 psig.
  - c. CWP Rating: 600 psig.
  - d. Body Design: Two piece.
  - e. Body Material: Bronze.
  - f. Ends: Threaded.
  - g. Seats: PTFE or TFE.
  - h. Stem: Bronze.
  - i. Ball: Chrome-plated brass.
  - j. Port: Full.

## 2.4 BRONZE SWING CHECK VALVES

### A. Class 125, Bronze Swing Check Valves with Bronze Disc:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. American Valve, Inc.
  - b. Crane Co.; Crane Valve Group; Crane Valves.
  - c. Crane Co.; Crane Valve Group; Jenkins Valves.
  - d. Crane Co.; Crane Valve Group; Stockham Division.
  - e. Hammond Valve.
  - f. Kitz Corporation.
  - g. Milwaukee Valve Company.
  - h. NIBCO INC.
  - i. Powell Valves.
  - j. Red-White Valve Corporation.
  - k. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
  - l. Zy-Tech Global Industries, Inc.

2. Description:
  - a. Standard: MSS SP-80, Type 3.
  - b. CWP Rating: 200 psig.
  - c. Body Design: Horizontal flow.
  - d. Body Material: ASTM B 62, bronze.
  - e. Ends: Threaded.
  - f. Disc: Bronze.

B. Class 125, Bronze Swing Check Valves with Nonmetallic Disc:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. Crane Co.; Crane Valve Group; Crane Valves.
  - b. Crane Co.; Crane Valve Group; Jenkins Valves.
  - c. Crane Co.; Crane Valve Group; Stockham Division.
  - d. Hammond Valve.
  - e. Kitz Corporation.
  - f. Milwaukee Valve Company.
  - g. NIBCO INC.
  - h. Red-White Valve Corporation.
  - i. Watts Regulator Co.; a division of Watts Water Technologies, Inc.

2. Description:
  - a. Standard: MSS SP-80, Type 4.
  - b. CWP Rating: 200 psig.
  - c. Body Design: Horizontal flow.
  - d. Body Material: ASTM B 62, bronze.
  - e. Ends: Threaded.
  - f. Disc: PTFE or TFE.

2.5 BRONZE GATE VALVES

A. Class 125, NRS Bronze Gate Valves:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - a. American Valve, Inc.
  - b. Crane Co.; Crane Valve Group; Crane Valves.
  - c. Crane Co.; Crane Valve Group; Jenkins Valves.
  - d. Crane Co.; Crane Valve Group; Stockham Division.
  - e. Hammond Valve.
  - f. Kitz Corporation.
  - g. Milwaukee Valve Company.
  - h. NIBCO INC.
  - i. Powell Valves.
  - j. Red-White Valve Corporation.

- k. Watts Regulator Co.; a division of Watts Water Technologies, Inc.
  - l. Zy-Tech Global Industries, Inc.
2. Description:
- a. Standard: MSS SP-80, Type 1.
  - b. CWP Rating: 200 psig.
  - c. Body Material: ASTM B 62, bronze with integral seat and screw-in bonnet.
  - d. Ends: Threaded[ or solder joint].
  - e. Stem: Bronze.
  - f. Disc: Solid wedge; bronze.
  - g. Packing: Asbestos free.
  - h. Handwheel: Malleable iron[, bronze, or aluminum].

## 2.6 LUBRICATED PLUG VALVES

### A. Class 125, Regular-Gland, Lubricated Plug Valves with Threaded Ends:

- 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  - a. Nordstrom Valves, Inc.
- 2. Description:
  - a. Standard: MSS SP-78, Type II.
  - b. CWP Rating: 200 psig.
  - c. Body Material: ASTM A 48/A 48M or ASTM A 126, cast iron with lubrication-sealing system.
  - d. Pattern: Regular or short.
  - e. Plug: Cast iron or bronze with sealant groove.

### B. Class 125, Regular-Gland, Lubricated Plug Valves with Flanged Ends:

- 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  - a. Nordstrom Valves, Inc.
- 2. Description:
  - a. Standard: MSS SP-78, Type II.
  - b. CWP Rating: 200 psig.
  - c. Body Material: ASTM A 48/A 48M or ASTM A 126, cast iron with lubrication-sealing system.
  - d. Pattern: Regular or short
  - e. Plug: Cast iron or bronze with sealant groove.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.
- B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.
- C. Examine threads on valve and mating pipe for form and cleanliness.
- D. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.
- E. Do not attempt to repair defective valves; replace with new valves.

#### **3.2 VALVE INSTALLATION**

- A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.
- B. Locate valves for easy access and provide separate support where necessary.
- C. Install valves in horizontal piping with stem at or above center of pipe.
- D. Install valves in position to allow full stem movement.
- E. Install check valves for proper direction of flow and as follows:
  - 1. Swing Check Valves: In horizontal position with hinge pin level.

#### **3.3 ADJUSTING**

- A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

#### **3.4 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS**

- A. If valve applications are not indicated, use the following:
  - 1. Shutoff Service: Ball, or gate valves.
  - 2. Throttling Service: ball valves.
- B. If valves with specified SWP classes or CWP ratings are not available, the same types of valves with higher SWP classes or CWP ratings may be substituted.

- C. Select valves, except wafer types, with the following end connections:
1. For Copper Tubing, NPS 2 and Smaller: Threaded ends except where solder-joint valve-end option is indicated in valve schedules below.
  2. For Copper Tubing, NPS 2-1/2 to NPS 4: Flanged ends except where threaded valve-end option is indicated in valve schedules below.
  3. For Steel Piping, NPS 2 and Smaller: Threaded ends.
  4. For Steel Piping, NPS 2-1/2 to NPS 4: Flanged ends except where threaded valve-end option is indicated in valve schedules below.
  5. For Grooved-End Copper Tubing: Valve ends may be grooved.

### 3.5 HYDRONIC VALVE SCHEDULE

- A. Pipe NPS 2 and Smaller:
1. Bronze and Brass Valves: May be provided with solder-joint ends instead of threaded ends.
  2. Ball Valves: Two-piece, full port, brass or bronze with bronze trim.
  3. Bronze Swing Check Valves: Class 125, nonmetallic disc.
  4. Bronze Gate Valves: Class 125, NRS.

END OF SECTION 220523

## SECTION 233113 - METAL DUCTS

### PART 1 - GENERAL

#### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. Section Includes:

1. Single-wall rectangular ducts and fittings.
2. Single-wall round ducts and fittings.
3. Sheet metal materials.
4. Duct liner.
5. Sealants and gaskets.
6. Hangers and supports.
7. Seismic-restraint devices.

- B. Related Sections:

1. Division 23 Section "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing requirements for metal ducts.
2. Division 23 Section "Air Duct Accessories" for dampers, sound-control devices, duct-mounting access doors and panels, turning vanes, and flexible ducts.

#### 1.3 PERFORMANCE REQUIREMENTS

- A. Delegated Duct Design: Duct construction, including sheet metal thicknesses, seam and joint construction, reinforcements, and hangers and supports, shall comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and performance requirements and design criteria indicated in "Duct Schedule" Article.
- B. Structural Performance: Duct hangers and supports and seismic restraints shall withstand the effects of gravity and seismic loads and stresses within limits and under conditions described in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"
  1. Seismic Hazard Level A: Seismic force to weight ratio, 0.48.
- C. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1-2004.

#### 1.4 SUBMITTALS

- A. Product Data: For each type of the following products:
1. Liners and adhesives.
  2. Sealants and gaskets.
  3. Seismic-restraint devices.
- B. Shop Drawings:
1. Fabrication, assembly, and installation, including plans, elevations, sections, components, and attachments to other work.
  2. Factory- and shop-fabricated ducts and fittings.
  3. Duct layout indicating sizes, configuration, liner material, and static-pressure classes.
  4. Elevation of top of ducts.
  5. Dimensions of main duct runs from building grid lines.
  6. Fittings.
  7. Reinforcement and spacing.
  8. Seam and joint construction.
  9. Penetrations through fire-rated and other partitions.
  10. Equipment installation based on equipment being used on Project.
  11. Locations for duct accessories, including dampers, turning vanes, and access doors and panels.
  12. Hangers and supports, including methods for duct and building attachment, seismic restraints, and vibration isolation.
- C. Coordination Drawings: Plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
1. Duct installation in congested spaces, indicating coordination with general construction, building components, and other building services. Indicate proposed changes to duct layout.
  2. Suspended ceiling components.
  3. Structural members to which duct will be attached.
  4. Size and location of initial access modules for acoustical tile.
  5. Penetrations of smoke barriers and fire-rated construction.
  6. Items penetrating finished ceiling including the following:
    - a. Lighting fixtures.
    - b. Air outlets and inlets.
    - c. Speakers.
    - d. Sprinklers.
    - e. Access panels.
    - f. Perimeter moldings.
- D. Field quality-control reports.

## 1.5 QUALITY ASSURANCE

- A. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1-2004, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-Up."
- B. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004, Section 6.4.4 - "HVAC System Construction and Insulation."

## PART 2 - PRODUCTS

### 2.1 SINGLE-WALL RECTANGULAR DUCTS AND FITTINGS

- A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" based on indicated static-pressure class unless otherwise indicated.
- B. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 1-4, "Transverse (Girth) Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
- C. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 1-5, "Longitudinal Seams - Rectangular Ducts," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
- D. Elbows, Transitions, Offsets, Branch Connections, and Other Duct Construction: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 2, "Fittings and Other Construction," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

### 2.2 SINGLE-WALL ROUND DUCTS AND FITTINGS

- A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 3, "Round, Oval, and Flexible Duct," based on indicated static-pressure class unless otherwise indicated.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following
    - a. Lindab Inc.
    - b. McGill AirFlow LLC.
    - c. SEMCO Incorporated.
    - d. Sheet Metal Connectors, Inc.
    - e. Spiral Manufacturing Co., Inc.

- B. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-2, "Transverse Joints - Round Duct," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
  - 1. Transverse Joints in Ducts Larger Than 60 Inches in Diameter: Flanged.
- C. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-1, "Seams - Round Duct and Fittings," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
  - 1. Fabricate round ducts larger than 90 inches in diameter with butt-welded longitudinal seams.
- D. Tees and Laterals: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-4, "90 Degree Tees and Laterals," and Figure 3-5, "Conical Tees," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

### 2.3 SHEET METAL MATERIALS

- A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.
- B. Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
  - 1. Galvanized Coating Designation: G60.
  - 2. Finishes for Surfaces Exposed to View: Mill phosphatized.
- C. Factory- or Shop-Applied Antimicrobial Coating:
  - 1. Apply to the surface of sheet metal that will form the interior surface of the duct. An untreated clear coating shall be applied to the exterior surface.
  - 2. Antimicrobial compound shall be tested for efficacy by an NRTL and registered by the EPA for use in HVAC systems.
  - 3. Coating containing the antimicrobial compound shall have a hardness of 2H, minimum, when tested according to ASTM D 3363.
  - 4. Surface-Burning Characteristics: Maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.
  - 5. Shop-Applied Coating Color: Black
  - 6. Antimicrobial coating on sheet metal is not required for duct containing liner treated with antimicrobial coating.

- D. Reinforcement Shapes and Plates: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.
- E. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

## 2.4 DUCT LINER

- A. Fibrous-Glass Duct Liner: Comply with ASTM C 1071, NFPA 90A, or NFPA 90B; and with NAIMA AH124, "Fibrous Glass Duct Liner Standard."
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following
    - a. CertainTeed Corporation; Insulation Group.
    - b. Johns Manville.
    - c. Knauf Insulation.
    - d. Owens Corning.
    - e. Maximum Thermal Conductivity:
      - 1) Type I, Flexible: 0.27 Btu x in./h x sq. ft. x deg F at 75 deg F mean temperature.
      - 2) Type II, Rigid: 0.23 Btu x in./h x sq. ft. x deg F at 75 deg F mean temperature.
  - 2. Antimicrobial Erosion-Resistant Coating: Apply to the surface of the liner that will form the interior surface of the duct to act as a moisture repellent and erosion-resistant coating. Antimicrobial compound shall be tested for efficacy by an NRTL and registered by the EPA for use in HVAC systems.
  - 3. Water-Based Liner Adhesive: Comply with NFPA 90A or NFPA 90B and with ASTM C 916.
    - a. For indoor applications, use adhesive that has a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- B. Flexible Elastomeric Duct Liner: Preformed, cellular, closed-cell, sheet materials complying with ASTM C 534, Type II, Grade 1; and with NFPA 90A or NFPA 90B.
  - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
    - a. Aeroflex USA Inc.
    - b. Armacell LLC.
    - c. Rubatex International, LLC
  - 2. Surface-Burning Characteristics: Maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.
  - 3. Liner Adhesive: As recommended by insulation manufacturer and complying with NFPA 90A or NFPA 90B.
    - a. For indoor applications, use adhesive that has a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

- C. Insulation Pins and Washers:
1. Cupped-Head, Capacitor-Discharge-Weld Pins: Copper- or zinc-coated steel pin, fully annealed for capacitor-discharge welding, 0.106-inch- diameter shank, length to suit depth of insulation indicated with integral 1-1/2-inch galvanized carbon-steel washer.
  2. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- thick galvanized steel; with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
- D. Shop Application of Duct Liner: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-19, "Flexible Duct Liner Installation."
1. Adhere a single layer of indicated thickness of duct liner with at least 90 percent adhesive coverage at liner contact surface area. Attaining indicated thickness with multiple layers of duct liner is prohibited.
  2. Apply adhesive to transverse edges of liner facing upstream that do not receive metal nosing.
  3. Butt transverse joints without gaps, and coat joint with adhesive.
  4. Fold and compress liner in corners of rectangular ducts or cut and fit to ensure butted-edge overlapping.
  5. Do not apply liner in rectangular ducts with longitudinal joints, except at corners of ducts, unless duct size and dimensions of standard liner make longitudinal joints necessary.
  6. Apply adhesive coating on longitudinal seams in ducts with air velocity of 2500 fpm.
  7. Secure liner with mechanical fasteners 4 inches from corners and at intervals not exceeding 12 inches transversely; at 3 inches from transverse joints and at intervals not exceeding 18 inches longitudinally.
  8. Secure transversely oriented liner edges facing the airstream with metal nosings that have either channel or "Z" profiles or are integrally formed from duct wall. Fabricate edge facings at the following locations:
    - a. Fan discharges.
    - b. Intervals of lined duct preceding unlined duct.
    - c. Upstream edges of transverse joints in ducts where air velocities are higher than 2500 fpm or where indicated.
  9. Terminate inner ducts with buildouts attached to fire-damper sleeves, dampers, turning vane assemblies, or other devices. Fabricated buildouts (metal hat sections) or other buildout means are optional; when used, secure buildouts to duct walls with bolts, screws, rivets, or welds.

## 2.5 SEALANT AND GASKETS

- A. General Sealant and Gasket Requirements: Surface-burning characteristics for sealants and gaskets shall be a maximum flame-spread index of 25 and a maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.
- B. Two-Part Tape Sealing System:

1. Tape: Woven cotton fiber impregnated with mineral gypsum and modified acrylic/silicone activator to react exothermically with tape to form hard, durable, airtight seal.
2. Tape Width: 3 inches.
3. Sealant: Modified styrene acrylic.
4. Water resistant.
5. Mold and mildew resistant.
6. Maximum Static-Pressure Class: 10-inch wg, positive and negative.
7. Service: Indoor and outdoor.
8. Service Temperature: Minus 40 to plus 200 deg F.
9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum.
10. For indoor applications, use sealant that has a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. Water-Based Joint and Seam Sealant:

1. Application Method: Brush on.
2. Solids Content: Minimum 65 percent.
3. Shore A Hardness: Minimum 20.
4. Water resistant.
5. Mold and mildew resistant.
6. VOC: Maximum 75 g/L (less water).
7. Maximum Static-Pressure Class: 10-inch wg, positive and negative.
8. Service: Indoor or outdoor.
9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum sheets.

D. Flanged Joint Sealant: Comply with ASTM C 920.

1. General: Single-component, acid-curing, silicone, elastomeric.
2. Type: S.
3. Grade: NS.
4. Class: 25.
5. Use: O.
6. For indoor applications, use sealant that has a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

E. Flange Gaskets: Butyl rubber, neoprene, or EPDM polymer with polyisobutylene plasticizer.

F. Round Duct Joint O-Ring Seals:

1. Seal shall provide maximum leakage class of 3 cfm/100 sq. ft. at 1-inch wg and shall be rated for 10-inch wg static-pressure class, positive or negative.
2. EPDM O-ring to seal in concave bead in coupling or fitting spigot.
3. Double-lipped, EPDM O-ring seal, mechanically fastened to factory-fabricated couplings and fitting spigots.

## 2.6 HANGERS AND SUPPORTS

- A. Hanger Rods for Noncorrosive Environments: Cadmium-plated steel rods and nuts.
- B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.
- C. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 4-1, "Rectangular Duct Hangers Minimum Size," and Table 4-2, "Minimum Hanger Sizes for Round Duct."
- D. Steel Cables for Galvanized-Steel Ducts: Galvanized steel complying with ASTM A 603.
- E. Steel Cable End Connections: Cadmium-plated steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.
- F. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.
- G. Trapeze and Riser Supports:
  - 1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.

## 2.7 SEISMIC-RESTRAINT DEVICES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following
  - 1. Cooper B-Line, Inc.; a division of Cooper Industries.
  - 2. Ductmate Industries, Inc.
  - 3. Hilti Corp.
  - 4. Kinetics Noise Control.
  - 5. Loos & Co.; Cableware Division.
  - 6. Mason Industries.
  - 7. TOLCO; a brand of NIBCO INC.
  - 8. Unistrut Corporation; Tyco International, Ltd.
- B. General Requirements for Restraint Components: Rated strengths, features, and applications shall be as defined in reports by an agency acceptable to authorities having jurisdiction.
  - 1. Structural Safety Factor: Allowable strength in tension, shear, and pullout force of components shall be at least four times the maximum seismic forces to which they will be subjected.
- C. Channel Support System: Shop- or field-fabricated support assembly made of slotted steel channels rated in tension, compression, and torsion forces and with accessories for attachment to braced component at one end and to building structure at the other end. Include matching components and corrosion-resistant coating.

- D. Restraint Cables: ASTM A 603, galvanized-steel cables with end connections made of cadmium-plated steel assemblies with brackets, swivel, and bolts designed for restraining cable service; and with an automatic-locking and clamping device or double-cable clips.
- E. Hanger Rod Stiffener: Reinforcing steel angle clamped to hanger rod.
- F. Mechanical Anchor Bolts: Drilled-in and stud-wedge or female-wedge type. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488.

### **PART 3 - EXECUTION**

#### **3.1 DUCT INSTALLATION**

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of duct system. Indicated duct locations, configurations, and arrangements were used to size ducts and calculate friction loss for air-handling equipment sizing and for other design considerations. Install duct systems as indicated unless deviations to layout are approved on Shop Drawings and Coordination Drawings.
- B. Install ducts according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" unless otherwise indicated.
- C. Install round ducts in maximum practical lengths.
- D. Install ducts with fewest possible joints.
- E. Install factory- or shop-fabricated fittings for changes in direction, size, and shape and for branch connections.
- F. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.
- G. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.
- H. Install ducts with a clearance of 1 inch, plus allowance for insulation thickness.
- I. Route ducts to avoid passing through transformer vaults and electrical equipment rooms and enclosures.
- J. Where ducts pass through non-fire-rated interior partitions and exterior walls and are exposed to view, cover the opening between the partition and duct or duct insulation with sheet metal flanges of same metal thickness as the duct. Overlap openings on four sides by at least 1-1/2 inches.
- K. Where ducts pass through fire-rated interior partitions and exterior walls, install fire dampers. Comply with requirements in Division 23 Section "Air Duct Accessories" for fire and smoke dampers.

- L. Protect duct interiors from moisture, construction debris and dust, and other foreign materials. Comply with SMACNA's "Duct Cleanliness for New Construction Guidelines."

### 3.2 INSTALLATION OF EXPOSED DUCTWORK

- A. Protect ducts exposed in finished spaces from being dented, scratched, or damaged.
- B. Trim duct sealants flush with metal. Create a smooth and uniform exposed bead. Do not use two-part tape sealing system.
- C. Maintain consistency, symmetry, and uniformity in the arrangement and fabrication of fittings, hangers and supports, duct accessories, and air outlets.
- D. Repair or replace damaged sections and finished work that does not comply with these requirements.

### 3.3 DUCT SEALING

- A. Seal ducts for duct static-pressure, seal classes, and leakage classes specified in "Duct Schedule" Article according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
- B. Seal ducts to the following seal classes according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible":
  - 1. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
  - 2. Outdoor, Supply-Air Ducts: Seal Class A.
  - 3. Outdoor, Exhaust Ducts: Seal Class C.
  - 4. Outdoor, Return-Air Ducts: Seal Class C.
  - 5. Unconditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class B.
  - 6. Unconditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class A.
  - 7. Unconditioned Space, Exhaust Ducts: Seal Class C.
  - 8. Unconditioned Space, Return-Air Ducts: Seal Class B.
  - 9. Conditioned Space, Supply-Air Ducts in Pressure Classes 2-Inch wg and Lower: Seal Class C.
  - 10. Conditioned Space, Supply-Air Ducts in Pressure Classes Higher Than 2-Inch wg: Seal Class B.
  - 11. Conditioned Space, Exhaust Ducts: Seal Class B.
  - 12. Conditioned Space, Return-Air Ducts: Seal Class C.

### 3.4 HANGER AND SUPPORT INSTALLATION

- A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 4, "Hangers and Supports."

- B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.
  - 1. Where practical, install concrete inserts before placing concrete.
  - 2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
  - 3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes or for slabs more than 4 inches thick.
  - 4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.
  - 5. Do not use powder-actuated concrete fasteners for seismic restraints.
- C. Hanger Spacing: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 4-1, "Rectangular Duct Hangers Minimum Size," and Table 4-2, "Minimum Hanger Sizes for Round Duct," for maximum hanger spacing; install hangers and supports within 24 inches of each elbow and within 48 inches of each branch intersection.
- D. Hangers Exposed to View: Threaded rod and angle or channel supports.
- E. Support vertical ducts with steel angles or channel secured to the sides of the duct with welds, bolts, sheet metal screws, or blind rivets; support at each floor and at a maximum intervals of 16 feet (5 m).
- F. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

### 3.5 SEISMIC-RESTRAINT-DEVICE INSTALLATION

- A. Install ducts with hangers and braces designed to support the duct and to restrain against seismic forces required by applicable building codes. Comply with SMACNA's "Seismic Restraint Manual: Guidelines for Mechanical Systems."
  - 1. Space lateral supports a maximum of 40 feet o.c., and longitudinal supports a maximum of 80 feet o.c.
  - 2. Brace a change of direction longer than 12 feet.
- B. Select seismic-restraint devices with capacities adequate to carry present and future static and seismic loads.
- C. Install cables so they do not bend across edges of adjacent equipment or building structure.
- D. Install cable restraints on ducts that are suspended with vibration isolators.
- E. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction.
- F. Attachment to Structure: If specific attachment is not indicated, anchor bracing and restraints to structure, to flanges of beams, to upper truss chords of bar joists, or to concrete members.
- G. Drilling for and Setting Anchors:

1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcement or embedded items during drilling. Notify the Architect if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
4. Set anchors to manufacturer's recommended torque, using a torque wrench.
5. Install zinc-coated steel anchors for interior applications and stainless-steel anchors for applications exposed to weather.

### 3.6 CONNECTIONS

- A. Make connections to equipment with flexible connectors complying with Division 23 Section "Air Duct Accessories."
- B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

### 3.7 PAINTING

- A. Paint interior of metal ducts that are visible through registers and grilles and that do not have duct liner. Apply one coat of flat, black, latex paint over a compatible galvanized-steel primer. Paint materials and application requirements are specified in Division 09 painting Sections.

### 3.8 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
  1. Test for leaks before applying external insulation.
  2. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure.
  3. Give seven days' advance notice for testing.
- B. Duct System Cleanliness Tests:
  1. Visually inspect duct system to ensure that no visible contaminants are present.
  2. Test sections of metal duct system, chosen randomly by Owner, for cleanliness according to "Vacuum Test" in NADCA ACR, "Assessment, Cleaning and Restoration of HVAC Systems."
    - a. Acceptable Cleanliness Level: Net weight of debris collected on the filter media shall not exceed 0.75 mg/100 sq. cm.
- C. Duct system will be considered defective if it does not pass tests and inspections.

- D. Prepare test and inspection reports.

### 3.9 DUCT CLEANING

- A. Clean new and existing duct system(s) before testing, adjusting, and balancing.
- B. Use service openings for entry and inspection.
  - 1. Create new openings and install access panels appropriate for duct static-pressure class if required for cleaning access. Provide insulated panels for insulated or lined duct. Patch insulation and liner as recommended by duct liner manufacturer. Comply with Division 23 Section "Air Duct Accessories" for access panels and doors.
  - 2. Disconnect and reconnect flexible ducts as needed for cleaning and inspection.
  - 3. Remove and reinstall ceiling to gain access during the cleaning process.
- C. Particulate Collection and Odor Control:
  - 1. When venting vacuuming system inside the building, use HEPA filtration with 99.97 percent collection efficiency for 0.3-micron-size (or larger) particles.
  - 2. When venting vacuuming system to outdoors, use filter to collect debris removed from HVAC system, and locate exhaust downwind and away from air intakes and other points of entry into building.
- D. Clean the following components by removing surface contaminants and deposits:
  - 1. Air outlets and inlets (registers, grilles, and diffusers).
  - 2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
  - 3. Air-handling unit internal surfaces and components including mixing box, coil section, air wash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.
  - 4. Coils and related components.
  - 5. Return-air ducts, dampers, actuators, and turning vanes except in ceiling plenums and mechanical equipment rooms.
  - 6. Supply-air ducts, dampers, actuators, and turning vanes.
  - 7. Dedicated exhaust and ventilation components and makeup air systems.
- E. Mechanical Cleaning Methodology:
  - 1. Clean metal duct systems using mechanical cleaning methods that extract contaminants from within duct systems and remove contaminants from building.
  - 2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.
  - 3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of metal ducts, duct liner, or duct accessories.
  - 4. Clean fibrous-glass duct liner with HEPA vacuuming equipment; do not permit duct liner to get wet. Replace fibrous-glass duct liner that is damaged, deteriorated, or delaminated or that has friable material, mold, or fungus growth.

5. Clean coils and coil drain pans according to NADCA 1992. Keep drain pan operational. Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.
6. Provide drainage and cleanup for wash-down procedures.
7. Antimicrobial Agents and Coatings: Apply EPA-registered antimicrobial agents if fungus is present. Apply antimicrobial agents according to manufacturer's written instructions after removal of surface deposits and debris.

### 3.10 START UP

- A. Air Balance: Comply with requirements in Division 23 Section "Testing, Adjusting, and Balancing for HVAC."

### 3.11 DUCT SCHEDULE

#### A. Supply Ducts:

1. Ducts Connected to Constant-Volume Air-Handling Units
  - a. Pressure Class: Positive 1-inch wg.
  - b. Minimum SMACNA Seal Class: B.
  - c. SMACNA Leakage Class for Rectangular: 12
  - d. SMACNA Leakage Class for Round: 12

#### B. Return Ducts:

1. Ducts Connected to Air-Handling Units
  - a. Pressure Class: Positive or negative 1-inch wg.
  - b. Minimum SMACNA Seal Class: B.
  - c. SMACNA Leakage Class for Rectangular: 12
  - d. SMACNA Leakage Class for Round and Flat Oval: 12

#### C. Intermediate Reinforcement:

1. Galvanized-Steel Ducts: Galvanized steel

#### D. Liner:

1. Supply Air Ducts: Fibrous glass, Type I, 1 inch thick.
2. Return Air Ducts: Fibrous glass, Type I, 1 inch thick.

#### E. Elbow Configuration:

1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Elbows."
  - a. Velocity 1000 fpm or Lower:

- 1) Radius Type RE 1 with minimum 0.5 radius-to-diameter ratio.
  - 2) Mitered Type RE 4 without vanes.
- b. Velocity 1000 to 1500 fpm:
- 1) Radius Type RE 1 with minimum 1.0 radius-to-diameter ratio.
  - 2) Radius Type RE 3 with minimum 0.5 radius-to-diameter ratio and two vanes.
  - 3) Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-3, "Vanes and Vane Runners," and Figure 2-4, "Vane Support in Elbows."
- c. Velocity 1500 fpm or Higher:
- 1) Radius Type RE 1 with minimum 1.5 radius-to-diameter ratio.
  - 2) Radius Type RE 3 with minimum 1.0 radius-to-diameter ratio and two vanes.
  - 3) Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-3, "Vanes and Vane Runners," and Figure 2-4, "Vane Support in Elbows."
2. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Elbows."
- a. Radius Type RE 1 with minimum 1.5 radius-to-diameter ratio.
  - b. Radius Type RE 3 with minimum 1.0 radius-to-diameter ratio and two vanes.
  - c. Mitered Type RE 2 with vanes complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-3, "Vanes and Vane Runners," and Figure 2-4, "Vane Support in Elbows."
3. Round Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-3, "Round Duct Elbows."
- a. Minimum Radius-to-Diameter Ratio and Elbow Segments: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 3-1, "Mitered Elbows." Elbows with less than 90-degree change of direction have proportionately fewer segments.
    - 1) Velocity 1000 fpm or Lower: 0.5 radius-to-diameter ratio and three segments for 90-degree elbow.
    - 2) Velocity 1000 to 1500 fpm: 1.0 radius-to-diameter ratio and four segments for 90-degree elbow.
    - 3) Velocity 1500 fpm or Higher: 1.5 radius-to-diameter ratio and five segments for 90-degree elbow.
    - 4) Radius-to Diameter Ratio: 1.5.
  - b. Round Elbows, 12 Inches and Smaller in Diameter: Stamped or pleated.
  - c. Round Elbows, 14 Inches and Larger in Diameter: Standing seam

F. Branch Configuration:

1. Rectangular Duct: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-6, "Branch Connections."
  - a. Rectangular Main to Rectangular Branch: 45-degree entry.
  - b. Rectangular Main to Round Branch: Spin in.
  
2. Round: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-4, "90 Degree Tees and Laterals," and Figure 3-5, "Conical Tees." Saddle taps are permitted in existing duct.
  - a. Velocity 1000 fpm or Lower: 90-degree tap.
  - b. Velocity 1000 to 1500 fpm: Conical tap.
  - c. Velocity 1500 fpm or Higher: 45-degree lateral.

END OF SECTION 233113

## **SECTION 233300 - AIR DUCT ACCESSORIES**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### **1.2 SUMMARY**

- A. Section Includes:

1. Backdraft dampers.
2. Manual volume dampers.
3. Control dampers.
4. Fire dampers.
5. Flange connectors.
6. Turning vanes.
7. Duct-mounted access doors.
8. Flexible connectors.
9. Flexible ducts.
10. Duct accessory hardware.

- B. Related Sections:

1. Division 23 Section "HVAC Gravity Ventilators" for roof-mounted ventilator caps.
2. Division 28 Section "Fire Detection and Alarm" for duct-mounted fire and smoke detectors.

#### **1.3 SUBMITTALS**

- A. Product Data: For each type of product indicated.

- B. Shop Drawings: For duct accessories. Include plans, elevations, sections, details and attachments to other work.

1. Detail duct accessories fabrication and installation in ducts and other construction. Include dimensions, weights, loads, and required clearances; and method of field assembly into duct systems and other construction. Include the following:
  - a. Special fittings.
  - b. Manual volume damper installations.
  - c. Control damper installations.
  - d. Fire-damper, including sleeves; and duct-mounted access doors and remote damper operators.

- e. Wiring Diagrams: For power, signal, and control wiring.
  - C. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which ceiling-mounted access panels and access doors required for access to duct accessories are shown and coordinated with each other, using input from Installers of the items involved.
  - D. Source quality-control reports.
  - E. Operation and Maintenance Data: For air duct accessories to include in operation and maintenance manuals.
  - F. LEED Submittals:
    - 1. Product Data for Prerequisite EQ 1: Documentation indicating that units comply with ASHRAE 62.1.
- 1.4 QUALITY ASSURANCE
- A. Comply with NFPA 90A, "Installation of Air Conditioning and Ventilating Systems," and with NFPA 90B, "Installation of Warm Air Heating and Air Conditioning Systems."
  - B. Comply with AMCA 500-D testing for damper rating.
- 1.5 EXTRA MATERIALS
- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
    - 1. Fusible Links: Furnish quantity equal to 10 percent of amount installed.

## **PART 2 - PRODUCTS**

### 2.1 MATERIALS

- A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.
- B. Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
  - 1. Galvanized Coating Designation: G60.
  - 2. Exposed-Surface Finish: Mill phosphatized.
- C. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts; compatible materials for aluminum and stainless-steel ducts.

- D. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

## 2.2 BACKDRAFT DAMPERS

- A. Manufacturers: Subject to compliance with requirements,
  - 1. Air Balance Inc.; a division of Mestek, Inc.
  - 2. American Warming and Ventilating; a division of Mestek, Inc.
  - 3. Cesco Products; a division of Mestek, Inc.
  - 4. Duro Dyne Inc.
  - 5. Greenheck Fan Corporation.
  - 6. Lloyd Industries, Inc.
  - 7. Nailor Industries Inc.
  - 8. NCA Manufacturing, Inc.
  - 9. Pottorff; a division of PCI Industries, Inc.
  - 10. Ruskin Company.
  - 11. SEMCO Incorporated.
  - 12. Vent Products Company, Inc.
- B. Description: Gravity balanced.
- C. Maximum Air Velocity: 2000 fpm.
- D. Maximum System Pressure: 2-inches wg.
- E. Frame: 0.052-inch- thick, galvanized sheet steel, with welded corners
- F. Blades: Multiple single-piece blades, center-pivoted, maximum 6-inch width, 0.025-inch-thick, roll-formed aluminum with sealed edges.
- G. Blade Action: Parallel.
- H. Blade Seals: Neoprene, mechanically locked.
- I. Blade Axles:
  - 1. Material: Galvanized steel
  - 2. Diameter: 0.20 inch.
- J. Tie Bars and Brackets: Galvanized steel.
- K. Return Spring: Adjustable tension.
- L. Bearings: Steel ball or synthetic pivot bushings.
- M. Accessories:
  - 1. Electric actuators.

## 2.3 MANUAL VOLUME DAMPERS

### A. Low-Leakage, Steel, Manual Volume Dampers:

1. Manufacturers: Subject to compliance with requirements,
  - a. Air Balance Inc.; a division of Mestek, Inc.
  - b. American Warming and Ventilating; a division of Mestek, Inc.
  - c. Flexmaster U.S.A., Inc.
  - d. McGill AirFlow LLC.
  - e. METALAIRE, Inc.
  - f. Nailor Industries Inc.
  - g. Pottorff; a division of PCI Industries, Inc.
  - h. Ruskin Company.
  - i. Trox USA Inc.
  - j. Vent Products Company, Inc.
2. Low-leakage rating, with linkage outside airstream, and bearing AMCA's Certified Ratings Seal for both air performance and air leakage.
3. Suitable for horizontal or vertical applications.
4. Frames:
  - a. U shaped.
  - b. Galvanized -steel channels, 0.064 inch thick.
  - c. Mitered and welded corners.
  - d. Flanges for attaching to walls and flangeless frames for installing in ducts.
5. Blades:
  - a. Multiple blades.
  - b. Opposed-blade design.
  - c. Stiffen damper blades for stability.
  - d. Galvanized, roll-formed steel, 0.064 inch thick.
6. Blade Axles: Galvanized steel
7. Bearings:
  - a. Oil-impregnated bronze
  - b. Dampers in ducts with pressure classes of 3-inch wg or less shall have axles full length of damper blades and bearings at both ends of operating shaft.
8. Blade Seals: Vinyl
9. Jamb Seals: Cambered stainless steel
10. Tie Bars and Brackets: Galvanized steel

## 2.4 CONTROL DAMPERS

### A. Manufacturers: Subject to compliance with requirements,

1. American Warming and Ventilating; a division of Mestek, Inc.

2. Arrow United Industries; a division of Mestek, Inc.
  3. Cesco Products; a division of Mestek, Inc.
  4. Duro Dyne Inc.
  5. Flexmaster U.S.A., Inc.
  6. Greenheck Fan Corporation.
  7. Lloyd Industries, Inc.
  8. M&I Air Systems Engineering; Division of M&I Heat Transfer Products Ltd.
  9. McGill AirFlow LLC.
  10. METALAIRE, Inc.
  11. Metal Form Manufacturing, Inc.
  12. Nailor Industries Inc.
  13. NCA Manufacturing, Inc.
  14. Ruskin Company.
  15. Vent Products Company, Inc.
  16. Young Regulator Company.
- B. Low-leakage rating, with linkage outside airstream, and bearing AMCA's Certified Ratings Seal for both air performance and air leakage.
- C. Frames:
- 1 U shaped.
  2. Galvanized -steel channels, 0.064 inch thick.
  3. Mitered and welded corners.
- D. Blades:
1. Multiple blade with maximum blade width of 8 inches.
  2. Opposed-blade design.
  3. Galvanized steel.
  4. 0.064 inch thick.
  5. Blade Edging: Closed-cell neoprene edging.
- E. Blade Axles: 1/2-inch- diameter; galvanized steel blade-linkage hardware of zinc-plated steel and brass; ends sealed against blade bearings.
1. Operating Temperature Range: From minus 40 to plus 200 deg F.
- F. Bearings:
1. Oil-impregnated bronze
  2. Dampers in ducts with pressure classes of 3-inch wg or less shall have axles full length of damper blades and bearings at both ends of operating shaft.
  3. Thrust bearings at each end of every blade.
- 2.5 FIRE DAMPERS
- A. Manufacturers: Subject to compliance with requirements,
1. Air Balance Inc.; a division of Mestek, Inc.

2. Arrow United Industries; a division of Mestek, Inc.
  3. Cesco Products; a division of Mestek, Inc.
  4. Greenheck Fan Corporation.
  5. McGill AirFlow LLC.
  6. METALAIRE, Inc.
  7. Nailor Industries Inc.
  8. NCA Manufacturing, Inc.
  9. PHL, Inc.
  10. Pottorff; a division of PCI Industries, Inc.
  11. Prefco; Perfect Air Control, Inc.
  12. Ruskin Company.
  13. Vent Products Company, Inc.
  14. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
- B. Type: Dynamic; rated and labeled according to UL 555 by an NRTL.
- C. Closing rating in ducts up to 4-inch wg static pressure class and minimum 4000-fpm velocity.
- D. Fire Rating: 1-1/2 hours.
- E. Frame: Curtain type with blades outside airstream, fabricated with roll-formed, 0.034-inch-thick galvanized steel; with mitered and interlocking corners.
- F. Mounting Sleeve: Factory- or field-installed, galvanized sheet steel.
1. Minimum Thickness: 0.052 or 0.138 inch thick, as indicated, and of length to suit application.
  2. Exception: Omit sleeve where damper-frame width permits direct attachment of perimeter mounting angles on each side of wall or floor; thickness of damper frame must comply with sleeve requirements.
- G. Mounting Orientation: Vertical or horizontal as indicated.
- H. Blades: Roll-formed, interlocking, 0.034-inch- thick, galvanized sheet steel. In place of interlocking blades, use full-length, 0.034-inch- thick, galvanized-steel blade connectors.
- I. Horizontal Dampers: Include blade lock and stainless-steel closure spring.
- J. Heat-Responsive Device: Replaceable, 165 deg F rated, fusible links.
- 2.6 FLANGE CONNECTORS
- A. Manufacturers: Subject to compliance with requirements,
1. Ductmate Industries, Inc.
  2. Nexus PDQ; Division of Shilco Holdings Inc.
  3. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
- B. Description: Add-on or roll-formed, factory-fabricated, slide-on transverse flange connectors, gaskets, and components.

- C. Material: Galvanized steel.
- D. Gage and Shape: Match connecting ductwork.

## 2.7 TURNING VANES

- A. Manufacturers: Subject to compliance with requirements:
  - 1. Ductmate Industries, Inc.
  - 2. Duro Dyne Inc.
  - 3. METALAIRE, Inc.
  - 4. SEMCO Incorporated.
  - 5. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
- B. Manufactured Turning Vanes for Metal Ducts: Curved blades of galvanized sheet steel; support with bars perpendicular to blades set; set into vane runners suitable for duct mounting.
  - 1. Acoustic Turning Vanes: Fabricate airfoil-shaped aluminum extrusions with perforated faces and fibrous-glass fill.
- C. General Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 2-3, "Vanes and Vane Runners," and 2-4, "Vane Support in Elbows."
- D. Vane Construction: Double wall.

## 2.8 DUCT-MOUNTED ACCESS DOORS

- A. Manufacturers: Subject to compliance with requirements,
  - 1. American Warming and Ventilating; a division of Mestek, Inc.
  - 2. Cesco Products; a division of Mestek, Inc.
  - 3. Ductmate Industries, Inc.
  - 4. Flexmaster U.S.A., Inc.
  - 5. Greenheck Fan Corporation.
  - 6. McGill AirFlow LLC.
  - 7. Nailor Industries Inc.
  - 8. Pottorff; a division of PCI Industries, Inc.
  - 9. Ventfabrics, Inc.
  - 10. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
- B. Duct-Mounted Access Doors: Fabricate access panels according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 2-10, "Duct Access Doors and Panels," and 2-11, "Access Panels - Round Duct."
  - 1. Door:
    - a. Double wall, rectangular.
    - b. Galvanized sheet metal with insulation fill and thickness as indicated for duct pressure class.
    - c. Vision panel.

- d. Hinges and Latches: 1-by-1-inch butt or piano hinge and cam latches.
  - e. Fabricate doors airtight and suitable for duct pressure class.
2. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets.
  3. Number of Hinges and Locks:
    - a. Access Doors Less Than 12 Inches Square: No hinges and two sash locks.
    - b. Access Doors up to 18 Inches Square: Two hinges and two sash locks.
    - c. Access Doors up to 24 by 48 Inches: Three hinges and two compression latches with outside handles.
    - d. Access Doors Larger Than 24 by 48 Inches: Four hinges and two compression latches with outside and inside handles.

## 2.9 FLEXIBLE CONNECTORS

- A. Manufacturers: Subject to compliance with requirements,
  1. Ductmate Industries, Inc.
  2. Duro Dyne Inc.
  3. Ventfabrics, Inc.
  4. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
- B. Materials: Flame-retardant or noncombustible fabrics.
- C. Coatings and Adhesives: Comply with UL 181, Class 1.
- D. Metal-Edged Connectors: Factory fabricated with a fabric strip 3-1/2 inches wide attached to 2 strips of 2-3/4-inch- wide, 0.028-inch- thick, galvanized sheet steel or 0.032-inch- thick aluminum sheets. Provide metal compatible with connected ducts.
- E. Indoor System, Flexible Connector Fabric: Glass fabric double coated with neoprene.
  1. Minimum Weight: 26 oz./sq. yd..
  2. Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling.
  3. Service Temperature: Minus 40 to plus 200 deg F.
- F. Thrust Limits: Combination coil spring and elastomeric insert with spring and insert in compression, and with a load stop. Include rod and angle-iron brackets for attaching to fan discharge and duct.
  1. Frame: Steel, fabricated for connection to threaded rods and to allow for a maximum of 30 degrees of angular rod misalignment without binding or reducing isolation efficiency.
  2. Outdoor Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
  3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
  4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
  5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
  6. Elastomeric Element: Molded, oil-resistant rubber or neoprene.

7. Coil Spring: Factory set and field adjustable for a maximum of 1/4-inch movement at start and stop.

## 2.10 FLEXIBLE DUCTS

- A. Manufacturers: Subject to compliance with requirements,
  1. Flexmaster U.S.A., Inc.
  2. McGill AirFlow LLC.
  3. Ward Industries, Inc.; a division of Hart & Cooley, Inc.
- B. Insulated, Flexible Duct: UL 181, Class 1, 2-ply vinyl film supported by helically wound, spring-steel wire; fibrous-glass insulation; polyethylene vapor-barrier film.
  1. Pressure Rating: 10-inch wg positive and 1.0-inch wg negative.
  2. Maximum Air Velocity: 4000 fpm.
  3. Temperature Range: Minus 10 to plus 160 deg F.
  4. Insulation R-value: Comply with ASHRAE/IESNA 90.1-2004.
- C. Flexible Duct Connectors:
  1. Clamps: Stainless-steel band with cadmium-plated hex screw to tighten band with a worm-gear action in sizes 3 through 18 inches, to suit duct size.

## 2.11 DUCT ACCESSORY HARDWARE

- A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct-insulation thickness.
- B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for metal ducts and in NAIMA AH116, "Fibrous Glass Duct Construction Standards," for fibrous-glass ducts.
- B. Install duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel and fibrous-glass ducts, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.
- C. Install volume dampers at points on supply, return, and exhaust systems where branches extend from larger ducts. Where dampers are installed in ducts having duct liner, install dampers with hat channels of same depth as liner, and terminate liner with nosing at hat channel.

1. Install steel volume dampers in steel ducts.
- D. Set dampers to fully open position before testing, adjusting, and balancing.
- E. Install test holes at fan inlets and outlets and elsewhere as indicated.
- F. Install fire dampers according to UL listing.
- G. Install duct access doors on sides of ducts to allow for inspecting, adjusting, and maintaining accessories and equipment at the following locations:
1. On both sides of duct coils.
  2. Upstream and downstream from duct filters.
  3. At outdoor-air intakes and mixed-air plenums.
  4. At drain pans and seals.
  5. Downstream from manual volume dampers, control dampers, backdraft dampers, and equipment.
  6. Adjacent to and close enough to fire or smoke dampers, to reset or reinstall fusible links. Access doors for access to fire or smoke dampers having fusible links shall be pressure relief access doors and shall be outward operation for access doors installed upstream from dampers and inward operation for access doors installed downstream from dampers.
  7. At each change in direction and at maximum 50-foot spacing.
  8. Upstream and downstream from turning vanes.
  9. Control devices requiring inspection.
  10. Elsewhere as indicated.
- H. Install access doors with swing against duct static pressure.
- I. Access Door Sizes:
1. Head and Hand Access: 18 by 10 inches.
  2. Head and Shoulders Access: 21 by 14 inches.
  3. Body Access: 25 by 14 inches.
  4. Body plus Ladder Access: 25 by 17 inches.
- J. Label access doors according to Division 23 Section "Identification for HVAC Piping and Equipment" to indicate the purpose of access door.
- K. Install flexible connectors to connect ducts to equipment.
- L. Connect diffusers or light troffer boots to ducts directly or with maximum 60-inch lengths of flexible duct clamped or strapped in place.
- M. Connect flexible ducts to metal ducts with draw bands Install duct test holes where required for testing and balancing purposes.
- N. Install thrust limits at centerline of thrust, symmetrical on both sides of equipment. Attach thrust limits at centerline of thrust and adjust to a maximum of 1/4-inch movement during start and stop of fans.

### 3.2 FIELD QUALITY CONTROL

#### A. Tests and Inspections:

1. Operate dampers to verify full range of movement.
2. Inspect locations of access doors and verify that purpose of access door can be performed.
3. Operate fire, smoke, and combination fire and smoke dampers to verify full range of movement and verify that proper heat-response device is installed.
4. Inspect turning vanes for proper and secure installation.
5. Operate remote damper operators to verify full range of movement of operator and damper.

END OF SECTION 233300

## **SECTION 233416 - CENTRIFUGAL HVAC FANS**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### **1.2 SUMMARY**

- A. Section Includes: For each product.
  - 1. Airfoil centrifugal fans.
  - 2. Backward-inclined centrifugal fans.
  - 3. Forward-curved centrifugal fans.
  - 4. Plenum fans.
  - 5. Plug fans.

#### **1.3 ACTION SUBMITTALS**

- A. Product Data:
  - 1. Include rated capacities, furnished specialties, and accessories for each fan.
  - 2. Certified fan performance curves with system operating conditions indicated.
  - 3. Certified fan sound-power ratings.
  - 4. Motor ratings and electrical characteristics, plus motor and electrical accessories.
  - 5. Material thickness and finishes, including color charts.
  - 6. Dampers, including housings, linkages, and operators.
- B. Shop Drawings:
  - 1. Include plans, elevations, sections, and attachment details.
  - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 3. Include diagrams for power, signal, and control wiring.
  - 4. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
  - 5. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.

C. LEED Submittals:

1. Product Data for Prerequisite EQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Show fan room layout and relationships between components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate and certify field measurements.
- B. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For centrifugal fans to include in emergency, operation, and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

- A. Belts: One set for each belt-driven unit.

**PART 2 - PRODUCTS**

2.1 PERFORMANCE REQUIREMENTS

- A. AMCA Compliance:
  1. Comply with AMCA performance requirements and bear the AMCA-Certified Ratings Seal.
  2. Operating Limits: Classify according to AMCA 99.
- B. Unusual Service Conditions:
  1. Ambient Temperature: 70 degrees F.
  2. Altitude: 200 feet above sea level.
  3. High humidity.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. Capacities and Characteristics:
  1. See Schedule on Drawings.

2.2 AIRFOIL CENTRIFUGAL FANS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Greenheck Fan Corporation.
  2. Loren Cook Company.
  3. Twin City
- B. Description:
1. Factory-fabricated, -assembled, -tested, and -finished, belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor, drive assembly, and support structure.
  2. Deliver fans as factory-assembled units, to the extent allowable by shipping limitations.
  3. Factory-installed and -wired disconnect switch.
- C. Housings:
1. Formed panels to make curved-scroll housings with shaped cutoff.
  2. Panel Bracing: Steel angle- or channel-iron member supports for mounting and supporting fan scroll, wheel, motor, and accessories.
  3. Horizontally split, bolted-flange housing.
  4. Spun inlet cone with flange.
  5. Outlet flange.
- D. Airfoil Wheels:
1. Single-width-single-inlet and double-width-double-inlet construction with curved inlet flange.
  2. Heavy backplate.
  3. Hollow die-formed, airfoil-shaped blades continuously welded at tip flange and backplate.
  4. Cast-iron or cast-steel hub riveted to backplate and fastened to shaft with setscrews.
- E. Shafts:
1. Statically and dynamically balanced and selected for continuous operation at maximum rated fan speed and motor horsepower, with adjustable alignment and belt tensioning.
  2. Turned, ground, and polished hot-rolled steel with keyway. Ship with protective coating of lubricating oil.
  3. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range.
- F. Grease-Lubricated Shaft Bearings:
1. Self-aligning, pillow-block-type, tapered roller bearings with double-locking collars and two-piece, cast-iron housing.
  2. Ball-Bearing Rating Life: ABMA 9, L10 at **50,000**hours.
- G. Grease-Lubricated Shaft Bearings:
1. Self-aligning, pillow-block-type, ball or roller bearings with adapter mount and two-piece, cast-iron housing.

2. *l* Ball-Bearing Rating Life: ABMA 9, L10 at **50,000** hours.

H. Belt Drives:

1. Factory mounted, with adjustable alignment and belt tensioning.
2. Service Factor Based on Fan Motor Size:**1.2**.
3. Fan Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.
4. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with larger motors. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
5. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
6. Belt Guards: Fabricate to comply with OSHA and SMACNA requirements of diamond-mesh wire screen welded to steel angle frame or equivalent, prime coated. Secure to fan or fan supports without short circuiting vibration isolation. Include provisions for adjustment of belt tension, lubrication, and use of tachometer with guard in place.
7. Motor Mount: Adjustable for belt tensioning.

I. Accessories:

1. Access for Inspection, Cleaning, and Maintenance: Comply with requirements in ASHRAE62.1.
2. Scroll Drain Connection: NPS 1 steel pipe coupling welded to low point of fan scroll on outdoor fans.
3. Companion Flanges: Rolled flanges for duct connections of same material as housing.
4. Discharge Dampers: Assembly with **opposed** blades constructed of two plates formed around and to shaft, channel frame, and sealed ball bearings; with blades linked outside of airstream to single control lever of same material as housing.
5. Shaft Seals: Airtight seals installed around shaft on drive side of single-width fans.
6. Weather Cover: Enameled-steel sheet with ventilation slots, bolted to housing on outdoor fans.

### 2.3 BACKWARD-INCLINED CENTRIFUGALFANS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Aerovent; a Twin City Fan company.
2. Greenheck Fan Corporation.
3. Loren Cook Company.
4. Trane

B. Description:

1. Factory-fabricated, -assembled, -tested, and -finished, belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor, drive assembly, and support structure.
2. Deliver fans as factory-assembled units, to the extent allowable by shipping limitations.
3. Factory-installed and -wired disconnect switch.

C. Housings:

1. Formed panels to make curved-scroll housings with shaped cutoff.

2. Panel Bracing: Steel angle- or channel-iron member supports for mounting and supporting fan scroll, wheel, motor, and accessories.
3. Horizontally split, bolted-flange housing.
4. Spun inlet cone with flange.
5. Outlet flange.

D. Backward-Inclined Wheels:

1. Single-width-single-inlet and double-width-double-inlet construction with curved inlet flange, backplate, backward-inclined blades, and fastened to shaft with setscrews.
2. Welded or riveted to flange and backplate; cast-iron or cast-steel hub riveted to backplate.

E. Shafts:

1. Statically and dynamically balanced and selected for continuous operation at maximum rated fan speed and motor horsepower, with adjustable alignment and belt tensioning.
2. Turned, ground, and polished hot-rolled steel with keyway. Ship with protective coating of lubricating oil.
3. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range.

F. Grease-Lubricated Shaft Bearings:

1. Self-aligning, pillow-block-type, tapered roller bearings with double-locking collars and two-piece, cast-iron housing.
2. Ball-Bearing Rating Life: ABMA 9, L10 at 50,000 hours.

G. Grease-Lubricated Shaft Bearings:

1. Self-aligning, pillow-block-type, ball or roller bearings with adapter mount and two-piece, cast-iron housing.
2. Ball-Bearing Rating Life: ABMA 9, L10 at 50,000 hours.

H. Belt Drives:

1. Factory mounted, with adjustable alignment and belt tensioning.
2. Service Factor Based on Fan Motor Size: 1.5
3. Fan Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.
4. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with larger motors. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
5. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
6. Belt Guards: Fabricate to comply with OSHA and SMACNA requirements of diamond-mesh wire screen welded to steel angle frame or equivalent, prime coated. Secure to fan or fan supports without short circuiting vibration isolation. Include provisions for adjustment of belt tension, lubrication, and use of tachometer with guard in place.
7. Motor Mount: Adjustable for belt tensioning.

I. Accessories:

1. Access for Inspection, Cleaning, and Maintenance: Comply with requirements in

ASHRAE62.1.

2. Scroll Drain Connection: NPS 1 steel pipe coupling welded to low point of fan scroll on outdoor fans.
3. Companion Flanges: Rolled flanges for duct connections of same material as housing.
4. Discharge Dampers: Assembly with opposed blades constructed of two plates formed around and to shaft, channel frame, and sealed ball bearings; with blades linked outside of airstream to single control lever of same material as housing.
5. Shaft Seals: Airtight seals installed around shaft on drive side of single-width fans.
6. Weather Cover: Enameled-steel sheet with ventilation slots, bolted to housing.

## 2.4 FORWARD-CURVED CENTRIFUGALFANS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Greenheck Fan Corporation.
  2. Loren Cook Company.
  3. Twin City.
  4. Trane.
- B. Description:
  1. Factory-fabricated, -assembled, -tested, and -finished, belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor, drive assembly, and support structure.
  2. Deliver fans as factory-assembled units, to the extent allowable by shipping limitations.
  3. Factory-installed and -wired disconnect switch.
- C. Housings:
  1. Formed panels to make curved-scroll housings with shaped cutoff.
  2. Panel Bracing: Steel angle- or channel-iron member supports for mounting and supporting fan scroll, wheel, motor, and accessories.
  3. Horizontally split, bolted-flange housing.
  4. Spun inlet cone with flange.
  5. Outlet flange.
- D. Forward-Curved Wheels:
  1. Black-enameled or galvanized-steel construction with inlet flange, backplate, shallow blades with inlet and tip curved forward in direction of airflow.
  2. Mechanically secured to flange and backplate; cast-steel hub swaged to backplate and fastened to shaft with setscrews.
- E. Shafts:
  1. Statically and dynamically balanced and selected for continuous operation at maximum rated fan speed and motor horsepower, with adjustable alignment and belt tensioning.
  2. Turned, ground, and polished hot-rolled steel with keyway. Ship with protective coating of lubricating oil.
  3. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range.

F. Grease-Lubricated Shaft Bearings:

1. Self-aligning, pillow-block-type, tapered roller bearings with double-locking collars and two-piece, cast-iron housing.
2. Ball-Bearing Rating Life: ABMA 9, L10 at 50,000 hours.

G. Grease-Lubricated Shaft Bearings:

1. Self-aligning, pillow-block-type, ball or roller bearings with adapter mount and two-piece, cast-iron housing.
2. Ball-Bearing Rating Life: ABMA 9, L10 at 50,000 hours.

H. Belt Drives:

1. Factory mounted, with adjustable alignment and belt tensioning.
2. Service Factor Based on Fan Motor Size:1.2.
3. Fan Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.
4. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with larger motors. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
5. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
6. Belt Guards: Fabricate to comply with OSHA and SMACNA requirements of diamond-mesh wire screen welded to steel angle frame or equivalent, prime coated. Secure to fan or fan supports without short circuiting vibration isolation. Include provisions for adjustment of belt tension, lubrication, and use of tachometer with guard in place.
7. Motor Mount: Adjustable for belt tensioning.

I. Accessories:

1. Access for Inspection, Cleaning, and Maintenance: Comply with requirements in ASHRAE62.1.
2. Scroll Drain Connection: NPS 1 (DN 25) steel pipe coupling welded to low point of fan scroll.
3. Companion Flanges: Rolled flanges for duct connections of same material as housing.
4. Variable Inlet Vanes: With blades supported at both ends with two permanently lubricated bearings of same material as housing. Variable mechanism terminating in single control lever with control shaft for double-width fans.
5. Discharge Dampers: Assembly with opposed blades constructed of two plates formed around and to shaft, channel frame, and sealed ball bearings; with blades linked outside of airstream to single control lever of same material as housing.
6. Inlet Screens: Grid screen of same material as housing.
7. Shaft Cooler: Metal disk between bearings and fan wheel, designed to dissipate heat from shaft.
8. Spark-Resistant Construction: AMCA99.
9. Shaft Seals: Airtight seals installed around shaft on drive side of single-width fans.
10. Weather Cover: Enameled-steel sheet with ventilation slots, bolted to housing.

## 2.5 MOTORS

- A. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

## 2.6 SOURCE QUALITY CONTROL

- A. Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.
- B. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings according to AMCA 210/ASHRAE 51, "Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating."

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. Install centrifugal fans level and plumb.
- B. Disassemble and reassemble units, as required for moving to the final location, according to manufacturer's written instructions.
- C. Lift and support units with manufacturer's designated lifting or supporting points.
- D. Equipment Mounting: Install continuous-thread hanger rods and spring hangers of size required to support weight of fan unit.
  - 1. Comply with requirements for seismic-restraint devices specified in Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment."
  - 2. Comply with requirements for hangers and supports specified in Section 230529 "Hangers and Supports for HVAC Piping and Equipment."
- E. Curb Support: Install roof curb on roof structure, level and secure, according to "The NRCA Roofing and Waterproofing Manual," Low-Slope Membrane Roofing Construction Details Section, Illustration "Raised Curb Detail for Rooftop Air Handling Units and Ducts." Install and secure centrifugal fans on curbs, and coordinate roof penetrations and flashing with roof construction.
- F. Install units with clearances for service and maintenance.
- G. Label fans according to requirements specified in Section 230553 "Identification for HVAC Piping and Equipment."

### 3.1 CONNECTIONS

- A. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Section 233300 "Air Duct Accessories."
- B. Install ducts adjacent to fans to allow service and maintenance.
- C. Install piping from scroll drain connection, with trap with seal equal to 1.5 times specified static pressure, to nearest floor drain with pipe sizes matching the drain connection.

### 3.2 FIELD QUALITYCONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- C. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
  - 1. Verify that shipping, blocking, and bracing are removed.
  - 2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
  - 3. Verify that cleaning and adjusting are complete.
  - 4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
  - 5. Adjust belt tension.
  - 6. Adjust damper linkages for proper damper operation.
  - 7. Verify lubrication for bearings and other moving parts.
  - 8. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
  - 9. See Section 230593 "Testing, Adjusting, and Balancing For HVAC" for testing, adjusting, and balancing procedures.
  - 10. Remove and replace malfunctioning units and retest as specified above.
- D. Test and adjust controls and safeties. Controls and equipment will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports.

3.3 DEMONSTRATION

- A. Engage a factory-authorized service representative to train maintenance personnel to adjust, operate, and maintain centrifugal fans.

**END OF SECTION 233416**

## **SECTION 233600 - AIR TERMINAL UNITS**

### **PART 1 - GENERAL**

#### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. Section Includes:
  - 1. Shutoff, single-duct air terminal units.

#### 1.3 PERFORMANCE REQUIREMENTS

- A. Structural Performance: Hangers and supports and seismic restraints shall withstand the effects of gravity and seismic loads and stresses within limits and under conditions described in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible".

#### 1.4 SUBMITTALS

- A. Product Data: For each type of the following products, including rated capacities, furnished specialties, sound-power ratings, and accessories.
  - 1. Air terminal units.
  - 2. Liners and adhesives.
  - 3. Sealants and gaskets.
  - 4. Seismic-restraint devices.
- B. LEED Submittals:
  - 1. Product Data for Prerequisite EQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."

- C. Shop Drawings: For air terminal units. Include plans, elevations, sections, details, and attachments to other work.
  - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - 2. Wiring Diagrams: For power, signal, and control wiring.
  - 3. Hangers and supports, including methods for duct and building attachment, seismic restraints, and vibration isolation.
  
- D. Delegated-Design Submittal:
  - 1. Materials, fabrication, assembly, and spacing of hangers and supports.
  - 2. Design Calculations: Calculations, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation for selecting hangers and supports and seismic restraints.
  
- E. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
  - 1. Ceiling suspension assembly members.
  - 2. Size and location of initial access modules for acoustic tile.
  - 3. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.
  
- F. Field quality-control reports.
  
- G. Operation and Maintenance Data: For air terminal units to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:
  - 1. Instructions for resetting minimum and maximum air volumes.
  - 2. Instructions for adjusting software setpoints.

## 1.5 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
  
- B. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-Up."

## 1.6 EXTRA MATERIALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

## PART 2 - PRODUCTS

### 2.1 SHUTOFF, SINGLE-DUCT AIR TERMINAL UNITS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Nailor Industries Inc.
  2. Price Industries.
  3. Titus.
- B. Configuration: Volume-damper assembly inside unit casing with control components inside a protective metal shroud.
- C. Casing: 0.034-inch (0.85-mm) steel.
1. Casing Lining: Adhesive attached, 1-inch-thick, coated, fibrous-glass duct liner complying with ASTM C 1071, and having a maximum flame-spread index of 25 and a maximum smoke-developed index of 50, for both insulation and adhesive, when tested according to ASTM E84.
    - a. Inner lining shall be solid metal.
  2. Air Inlet: Round stub connection or S-slip and drive connections for duct attachment.
  3. Air Outlet: S-slip and drive connections.
  4. Access: Removable panels for access to parts requiring service, adjustment, or maintenance; with airtight gasket.
  5. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE62.1.
- D. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.
1. Maximum Damper Leakage: ARI 880 rated, 2 percent of nominal airflow at 6-inch wg (1500-Pa) inlet static pressure.
  2. Damper Position: Normally open.
- E. Hydronic Coils: Coppertube, with mechanically bonded aluminum fins spaced no closer than 0.1 inch (2.5 mm), and rated for a minimum working pressure of 200 psig (1380 kPa) and a maximum entering-water temperature of 220 deg F (104 deg C). Include manual air vent and drain valve.

## 2.2 HANGERS AND SUPPORTS

- A. Hanger Rods for Noncorrosive Environments: Cadmium-plated steel rods and nuts.
- B. Steel Cable End Connections: Cadmium-plated steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.
- C. Air Terminal Unit Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.
- D. Trapeze and Riser Supports: Steel shapes and plates for units with steel casings; aluminum for units with aluminum casings.

## 2.3 SEISMIC-RESTRAINT DEVICES

- A. General Requirements for Restraint Components: Rated strengths, features, and applications shall be as defined in reports by an agency acceptable to authorities having jurisdiction.
  - 1. Structural Safety Factor: Allowable strength in tension, shear, and pullout force of components shall be at least four times the maximum seismic forces to which they will be subjected.
- B. Channel Support System: Shop- or field-fabricated support assembly made of slotted steel channels rated intension, compression, and torsion forces and with accessories for attachment to braced component at one end and to building structure at the other end. Include matching components and corrosion-resistant coating.
- C. Restraint Cables: ASTM A 603, galvanized-steel cables with end connections made of cadmium-plated steel assemblies with brackets, swivel, and bolts designed for restraining cable service; with an automatic-locking and clamping device or double-cable clips.
- D. Hanger Rod Stiffener: Reinforcing steel angle clamped to hanger rod.
- E. Mechanical Anchor Bolts: Drilled-in and stud-wedge or female-wedge type. Select anchor bolts with strength required for anchor and as tested according to ASTM E488.

## 2.4 SOURCE QUALITY CONTROL

- A. Factory Tests: Test assembled air terminal units according to ARI880.
  - 1. Label each air terminal unit with plan number, nominal airflow, maximum and minimum factory-set airflows, coil type, and ARI certification seal.

### **PART 3 - EXECUTION**

#### 3.1 INSTALLATION

- A. Install air terminal units according to NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems."
- B. Install air terminal units level and plumb. Maintain sufficient clearance for normal service and maintenance.
- C. Install wall-mounted thermostats.

#### 3.2 HANGER AND SUPPORT INSTALLATION

- A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports."
- B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.
  - 1. Where practical, install concrete inserts before placing concrete.
  - 2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
  - 3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes and for slabs more than 4 inches thick.
  - 4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes and for slabs less than 4 inches thick.
  - 5. Do not use powder-actuated concrete fasteners for seismic restraints.
- C. Hangers Exposed to View: Threaded rod and angle or channel supports.
- D. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

#### 3.3 SEISMIC-RESTRAINT-DEVICE INSTALLATION

- A. Install hangers and braces designed to support the air terminal units and to restrain against seismic forces required by applicable building codes.

- B. Select seismic-restraint devices with capacities adequate to carry present and future static and seismic loads.
- C. Install cables so they do not bend across edges of adjacent equipment or building structure.
- D. Install cable restraints on air terminal units that are suspended with vibration isolators.
- E. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction.
- F. Attachment to Structure: If specific attachment is not indicated, anchor bracing and restraints to structure, to flanges of beams, to upper truss chords of bar joists, or to concrete members.
- G. Drilling for and Setting Anchors:
  - 1. Identify position of reinforcing steel and other embedded items before drilling holes for anchors. Do not damage existing reinforcement or embedded items during drilling. Notify the Architect if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
  - 2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
  - 3. Wedge Anchors: Protect threads from damage during anchor installation. Install heavy-duty sleeve anchors with sleeve fully engaged in the structural element to which anchor is to be fastened.
  - 4. Set anchors to manufacturer's recommended torque, using a torque wrench.
  - 5. Install zinc-coated steel anchors for interior applications and stainless-steel anchors for applications exposed to weather.

### 3.4 CONNECTIONS

- A. Install piping adjacent to air terminal unit to allow service and maintenance.
- B. Hot-Water Piping: In addition to requirements in Section 232113 "Hydronic Piping," connect heating coils to supply with shutoff valve, strainer, control valve, and union or flange; and to return with balancing valve and union or flange.
- C. Connect ducts to air terminal units according to Section 233113 "Metal Ducts."
- D. Make connections to air terminal units with flexible connectors complying with requirements in Section 233300 "Air Duct Accessories."

### 3.5 IDENTIFICATION

- A. Label each air terminal unit with plan number, nominal airflow, and maximum and minimum factory-set airflows. Comply with requirements in Section 230553 "Identification for HVAC Piping and Equipment" for equipment labels and warning signs and labels.

### 3.6 FIELD QUALITY CONTROL

- A. Testing Agency: Contractor shall engage a qualified testing agency to perform tests and inspections.
- B. Tests and Inspections:
  - 1. After installing air terminal units and after electrical circuitry has been energized, test for compliance with requirements.
  - 2. Leak Test: After installation, fill water coils and test for leaks. Repair leaks and retest until no leaks exist.
  - 3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
  - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Air terminal unit will be considered defective if it does not pass tests and inspections.
- D. Prepare test and inspection reports.

### 3.7 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
  - 1. Complete installation and startup checks according to manufacturer's written instructions.
  - 2. Verify that inlet duct connections are as recommended by air terminal unit manufacturer to achieve proper performance.
  - 3. Verify that controls and control enclosure are accessible.
  - 4. Verify that control connections are complete.
  - 5. Verify that nameplate and identification tag are visible.
  - 6. Verify that controls respond to inputs as specified.

### 3.8 DEMONSTRATION

- A. Engage a factory-authorized service representative to train maintenance personnel to adjust, operate, and maintain air terminal units.

**END OF SECTION 233600**

## **SECTION 233713 - DIFFUSERS, REGISTERS AND GRILLES**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### **1.2 SUMMARY**

- A. Section Includes:
  - 1. Rectangular and square ceiling diffusers.
  - 2. Adjustable bar registers and grilles.
- B. Related Sections:
  - 1. Division 23 Section "Air Duct Accessories" for fire and smoke dampers and volume-control dampers not integral to diffusers, registers, and grilles.

#### **1.3 SUBMITTALS**

- A. Product Data: For each type of product indicated, include the following:
  - 1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.
  - 2. Diffuser, Register, and Grille Schedule: Indicate drawing designation, room location, quantity, model number, size, and accessories furnished.
- B. Samples for Initial Selection: For diffusers, registers, and grilles with factory-applied color finishes.
- C. Samples for Verification: For diffusers, registers, and grilles, in manufacturer's standard sizes to verify color selected.
- D. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:
  - 1. Ceiling suspension assembly members.
  - 2. Method of attaching hangers to building structure.
  - 3. Size and location of initial access modules for acoustical tile.
  - 4. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.
  - 5. Duct access panels.

- E. Source quality-control reports.
- F. LEED Submittals:
  - 1. Product Data for Prerequisite EQ 1: Documentation indicating that units comply with ASHRAE 62.1.

## **PART 2 - PRODUCTS**

### 2.1 CEILING DIFFUSERS

- A. Rectangular and Square Ceiling Diffusers
  - 1. Manufacturers: Subject to compliance with requirements,
    - a. A-J Manufacturing Co., Inc.
    - b. Anemostat Products; a Mestek company.
    - c. Carnes.
    - d. Hart & Cooley Inc.
    - e. Krueger.
    - f. METALAIRE, Inc.
    - g. Nailor Industries Inc.
    - h. Price Industries.
    - i. Titus.
    - j. Tuttle & Bailey.
  - 2. Design basis was Titus model OMNI.
  - 3. Material: Steel
  - 4. Finish: Baked enamel, white
  - 5. Face Size: 24 by 24 inches.
  - 6. Face Style: Flat Plate
  - 7. Mounting: T-bar
    - 8. Pattern: Fixed
  - 9. Dampers: Radial opposed blade
  - 10. Accessories:
    - a. Equalizing grid.
    - b. Sectorizing baffles.
    - c. Operating rod extension.

### 2.2 REGISTERS AND GRILLES

- A. Adjustable Bar Register
  - 1. Manufacturers: Subject to compliance with requirements,
    - a. Anemostat Products; a Mestek company.
    - b. Carnes.
    - c. Dayus Register & Grille Inc.
    - d. Hart & Cooley Inc.

- e. Krueger.
  - f. METALAIRE, Inc.
  - g. Nailor Industries Inc.
  - h. Price Industries.
  - i. Titus.
  - j. Tuttle & Bailey.
- 2. Design basis is Titus model 300 for supply and 350 for returns.
  - 3. Material: Steel
  - 4. Finish: Baked enamel, white
  - 5. Face Blade Arrangement: Vertical spaced 3/4 inch apart.
  - 6. Core Construction: Integral
  - 7. Rear-Blade Arrangement: Horizontal spaced 3/4 inch apart.
  - 8. Frame: 1 inch wide.
  - 9. Mounting: Lay in.
  - 10. Damper Type: Adjustable opposed blade
  - 11. Accessories:
    - a. Front and Rear-blade gang operator.
    - b. Filter

### 2.3 SOURCE QUALITY CONTROL

- A. Verification of Performance: Rate diffusers, registers, and grilles according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Examine areas where diffusers, registers, louvers and grilles are to be installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.2 INSTALLATION

- A. Install diffusers, registers, louvers and grilles level and plumb.
- B. Ceiling-Mounted Outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practical. For units installed in lay-in ceiling panels,

locate units in the center of panel. Where architectural features or other items conflict with installation, notify Architect for a determination of final location.

- C. Install diffusers, registers, louvers and grilles with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

### 3.3 ADJUSTING

- A. After installation, adjust diffusers, registers, and grilles to air patterns indicated, or as directed, before starting air balancing.

END OF SECTION 233713

## **SECTION 234170 – ROOFTOP UNITS**

### **PART 1 - GENERAL**

#### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 GENERAL DESCRIPTION

- A. This Section includes the design, controls and installation requirements for packaged rooftop units.

#### 1.3 QUALITY ASSURANCE

- A. Packaged air-cooled condenser units shall be certified in accordance with ANSI/AHRI Standard 340/360 performance rating of commercial and industrial unitary air-conditioning and heat pump equipment.
- B. Unit shall be certified in accordance with UL Standard 1995/CSA C22.2 No. 236, Safety Standard for Heating and Cooling Equipment.
- C. Unit and refrigeration system shall comply with ASHRAE 15, Safety Standard for Mechanical Refrigeration.
- D. Unit shall be certified in accordance with ANSI Z21.47b/CSA 2.3b and ANSI Z83.8/CSA 2.6, Safety Standard Gas-Fired Furnaces.
- E. Unit Seasonal Energy Efficiency Ratio (SEER) shall be equal to or greater that prescribed by ASHRAE 90.1, Energy Efficient Design of New Buildings except Low-Rise Residential Buildings.
- F. Unit shall be safety certified by ETL and ETL US listed. Unit nameplate shall include the ETL/ETL Canada label.

#### 1.4 SUBMITTALS

- A. Product Data: Literature shall be provided that indicates dimensions, operating and shipping weights, capacities, ratings, fan performance, filter information, factory supplied accessories, electrical characteristics and connection requirements. Installation, Operation and Maintenance manual with startup requirements shall be provided.
- B. Shop Drawings: Unit drawings shall be provided that indicate assembly, unit dimensions, construction details, clearances and connection details. Computer generated fan curves for each fan shall be submitted with specific design operation point noted. Wiring diagram shall be

provided with details for both power and control systems and differentiate between factory installed and field installed wiring.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

- A. Unit shall be shipped with doors bolted shut and outside air hood closed to prevent damage during transport and thereafter while in storage awaiting installation.
- B. Follow Installation, Operation and Maintenance manual instructions for rigging, moving, and unloading the unit at its final location.
- C. Unit shall be stored in a clean, dry place protected from construction traffic in accordance with the Installation, Operation and Maintenance manual.

#### 1.6 WARRANTY

- A. Provide a limited “parts only” warranty for a period of 24 months from the date of original equipment shipment from the factory. Warranty shall cover material and workmanship that prove defective, within the specified warranty period, provided manufacturer’s written instructions for installation, operation and maintenance have been followed. Warranty excludes parts associated with routine maintenance, such as belts and air filters.

#### 1.7 STARTUP REPAIR PROGRAM

- A. Provide startup repair for a period of 12 months from the date of original equipment shipment from the factory. Program shall cover labor for materials and workmanship that prove defective, within the specified warranty period, provided manufacturer’s written instructions for installation, operation and maintenance have been followed. Program excludes labor associated with routine maintenance, such as belt and air filter replacement.

### **PART 2 - PRODUCTS**

#### 2.1 MANUFACTURER

- A. Products shall be provided by the following manufacturers:
  - 1. AAON
  - 2. Substitute equipment shall include:
    - a. R-410A refrigerant
    - b. Direct drive supply fans
    - c. Double wall cabinet construction
    - d. Insulation with a minimum R-value of 13
    - e. Stainless steel drain pans
    - f. Hinged access doors with lockable handles

- g. Inverter driven variable speed compressor
- h. VFD controlled variable speed compressor
- i. All other provisions of the specifications must be satisfactorily addressed

## 2.2 ROOFTOP UNITS

### A. General Description

1. Packaged rooftop unit shall include compressor, evaporator coil, filters, supply fan, dampers, air-cooled condenser coils, condenser fan, reheat coil, gas heater, and unit controls.
2. Unit shall be factory assembled and tested including leak testing of the DX coils, pressure testing of the refrigeration circuit, and run testing of the completed unit. Run test report shall be supplied with the unit in the service compartment's literature pocket.
3. Unit shall have decals and tags to indicate lifting and rigging, service areas and caution areas for safety and to assist service personnel.
4. Unit components shall be labeled, including refrigeration system components and electrical and controls components.
5. Estimated sound power levels (dB) shall be shown on the unit ratings sheets.
6. Installation, Operation and Maintenance manual shall be supplied within the units.
7. Laminated color-coded wiring diagram shall match factory installed wiring and shall be affixed to the interior of the control compartment's hinged access door.
8. Unit nameplate shall be provided in two locations on the unit, affixed to the exterior of the unit and affixed to the interior of the control compartment's hinged access door.

### B. Construction

1. All cabinet walls, access doors, and roof shall be fabricated of double wall, impact resistant, rigid polyurethane foam panels.
2. Unit insulation shall have a minimum thermal resistance R-value of 13. Foam insulation shall have a minimum density of 2 pounds/cubic foot and shall be tested in accordance with ASTM D-1929 for a minimum flash ignition temperature of 610°F.
3. Unit construction shall be double wall with G90 galvanized steel on both sides and a thermal break. Double wall construction with a thermal break prevents moisture accumulation on the insulation, provides a cleanable interior, reduces heat transfer through the panel, and prevents exterior condensation on the panel.
4. Unit shall be designed to reduce air leakage and infiltration through the cabinet. Cabinet leakage shall not exceed 1% of total airflow when tested at 3 times the minimum external static pressure provided in AHRI Standard 210/240. Panel deflection shall not exceed L/240 ratio at 125% of design static pressure, at a maximum 8 inches of positive or negative static pressure, to reduce air leakage. Deflection shall be measured at the midpoint of the panel height and width. Continuous sealing shall be included between panels and between access doors and openings to reduce air leakage. Piping and electrical conduit through cabinet panels shall include sealing to reduce air leakage.

5. Roof of the air tunnel shall be sloped to provide complete drainage. Cabinet shall have rain break overhangs above access doors.
6. Access to filters, dampers, cooling coil, reheat coil, heater, compressor, and electrical and controls components shall be through hinged access doors with quarter turn, lockable handles. Full length stainless steel piano hinges shall be included on the doors.
7. Exterior paint finish shall be capable of withstanding at least 2,500 hours, with no visible corrosive effects, when tested in a salt spray and fog atmosphere in accordance with ASTM B 117-95 test procedure.
8. Units shall include double sloped 304 stainless steel drain pans.
9. Unit shall be provided with through the base vertical discharge and return air openings. All openings through the unit shall have upturned flanges of at least 1/2 inch around the opening.
10. Unit shall include lifting lugs on the top of the unit.

C. Electrical

1. Unit shall have a 5kAIC SCCR.
2. Unit shall be provided with factory installed and factory wired, non-fused disconnect switch.
3. Unit shall be provided with a factory installed and factory wired 115V, 12 amp GFI outlet disconnect switch in the unit control panel.
4. Unit shall be provided with phase and brown out protection which shuts down all motors in the unit if the electrical phases are more than 10% out of balance on voltage, the voltage is more than 10% under design voltage or on phase reversal.
5. Unit shall be provided with remote stop/start terminals which require contact closure for unit operation. When these contacts are open the low voltage circuit is broken and the unit will not operate.

D. Supply Fans

1. Unit shall include direct drive, unhooded, backward curved, plenum supply fans.
2. Blowers and motors shall be dynamically balanced.
3. Motor shall be a high efficiency electrically commutated motor.

E. Cooling Coils

1. Evaporator Coils
  - a. Coils shall be designed for use with R-410A refrigerant and constructed of copper tubes with aluminum fins mechanically bonded to the tubes and aluminum end casings. Fin design shall be sine wave rippled.
  - b. Coil shall be standard capacity.
  - c. Coils shall be helium hydrogen or helium leak tested.
  - d. Coils shall be furnished with factory installed electronic expansion valves.

F. Refrigeration System

1. Unit shall be factory charged with R-410A refrigerant.
2. Compressors shall be scroll type with thermal overload protection and carry a 5 year non-prorated warranty, from the date of original equipment shipment from the factory.

3. Compressors shall be mounted in an isolated service compartment which can be accessed without affecting unit operation. Lockable hinged compressor access doors shall be fabricated of double wall, rigid polyurethane foam injected panels to prevent the transmission of noise outside the cabinet.
4. Compressors shall be isolated from the base pan with the compressor manufacturer's recommended rubber vibration isolators, to reduce any transmission of noise from the compressors into the building area.
5. Each refrigeration circuit shall be equipped with electronic expansion valve type refrigerant flow control.
6. Each refrigeration circuit shall be equipped with automatic reset low pressure and manual reset high pressure refrigerant safety controls, Schrader type service fittings on both the high pressure and low pressure sides and a factory installed liquid line filter driers.
7. Unit shall include a inverter driven variable speed scroll compressor on the refrigeration circuit which shall be capable of modulating refrigerant capacity.
8. Refrigeration circuit shall be provided with hot gas reheat coil, modulating valves, electronic controller, supply air temperature sensor and a control signal terminal which allow the unit to have a dehumidification mode of operation, which includes supply air temperature control to prevent supply air temperature swings and overcooling of the space.
9. Refrigeration circuit shall be provided with an adjustable temperature sensor freeze stat which shuts down the cooling circuit when the evaporator coil tubing falls below the setpoint.

G. Condensers

1. Air-Cooled Condenser
  - a. Condenser fans shall be a vertical discharge, axial flow, direct drive fans.
  - b. Coils shall be designed for use with R-410A refrigerant.
  - c. Condenser coils shall be multi-pass and fabricated from aluminum microchannel tubes.
  - d. Coils shall be designed for a minimum of 10°F of refrigerant sub-cooling.
  - e. Coils shall be hydrogen or helium leak tested.
  - f. Condenser fans shall be high efficiency electrically commutated motor driven with factory installed head pressure control module. Condenser airflow shall continuously modulate based on head pressure and cooling operation shall be allowed down to 35°F with adjustable compressor lockout.

H. Gas Heating

1. Stainless steel heat exchanger furnace shall carry a 25 year non-prorated warranty, from the date of original equipment shipment from the factory.
2. Gas furnace shall consist of stainless steel heat exchangers with multiple concavities, an induced draft blower and an electronic pressure switch to lockout the gas valve until the combustion chamber is purged and combustion airflow is established.

3. Furnace shall include a gas ignition system consisting of an electronic igniter to a pilot system, which will be continuous when the heater is operating, but will shut off the pilot when heating is not required.
  4. Unit shall include a single gas connection and have gas supply piping entrances in the unit base for through-the-curb gas piping and in the outside cabinet wall for across the roof gas piping.
  5. Modulating Natural Gas Furnace shall be equipped with modulating gas valves, adjustable speed combustion blowers, stainless steel tubular heat exchangers, and electronic controller. Combustion blowers and gas valves shall be capable of modulation. Electronic controller includes a factory wired, field installed supply air temperature sensor. Sensor shall be field installed in the supply air ductwork. Supply air temperature setpoint shall be adjustable on the electronic controller within the control compartment. Gas heater shall be capable of capacity turndown ratio as shown on the unit rating sheet.
- I. Filters
1. Unit shall include 4 inch thick, pleated panel filters with an ASHRAE efficiency MERV rating of 8, upstream of the cooling coil.
  2. Unit shall include a clogged filter switch.
- J. Outside Air/Economizer
1. Unit shall include 0-100% economizer consisting of a motor operated outside air damper and return air damper assembly constructed of extruded aluminum, hollow core, airfoil blades with rubber edge seals and aluminum end seals. Damper blades shall be gear driven and designed to have no more than 15 CFM of leakage per sq. ft. of damper area when subjected to 2 inches w.g. air pressure differential across the damper. Unit shall include outside air opening bird screen, outside air hood with rain lip and barometric relief dampers.
  2. Damper assembly shall be controlled by spring return enthalpy activated fully modulating actuator.
- K. Controls
1. Factory Installed and Factory Provided Controller
    - a. Unit controller shall be capable of controlling all features and options of the unit. Controller shall be factory installed in the unit controls compartment and factory tested.
    - b. Controller shall be capable of standalone operation with unit configuration, setpoint adjustment, sensor status viewing, unit alarm viewing, and occupancy scheduling available without dependence on a building management system.
    - c. Controller shall have an onboard clock and calendar functions that allow for occupancy scheduling.
    - d. Controller shall include non-volatile memory to retain all programmed values without the use of a battery, in the event of a power failure.
    - e. Variable Air Volume Controller

- 1) Unit shall utilize a variable capacity compressor system and a variable speed supply fan system to modulate cooling and airflow as required to meet space temperature cooling loads and to save operating energy.
  - 2) Unit shall utilize a variable speed compressor system and a variable speed supply fan system to modulate cooling and airflow as required to meet space temperature cooling loads and to save operating energy. Supply fan speed shall modulate based on supply air duct static pressure. Cooling capacity shall modulate based on supply air temperature.
  - 3) With modulating hot gas reheat, unit shall modulate cooling and hot gas reheat as efficiently as possible, to meet space humidity loads and prevent supply air temperature swings and overcooling of the space.
  - 4) Unit shall modulate heating with constant airflow to meet space temperature heating loads. Modulating heating capacity shall modulate based on supply air temperature.
- f. Unit configuration, setpoint adjustment, sensor status viewing, unit alarm viewing, and occupancy scheduling shall be accomplished with connection to interface module with LCD screen and input keypad, interface module with touch screen, or with connection to PC with free configuration software. Controller shall be capable of connection with other factory installed and factory provided unit controllers with individual unit configuration, setpoint adjustment, sensor status viewing, and occupancy scheduling available from a single unit. Connection between unit controllers shall be with a modular cable. Controller shall be capable of communicating and integrating with a LonWorks or BACnet network. [Orion Controls System]

L. Accessories

1. Unit shall be provided with a safety shutdown terminal block for field installation of a smoke detector which shuts off the unit's control circuit.

2.3 Curbs

- A. Curbs shall to be fully gasketed between the curb top and unit bottom with the curb providing full perimeter support, cross structure support and air seal for the unit. Curb gasket shall be furnished within the control compartment of the rooftop unit to be mounted on the curb immediately before mounting of the rooftop unit.
- B. Knockdown curb (with duct support rails) shall be factory furnished for field assembly.
- C. Solid bottom curb shall be factory assembled and fully lined with curb rated 1 inch fiberglass insulation and include a wood nailer strip. (Curb shall be adjustable up to 3/4 inch per foot to allow for sloped roof applications.)

**PART 3 - EXECUTION**

3.1 Installation, Operation and Maintenance

- A. Installation, Operation and Maintenance manual shall be supplied with the unit.
- B. Install unit, including field installed components, in accordance with Installation, Operation and Maintenance manual instructions.
- C. Start up and maintenance requirements shall be complied with to ensure safe and correct operation of the unit.

END OF SECTION 234170

## **SECTION 235216 - CONDENSING HOT WATER BOILERS**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### **1.2 SUMMARY**

- A. This Section includes packaged full condensing hot water boiler(s), and accessories for producing hydronic hot water with the following configurations, burners, and outputs:
  - 1. Factory packaged and assembled boiler.
  - 2. Integral natural gas and/or propane forced draft premix burner.

#### **1.3 ACTION SUBMITTALS**

- A. Product Data: Include performance data, operating characteristics, furnished specialties, and accessories.
- B. Shop Drawings: For boilers, boiler trim, and accessories. Include plans, elevations, sections, details, and attachments to other work.
  - 1. Design calculations and vibration isolation base details, signed and sealed by a qualified professional engineer.
    - a. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
    - b. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails and equipment mounting frames.
  - 2. Wiring Diagrams: Power, signal, and control wiring.

#### **1.4 INFORMATIONAL SUBMITTALS**

- A. Manufacturer Seismic Qualification Certification: Submit certification that boiler, accessories, and components will withstand seismic forces defined in Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment." Include the following:
  - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

- a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
  2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
  3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- B. Source quality-control test reports.
- C. Field quality-control test reports.
- D. Warranty: Special warranty specified in this Section.
- E. Other Informational Submittals:
1. ASME "A" Stamp Certification and Report: Submit "A" stamp certificate of authorization as required by authorities having jurisdiction, and document hydrostatic testing of piping external to boiler.
  2. Startup service reports.
- F. LEED Submittals:
1. Product Data for Prerequisite EQ 1: Documentation indicating that units comply with ASHRAE 62.1.

#### 1.5 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For boilers, components, and accessories to include in emergency, operation, and maintenance manuals.

#### 1.6 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- B. ASME Compliance: Fabricate and label boilers to comply with ASME Boiler and Pressure Vessel Code.
- C. ASHRAE/IESNA 90.1 Compliance: Boilers shall have minimum efficiency according to "Gas and Oil Fired Boilers - Minimum Efficiency Requirements."
- D. DOE Compliance: Minimum efficiency shall comply with 10 CFR 430, Subpart B, Appendix N, "Uniform Test Method for Measuring the Energy Consumption of Furnaces and Boilers."
- E. I=B=R Compliance: Boilers shall be tested and rated according to HI's "Rating Procedure for Heating Boilers" and "Testing Standard for Commercial Boilers," with I=B=R emblem on a nameplate affixed to boiler.

- F. CSA or UL Compliance: Test boilers for compliance with UL 795, "Commercial-Industrial Gas Heating Equipment." Boilers shall be listed and labeled by a testing agency acceptable to authorities having jurisdiction.
- G. ASME CSD-1 Certification, in the form of completed data sheet.

## 1.7 COORDINATION

- A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

## 1.8 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace pressure vessel damaged by thermal shock that fail in materials or workmanship within specified warranty period.
  - A. Warranty Period for Heat Exchangers: 20 years from date of Substantial Completion when utilized in a closed loop hydronic heating system with a temperature differential of 120 °F or less. The boiler pressure vessel shall be guaranteed accordingly without a minimum flow rate or return water temperature requirement. The boiler shall not require the use of flow switches or other devices to ensure minimum flow.
  - B. The pressure vessel, tubes and tube sheets (heat exchanger) shall be guaranteed against flue gas corrosion and materials/workmanship for a period of 10 years. The condensate collection box shall be guaranteed for 20 years. The burner cylinder shall be warranted for a period of 5 years.
  - C. All parts not covered by the above warranties shall carry a 1 year warranty from startup, or 18 months from shipment, whichever occurs first. This shall include all electrical components and burner components.

## PART 2 - PRODUCTS

### 2.1 CONDENSING BOILERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Lochinvar
  - 2. Buderus.
  - 3. Ruud
- B. BOILER shall bear the ASME "H" stamp for 160 psi working pressure and shall be National Board listed. The BOILER shall have a fully welded, stainless steel, water tube heat exchanger. Multiple pressure vessels in a single enclosure are not acceptable. There shall be no banding material, bolts, gaskets or "O" rings in the pressure vessel construction. The heat exchanger shall be designed for a single-pass water flow to limit the water side pressure drop. Pressure drop shall be no greater than 2.2 psi at 75GPM. The condensate collection basin shall be constructed of welded stainless steel. The complete heat exchanger assembly shall carry a ten (10) year limited warranty. Turndown ratio shall be 10:1 minimum.
- C. The BOILER shall be certified and listed by C.S.A. International under the latest edition of the

harmonized ANSI Z21.13 test standard for the U.S. and Canada. The BOILER shall comply with the energy efficiency requirements of the latest edition of ASHRAE 90.1 and the minimum efficiency requirements of the latest edition of the AHRI BTS-2000 Standard as defined by the Department of Energy in 10 CFR Part 431. The BOILER shall operate at a minimum of 97% Combustion and Thermal Efficiency at full fire as registered with AHRI. The BOILER shall be certified for indoor installation.

- D. The BOILER shall be constructed with a heavy gauge steel jacket assembly, primed and pre-painted on both sides. The combustion chamber shall be sealed and completely enclosed, independent of the outer jacket assembly, so that integrity of the outer jacket does not affect a proper seal. A burner/flame observation port shall be provided for observing the burner flame and combustion chamber. The burner shall be a premix design constructed of high temperature stainless steel with a woven Fecralloy outer covering to provide smooth operation at all modulating firing rates. The BOILER shall be supplied with a negative pressure regulation gas valve and be equipped with a pulse width modulation blower system to precisely control the fuel/air mixture to the burner. The BOILER shall operate in a safe condition with gas supply pressures as low as 4 inches of water column. The burner flame shall be ignited by direct spark ignition with flame monitoring via a flame sensor.
- E. The BOILER shall utilize a 24 VAC control circuit and components. The control system shall have a factory installed display for boiler set-up, boiler status, and boiler diagnostics. All components shall be easily accessed and serviceable from the front and top of the jacket. The BOILER shall be equipped with a temperature/pressure gauge; high limit temperature control with manual reset; ASME certified pressure relief valve set for 50 psi (standard); outlet water temperature sensor with a dual thermistor to verify accuracy; system supply water temperature sensor; outdoor air sensor, flue temperature sensor with dual thermistor to verify accuracy; low water cut off with manual reset, blocked drain switch and a condensate trap for the heat exchanger condensate drain.
- F. The BOILER shall feature the “SMART TOUCH™” control with CON-X-US which is standard and factory installed with an 7” liquid crystal touch screen display, password security, outdoor air reset, pump delay with freeze protection, pump exercise, ramp delay featuring six steps, domestic hot water prioritization with limiting capabilities and PC port connection. A secondary control that is field mounted outside or inside the appliance is not acceptable. The BOILER shall have alarm contacts for any failure, runtime contacts and data logging of runtime at given modulation rates, ignition attempts and ignition failures. The BOILER shall have a built-in “Cascade” to sequence and rotate while maintaining modulation of up to eight boilers of different Btu inputs without utilization of an external controller. The internal “Cascade” function shall be capable of lead-lag, efficiency optimization, front-end loading, and rotation of lead boiler every 24 hours. The control must include cascade redundancy to allow a member boiler to become the temporary leader if the original lead boiler shall loose communication with the members. The BOILER shall be capable of controlling an isolation valve (valve shall be offered by manufacturer) during heating operation and rotation of open valves in standby operation for full flow applications. The control must be equipped with standard BACnet MSTP and Modbus communication protocol with a minimum 55 readable points. The BOILER shall have an optional gateway device which will allow integration with LON or BACnet (IP) protocols.
- G. The “SMART TOUCH™” control shall include CON-X-US communication platform that will allow remote access via a smart phone or Tablet. This will allow the ability to monitor and manage multiple KNIGHT XL Boilers and send alerts via text or e-mail notifying of changes in system status. A user shall have the ability to check system status or re-program any boiler function remotely.
- H. The “SMART TOUCH™” control shall increase fan speed to boost flame signal when a weak flame signal is detected during normal operation. A 0 -10 VDC output signal shall control a variable speed boiler pump (pump to be offered by manufacturer) to keep a fixed delta t across the boiler regardless of the modulation rate. The BOILER shall have the capability to receive a 0 – 10 VDC input signal

from a variable speed system pump to anticipate changes in system heat load in order to prevent flow related issues and erratic temperature cycling.

- I. The BOILER shall be equipped with two terminal strips for electrical connection. A low voltage connection board with 44 connection points for safety and operating controls, i.e., Alarm Contacts, Runtime Contacts, Louver Proving Switch, Tank Thermostat, Domestic Hot Water Building Recirculation Pump Contacts, Domestic Hot Water Building Recirculation Temperature Sensor Contacts, Remote Enable/Disable, System Supply Temperature Sensor, Outdoor Temperature Sensor, Tank Temperature Sensor, Modbus Building Management System Signal and Cascade Control Circuit. A high voltage terminal strip shall be provided for Supply voltage. Supply voltage shall be 120 volt / 60 hertz / single phase on all models. The high voltage terminal strip plus integral relays are provided for independent pump control of the System pump, the Boiler pump and the Domestic Hot Water pump.
- J. The BOILER shall be installed and vented with a Direct Vent system with vertical roof top termination of both the exhaust vent and combustion air. The flue shall be Category IV approved material constructed of PVC, CPVC, Polypropylene or Stainless Steel. A separate pipe shall supply combustion air directly to the boiler from the outside. The boiler's total combined air intake length shall not exceed 150 equivalent feet. The boiler's total combined exhaust venting length shall not exceed 150 equivalent feet. The air inlet must terminate on the rooftop with the exhaust.
- K. The BOILER shall have an independent laboratory rating for Oxides of Nitrogen (NO<sub>x</sub>) to meet the requirements of South Coast Air Quality Management District in Southern California and the requirements of Texas Commission on Environmental Quality. The manufacturer shall verify proper operation of the burner, all controls and the integrity of the heat exchanger by connection to water and venting for a factory fire test prior to shipping.
- L. The BOILER shall be suitable for use with polypropylene glycol up to a 50% concentration. The de-rate associated with the glycol will vary per glycol manufacturer.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Before boiler installation, examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, and piping and electrical connections to verify actual locations, sizes, and other conditions affecting boiler performance, maintenance, and operations.
  - 1. Final boiler locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.
- B. Examine mechanical spaces for suitable conditions where boilers will be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 BOILER INSTALLATION**

- A. Install boilers level on concrete base. Concrete materials and installation requirements are specified with concrete.

- B. Vibration Isolation: Elastomeric isolator pads with a minimum static deflection of 0.25 inch (6.35 mm). Vibration isolation devices and installation requirements are specified in Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment."
- C. Install gas-fired boilers according to NFPA 54.
- D. Assemble casing panels per manufacturer's instructions.
- E. Assemble and install boiler trim.
- F. Install electrical devices furnished with boiler but not specified to be factory mounted.
- G. Install control wiring to field-mounted electrical devices.

### 3.3 CONNECTIONS

- A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to boiler to allow service and maintenance.
- C. Connect gas piping to boiler gas-train inlet with union. Piping size shall per installation instructions not size of gas train connection. Provide a reducer if required.

- D. Connect hot water supply-, return-, and drain tappings with shutoff valve and union or flange at each connection.
- E. Install piping from safety valves to nearest floor drain to a safe point of discharge.
- F. Install piping from equipment drain connection to nearest floor drain. Piping shall be at least full size of connection. Provide an isolation valve if required.
- G. Boiler Flue Venting:
  - 1. Install venting kit and combustion-air intake.
  - 2. Connect full size to boiler connections.
- H. Connect vents to full size of boiler inlet and outlet.
- I. Install flue gas condensate PVC drain piping to condensate neutralization assembly including loop trap seal.
- J. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
- K. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

### 3.4 FIELD QUALITY CONTROL

- A. Perform tests and inspections and prepare test reports.
  - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Tests and Inspections:
  - 1. Perform installation and startup checks according to manufacturer's written instructions.
  - 2. Leak Test: Hydrostatic test. Repair leaks and retest until no leaks exist.
  - 3. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion.
  - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
    - a. Burner Test: Adjust burner to eliminate excess oxygen, carbon dioxide, oxides of nitrogen emissions, and carbon monoxide in flue gas and to achieve combustion efficiency.
    - b. Check and adjust initial operating set points and high- and low-limit safety set points of fuel supply, water level, and water temperature, steam pressure.
    - c. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

- C. Remove and replace malfunctioning units and retest as specified above.
- D. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other than normal occupancy hours for this purpose.
- E. Performance Tests:
  - 1. Engage a factory-authorized service representative to inspect component assemblies and equipment installations, including connections, and to conduct performance testing.
  - 2. Boilers shall comply with performance requirements indicated, as determined by field performance tests. Adjust, modify, or replace equipment in order to comply.
  - 3. Perform field performance tests to determine the capacity and efficiency of the boilers.
    - a. For dual-fuel boilers, perform tests for each fuel.
    - b. Test for full capacity.
    - c. Test for boiler efficiency at low fire 20, 40, 60, 80, and 100 percent of full capacity. Determine efficiency at each test point.
  - 4. Repeat tests until results comply with requirements indicated.
  - 5. Provide analysis equipment required to determine performance.
  - 6. Provide temporary equipment and system modifications necessary to dissipate the heat produced during tests if building systems are not adequate.
  - 7. Notify Architect in advance of test dates.
  - 8. Document test results in a report and submit to Architect.

### 3.5 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Cleveland Clinic maintenance personnel to adjust, operate, and maintain boilers. Video training sessions. Refer to Section 017900 "Demonstration and Training."

**END OF SECTION 235216**

## **SECTION 236433 - MODULAR CHILLERS**

### **PART 1 – GENERAL**

#### 1.1 SECTION INCLUDES

- A. Modular Chillers

#### 1.2 RELATED REQUIREMENTS

- A. Section 230548 - Vibration and Seismic Controls for HVAC.
- B. Section 230593 - Testing, Adjusting, and Balancing for HVAC.
- C. Section 232113 - Hydronic Piping.
- D. Section 232123 - Hydronic Pumps.
- E. Section 236500 – Cooling Towers

#### 1.3 REFERENCE STANDARDS

- A. ABMA STD 9 - Load Ratings and Fatigue Life for Ball Bearings 2015.
- B. ABMA STD 11 - Load Ratings and Fatigue Life for Roller Bearings 2014.
- C. ASME B31.5 - Refrigeration Piping and Heat Transfer Components 2016.
- D. ASME PTC 23 - Atmospheric Water Cooling Equipment 2003, Reaffirmed 2014.
- E. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products 2017.
- F. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process 2018.
- G. ASTM D2794 - Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact) 1993 (Reapproved 2010).
- H. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials 2018b.
- I. ASTM G21 - Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Fungi 2015.
- J. ISO 9001 - Quality management systems -- Requirements 2015.
- K. NEMA MG 1 - Motors and Generators 2017.

#### 1.4 SUBMITTALS

- A. See Section 013000 - Administrative Requirements, for submittal procedures.
- B. Product Data: Provide rated capacities, dimensions, weights and point loadings, accessories, required clearances, electrical requirements and wiring diagrams, and location and size of field connections. Submit schematic indicating capacity controls.
- C. Shop Drawings: Indicate dimensions, sizes, and locations for mounting bolt holes.

- D. Manufacturer's Certificate: Certify that chiller performance, based on ASME PTC 23 meets or exceeds specified requirements.
- E. Manufacturer's Instructions: Submit manufacturer's complete installation instructions.
- F. Operation and Maintenance Data: Include start-up instructions, maintenance data, parts lists, controls, and accessories.
- G. Warranty: Submit manufacturer's warranty and ensure forms have been filled out in Owner 's name and registered with manufacturer.

#### 1.5 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum twenty years of documented experience and ISO 9001 certification.
- B. Installer Qualifications: Company specializing in performing the type of work specified in this section with minimum 5 years of experience and approved by manufacturer.

#### 1.6 REGULATORY REQUIREMENTS

- A. Products Requiring Electrical Connection: Listed and classified by Underwriters Laboratories Inc. as suitable for the purpose specified and indicated.

#### 1.7 DELIVERY, STORAGE, AND HANDLING

- A. Factory assemble entire unit. For shipping, disassemble into as large as practical sub-assemblies so that minimum amount of field work is required for re-assembly.
- B. Comply with manufacturer's installation instructions for rigging, unloading, and transporting units.

#### 1.8 WARRANTY

- A. See Section 017800 - Closeout Submittals, for additional warranty requirements.
- B. Provide a one year warranty to include coverage for defects in material and workmanship labor only.
- C. Fans, fan shafts, bearings, sheaves, gearboxes, drive shafts, couplings, and mechanical equipment support must be warranted against defects in materials and workmanship for a period of five (5) years; or seven (7) if motor space heater is properly wired.

## **PART 2 - PRODUCTS**

### 2.1 UNIT DESCRIPTION

- A. Chiller shall incorporate scroll compressors and consist of multiple refrigerant circuits. Each refrigerant circuit shall consist of an individual compressor, condenser, evaporator, thermal

expansion valve and control system. The multi-circuit chiller must be able to produce chilled water even in the event of a failure of one or more refrigerant circuits. All operating components for each module, including compressors, heat exchangers, piping, and controls shall be securely fastened to a unitized heavy gauge steel frame having an electro-statically applied powder, oven baked enamel finish. Steel frame work shall be completely factory assembled and base shall include forklift slots to eliminate the need for a pallet. Compressor motor contactors, control transformers, (one for each compressor circuit), transformer primary and secondary fuses are located in the control panel. Each chiller module has two (2) steps of control (100%, 50% and off) by cycling off the compressors. All electrical controls, contactors, and relays, for each module shall be mounted within that module and be of the low voltage type.

- B. Headers - each module shall include supply & return mains for both evaporator and condenser water. Grooved end connections are provided for interconnection to 6" standard piping with grooved couplings and end caps.

## 2.2 BASIC CONSTRUCTION

- A. The frame design shall consist of heavy gauge galvanized steel with 3 mil powder coat paint finish baked at 350° for resilience in transport and installation. The module must have a low center of gravity, detachable schedule 40 carbon steel pipe water headers two (2) for chilled water loop and two (2) for condenser loop and two each insulated with ¾" closed cell insulation, designed to connect to adjacent modules through the use of 300 psi rated grooved couplings, base with cutouts for forklift or pallet jack and the frame must be designed to fit through a standard 36" doorway.

## 2.3 EVAPORATORS AND CONDENSERS

- A. Each evaporator and condenser shall be dual-circuited, brazed plate heat exchangers constructed of 316 stainless steel; designed, tested, and UL stamped in accordance with ASME Section VIII pressure vessel code for 650 psig working refrigerant pressure on the evaporator and 650 psig working pressure on the condenser. Both the condenser and evaporator heat exchanger shall have a working pressure for the water circuits at least 285 psig.
- B. Both evaporator and condenser brazed plate heat exchangers shall have a waterside flush connection with ball valve on each module to permit back flushing or cleaning of heat exchangers without removing chiller headers or other in place components.

## 2.4 COMPRESSORS

- A. Unit shall contain multiple hermetic scroll compressors independently circuited and with internal isolation mounted with rubber-in-shear isolators. Each compressor system also includes high discharge pressure and low suction pressure manual reset safety cut-outs. The compressors are direct-drive, hermetic, 3600 rpm (@ 60 Hz) fixed compression, scroll compressors. Each

compressor has integral centrifugal oil pump, oil level sight-glass, oil charging valve, and an internal check valve on the scroll discharge port. Motor is suction gas-cooled, hermetically sealed, two-pole, squirrel cage induction type.

## 2.5 FACTORY INSULATED SURFACES

- A. All internal water piping and refrigeration piping (except discharge line), cooling header and load heat exchanger are factory insulated.

## 2.6 STARTER/CONTROL PANEL

- A. Starter/Control Panel: Module DDC Controls provides individual control as well as system integration. Simple two-conductor shielded daisy chain connection to allow communication between modules with minimal field wiring. NEMA Type 1 enclosure panel shall consist of control transformer, power distribution block, isolation relays, 16-bit microprocessor DDC control, status indicating lights showing , 1) compressor operation (on/off), 2) unit alarm status and 3) power on, relays for status and alarm and two toggle switches to disable each individual compressor during start-up or troubleshooting.

## 2.7 MASTER CONTROLLER SYSTEM

- A. System shall be fully compatible with the Building Automation System via native BACnet and LonWorks communication.
- B. Scheduling of the various compressors shall be performed by the Master microprocessor based controller. A compressor run time equalization sequence is provided to ensure even distribution of compressor run time. A load limit control shall be available to limit the number of compressors that can be energized at one time.
- C. The Master Controller shall monitor and report the following for each refrigeration circuit in each module:
  - 1. Discharge pressure and temperature faults.
  - 2. Suction pressure and temperature faults.
  - 3. Compressor fault.
  - 4. Low evaporator leaving chilled water temperature fault.
- D. The Master Controller shall monitor and report the following systems parameters for the chiller system:
  - 1. Chilled water entering and leaving temperature.
  - 2. Condenser water entering and leaving temperature
  - 3. Evaporator and condenser water flow availability.

- E. Any module failure condition shall cause a fault indication at the Master Controller and shut down of that compressor circuit with the transfer of the load requirements to the next available compressor circuit. In the case of a System fault the entire chiller will be shut down. When any fault occurs, the Master Controller shall record conditions at the time of the fault, and store the data for recall. This information shall be capable of recall through the keypad of the Master Controller and displayed on the 4 line by 40 character, back-lit LCD. A history of faults shall be maintained including date and time for each fault (up to the last 100 occurrences). Internal leaving chilled water reset control will insure that the parallel evaporators are operated above the freeze point for part load operation.

## 2.8 POWER CONNECTIONS

- A. Each module shall have its own electrical power panel mounted to the unit frame. Each module will be independently powered by a field installed fused disconnect switch (or equivalent module circuit breaker) supplied by others, so that any one module can be shut down for repair without interrupting the remaining chiller modules' operation. The power panel for each module shall contain:
  - 1. Main input terminal block
  - 2. Compressor motor contractors
  - 3. Motor overload protection per compressor
  - 4. Individual compressor motor fusing or breakers
  - 5. Local manual "ON" / "OFF" compressor switch to allow service or repair to individual modules and compressors without interrupting service of the entire chiller.
- B. Single point power connection to entire chiller bank is not acceptable due to need for power redundancy. The use of buss bars to power chillers is unacceptable without individual module disconnects.

## 2.9 WATER ISOLATION VALVES

- A. Water Isolation Valves and Flush Ports - Factory installed to provide isolation to the module for maintenance and cleaning of evaporator and condenser heat exchangers. This is accomplished without increasing unit or bank dimensions while adjacent modules continue normal operation.

## 2.10 STRAINERS

- A. Strainers shall be installed on cooling and condenser loop inlets of the chiller bank. Strainers must be field installed external to chiller for ease of service. Strainers located inside of headers, requiring disassembly for cleaning are not recommended.

2.11 SOUND ATTENUATION PANELS

- A. The Chiller shall be equipped with 18-gauge galvanized steel sound attenuation panels with 1” fiberglass insulation and 3 mill powder-coat paint finish for front, bank and top.
- B. The chiller bank end panels with the same construction as above will be furnished for field installation.

2.12 WATER TESTING

- A. The Manufacturer shall provide water bottles and certified sample testing for cooling, heating and source loops prior to commencement of equipment warranty.
- B. All water loops that come into contact with the brazed plate heat exchangers shall adhere to the below water quality parameters:

<b>Property of Fluid</b>	<b>Recommended Level</b>
Ammonia	Less than 2.0 mg/l
CaCO <sub>3</sub> Alkalinity	30 – 500 mg/l
CaCO <sub>3</sub> Hardness	30 – 500 mg/l
Chlorides	Less than 200 mg/l
Dissolved Solids	Less than 1000 mg/l
Iron	Less than 5.0 mg/l
Manganese	Less than 0.4 mg/l
Nitrate	Less than 100 mg/l
pH	7.0 – 9.0
Sulphate	Less than 200 mg/l

2.13 SAFETIES, CONTROLS AND OPERATION

- A. Chiller safety controls system shall be provided with the unit (minimum) as follows:
  - 1. Low evaporator refrigerant pressure.

2. Loss of flow through the evaporator
  3. Loss of flow through the condenser.
  4. High condenser refrigerant pressure
  5. High compressor motor temperature-
  6. Low leaving evaporator water temperature
  7. Failure of chiller to start or chiller shutdown due to any of the above safety cutouts shall be enunciated by display of the appropriate diagnostic description at the unit control panel. This annunciation will be in plain English- Alphanumeric codes shall be unacceptable.
- B. The chiller system shall be furnished with a Master Controller shipped loose as described above
- C. Provide automatic chiller shutdown during periods when the load level decreases below the normal operating requirements of the chiller. Upon an increase in load, the chiller shall automatically restart.
- D. Provisions for connection to automatically enable the chiller from a remote energy management system.
- E. The control panel shall provide alphanumeric display showing all system parameters in the English language with numeric data in English units.
- F. Power Phase Monitor
1. Provide power phase monitor shipped loose to be installed on the incoming power supply to the chillers
  2. Power Phase Monitor shall provide protection against low voltage, phase rotation, loss of phase, and phase imbalance

## 2.14 WARRANTY

- A. "Parts-Only" Warranty shall be twelve (12) months from date of unit start-up or eighteen (18) months from date of shipment, whichever comes first. Provide 4-year extended parts-only warranty for compressors is provided. (5 years total)

## PART 3 EXECUTION

### 3.1 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Provide the services of the manufacturer's field representative to supervise rigging, hoisting, and installation, allowing for minimum of one eight hour day.
- C. Install chiller on structural concrete pads as instructed by manufacturer.
- D. Connect condenser water and chilled water piping with flanged connections to chiller. Pitch condenser water and chilled water supply to chiller and condenser water and chilled water return away from chiller.
- E. Pipe pressure relief, bleed, and drain, to floor drain.

### 3.2 FIELD QUALITY CONTROL

- A. See Section 014000 - Quality Requirements, for additional requirements.

- B. Provide the services of the manufacturer's field representative to inspect chiller after installation and submit report prior to start-up, verifying installation is in accordance with specifications and manufacturer's recommendations.
- C. Test for capacity under actual operating conditions in accordance with CTI ATC-105 and verify specified performance.

3.3 SYSTEM STARTUP

- A. Start-up chiller in presence of and instruct Owner 's operating personnel.

**END OF SECTION**

## **SECTION 236500 - COOLING TOWERS**

### **PART 1 GENERAL**

#### **1.1 SECTION INCLUDES**

- A. Closed-circuit, forced-draft, counter-flow cooling towers.

#### **1.2 RELATED REQUIREMENTS**

- A. Section 230548 - Vibration and Seismic Controls for HVAC.
- B. Section 230593 - Testing, Adjusting, and Balancing for HVAC.
- C. Section 232113 - Hydronic Piping.
- D. Section 232123 - Hydronic Pumps.
- E. Section 236433 - Modular Water Chillers.
- F. Section 260583 - Wiring Connections: Electrical characteristics and wiring connections.

#### **1.3 REFERENCE STANDARDS**

- A. ABMA std 9 - load ratings and fatigue life for ball bearings 2015.
- B. ABMA std 11 - load ratings and fatigue life for roller bearings 2014.
- C. ASME B31.5 - Refrigeration Piping and Heat Transfer Components 2016.
- D. ASME PTC 23 - Atmospheric Water Cooling Equipment 2003, Reaffirmed 2014.
- E. ASTM A123/A123M - Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products 2017.
- F. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process 2018.
- G. ASTM B117 - Standard Practice for Operating Salt Spray (Fog) Apparatus 2018.
- H. ASTM D2794 - Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact) 1993 (Reapproved 2010).
- I. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials 2018b.
- J. ASTM G21 - Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Fungi 2015.
- K. CTI ATC-105 - Acceptance Test Code 2000.
- L. CTI STD-201 OM - Operations Manual for Thermal Performance Certification of Evaporative Heat Rejection Equipment 2017.
- M. CTI STD-201 RS - Performance Rating of Evaporative Heat Rejection Equipment 2017.
- N. CTI STD-111 - Gear Speed Reducers for Application on Industrial Water Cooling Towers; 2009.
- O. ISO 9001 - Quality management systems -- Requirements 2015.
- P. NEMA MG 1 - Motors and Generators 2017.

#### 1.4 SUBMITTALS

- A. See section 013000 - administrative requirements, for submittal procedures.
- B. Product Data: Provide rated capacities, dimensions, weights and point loadings, accessories, required clearances, electrical requirements and wiring diagrams, and location and size of field connections. Submit schematic indicating capacity controls.
- C. Shop Drawings: Indicate suggested structural steel supports including dimensions, sizes, and locations for mounting bolt holes.
- D. Manufacturer's Certificate: Certify that cooling tower performance, based on ASME PTC 23 meets or exceeds specified requirements and submit performance curve plotting leaving water temperature against wet bulb temperature.
- E. Manufacturer's Instructions: Submit manufacturer's complete installation instructions.
- F. Operation and Maintenance Data: Include start-up instructions, maintenance data, parts lists, controls, and accessories.
- G. Warranty: Submit manufacturer's warranty and ensure forms have been filled out in Owner 's name and registered with manufacturer.
- H. Maintenance Materials: Furnish the following for Owner 's use in maintenance of project.
  - 1. See Section 016000 - Product Requirements, for additional provisions.
  - 2. Extra Fan Belts: One set, matched, for each unit.
  - 3. Extra Spray Nozzles: One nozzle kits for each cell.
  - 4. Extra Access Door Gaskets: One for each door.
  - 5. Extra Valve Seats: One for each make-up valve and control valve.

#### 1.5 QUALITY ASSURANCE

- A. Manufacturer qualifications: company specializing in manufacturing the type of products specified in this section, with minimum twenty years of documented experience and iso 9001 certification.
- B. Installer qualifications: company specializing in performing the type of work specified in this section with minimum 5 years of experience and approved by manufacturer.

#### 1.6 REGULATORY REQUIREMENTS

- A. Products requiring electrical connection: listed and classified by underwriters laboratories inc. as suitable for the purpose specified and indicated.

#### 1.7 DELIVERY, STORAGE, AND HANDLING

- A. Factory assemble entire unit. for shipping, disassemble into as large as practical sub-assemblies so that minimum amount of field work is required for re-assembly.
- B. Comply with manufacturer's installation instructions for rigging, unloading, and transporting units.

#### 1.8 WARRANTY

- A. See section 017800 - closeout submittals, for additional warranty requirements.
- B. Provide a one year warranty to include coverage for defects in material and workmanship labor only.

- C. Fans, fan shafts, bearings, sheaves, gearboxes, drive shafts, couplings, and mechanical equipment support must be warranted against defects in materials and workmanship for a period of five (5) years; or seven (7) if motor space heater is properly wired.

## **PART 2 PRODUCTS**

### **2.1 MANUFACTURERS**

- A. Basis OF DESIGN: BALTIMORE AIRCOIL COMPANY
- B. Closed-circuit, forced-draft, counter-flow cooling towers:
  - 1. Baltimore Aircoil Company; Series VFL: [www.baltimoreaircoil.com](http://www.baltimoreaircoil.com) or approved equal.

### **2.2 MANUFACTURED UNITS**

- A. Provide units for indoor or outdoor use, factory-assembled, sectional, vertical discharge, blow through design, with fan assemblies built into pan and casing.

### **2.3 COMPONENTS**

#### **A. Cold Water Basin:**

- 1. Sloped with depressed section with drain/clean-out connection. Type 304 bolted stainless steel panels and structural members. Basins constructed of 301 stainless steel are not acceptable.

#### **B. Casing Panels and Framework:**

- 1. Casing panels: Galvanized steel protected by a thermosetting hybrid polymer. The polymer to consist of G-235 (Z700 metric) hot-dip galvanized steel prepared in a four-step (clean, pre-treat, rinse, and dry) process with an electrostatically applied, thermosetting, hybrid polymer fuse-bonded to the substrate during a thermally activated curing stage and monitored by a 23-step quality assurance program. Other coatings must be submitted to the engineer for pre-approval. Approved equals must have undergone testing, resulting in the following results as a minimum:
  - a. When X-scribed to the steel substrate, unit to withstand 6000 hours of 5 percent salt spray per ASTM B117 without blistering, chipping, or loss of adhesion.
  - b. When X-scribed to the steel substrate, unit to withstand 6000 hours of exposure to acidic (pH=4.0) and alkaline (pH=11.0) water solutions at 95 degrees F (35 degrees C) without signs of chemical attack.
  - c. Unit to withstand impact of 160 in-lbs per ASTM D2794 without fracture or delamination of the polymer layer.
  - d. Unit to withstand 6000 hours of ultraviolet radiation equivalent to 120,000 hours of noontime sun exposure without loss of functional properties.
  - e. Unit to withstand 200 thermal shock cycles between minus 25 degrees F and 180 degrees F (minus 32 degrees C and 82 degrees C) without loss of adhesion or other deterioration.
  - f. Unit to withstand 6000 hours of exposure to 60 psi (42,184 kg/m<sup>2</sup>) water jet without signs of wear or erosion.
  - g. Type 304 stainless steel may be supplied as an equal to eliminate the need for passivation, minimize maintenance requirements, and prolong equipment life.

- C. Casing panels and framework will be constructed of G235 galvanized steel.
- D. Fans: Forward curved centrifugal type mounted on steel shaft, with belt drive, bearings with ABMA STD 9 or ABMA STD 11 L-10 life at 80,000 hours, with extended grease fittings.
- E. Motors and Drives:
  - 1. Single speed (1800 rpm) mounted on adjustable steel base. Refer to Section 23 0513.
  - 2. Fan Drive System:
    - a. Belt Drive: Designed for minimum 150 percent motor nameplate power.
- F. Fan Guard: Welded steel rod and wire guard, hot dipped galvanized after fabrication.
- G. Heat Transfer Coils:
  - 1. Wet Coil:
    - a. Galvanized Steel: The coil shall be constructed of continuous serpentine all prime surface steel, be pneumatically tested at 375 psig (2,685 kPa), and be hot-dip galvanized after fabrication. The coil shall be designed for free drainage of fluid and shall be ASME B31.5 compliant. Maximum allowable working pressure shall be 300 psig (280 psig for coils supplied with a CRN).
- H. Distribution Section: Polyvinyl chloride piping header and branches with ABS plastic spray nozzles.
- I. Drift Eliminators: Three pass PVC, drift loss limited to 0.005 percent of total water circulated.
- J. Electronic water level control with NEMA 4 enclosure, solid state controls, stainless steel water level sensing electrodes. Stainless steel mounting hardware.
- K. Hardware: Galvanized steel nuts, bolts, washers, and tappers; assembled with phenolic epoxy coated, corrosion resistant washer head fasteners.
- L. Galvanized Steel Sheet Components: Hot-dipped galvanized, ASTM A653/A653M, with G235/Z700 coating, and finished with zinc chromated aluminum paint.

#### 2.4 PERFORMANCE REQUIREMENTS

- A. This section is based on specific selections of equipment, and these selections relate to selection of related equipment, Section 232123 - Hydronic Pumps and Section 236433 - Modular Water Chillers. In substituting equipment, ensure that performance selection criteria matches that specified or that the selection of related equipment is acceptable or is revised to suit.

#### 2.5 ACCESSORIES

- A. Electric Immersion Heaters: In pan suitable to maintain temperature of water in pan at 40 degrees F (4.4 degrees C) when outside temperature is 0 degrees F (-17.7 degrees C) or -20 degrees F (-28.9 degrees C) and wind velocity is 15 mph (25 kph); immersion thermostat and float control operate heaters on low temperature when the pan is filled. Heaters will be constructed of copper.
- B. Basin Sweeper Piping: The cold water basin of the cooling tower shall be equipped with PVC sump sweeper piping with plastic eductor nozzles.
- C. Electric Temperature Controller: In pan; with sensor to cycle fans. Coordinate with other disciplines.

- D. Time Delay Relay: Limits fan motor starts to not more than six per hour. Coordinate with other disciplines.
- E. Vibration Switch: Provide an electronic remote reset vibration switch with contact for BAS monitoring. Wiring shall be by the installing contractor. The electronic vibration cutout switch shall be set to trip at a point so as not to cause damage to the cooling tower. To ensure this, the trip point will be set in a frequency range of 2 to 1000 Hertz and a trip point of 0.45 in/sec (0.0114 m/sec).
- F. Access Packages: See submittal documents for access package requirements. Platforms and ladders must ship assembled from cooling tower manufacturer.
  - 1. Exterior Ladder with Handrails: An aluminum ladder with galvanized steel safety cage and safety gate shall be provided for access to the top of the unit. 1-1/4 inch (32 mm) galvanized steel pipe handrail shall be provided around the perimeter of the cooling tower cells. The handrails shall be provided with knee and toe rails and shall conform to OSHA requirements applicable at the time of shipment. Galvanized steel drift eliminators will be supplied to provide dependable walking surface.
- G. Intake Sound Attenuation: The unit shall be equipped with intake sound attenuators consisting of fiberglass acoustical baffles encased in steel to further reduce sound levels.
- H. Discharge Options: The unit shall be equipped with a tapered hood lined with sound absorbing fiberglass acoustical baffles to reduce sound levels from the top of the unit.
  - 1. (Alternate without sound attenuation) The unit shall be equipped with a tapered hood to increase discharge velocity or to raise the discharge to the top of an enclosure.

## **PART 3 EXECUTION**

### **3.1 INSTALLATION**

- A. Install in accordance with manufacturer's instructions.
- B. Provide the services of the manufacturer's field representative to supervise rigging, hoisting, and installation, allowing for minimum of one eight hour day per tower.
- C. Install tower on structural steel beams as instructed by manufacturer.
- D. Install tower on vibration isolators. Refer to Section 230548.
- E. Connect condenser water piping with flanged connections to tower. Pitch condenser water supply to tower and condenser water suction away from tower. Refer to Section 232113.
- F. Connect make-up water piping with flanged or union connections to tower. Pitch to tower. Refer to Section 221005.
- G. Connect overflow, bleed, and drain, to floor drain.

### **3.2 FIELD QUALITY CONTROL**

- A. See Section 014000 - Quality Requirements, for additional requirements.
- B. Provide the services of the manufacturer's field representative to inspect tower after installation and submit report prior to start-up, verifying installation is in accordance with specifications and manufacturer's recommendations.
- C. Test for capacity under actual operating conditions in accordance with CTI ATC-105 and verify specified performance.

1. Refer to Section 230593.

### 3.3 SYSTEM STARTUP

- A. Start-up tower in presence of and instruct Owner 's operating personnel.

**END OF SECTION**

## **SECTION 238239 - UNIT HEATERS**

### **PART 1 - GENERAL**

#### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

#### 1.2 SUMMARY

- A. Section Includes:
  - 1. Cabinet unit heaters with centrifugal fans and hot-water coils.
  - 2. Propeller unit heaters with hot-water coils.
  - 3. Wall and ceiling heaters with propeller fans and electric-resistance heating coils.

#### 1.3 DEFINITIONS

- A. BAS: Building automation system.
- B. CWP: Cold working pressure.
- C. PTFE: Polytetrafluoroethylene plastic.
- D. TFE: Tetrafluoroethylene plastic.

#### 1.4 ACTION SUBMITTALS

- A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each product indicated.
- B. LEED Submittals:
  - 1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."

C. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required

clearances, method of field assembly, components, and location and size of each field connection.

1. Plans, elevations, sections, and details.
2. Location and size of each field connection.
3. Details of anchorages and attachments to structure and to supported equipment.
4. Equipment schedules to include rated capacities, operating characteristics, furnished specialties, and accessories.
5. Location and arrangement of piping valves and specialties.
6. Location and arrangement of integral controls.
7. Wiring Diagrams: Power, signal, and control wiring.

D. Samples for Initial Selection: Finish colors for units with factory-applied color finishes.

E. Samples for Verification: Finish colors for each type of cabinet unit heater and wall and ceiling heaters indicated with factory-applied color finishes.

### 1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans, reflected ceiling plans, and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

1. Suspended ceiling components.
2. Structural members to which unit heaters will be attached.
3. Method of attaching hangers to building structure.
4. Size and location of initial access modules for acoustical tile.
5. Items penetrating finished ceiling, including the following:
  - a. Lighting fixtures.
  - b. Air outlets and inlets.
  - c. Speakers.
  - d. Sprinklers.
  - e. Access panels.
6. Perimeter moldings for exposed or partially exposed cabinets.

- B. **Manufacturer Seismic Qualification Certification:** Submit certification that cabinet unit heaters, accessories, and components will withstand seismic forces defined in Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment." Include the following:
  - 1. **Basis for Certification:** Indicate whether withstand certification is based on actual test of assembled components or on calculation.
    - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
    - b. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
  - 2. **Dimensioned Outline Drawings of Equipment Unit:** Identify center of gravity and locate and describe mounting and anchorage provisions.
  - 3. **Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.**
- C. **Field quality-control test reports.**

#### 1.6 CLOSEOUT SUBMITTALS

- A. **Operation and Maintenance Data:** For cabinet unit heaters to include in emergency, operation, and maintenance manuals.

#### 1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. **Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.**
  - 1. **Cabinet Unit Heater Filters:** Furnish one spare filter(s) for each filter installed.

#### 1.8 QUALITY ASSURANCE

- A. **Electrical Components, Devices, and Accessories:** Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- B. **ASHRAE Compliance:** Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
- C. **ASHRAE/IESNA 90.1 Compliance:** Applicable requirements in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

## PART 2 - PRODUCTS

### 2.1 CABINET UNIT HEATERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Modine Viking.
  2. Trane.
- B. Description: A factory-assembled and -tested unit complying with ARI440.
1. Comply with UL2021.
- C. Cabinet: Steel with baked-enamel finish with manufacturer's standard paint, in color selected by Architect.
1. Vertical Unit, Exposed Front Panels: Minimum 0.0528-inch-thick, galvanized, sheet steel, removable panels with channel-formed edges secured with tamperproof cam fasteners.
  2. Recessing Flanges: Steel, finished to match cabinet.
  3. Control Access Door: Key operated.
  4. Base: Minimum 0.0528-inch-thick steel, finished to match cabinet, 6 inches (150 mm) high with leveling bolts.
  5. False Back: Minimum 0.0428-inch- (1.1-mm-) thick steel, finished to match cabinet.
- D. Filters: Minimum arrestance according to ASHRAE 52.1 and a minimum efficiency reporting value(MERV)according to ASHRAE52.  
pleated: 90 percent arrestance and 7 MERV.
- E. Hot-WaterCoil:Coppertube,withmechanicallybondedaluminumfinsspacednocloserthan 0.1 inch (2.5 mm) and rated for a minimum working pressure of 200 psig (1378 kPa) and a maximum entering-water temperature of 220 deg F (104 deg C). Include manual air vent and drain.

F. Fan and Motor Board: Removable.

1. Fan: Forward curved, double width, centrifugal; directly connected to motor.

Thermoplastic or painted-steel wheels, and aluminum, painted-steel, or galvanized-steel fan scrolls.

2. Motor: Permanently lubricated, multispeed; resiliently mounted on motor board. Comply with requirements in Section 230513 "Common Motor Requirements for HVAC equipment."
3. Wiring Terminations: Connect motor to chassis wiring with plug connection.
4. Wrought-Copper Unions: ASMEB16.22.

G. Control devices and operational sequences are specified in Section 230993 "Sequence of Operations for HVAC Controls."

H. DDC Terminal Controller:

1. Heating Coil Operations:

- a. Occupied Periods: Modulate control valve to provide heating if room temperature falls below thermostat set point.
- b. Unoccupied Periods: Start fan and modulate control valve if room temperature falls below setback temperature.

I. Electrical Connection: Factory wire motors and controls for a single field connection.

J. Capacities and Characteristics:

1. See schedule on drawings

2.2 PROPELLER UNIT HEATERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Modine Viking.
2. Trane.

B. Description: An assembly including casing, coil, fan, and motor in horizontal discharge configuration with adjustable discharge louvers.

C.

- D. Cabinet: Removable panels for maintenance access to controls.
- E. Cabinet Finish: Manufacturer's standard baked enamel applied to factory- assembled and - tested propeller unit heater before shipping.
- F. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE62.1.
- G. Discharge Louver: Adjustable fin diffuser for horizontal units and conical diffuser for vertical units.
- H. General Coil Requirements: Test and rate hot-water propeller unit heater coils according to ASHRAE33.
- I. Hot-Water Coil: Copper tube, minimum 0.025-inch (0.635-mm) wall thickness, with mechanically bonded aluminum fins spaced no closer than 0.1 inch (2.5 mm) and rated for a minimum working pressure of 200 psig (1380 kPa) and a maximum entering-water temperature of 325 deg F (163 deg C), with manual air vent. Test for leaks to 350 psig (2413 kPa) underwater.
- J. Fan: Propeller type with aluminum wheel directly mounted on motor shaft in the fanventuri.
- K. Fan Motors: Comply with below.
  - 1. Motor Type: Permanently lubricated
- L. Control Devices:
  - 1. Unit-mounted thermostat.
- M. Capacities and Characteristics
  - 1. See schedule on drawing.

### **PART 3 - EXECUTION**

#### **3.1 EXAMINATION**

- A. Examine areas to receive unit heaters for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine roughing-in for piping and electrical connections to verify actual locations before unit heater installation.

- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.2 INSTALLATION

- A. Install wall boxes in finished wall assembly; seal and weatherproof. Joint-sealant materials and applications are specified in Section 079200 "Joint Sealants."
- B. Install cabinet unit heaters to comply with NFPA 90A.
- C. Install propeller unit heaters level and plumb.
- D. Suspend cabinet unit heaters from structure with elastomeric hangers and seismic restraints. Vibration isolators and seismic restraints are specified in Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment."
- E. Suspend propeller unit heaters from structure with all-thread hanger rods and elastomeric hangers. Hanger rods and attachments to structure are specified in Section 230529 "Hangers and Supports for HVAC Piping and Equipment." Vibration hangers are specified in Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment."
- F. Install wall-mounting thermostats and switch controls in electrical outlet boxes at heights to match lighting controls. Verify location of thermostats and other exposed control sensors with Drawings and room details before installation.
- G. Install new filters in each fan-coil unit within two weeks of Substantial Completion.

### 3.3 CONNECTIONS

- A. Piping installation requirements are specified in Section 232113 "Hydronic Piping Steam and Condensate Heating Piping." Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to machine to allow service and maintenance.
- C. Connect piping to cabinet unit heater or unit heater.
- D. Comply with safety requirements in UL1995.
- E. Unless otherwise indicated, install union and gate or ball valve on supply-water connection and union and calibrated balancing valve on return-water connection of unit heater. Hydronic specialties are specified in Section 232113 "Hydronic Piping."
- F. Unless otherwise indicated, install union and gate or ball valve on steam-supply connection and union, strainer, steam trap, and gate or ball valve on condensate-return connection of unit heater.

- G. Connect control wiring according to Section 230923 "DDC control system."

### 3.4 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.
- B. Perform the following field tests and inspections and prepare test reports:
  - 1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
  - 2. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
- C. Remove and replace malfunctioning units and retest as specified above.

### 3.5 ADJUSTING

- A. Adjust initial temperature set points.
- B. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

### 3.6 DEMONSTRATION

- A. Engage a factory-authorized service representative to train maintenance personnel to adjust, operate, and maintain cabinet unit heaters.

**END OF SECTION 238239**

## **SECTION 260100 - BASIC ELECTRICAL REQUIREMENTS**

### **PART 1 - GENERAL**

#### 1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Owner's Agreement, including General Conditions and Division 1 Specification Sections, apply to this and other Sections of Division 16.

#### 1.02 SUMMARY

- A. The work under this Division shall consist of all labor, materials, equipment, and services necessary and required to complete all work as shown on the Drawings and in the Specifications (Contract Documents) and as inferable from the Drawings and Specifications.
- B. This Section includes general administrative and procedural requirements for electrical installations. The following administrative and procedural requirements are included in this Section to expand the requirements specified in Division 1:
  - 1. Submittals.
  - 2. Coordination drawings.
  - 3. Record Documents.
  - 4. Operation and Maintenance Manuals.
  - 5. Rough-ins.
  - 6. Electrical installations.
  - 7. Temporary light and power.
  - 8. Field testing.
  - 9. Quality control and acceptance testing.
  - 10. Selective demolition.
  - 11. Concrete equipment bases.
  - 12. Fire Stopping and Touchup painting.
  - 13. Lockout/tagout of overcurrent protective devices.
  - 15. Hazmat Disposal

- C. Related Sections: The following Sections contain requirements that relate to this Section and/or are governed by the requirements of this Section:

Raceways, Boxes and Cabinets

Wires and Cables

Wiring Devices

Electrical Identification

Grounding

Interior Lighting

Addressable Fire Alarm Systems

1.03 RELATED WORK NOT INCLUDED IN THIS DIVISION

- A. Raceways and conductors or connections to the Owner's equipment beyond the point indicated on the Electrical Drawings.
- B. Furnishing, setting, mounting or aligning of motors, motor driven equipment that is specified under other Divisions of these Specifications.
- C. Furnishing motor starters and control devices (except for those in the motor starter panel/Motor Control Centers, which are part of this division) or assembled and wired panels or cabinets containing these devices for heating, ventilating, air conditioning or other systems which are specified under other Sections, except as otherwise specified in this Section.
- D. Painting, except where specifically called for in other sections of this division (i.e.: identification) and except for factory applied prime or finish painting specified for equipment, fixtures, devices or materials furnished under this Section.

1.04 WORKMANSHIP

- A. All work performed shall be first class work in every respect. The work shall be performed by mechanics skilled in their respective trades, who shall at all times be under the supervision of competent persons.
- B. Work that is slipshod, poorly laid out, not perfectly aligned, or that is not consistent with the requirements generally accepted in the trade for "first class work" will not be acceptable.
- C. In addition to the materials specified elsewhere, furnish and install all other miscellaneous items necessary for the completion of the work to the extent that all systems be complete and operative.

- D. All work under this Section shall be performed in cooperation with the work performed under all other Sections of the Specifications on the Project in order to avoid interference's and to secure the proper installation of all work. Review the Drawings and Specifications covering the work to be performed under all Sections, so that the relation and extent of the work of this Section with respect to the work of all other Sections is understood.

#### 1.05 REGULATIONS AND CERTIFICATES

- A. All work under this Section shall comply with the applicable requirements of the National Electrical Code, other codes, laws, regulations and standards of all local and State authorities. Where references are made to laws, codes, regulations and standards, these documents, including the latest revisions and amendments thereto in effect as of the date of Bid Opening, shall form part of these Specifications.
- B. Upon completion of the work, furnish Certificates of Approval from the local authorities having jurisdiction for approving materials, equipment installation and procedures under this Section and such other certificates pertaining to the electrical work as may be required by the authorities for the issuance of a permanent Certificate of Occupancy. Pay all expenses arising from the procurement of these certificates and included in the lump sum Contract Price.

#### 1.06 BUILDING ACCESS

- A. The access into the building for Contractor's employees, equipment and materials furnished under this Contract shall be through openings and entrances designated by Owner. Refer to Division 1, Section 01500 - Temporary Facilities, for specific requirements relative to the use of building loading dock, staging areas and other existing facilities.

#### 1.07 EXPEDITING THE WORK

- A. Cooperate with all other subcontractors on the project. This Division shall be responsible for prompt delivery of all materials and equipment and for the installation of all work under this Division, at a time and in a manner that will ensure that there will be no delay in the construction schedule. Including but not limited to coordination with the utility company.
- B. Verify all conditions on the job which may affect the installation of the work, and become familiar with applicable local and State regulations. Any discrepancies or interferences shall be reported immediately to the Owner. Additions to the Contract Price will not be allowed when they are due to the failure to carefully inspect existing conditions.
- C. Method of Procedure (MOP) will be required as outlined in Division 1 of these Specifications and for all work that will involve disruption of service to the building. Submit Method of Procedure to the Owner and Architect for approval. The MOP shall state proposed starting dates of each item of work, transitions, shutdowns, etc. with the expected duration of each. Revise the MOP to address the concerns of the Owner or as specifically directed by the Owner.

- D. Upon award of contract, provide a graphic schedule detailing the entire electrical installation. The schedule shall be prepared using Microsoft Project. Cooperate with the General contractor and other trades to integrate the electrical schedule with the overall project schedule. The schedule shall include the following:
1. Indicate line items indicating each task including the work of all other trades.
  2. Identify all linked tasks.
  3. Indicate the critical path.
  4. Indicated percent complete, start, duration times and completion dates for each task.
  5. Group tasks into summary groups as applicable.
  6. Indicate milestones for completion dates and delivery dates.
  7. Indicate CINGULAR Wireless' established "quiet times" as non-working times.
- E. Update the project schedule for each project meeting or every two weeks which ever is more often.
- F. Provide updated "look ahead" schedules that indicate the work to be performed for the upcoming two-week period. This schedule will contain all the features of the basic project schedule but will be much more detailed than the basic project schedule.

#### 1.08 PROTECTION OF THE WORK

- A. All work, materials and equipment, whether incorporated into the building or not, shall be protected from damage due to moisture, dirt, plaster, concrete or from carelessness.
- B. All material and equipment which is damaged, including installed work, shall be repaired or replaced to the satisfaction of the Owner, at no additional cost to the owner.
- C. After work is completed, all work, equipment, shall be cleaned of all construction dirt. All waste and debris resulting from the electrical installation shall be removed from the site and disposed of in a legal manner.

#### 1.09 SUBMITTALS

- A. All shop drawings and manufacturer's literature shall conform to the requirements set forth in the General Conditions. The contractor shall verify the compliance of all shop drawings with the requirement of the contract documents. The contractor shall certify that the shop drawings comply with the requirements of the contract documents. Any deviation from the specified items shall be clearly marked and brought to the engineer's attention as deviations. Items that deviate from the specified that are not clearly highlighted (that manage pass through the approval) shall be changed after the installation when the deviation is discovered, at the cost of the contractor.
- B. Immediately after the Contract is awarded, submit, for approval, a complete list of materials, devices and equipment to be incorporated in the work. The list shall include manufacturers' names, catalog numbers, description of material, equipment, devices, etc. proposed to be utilized on this project only. The list shall clearly identify the proposed application of the materials and equipment. The list shall not preclude the necessity of submitting shop drawings for the items included herein.
- C. Shop drawings shall include descriptive data, manufacturer's ratings and application recommendations, cuts, diagrams, drawings, test reports, performance curves and such other information or samples as may be required by the Owner to judge compliance with the requirements of the Contract and suitability to the application. Items on the list shall be clearly identified as to proposed application. Approval of materials and equipment will be based on manufacturer's published ratings. Shop drawings shall clearly indicate the requirements for this specific project only.
- D. Each item shall be clearly identified as to proposed application. Where items of specified material and equipment are assembled to make up a larger apparatus, submit for approval the manufacturer's or fabricator's assembly shop drawings. Such drawings shall include dimensions and all essential details of arrangement, construction, assembly and connections. Wiring diagrams for special signal and control systems furnished under this Section shall also be submitted for approval. When directed by the Owner, submit in approved form for the record a Certificate of Compliance with a cited code or standard for the materials and equipment designated. Such certificates may be accepted in lieu of samples. Any materials, fixtures or equipment submitted for approval which are not in accordance with the Specifications requirements may be rejected. Any shop drawings marked "Revise and resubmit", "proceed with fabrication" or "Not Approved" shall be revised and resubmitted until accepted with "Approved".
- E. As part of the coordination work required, prepare installation drawings as necessary. It is intended that these drawings be used to coordinate the work of the various trades and to clarify details of proposed assembly, erection and installation.
- F. When indicated in these Specifications or on the Drawings, or when directed by the Owner, installation drawings shall be submitted for approval. Any installation drawing may be submitted to the Owner for comment and approval when an installation condition or problem arises which the Contractor wishes the Owner to review. All installation drawings submitted for review will be

considered and treated as shop drawings and the requirements pertaining to shop drawings shall govern.

- G. The following tabulation lists the major components for which shop drawings are required:
1. Conduit and fittings.
  2. Wire and cable.
  3. Equipment, panels, switchboards and circuit breakers.
  4. Splice and pull boxes.
  5. Cable Megger reports.
  6. Grounding system megger test reports.
  7. Written system description.
  8. Lighting Fixtures.
  9. Wiring Devices.
  10. Fire Alarm systems.
- H. Shop drawings for all devices shall be submitted within 30 calendar days from Award of Contract. If any equipment is not submitted within this time and/or in accordance with the requirements for shop drawings, and cannot be furnished in time to meet the construction schedule, provide temporary equipment that will perform the equivalent function, for the duration of the time until the specified equipment has arrived. Remove the temporary equipment and install the specified equipment at the Owner's convenience and at no additional cost to the Owner.
- I. Furnish to the Architect operating and maintenance instructions for each piece of equipment and each device. The instructions shall provide detailed description of the operation and maintenance of the equipment or device and shall include manufacturers' literature, detailed wiring diagrams, device internal wiring diagrams and descriptive literature. The instructions shall be furnished to the Architect 30 days prior to the completion of the building work. The instructions shall be submitted initially as a rough draft for approval. After the required corrections have been made, four sets in loose hardback covers shall be furnished to the Architect.
- J. Detail Drawings of fabrication and installation of supports and anchorage for electrical items.
- K. Coordination Drawings for electrical installation.

1. Prepare Coordination Drawings according to Division 1 Section 01300 - Submittals to a 1/4-inch-equals-1-foot scale or larger. Detail major elements, components, and systems of electrical equipment and materials in relation to each other and to other systems, installations, and building components. Indicate locations and space requirements for installation, access, and working clearance. Indicate where work requiring MOP approvals occur and show where sequence and coordination of installations are important to the efficient flow of the Work. Coordinate drawing preparation with effort specified in other Specification Sections. Include the following:
  - a. Provisions for scheduling, sequencing, moving and positioning large equipment in the building during construction.
  - b. Floor plans, elevations and details, including the following:
    - 1) Clearances to meet safety requirements and for servicing and maintaining equipment, including space for equipment disassembly required for periodic maintenance.
    - 2) Equipment support details.
    - 3) Exterior wall, roof and foundation penetrations of cable and raceway; and their relation to other penetrations and installations.
    - 4) Fire-rated interior wall and floor penetrations by electrical installations.
    - 5) Sizes and locations of required concrete pads and bases.
  - c. Reflected ceiling plans to coordinate and integrate installing air outlets and inlets, light fixtures, alarm and communication systems components, sprinklers and other ceiling-mounted items.
  - d. Methods of Procedures as specified in Division 1 - Methods of Procedure
- L. Samples of color, lettering style and other graphic representation required for each identification product for Project.

#### 1.10 RECORD DRAWINGS

- A. Maintain an accurate record of all work as actually installed. This record shall be kept current and shall be kept available at the site for inspection. Utilize the contract design drawings for marking up the work as installed. Upon completion of the work, and before final payment is authorized, AutoCAD<sup>®</sup> revision 14

drafted mylars of the as-built conditions with signed certification of accuracy shall be delivered to the Owner (this supersedes Supplementary and General Conditions). Provide the AutoCAD® “drawing” data files to the Owner.

1.11 GUARANTEE

- A. Guarantee all wiring free from unwanted grounds and short circuits.
- B. Guarantee all materials and workmanship free from defects for a period of one year starting from the date of acceptance by the Owner.
- C. Obtain from the various manufacturers or vendors standard guarantees or warranties for their particular equipment or components, and deliver them to the Owner.

1.12 FINAL INSPECTION

- A. Conduct a final inspection of all work installed under this Division of the Specification after the installation has been completed; the testing hereinafter specified has been performed; and test reports have been submitted to the Owner.
- B. During the conduct of the final inspection, have present a representative of the various manufacturers and a representatives of the manufacturers of other equipment as directed by the Owner.

1.13 TRAINING

- A. Provide a minimum of eight (4) hours training for the Owner’s on-site workforce for each type of equipment and/or system provided under this Division.
- B. The contractor shall provide two (2) VHS videotape copies of each training sessions to the Owner. Each session shall be provided on dedicated tapes. Tape labels shall be type written and dated.

1.14 QUALITY CONTROL AND ACCEPTANCE TESTING

- A. Provide Quality Control Performance Tests, and Acceptance Testing for all systems, devices and equipment installed or wired under this Division. Tests shall be performed to the satisfaction of the Owner and the Owner’s Representative.

1.15 SHUTDOWNS AND PREMIUM COSTS

- A. Should the contractor not be ready for the owner’s occupancy and shutdown and/or tie-ins be required when the owner’s equipment is on site the provisions of this paragraph will hold. Plan the installation of this work and connections to existing building systems and relocation of existing work to ensure minimum interference with building services.
- B. Submit for approval a schedule of necessary temporary shutdowns of the existing electrical services and shall secure such approval in writing before proceeding.

- C. All costs for performing specified overtime work and specified premium time work shall be at the contractor's expense.
- D. Electrical service, building services and systems shall not be interrupted during regular non-working hours. All work requiring the interruption of alarm systems or interruption or shutdown of electric power shall be performed during premium time. Provide temporary connections, if necessary, to maintain continuous electrical power for the operation of any area affected by the work of this Section.
- E. Once a system has been energized, any work requiring the interruption of alarm systems or interruption shutdown of an electrical panel shall be performed during premium time except as otherwise indicated. The installation of circuit breakers, connections to active circuit breakers and disconnecting from circuit breakers in active panelboards or switchboards shall be performed only during the shutdown of electric service to the panel.
- F. Any work under this Section which may cause interference with the Owner's operation shall be done in such a manner and at such time as is approved by the Owner and/or the Building Supervisor. Removal and alteration of electrical equipment, conduit and wiring and the installation of new work shall be performed with minimum interruption. Where the situation permits, make temporary connections as required to prevent electrical service interruptions.
- G. Approval for temporary shutdown of electrical services shall be secured from the Owner in writing a minimum of two weeks in advance. Provide temporary UPS systems for any critical load during shutdowns.
- H. Scheduled shutdowns shall be arranged to facilitate the phasing of the work. Complete as much preparatory work as can be done in advance of shutdown, so as to minimize the length of shutdowns. The shutdowns shall be arranged with the Owner.
- I. Provide sufficient personnel for all shutdowns to accomplish the required work within the time available.
- J. Should any work impair or limit the effectiveness of any existing system, provide adequate manpower to supervise any and all areas compromised by the work for the duration of the work. For example, if the work causes or requires the loss of fire alarm system coverage in part or full, provide certified dedicated fire warden personnel for each room and area lacking coverage, to detect and announce any potential fire or life safety hazard.

#### 1.16 DELIVERY, STORAGE AND HANDLING

- A. Deliver products to the project properly identified with names, model numbers, types, grades, compliance labels, and other information needed for identification.

- B. Storage: Materials stored at the project site which become soiled with construction dirt, concrete or earth work shall be removed from the site and replaced with new. Do not install soiled material.
- C. Cleaning: Clean wipe the interior of all conduit, pullboxes and panel board backboxes, soiled by masonry trades, before proceeding with wiring.
- D. Generally, do not install damaged, broken or marred material or products; replace with new. On long delivery items that are damaged in shipping or storage, field repair these items and temporarily install them in the interim until replacement items have arrived. Replace the damaged items when the replacement item has arrived.

#### 1.17 SEQUENCING AND SCHEDULING

- A. Coordinate installation with other building components and the work of other trades.
- B. Coordinate the installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.
- C. Sequence, coordinate and integrate installations of materials and equipment for efficient flow of the Work. Coordinate installation of large equipment requiring positioning or greater access prior to closing in the building.
- D. Coordinate connection of electrical services to equipment of other trades and Divisions.
- E. Coordinate installation of identifying devices after completing covering and painting where devices are applied to surfaces. Install identifying devices prior to installing acoustical ceilings and similar concealment.
- F. Coordinate delivery and setting of all equipment that require concrete pads, with Division 3.
- G. Prior to the commencement of the work of other Divisions, mark the area of all electrical distribution equipment and inform the other trades of required clearances. Designate the area equal to the footprint of the electrical equipment, from the top of the equipment to the structural ceiling above as dedicated electrical space. Inform all trades not to interlope this area. This applies to all distribution boards, switchgear, motor control centers (FBO) and panelboards.
- H. Arrange for chases, slots and openings in building structure during progress of construction to allow for electrical installations.
- I. Coordinate connecting electrical systems with exterior underground and overhead utilities and services. Comply with requirements of governing regulations, franchised service companies, and controlling agencies.

#### 1.18 DRAWINGS AND SPECIFICATIONS

- A. The Drawings are to be considered schematic only and do not necessarily show the exact location and details of the work to be installed. It shall be the responsibility of the Contractor to provide the work in conformity with the requirements of these Specifications, the applicable codes, regulations and standards, and the best trade practices meeting with the approval of the Owner. If any departures from the Drawings are deemed necessary, details of such departures and the reasons therefore shall be submitted immediately to the Owner for approval. If any conflicts or discrepancies are found to exist on the Drawings, in the Specifications or between the Drawings and the Specifications, assume the most expensive option and include such costs in the Bid. It shall be understood that the Owner reserves the right to change the location of equipment and apparatus to a reasonable extent as building conditions may dictate, without extra cost to the Owner.
- B. Locations of lighting fixtures, outlets, panels, devices and other equipment are approximately correct, but are subject to such revision as may be found necessary or desirable at the time work is installed in consequence of increase or reduction in the number of outlets, to meet field conditions, to coordinate with modular requirements of ceilings, to simplify work, or for other legitimate causes.
- C. Architect's Drawings of the building shall be examined to ascertain whether any changes have been made since Electrical Drawings were completed. Particular caution shall be exercised with reference to location of panels, outlets, switches, etc. and precise and definite locations shall be approved by the Owner before proceeding with installation. It shall be distinctly understood that the Drawings show only general run of conduit and approximate location of outlets.
- D. Any significant changes in location of outlets, cabinets, etc., found necessary in order to meet field conditions, shall be brought to the immediate attention of the Owner and written approval must be obtained before such alterations are made.
- E. Locations of outlets and equipment not definitely located on the Drawings shall be obtained from the Architect in the field.
- F. Electrical Drawings show general arrangement of conduit, equipment and appurtenances and shall be followed as closely as actual building construction and work of other trades will permit. Verify dimensions in field and measure off building construction for locations of equipment and devices. Electrical work shall conform to requirements shown on each trade's Drawings. Architectural layout on Construction Drawings shall take precedence over Architectural layout on Electrical Drawings. Because of the small scale of Electrical Drawings, it is not possible to indicate every offset, fitting and accessory which may be required. Investigate structural and finish conditions affecting work and arrange electrical work accordingly, providing all accessories required to meet such conditions.
- G. Circuit "tags" in the form of arrows are used to indicate home runs of conduit to electrical panels. These tags show quantity of circuits in each home run, number of each circuit and panel designation. Circuit numbers shown are for reference only to indicate devices on a common circuit, not necessarily the exact circuit position to be utilized. Show actual circuit numbers on the finished record drawings and on the panel directory card.

- H. The Drawings generally do not indicate the quantity of wires or conduit for branch circuit wiring nor the conduit size for feeders. Provide the correct wire size and quantity of wires installed in conduit of proper size as required by the indicated circuiting, control wire diagrams, if any, specified voltage drop or maximum distance limitations and applicable requirements of the National Electrical Code. Show branch circuit and feeder wiring and conduit runs on the record drawings.

1.19 WRITTEN SYSTEM DESCRIPTION

- A. Submit a complete written description of the electrical distribution system as finally installed. Description shall be written in simple English providing a general understanding of the operation of the AC power distribution system.
- B. Refer to as-built drawings and shop drawings as well as manufacturers descriptive data for detailed information.

1.20 TEMPORARY POWER

- A. Arrange, obtain and pay for temporary utility service to the site during construction. Provide temporary lighting and receptacles for the use of all contractors during construction. Maintain the existing electrical service to accommodate temporary power to the building while waiting for final power. Remove as directed.
- B. All temporary circuits shall be provided with GFI protection in accordance with OSHA standards.
- C. Remove all temporary distribution at the completion of the project or as directed by the owner.

**PART 2 - PRODUCTS**

2.01 EQUIPMENT

- A. General: All equipment shall be the capacity and types specified and as shown in the Contract Documents, and shall be the listed manufacturers and model numbers unless otherwise noted.
- B. All equipment, materials, devices and accessories shall be in full compliance with all State, city and local codes and laws and shall comply with the NFPA, ANSI, NEMA, and shall be UL listed and labeled for the application.

2.02 MATERIAL

- A. Provide all materials required for a complete and proper installation.
- B. In addition to the materials specified elsewhere, all other miscellaneous items necessary for the completion of the work shall be furnished and installed by the Contractor to the extent that all systems be complete and operative.

- C. All material and equipment furnished under this Division shall be new and listed and/or labeled by the Underwriters' Laboratories, Inc. for the application, unless otherwise specified herein. Materials, material sizes and methods of construction not specified shall be at least equal to or better than the standards listed by the Underwriters' Laboratories, Inc. and/or requirements of the laws, regulations and codes mentioned hereinafter.

## 2.03 SUPPORTING DEVICES

- A. Channel and angle support systems, hangers, anchors, sleeves, brackets, fabricated items and fasteners are designed to provide secure support from the building structure for electrical components.
  - 1. Material: Steel, except as otherwise indicated, protected from corrosion with zinc coating or with treatment of equivalent corrosion resistance using approved alternative finish or inherent material characteristics.
  - 2. Material: Nonconductive structurally rated fiberglass for equipment and materials connected to any isolated ground plane.
  - 3. Metal Items for Use Outdoors or in Damp Locations: Hot-dip galvanized steel, except as otherwise indicated.
- B. Steel channel supports have 9/16-inch diameter holes at a maximum of 8 inches O.C., in at least 1 surface.
  - 1. Fittings and accessories mate and match with channels and are from the same manufacturer.
- C. Nonmetallic Channel and Angle Systems: Structural-grade, factory formed, fiber glass-resin channels and angles with 9/16-inch diameter holes at a maximum of 8 inches O.C., in at least 1 surface.
  - 1. Fittings and accessories mate and match with channels or angles and are from the same manufacturer.
  - 2. Fitting and Accessory Material: Same as channels and angles, except metal items may be stainless steel.
- D. Raceway and Cable Supports: Manufactured clevis hangers, riser clamps, straps, threaded C-clamps with retainers, ceiling trapeze hangers, wall brackets and spring steel clamps or "click"- type hangers.
- E. Sheet-Metal Sleeves: 0.0276-inch or heavier galvanized sheet steel, round tube, closed with welded longitudinal joint.
- F. Pipe Sleeves: ASTM A 53, Type E, Grade A, Schedule 40, galvanized steel, plain ends.

- G. Cable Supports for Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug for non-armored electrical cables in riser conduits. Plugs have number and size of conductor gripping holes as required to suit individual risers. Body constructed of malleable iron casting with hot-dip galvanized finish.
- H. Expansion Anchors: Carbon-steel wedge or sleeve type.
- I. Toggle Bolts: All-steel springhead type.
- J. Powder-Driven Anchors are not allowed.

## 2.04

### ELECTRICAL IDENTIFICATION

- A. Manufacturer's Standard Products: Where more than one type is listed for a specified application, selection is Installer's option, but provide single type for each application category. Use colors prescribed by ANSI A13.1, NFPA 70, and these Specifications.
- B. Raceway and Cable Labels: Conform to ANSI A13.1, Table 3, for minimum size of letters for legend and minimum length of color field for each raceway or cable size.
  - 1. Type: Preprinted, flexible, self-adhesive, vinyl. Legend is overlaminated with a clear, weather- and chemical-resistant coating.
  - 2. Color: Black legend on orange field.
  - 3. Legend: Indicates voltage.
- C. Colored Adhesive Marking Tape for Raceways, Wires, and Cables: Self-adhesive vinyl tape not less than 3 mils thick by 1 inch wide.
- D. Underground Line Warning Tape: Permanent, bright-colored, continuous-printed, vinyl tape with the following features:
  - 1. Size: Not less than 4 mils thick by 6 inches wide.
    - a. Compounded for permanent direct-burial service.
  - 2. Embedded continuous metallic strip or core.
    - a. Printed Legend: Indicates type of underground line.
- E. Tape Markers: Vinyl or vinyl-cloth, self-adhesive, wraparound type with preprinted numbers and letters.
- F. Color-Coding Cable Ties: Type 6/6 nylon, self-locking type. Colors to suit coding scheme.

- G. Engraved, Plastic-Laminated Labels, Signs, and Instruction Plates: Engraving stock, melamine plastic laminate punched for mechanical fasteners 1/16-inch minimum thick for signs up to 20 sq. in., 1/8 inch thick for larger sizes. Engraved legend in black letters on white face.
- H. Interior Warning and Caution Signs: Preprinted, aluminum, baked enamel finish signs, punched for fasteners, with colors, legend and size appropriate to the application.
- I. Exterior Warning and Caution Signs: Weather-resistant, non-fading, preprinted, cellulose acetate butyrate signs with 0.0396-inch, galvanized steel backing, with colors, legend and size appropriate to the application. 1/4-inch grommets in corners for mounting.
- J. Fasteners for Plastic-Laminated and Metal Signs: Self-tapping stainless-steel screws or No. 10/32 stainless-steel machine screws with nuts and flat and lock washers.

2.05 TOUCHUP PAINT

- A. For Equipment: Provided by equipment manufacturer and selected to match equipment finish.
- B. For Non-Equipment Surfaces: Matching type and color of undamaged, existing adjacent finish.
- C. For Galvanized Surfaces: Zinc-rich paint recommended by item manufacturer.

2.06 LOCKOUT/TAGOUT OF BRANCH-CIRCUIT DEVICES

- A. Each overcurrent protective device, switch and/or means of disconnect shall be provided with the capability of being locked out in compliance with OSHA Standard 1910.147.
- B. Where factory furnished permanent lockout features are not available, each overcurrent protective device enclosure shall be provided with Stranco, Inc. Circuit Safe™ lockout system. Provide circuit safe unit with length to match the total length of the overcurrent protective devices, including the future devices. Coordinate the centerline separation of breakers and the distances from the enclosure center. Provide one pin holder and two of each type lockout pins for each enclosure. Provide mounting shims and offset brackets as required.

### **PART 3 - EXECUTION**

#### **3.01 GENERAL**

- A. Inspection: Prior to all work of this Section, carefully inspect the installed work of all other trades and verify that all such work is complete to the point where this installation may properly commence. Verify that the work of this Division may be completed in strict accordance with all pertinent codes and regulations, the approved shop drawings and the manufacturer's recommendations.
- B. Discrepancies: In the event of discrepancy, immediately notify the Owner. Do not proceed in areas of discrepancy until all such discrepancies have been fully resolved.
- C. Do not install work without approved shop drawings.
- D. Should the Contractor proceed without submittals and approvals of submittals, any costs incurred to correct problems that could have been corrected in the shop drawing or coordination drawings shall be the responsibility of the Contractor.
- E. All work performed shall be first class work in every respect. The work shall be performed by mechanics skilled in their respective trades, who shall at all times be under the supervision of competent persons.
- F. Work that is slipshod, poorly laid out, not perfectly aligned, or that is not consistent with the requirements generally accepted in the trade for "first class work" will not be acceptable.
- G. All work under this Section shall be performed in cooperation with the work performed under all other Sections of the Specifications on the Project in order to avoid interferences and to secure the proper installation of all work. Review the Drawings and Specifications covering the work to be performed under all Sections, so that the relation and extent of the work of this Section with respect to the work of all other Sections is understood.

### 3.02 INSTALLATION OF EQUIPMENT

- A. Locations: Install all equipment in the locations shown on the approved shop drawings, except where specifically otherwise approved on the job by the Owner. Do not install motor control centers and electrical equipment directly under the work of other trades (including new and existing work) even if such work is in the locations indicated on the contract documents or approved submittals. If such a condition occurs contact the Owner's representative for specific direction regarding the exact location of such equipment.
- B. Interferences: Avoid interference with structure, and with the work of other trades, preserving adequate headroom and clearing all doors and passageways to the approval of the Owner.
- C. Inspection: Check each piece of equipment in the system for defects, verifying that all parts are properly furnished and installed, that all items function properly, and that all adjustments have been made.
- D. Fabricate, test, assemble and install all material, equipment and systems in accordance with the requirements of the following:
  - 1. National Fire Protection Code – NFPA
  - 2. Occupational Safety and Health Administration (OSHA)
  - 3. American National Standards Institute (ANSI)
  - 4. Underwriters' Laboratories, Inc. (UL)
- E. Install components and equipment to provide the maximum possible headroom where mounting heights or other location criteria are not indicated.
- F. Install items level, plumb, and parallel and perpendicular to other building systems and components, except where otherwise indicated.
- G. Install equipment to facilitate service, maintenance, and repair or replacement of components. Connect for ease of disconnecting, with minimum interference with other installations.
- H. Give right of way to raceways and piping systems installed at a required slope.
- I. Install motor control equipment, motor control centers and other equipment furnished under other Divisions for mounting and wiring by this Division in accordance with the Specification Sections of the Division that is furnishing the equipment.
- J. Anchor all floor mounted electrical equipment to the floor or equipment pad at each corner of each section of the equipment. Provide seismic bracing as specified elsewhere.

### 3.03 CLOSING-IN OF UNINSPECTED WORK

- A. General: Do not allow or cause any of the work of this Division to be covered up or enclosed until it has been inspected, tested and approved by the Owner's representative and by all other authorities having jurisdiction.
- B. Uncovering: Should any of the work of this Division be covered up or enclosed before it has been completely inspected, tested and approved, do all things necessary to uncover all such work. After the work has been completely inspected, tested and approved, provide all materials and labor necessary and make all repairs necessary to restore the work to its original and proper condition at no additional cost to the Owner.

3.04 COOPERATION WITH OTHER TRADES

- A. Do all things necessary to cooperate with other trades in order that all systems in the work may be installed in the best arrangements.
- B. Coordinate as required with all other trades to share space in common areas and to provide the maximum of access to each system.
- C. Accept delivery, set, mount and wire all motor control centers, starters, adjustable frequency drives and other HVAC control equipment specified and provided under Division 15.

3.05 CLEANING

- A. It is the intent of these Specifications that all work, including the inside of equipment, be left in a clean condition. All construction dirt shall be removed from material and equipment.

3.06 COMPLETENESS

- A. It is the intent of these Specifications to provide a complete system. All material and equipment shall be installed properly. All material and equipment shall be adjusted so that it is operating as designed, to the satisfaction of the Owner.

3.07 ELECTRICAL SUPPORTING METHODS

- A. Damp Locations and Outdoors: Hot-dip galvanized materials or nonmetallic, U-channel system components.
- B. Dry Locations: Steel materials.
- C. Support Clamps for PVC Raceways: Click-type clamp system.
- D. Conform to manufacturer's recommendations for selecting supports.
- E. Strength of Supports: Adequate to carry all present and future loads, times a safety factor of at least 4; 200 lb. minimum design load.

3.08 CUTTING AND PATCHING

- A. Cut, channel, chase and drill floors, walls, partitions, ceilings and other surfaces necessary for electrical installations. Perform cutting by skilled mechanics of the trades involved.
- B. Repair disturbed surfaces to match adjacent undisturbed surfaces.

3.09 TOUCHUP PAINTING

- A. Thoroughly clean damaged areas and provide primer, intermediate and finish coats to suit the degree of damage at each location.
- B. Follow paint manufacturer's written instructions for surface preparation and for timing and application of successive coats.

3.10 TEMPORARY POWER FOR TOOLS AND EQUIPMENT

- A. The contractor shall provide ground fault circuit interrupters on each temporary power feed, including all extension cords.

3.11 DISPOSAL

- A. All materials removed under this contract shall be disposed of in a legal and approved manor. Items considered hazardous or that require manifested disposal shall be removed from equipment and/or devices separately contained and disposed of in such manor. Such items include but are not limited to ballasts (PCB or Not), fluorescent tubes (lamps), Mercury lamps and switches.

END OF SECTION 260100

## **SECTION 260519 - WIRES AND CABLES**

### **PART 1 - GENERAL**

#### 1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Owner's Agreement, including General Conditions and Division 1 Specification Sections, apply to this and other Sections of Division 16.

#### 1.02 SUMMARY

- A. This Section includes building wires and cables and associated splices, connectors, and terminations for wiring systems rated 600 volts and less.
- B. Related Sections: The following Sections contain requirements that relate to this Section:
  - 1. Section - Firestopping.
  - 2. Section - Basic Electrical Requirements for supporting devices for supports and anchors for fastening cable directly to building finishes.
  - 3. Section - Basic Electrical Requirements for insulation color-coding and wire and cable markers.

#### 1.03 SUBMITTALS

- A. General: Submit the following according to the Conditions of the Contract and Division 1 Specification Sections.
- B. Field test reports indicating and interpreting test results relative to compliance with performance requirements of testing standard.

#### 1.04 QUALITY ASSURANCE

- A. Testing Firm Qualifications: In addition to the requirements specified in Division 1 Section 01400 - Quality Control, an independent testing firm shall meet OSHA criteria for accreditation of testing laboratories, Title 29, Part 1907, or shall be a full member company of the International Electrical Testing Association (NETA) and shall be an approved testing agency.
  - 1. Testing Firm's Field Supervisor Qualifications: A person currently certified by the NETA National Institute for Certification in Engineering Technologies to supervise on-site testing specified in Part 3.
- B. Comply with NFPA 70 "National Electrical Code" for components and installation.
- C. Listing and Labeling: Provide products specified in this Section that are listed and labeled.

1. The Terms "Listed and Labeled": As defined in the "National Electrical Code," Article 100.

1.05 SEQUENCING AND SCHEDULING

- A. Coordination: Coordinate layout and installation of cable with other installations.
  1. Revise locations and elevations from those indicated as required to suit field conditions and as approved by the Owner's representative.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver wire and cable according to NEMA WC-26.

**PART 2 - PRODUCTS**

2.01 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  1. Wires and Cables
    - a. American Insulated Wire Corporation, Leviton Manufacturing Company
    - b. Brand-Rex Cable Systems, Brintec Corporation
    - c. Carol Cable Company, Inc.
    - d. Senator Wire & Cable Company
    - e. Southwire Company
  2. Connectors for Wires and Cables
    - a. Burndy
    - b. Electrical Products Division, 3M Company
    - c. O-Z/Gedney Unit, General Signal

2.02 BUILDING WIRES AND CABLES

- A. UL-listed Class B concentric round copper building wires and cables with conductor material, insulation type, cable construction, and rating as specified in Part 3 "Applications" Article.
- B. Rubber Insulation: Conform to NEMA WC 3.
- C. Thermoplastic Insulation: Conform to NEMA WC 5.
- D. Cross-Linked Polyethylene Insulation: Conform to NEMA WC 7.
- E. Ethylene Propylene Rubber Insulation (EPR): Conform to NEMA WC 8.

- F. Solid conductor for lighting and receptacle circuit conductors and all conductors 10 AWG and smaller; stranded conductor for larger than 10 AWG.

### 2.03 CONNECTORS AND SPLICES

- A. Provide UL-listed factory-fabricated compression style wiring connectors of size, ampacity rating, material, and type and class for application and for service indicated. Select to comply with Project's installation requirements and as specified in Part 3 "Applications" Article.
- B. For conductors #10 AWG and smaller: Wire and cable connectors shall be solderless, mechanical, solid copper or copper alloy types. Connectors shall be Buchanan Electrical Products copper squeeze-on type with molded rubber or vinyl cap, Minnesota Mining and Manufacturing Company "Scotchlock" or Ideal Industries "Super-Nut" spring connectors with molded vinyl cap or as approved.
- C. Connectors and/or terminations for conductors #8 AWG and larger: UL Standard 486A Dual crimp long barrel compression lugs with two bolt holes, Suitable for 90°C, insulated with clear heat shrink molded covers over the entire barrel portion of the lug. Similar to "Hylugs" manufactured by Burndy to accommodate 1/2" bolts. Compression crimp shall be performed utilizing dies that impress a mark indicating the die used to crimp the connection. Die mark shall be visible through the clear heat shrink cover.

## PART 3 - EXECUTION

### 3.01 EXAMINATION

- A. Examine raceways and building finishes to receive wires and cables for compliance with installation tolerances and other conditions. Do not proceed with installation until unsatisfactory conditions have been corrected.

### 3.02 APPLICATIONS

- A. Service Entrance: Type USE rated RHW-2, copper conductor rated 90°C insulation, in raceway.
- B. Feeders
  - 1. Cables 500MCM and smaller: Type THHN/THWN-2/XHHW-2/RHW-2, copper conductor, in raceway.
  - 2. Cables over 500MCM: Type THW, RHW, copper conductor, in raceway.
- C. Branch Circuits: Type THHN/THWN, copper conductor, in raceway.
- D. Lighting circuit drops to fixtures (limited to runs of no more than 5 feet where concealed): Type MC cable, copper conductor, 90°C insulation.

- E. Instrument cabling: Twisted shielded pair or triads with aluminum mylar shield and copper drain wire, Type XHHW or THHN insulation.
- F. Class 1 Control Circuits: Type THHN/THWN, copper conductor, in raceway.
- G. Class 2 Control Circuits: Type THHN/THWN, copper conductor, in raceway.
- H. Direct Current Circuits: Type EPR, copper conductor, in raceway.

### 3.03

#### INSTALLATION

- A. Install wires and cables as indicated, according to manufacturer's written instructions and the NECA "Standard of Installation." Install all wires and cabling concealed.
- B. Remove existing wire from raceway before pulling in new wire and cable.
- C. Pull conductors into raceway simultaneously where more than one is being installed in same raceway.
  - 1. Use pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation.
  - 2. Use pulling means, including fish tape, cable, rope, and basketweave wire/cable grips that will not damage cables or raceway.
- D. Where specifically allowed by the architect, Install exposed cable. Install parallel and perpendicular to surfaces or exposed structural members, and follow surface contours where possible.
- E. Conductor Splices: Keep to minimum.
  - 1. Splices are not permitted in feeders.
  - 2. Splices are permitted only where required to circuit specific devices on shared circuits.
  - 3. Install splices and tapes that possess equivalent or better mechanical strength and insulation ratings than conductors being spliced.
  - 4. Use only compression type splice and tap connectors that are compatible with conductor material.
- F. Wiring at Outlets: Install with at least 12 inches of slack conductor at each outlet.
- G. Connect outlets and components to wiring and to ground as indicated and instructed by manufacturer. Tighten connectors and terminals, including screws and bolts, according to equipment manufacturer's published torque-tightening values for equipment connectors. Where manufacturer's torquing requirements

are not indicated, tighten connectors and terminals according to tightening torques specified in UL Standard 486A.

- H. Provide each branch circuit with a dedicated ground conductor. Do not use multiconductor branch circuits, provide dedicated neutral conductors for each circuit requiring a neutral conductor.
- I. Connect each ground conductor to grounding bushings as it enters and/or exits boxes and enclosures.
- H. The drawings generally do not indicate the quantity of wires or conduit for branch circuit wiring nor the conduit size. Provide the correct wire size and quantity of wires installed in conduit of proper size as required by the indicated circuiting, control wire diagrams, if any, specified voltage drop or maximum distance limitations and applicable requirements of the national electrical code. Show branch circuit and feeder wiring and conduit runs on the record drawing.

### 3.04 FIELD QUALITY CONTROL

- A. Testing Firm: Provide the services of a qualified independent testing firm to perform specified field quality-control testing.
- B. Testing: Upon installation of wires and cables and before electrical circuitry has been energized, demonstrate product capability and compliance with requirements.
  - 1. Procedures: Perform each visual and mechanical inspection and electrical test stated in NETA Standard ATS, Section 7.3.1. Certify compliance with test parameters.
  - 2. Test all cables with 1000VDC megger test. Test branch circuit wiring for one minute. Test feeder wiring for 15 minutes with readings at one-minute intervals.
  - 3. Parallel feeders: Provide full load current tests for all parallel feeder conductors. Verify that current division between the parallel conductors does not vary more than 5%.
  - 4. Terminations: Provide infrared thermoscans of all terminations of conductors #8AWG and larger. Perform scans with conductors carrying the designed load.
- C. Correct malfunctioning products at site, where possible, and retest to demonstrate compliance; otherwise, remove and replace with new units, and retest.

END OF SECTION

## **SECTION 260526 - GROUNDING**

### **PART 1 - GENERAL**

#### 1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Owner's Agreement, including General Conditions and Division 1 Specification Sections, apply to this and other Sections of Division 26.

#### 1.02 SUMMARY

- A. This Section includes grounding of electrical systems and equipment and basic requirements for grounding for protection of life, equipment, circuits, and systems. Grounding requirements specified in this Section may be supplemented in other Sections of these Specifications.
- B. Related Sections: The following Sections contain requirements that relate to this Section:
  - 1. Division 26 Section 26 0519 - Wires and Cables for requirements for grounding conductors.

#### 1.03 SUBMITTALS

- A. General: Submit each item in this Article according to the Conditions of the Contract and Division 1 Specification Sections.
- B. Product Data for grounding rods, connectors and connection materials, and grounding fittings.
- C. Qualification data for firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
- D. Field tests and observation reports certified by the testing organization and indicating and interpreting the test reports for compliance with performance requirements.

#### 1.04 QUALITY ASSURANCE

- A. Testing Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7, or a full member company of the International Electrical Testing Association (NETA).
  - 1. Testing Agency Field Supervision: Use persons currently certified by NETA or the National Institute for Certification in Engineering Technologies to supervise on-site testing specified in Part 3.
- B. Comply with NFPA 70.

- C. Comply with UL 467.
- D. Listing and Labeling: Provide products specified in this Section that are listed and labeled.
  - 1. The Terms "Listed" and "Labeled": As defined in the National Electrical Code, Article 100.

## **PART 2 - PRODUCTS**

### 2.01 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Burndy
  - 2. O-Z/Gedney Company
  - 3. Thomas & Betts, Electrical

### 2.02 GROUNDING AND BONDING PRODUCTS

- A. Governing Requirements: Where types, sizes, ratings, and quantities indicated are in excess of National Electrical Code (NEC) requirements, the more stringent requirements and the greater size, rating, and quantity indications govern.

### 2.03 WIRE AND CABLE GROUNDING CONDUCTORS

- A. Comply with Division 26 Section 26 0519 - Wires and Cables. Conform to NEC Table 8, except as otherwise indicated, for conductor properties, including stranding.
  - 1. Material: Copper. Use only copper wire for both insulated and bare grounding conductors in direct contact with earth, concrete, masonry, crushed stone, and similar materials.
- B. Equipment Grounding Conductors: Insulated with green color insulation.
- C. Bare Copper Conductors: Conform to the following:
  - 1. Solid Conductors: ASTM B 3.
  - 2. Assembly of Stranded Conductors: ASTM B 8.
  - 3. Tinned Conductors: ASTM B 33.

### 2.04 MISCELLANEOUS CONDUCTORS

- A. Grounding Bus: Bare, annealed-copper bars of rectangular cross section.
- B. Braided Bonding Jumpers: Copper tape, braided No. 30 AWG bare copper wire, terminated with copper ferrules.

- C. Bonding Straps: Soft copper, 0.05 inch thick and 2 inches wide, except as indicated.

2.05 CONNECTOR PRODUCTS

- A. Pressure Connectors: High-conductivity-plated units.
- B. Bolted Clamps: Heavy-duty type.
- C. Exothermic-Welded Connections: Provided in kit form and selected per manufacturer's written instructions for specific types, sizes, and combinations of conductors and connected items.

**PART 3 - EXECUTION**

3.01 APPLICATION

- A. Equipment Grounding Conductors: Provide all branch circuits and feeders with ground conductors. Comply with NEC Article 250 for types, sizes, and quantities of equipment grounding conductors, except where specific types, larger sizes, or more conductors than required by NEC are indicated.
  - 1. Install equipment-grounding conductor with all circuit conductors.
  - 2. Busway Supply Circuits: Install separate equipment grounding conductor from the grounding bus in the switchgear to equipment grounding-bar terminal on busway.
  - 3. Non-metallic Raceways: Install Central office equipment grounding conductors in non-metallic raceways.
- B. Separately Derived Systems: Where NEC requires grounding, ground according to NEC Paragraph 250-26.
- C. Metal Poles Supporting Outdoor Lighting Fixtures: Ground pole to a grounding electrode in addition to separate equipment grounding conductor run with supply branch circuit.

3.02 INSTALLATION

- A. General: Ground electrical systems and equipment according to NEC requirements, except where Drawings or Specifications exceed NEC requirements.
- B. Grounding Rods
  - 1. Drive until tops are 2 inches below finished floor or final grade, except as otherwise indicated.

2. Interconnect with grounding-electrode conductors. Use exothermic welds, except at test wells and as otherwise indicated. Make these connections without damaging copper coating or exposing steel.
- D. Grounding Conductors: Route along the shortest and straightest paths possible, except as otherwise indicated. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage. Route and support so that conductors are not encircled by magnetic or conductive materials.
- E. Underground Grounding Conductors: Use bare copper wire. Bury at least 24 inches below grade.

### 3.03 CONNECTIONS

- A. General: Make connections so possibility of galvanic action or electrolysis is minimized. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact will be galvanically compatible.
  1. Use silver-plated materials to assure high conductivity and to make contact points closer in order of galvanic series.
  2. Make connections with clean, bare metal at points of contact.
  3. Provide antiox compounds at all bolted and compression connections.
  4. Coat and seal connections having dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.
  5. Cover crimp connections and barrels with clean heat shrink insulation.
- B. Exothermic-Welded Connections: Use for connections to structural steel and for underground connections, including those at test wells. Comply with manufacturer's written instructions. Welds that are puffed up or that show convex surfaces indicating improper cleaning are not acceptable.
- C. Equipment Grounding-Wire Terminations: For No. 8 AWG and larger, use two hole long barrel dual crimp tongue lugs. Apply antiox compound and clear heatshrink cover over all visible copper areas. No. 10 AWG and smaller grounding conductors may be tapped with "C" or "H" style compression connectors.
- D. Metal Raceway Terminations: Where metallic raceways terminate Provide each conduit with a grounding bushing. Connect grounding bushings with grounding conductor. Bond conduits at both entrances and exits with grounding bushings and continuous grounding conductors, except as otherwise indicated.
- E. Metal Box Terminations: Provide bonding conductors from grounding bushings to ground bars and to back boxes. Provide brazed or welded posts in each back box to accommodate the lugs specified.. Bond electrically non-continuous conduits at both entrances and exits with grounding bushings and bare grounding conductors, except as otherwise indicated.

- F. Tighten screws and bolts for grounding and bonding connectors and terminals according to manufacturer's published torque-tightening values. Where these requirements are not available, use those specified in UL 486A and UL 486B.
- G. Compression-Type Connections: Use hydraulic compression tools to provide correct circumferential pressure for compression connectors. Use tools and dies recommended by manufacturer of connectors. Provide embossing die code to make a visible indication that a connector has been adequately compressed on grounding conductor. Provide clear heat shrink insulating cover over the barrel section of the lug.
- H. Moisture Protection: Where insulated grounding conductors are connected to grounding rods or grounding buses, insulate entire area of connection and seal against moisture penetration of insulation and cable.

### 3.04 FIELD QUALITY CONTROL

- A. Perform tests described below.
- B. Tests: Subject the completed grounding system to a megger test at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal, and at ground test wells. Measure ground resistance not less than 2 full days after the last trace of precipitation, and without the soil being moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance. Perform tests by the 2-point method according to IEEE 81.
- C. Maximum grounding-to-resistance values are as follows:
  - 1. Equipment Rated 500 kVA and Less: 10 ohms.
  - 2. Equipment Rated 500 to 1000 kVA: 5 ohms.
  - 3. Equipment Rated More than 1000 kVA: 3 ohms.
- D. Excessive Ground Resistance: Where resistance to ground exceeds specified values, notify Owner promptly and include recommendations to reduce ground resistance and to accomplish recommended work.
- E. Report: Prepare test reports, certified by the testing organization, of ground resistance at each test location. Include observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results.

### 3.05 ADJUSTING AND CLEANING

- A. Restore surface features, at areas disturbed by work of this Section.

END OF SECTION

## **SECTION 260533 - RACEWAYS, BOXES AND CABINETS**

### **PART 1 - GENERAL**

#### 1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Owner's Agreement, including General Conditions and Division 1 Specification Sections, apply to this and other Sections of Division 26.

#### 1.02 SUMMARY

- A. Section includes raceways, fittings, boxes, enclosures and cabinets for electrical wiring. All raceways are to be installed concealed.
- B. Raceways include the following:
  - 1. Rigid metal conduit.
  - 2. Intermediate metal conduit.
  - 3. Electrical metallic tubing (EMT).
  - 4. PVC Conduit.
- C. Boxes, enclosures and cabinets include the following:
  - 1. Pull and junction boxes.
  - 2. Cabinets and hinged cover enclosures.
- D. Related Sections: The following Sections contain requirements that relate to this Section:
  - 1. Division 26 Section 26 0500 - Basic Electrical Requirements for supporting devices and anchors for raceway and box supports.

#### 1.03 SUBMITTALS

- A. General: Submit the following according to the Conditions of the Contract and Division 1 Specification Sections.
- B. Product data for surface raceway, wireway and fittings, floor boxes, hinged cover enclosures and cabinets.
- C. Shop drawings for nonstandard boxes, enclosures, and cabinets. Include layout drawings showing components and wiring.

#### 1.04 QUALITY ASSURANCE

- A. Comply with NFPA 70 "National Electrical Code" for components and installation.
- B. Listing and Labeling: Provide products specified in this Section that are listed and labeled.
  - 1. The Terms "Listed and Labeled": As defined in the "National Electrical Code," Article 100.
- C. Comply with NECA "Standard of Installation."
- D. Coordinate layout and installation of raceway and boxes with other construction elements to ensure adequate headroom, working clearance, and access.

## **PART 2 - PRODUCTS**

### 2.01 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide Products by of one of the following:
  - 1. Metal Conduit and Tubing
    - a. Anamet, Inc., Anaconda Metal Hose
    - b. Triangle PWC, Inc.
    - c. Wheatland Tube Company
  - 2. Conduit Bodies and Fittings
    - a. Emerson Electric Company, Appleton Electric Company
    - b. Hubbell, Inc., Killark Electric Manufacturing Company
    - c. General Signal, O-Z/Gedney Unit
  - 3. Boxes, Enclosures and Cabinets
    - a. Butler Manufacturing Company, Walker Division
    - b. Cooper Industries, Midwest Electric
    - c. Hubbell Inc., Killark Electric Manufacturing Company
    - d. General Signal, O-Z/Gedney
    - e. Square D Company
    - f. Thomas & Betts Corporation
  - 4. PVC Conduit and Tubing
    - a. Carlon, Inc.

### 2.02 METAL CONDUIT AND TUBING

- A. Rigid Steel Conduit: UL 6, ANSI C80.1.
- B. Intermediate Metal Conduit: UL 1242, ANSI C80.6.
- C. Electrical Metallic Tubing and Fittings: UL 797, ANSI C80.3 with compression-type fittings.
- D. Fittings: NEMA FB 1, compatible with conduit/tubing materials except that only threaded and compression type fittings are acceptable.

2.03 PULL AND JUNCTION BOXES

- A. Small Sheet Metal Boxes: NEMA OS 1.
- B. Cast Metal Boxes: NEMA FB 1, cast aluminum with gasketed cover.

2.04 CABINETS AND ENCLOSURES

- A. Hinged Cover Enclosures: NEMA 250, steel enclosure with continuous hinge cover and flush latch. Finish inside and out with manufacturer's standard enamel.
- B. Cabinets: NEMA 250, type 1, galvanized steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel. Hinged door in front cover with flush latch and concealed hinge. Key latch to match panelboards. Include metal barriers to separate wiring of different systems and voltage, and include accessory feet where required for freestanding equipment.

**PART 3 - EXECUTION**

3.01 EXAMINATION

- A. Examine surfaces to receive raceways, boxes, enclosures, and cabinets for compliance with installation tolerances and other conditions affecting performance of the raceway system. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 WIRING METHODS

- A. Indoors: Use the following wiring methods:
  - 1. Damp or Wet Locations: Rigid steel conduit.
  - 2. Exposed: Electrical metallic tubing, except where exposed to physical damage.
  - 3. Concealed: Electrical metallic tubing, except where exposed to physical damage.
  - 5. Boxes and Enclosures: NEMA Type 1, except in damp or wet locations use NEMA Type 4, stainless steel.

6. Where subject to physical damage: Rigid or intermediate metal conduit.
  7. All other locations: Rigid or intermediate metal conduit.
- B. Outdoors: Use the following wiring methods:
1. Damp or Wet Locations: Rigid steel conduit.
  2. Exposed: Rigid steel conduit.
  3. Underground: Schedule 40 PVC Conduit
  4. Concealed Rigid steel conduit.
  5. Boxes and Enclosures: NEMA Type 4.
  6. Where subject to physical damage: Rigid or intermediate metal conduit.
  7. All other locations: Rigid or intermediate metal conduit.
- C. The following conditions are defined as subject to physical damage for this section:
1. Exposed below 10' above the finished floor where conduit travels up from the floor level or enters the bottom of a box. Except at typical floor lobbies.

### 3.03 INSTALLATION

- A. Install raceways, boxes, enclosures, and cabinets as indicated, according to manufacturer's written instructions. Unless otherwise noted all race way is to be installed concealed.
- B. Do not use EMT in areas where raceway will be exposed to physical damage. Conceal conduit and EMT, unless otherwise indicated, within finished walls, ceilings, and floors.
- C. Keep raceways at least 6 inches away from parallel runs of flues and steam or hot water pipes. Install horizontal raceway runs above water and steam piping.
- D. Install raceways level and square and at proper elevations. Provide adequate headroom.
- E. Complete raceway installation before starting conductor installation.
- F. Support raceway as specified in Division 26 Section 26 0500 - Basic Electrical Requirements for supporting devices."
- G. Use temporary closures to prevent foreign matter from entering raceway.

- H. Protect stub-ups from damage where conduits rise through floor slabs. Arrange so curved portion of bends is not visible above the finished slab.
- I. Make bends and offsets so the inside diameter is not reduced. Unless otherwise indicated, keep the legs of a bend in the same plane and the straight legs of offsets parallel.
- J. Use raceway fittings compatible with raceway and suitable for use and location. For intermediate steel conduit, use threaded rigid steel conduit fittings, except as otherwise indicated. Unthreaded fittings shall not be used except for EMT.
- K. Run raceways concealed with a minimum of bends in the shortest practical distance considering the type of building construction and obstructions, except as otherwise indicated.
- L. Raceways Embedded in Slabs: Install in middle third of the slab thickness where practical, and leave at least 1-inch concrete cover.
  - 1. Secure raceways to reinforcing rods to prevent sagging or shifting during concrete placement.
  - 2. Space raceways laterally to prevent voids in the concrete.
  - 3. Run conduit larger than 1-inch trade size parallel to or at right angles to main reinforcement. When at right angles to reinforcement, place conduit close to slab support.
  - 4. Transition nonmetallic tubing to Schedule 80 non-metallic conduit, rigid steel conduit, or IMC before rising above floor.
- M. Where in unfinished spaces or where specifically approved by the architect, install raceways exposed. Install parallel to or at right angles to nearby surfaces or structural members, and follow the surface contours as much as practical.
  - 1. Run parallel or banked raceways together, on common supports where practical.
  - 2. Make bends in parallel or banked runs from same center line to make bends parallel. Use factory elbows only where they can be installed parallel; otherwise, provide field bends for parallel raceways.
- N. Join raceways with fittings designed and approved for the purpose and make joints tight.
  - 1. Make raceway terminations tight. Use bonding bushings at connections subject to vibration. Use ground conductors through the bonding bushings.
  - 2. Use insulating bushings to protect conductors.
  - 3. Use compression fitting for non-threaded connections.

- O. Terminations: Terminate raceways with locknuts and grounding bushings, align the raceway to enter squarely, and install the locknuts with dished part against the box. Where terminations cannot be made secure with one locknut, use two locknuts, one inside and one outside the box. Provide grounding bushings for all raceway terminations
- P. Where terminating in threaded hubs, screw the raceway or fitting tight into the hub so the end bears against the wire protection shoulder. Where chase nipples are used, align the raceway so the coupling is square to the box, and tighten the chase nipple so no threads are exposed.
- Q. Install pull wires in empty raceways. Use No. 14 AWG zinc-coated steel or monofilament plastic line having not less than 200-lb. tensile strength. Leave not less than 12 inches of slack at each end of the pull wire.
- R. Telephone and Signal System Raceways and underground raceways: In addition to the above requirements, install in maximum lengths of 150 feet and with a maximum of two 90° bends or equivalent. Install pull, junction boxes or hand holes where necessary to comply with these requirements.
- S. Install raceway sealing fittings according to the manufacturer's written instructions. Locate fittings at suitable, approved, accessible locations and fill them with UL-listed sealing compound. For concealed raceways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces. Install raceway sealing fittings at the following points and elsewhere as indicated:
  - 1. Where conduits enter or leave hazardous locations.
  - 2. Where conduits pass from warm locations to cold locations, such as the boundaries of refrigerated spaces and air-conditioned spaces.
  - 3. Where otherwise required by the NEC.
- T. Stub-Up Connections: Extend conduits through concrete floor for connection to freestanding equipment with an adjustable top or coupling threaded inside for plugs, and set flush with the finished floor. Extend conductors to equipment with rigid steel conduit; flexible metal conduit may be used 6 inches above the floor. Where equipment connections are not made under this Contract, install screwdriver-operated threaded flush plugs flush with floor.
- U. Flexible Connections: Use maximum of 6 feet of flexible conduit for recessed and semi-recessed lighting fixtures; for equipment subject to vibration, noise transmission, or movement; and for all motors. Use liquidtight flexible conduit in wet or damp locations. Install separate ground conductor across flexible connections.
- V. Do not install aluminum conduit embedded in or in contact with concrete.
- W. Set floor boxes level and adjust to floor surface.

- X. Install hinged cover enclosures and cabinets plumb. Support at each corner.
- Y. Provide grounding connections for all raceway, boxes, and components. Tighten connectors and terminals, including screws and bolts, according to equipment manufacturer's published torque-tightening values for equipment connectors. Where manufacturer's torquing requirements are not indicated, tighten connectors and terminals according to tightening torques specified in UL Standard 486A.
- Z. Install cast type boxes for all surface mounted devices, lighting etc. where boxes are surface mounted and mounted 10 foot above finished floor and below (including boxes under access floor).
- AA. Install electrical work that originates from different or diverse panelboards, load busses, services or derived systems (i.e: service switchboards or standby power) so that they are physically separated from each other. Distribution components that do not originate from the same load busses shall be run at extreme opposite ends of the facility. Where such can not be run at the extreme opposite ends of the facility, separate them to the extreme opposite ends of the room or space.

#### 3.04 PROTECTION

- A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, to ensure that coatings, finishes, and cabinets are without damage or deterioration at Substantial Completion.
  - 1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
  - 2. Repair damage to PVC or paint finishes with matching touch-up coating recommended by the manufacturer.

#### 3.05 IDENTIFICATION

- A. Provide identification for the following:
  - 1. All accessible raceway 2 inches and larger.
  - 2. Fire alarm raceway.
  - 3. Security raceway.
  - 4. HVAC control.
  - 5. Emergency lighting raceways.
  - 6. Communication raceways.
  - 7. Junction, Pull and Splice boxes.
  - 8. Switchgear Control circuits.

- B. Use plastic sheet raceway markers extending 360° around conduits with a minimum length of 8 inches. Text shall be legible to the naked eye from the floor level below.
  - 1. Identify system voltage.
  - 2. Identify conduit function or system.
  - 3. Provide at minimum intervals of every 20' on center.
- C. Use plastic laminated labels to identify boxes. Text shall be legible to the naked eye from the floor level below.
  - 1. Identify system voltage.
  - 2. Identify function or system.
  - 3. Identify box name or designation.

3.06 CLEANING

- A. Upon completion of installation of system, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finish, including chips, scratches, and abrasions.

END OF SECTION

## **SECTION 260553 - ELECTRICAL IDENTIFICATION**

### **PART 1 - GENERAL**

#### 1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Owner's Agreement, including General Conditions and Division 1 Specification Sections, apply to this and other Sections of Division 26.

#### 1.02 SUMMARY

- A. This Section includes identification of electrical materials, equipment, and installations.

#### 1.03 SUBMITTALS

- A. General: Submit each item in this Article according to the Conditions of the Contract and Division 1 Specification Sections.
- B. Product Data for each type of product specified.
- C. Schedule of identification nomenclature to be used for each identification signs and labels. Prior to fabrication submit schedule to the on-site work force representative, Building engineer and owner's design representative.
- D. Samples for each color, lettering style, and other graphic representation required for identification materials; samples of labels and signs.

#### 1.04 QUALITY ASSURANCE

- A. Comply with NFPA 70.
- B. Comply with ANSI C2.

#### 1.05 SEQUENCING AND SCHEDULING

- A. Coordinate installing electrical identification after completion of finishing where identification is applied to field-finished surfaces.
- B. Coordinate installing electrical identifying devices and markings prior to installing acoustical ceilings and similar finishes that conceal such items.

### **PART 2 - PRODUCTS**

#### 2.01 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Stranco, Inc.
2. Ideal Industries, Inc.
3. Panduit Corporation
4. Ready Made Sign Company; Cornerstone Direct Corporation Division
5. Seton Name Plate Corporation
6. Standard Signs, Inc.

## 2.02 RACEWAY AND CABLE LABELS

- A. Manufacturer's Standard Products: Where more than one type is listed for a specified application, selection is Installer's option, but provide single type for each application category. Use colors prescribed by ANSI A13.1, NFPA 70, and these Specifications.
- B. Conform to ANSI A13.1, Table 3, for minimum size of letters for legend and minimum length of color field for each raceway or cable size.
  1. Color: Black legend on orange field.
  2. Legend: Indicates Designation, voltage, rating, date of installation and service.
- C. Adhesive Labels: Preprinted, flexible, self-adhesive vinyl. Legend is overlaminated with a clear, weather- and chemical-resistant coating.
- D. Pre-tensioned, Wraparound Plastic Sleeves: Flexible, preprinted, color-coded, acrylic bands sized to suit the diameter of the line it identifies and arranged to stay in place by pre-tensioned gripping action when placed in position.
- E. Colored Adhesive Tape: Self-adhesive vinyl tape not less than 3 mils thick by 1 to 2 inches wide.
- F. Tape Markers: Vinyl or vinyl-cloth, self-adhesive, wraparound type with preprinted numbers and letters.
- G. Aluminum, Wraparound Marker Bands: Bands cut from 0.014-inch thick aluminum sheet, with stamped or embossed legend, and fitted with slots or ears for permanently securing around wire or cable jacket or around groups of conductors.
- H. Plasticized Card-Stock Tags: Vinyl cloth with preprinted and field-printed legends. Orange background, except as otherwise indicated, with eyelet for fastener.
- I. Aluminum-Faced Card-Stock Tags: Weather-resistant, 18-point minimum card stock faced on both sides with embossable aluminum sheet, 0.002 inch thick,

laminated with moisture-resistant acrylic adhesive, and punched for the fastener. Preprinted legends suit each application.

- J. Brass Tags: Metal tags with stamped legend, punched for fastener. Dimensions: 2 by 2 inches by 0.05 inch.

## 2.03 ENGRAVED NAMEPLATES AND SIGNS

- A. Manufacturer's Standard Products: Where more than one type is listed for a specified application, selection is Installer's option, but provide single type for each application category. Use colors prescribed by ANSI A13.1, NFPA 70, and these Specifications.
- B. Engraving stock, melamine plastic laminate, 1/16-inch minimum thick for signs up to 20 sq. in., 1/8 inch thick for larger sizes.
  - 1. Engraved Legend: Black letters on white face or white letters on red face where directed.
  - 2. Punched for mechanical fasteners.
- C. Baked-Enamel Signs for Interior Use: Preprinted aluminum signs, punched for fasteners, with colors, legend, and size as indicated or as otherwise required for the application. 1/4-inch grommets in corners for mounting.
- D. Exterior, Metal-Backed, Butyrate Signs: Weather-resistant, non-fading, preprinted, cellulose acetate butyrate signs with 0.0396-inch, galvanized steel backing, with colors, legend, and size appropriate to the application. 1/4-inch grommets in corners for mounting.
- E. Fasteners for Plastic-Laminated and Metal Signs: Self-tapping stainless-steel screws or No. 10/32 stainless-steel machine screws with nuts and flat and lock washers.

## 2.04 MISCELLANEOUS IDENTIFICATION PRODUCTS

- A. Cable Ties: Fungus-inert, self-extinguishing, 1-piece, self-locking, Type 6/6 nylon cable ties with the following features:
  - 1. Minimum Width: 3/16 inch.
  - 2. Tensile Strength: 50 lb minimum.
  - 3. Temperature Range: Minus 40 to 185 degrees F.
  - 4. Color: As indicated where used for color-coding.
- B. Paint: Alkyd-urethane enamel over primer as recommended by enamel manufacturer.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION**

- A. Install identification devices according to manufacturer's written instructions.
- B. Install labels where indicated and at locations for best convenience of viewing without interference with operation and maintenance of equipment.
- C. Lettering, Colors, and Graphics: Coordinate names, abbreviations, colors, and other designations used for electrical identification with corresponding designations used in the Contract Documents or required by codes and standards. Use consistent designations throughout the Project.
- D. Sequence of Work: Where identification is to be applied to surfaces that require finish, install identification after completion of finish work.
- E. Self-Adhesive Identification Products: Clean surfaces of dust, loose material, and oily films before applying.
- F. Identify feeders with "DANGER—120/208 (277/480 as applicable) VOLTS" in black letters 2 inches high, stenciled with paint at 10-foot intervals over a continuous, painted orange background. Identify the following:
  - 1. Entire floor area directly above conduits running beneath and within 12 inches of a basement or ground floor that is in contact with earth or is framed above unexcavated space.
  - 2. Wall surfaces directly external to conduits concealed within wall.
  - 3. All accessible surfaces of concrete envelope around conduits in vertical shafts, exposed in the building, or concealed above suspended ceilings.
  - 4. Entire surface of exposed conduits.
- G. Install painted identification as follows:
  - 1. Clean surfaces of dust, loose material, and oily films before painting.
  - 2. Prime Surfaces: For galvanized metal, use single-component, acrylic vehicle coating formulated for galvanized surfaces. For concrete masonry units, use heavy-duty, acrylic-resin block filler. For concrete surfaces, use clear, alkali-resistant, alkyd binder-type sealer.
  - 3. Apply one intermediate and one finish coat of silicone alkyd enamel.
  - 4. Apply primer and finish materials according to manufacturer's instructions.

- H. Identify Raceways and Exposed Cables of Certain Systems with Color Banding: Band exposed and accessible raceways of the systems listed below for identification.
  - 1. Bands: Pre-tensioned, snap-around, colored plastic sleeves; colored adhesive tape; or a combination of both. Make each color band 2 inches wide, completely encircling conduit, and place adjacent bands of 2-color markings in contact, side by side.
  - 2. Locate bands at changes in direction, at penetrations of walls and floors, at 20-foot maximum intervals in straight runs, and at 5 feet in congested areas.
  - 3. Colors: As follows:
    - a. Fire-Alarm System: Red.
    - b. Fire-Suppression Supervisory and Control System: Red and yellow.
    - c. Security System: Blue and yellow.
    - d. Mechanical and Electrical Supervisory System: Green and blue.
- I. Install Caution Signs for Enclosures: Use pressure-sensitive, self-adhesive label indicating system voltage in black, preprinted on orange field. Install on exterior of door or cover.
- J. Install Circuit Identification Labels on Boxes: Label externally as follows:
  - 1. Exposed Boxes: Pressure-sensitive, self-adhesive plastic label on cover.
  - 2. Concealed Boxes: Plasticized card-stock tags.
  - 3. Labeling Legend: Permanent, waterproof listing of panel and circuit number or equivalent.
- K. Color-Code Conductors: Secondary service, feeder and branch circuit conductors throughout the secondary electrical system.
  - 1. 208/120-V System: As follows:
    - a. Phase A: Black.
    - b. Phase B: Red.
    - c. Phase C: Blue.
    - d. Neutral: White.
    - e. Ground: Green.
  - 2. Factory-apply color the entire length of the conductors.

- L. Power Circuit Identification: Use metal tags or aluminum wraparound marker bands for cables, feeders, and power circuits in vaults, pull boxes, junction boxes, manholes and switchboard rooms.
  - 1. Legend: 1/4-inch steel letter and number stamping or embossing with legend corresponding to indicated circuit designations.
  - 2. Fasten tags with nylon cable ties; fasten bands using integral ears.
  
- M. Apply identification to conductors as follows:
  - 1. All Conductors: Indicate source and circuit numbers.
  - 2. Multiple Power or Lighting Circuits in the Same Enclosure: Identify each conductor with source, voltage, circuit number, and phase. Use color-coding for voltage and phase indication of secondary circuit.
  - 3. Multiple Control and Communications Circuits in the Same Enclosure: Identify each conductor by its system and circuit designation. Use a consistent system of tags, color-coding, or cable marking tape.
  
- N. Apply warning, caution, and instruction signs and stencils as follows:
  - 1. Install warning, caution and instruction signs where indicated or required to ensure safe operation and maintenance of electrical systems and of items to which they connect. Install engraved, plastic-laminated instruction signs with approved legend where instructions or explanations are needed for system or equipment operation. Install butyrate signs with metal backing for outdoor items.
  - 2. Emergency-Operating Signs: Install engraved laminate signs with white legend on red background with minimum 3/8-inch high lettering for emergency instructions on power transfer, load shedding, and other emergency operations.
  
- O. Install identification as follows:
  - 1. Apply equipment identification labels of engraved plastic laminate on each major unit of equipment, including central or master unit of each system. This includes communication, signal, and alarm systems, unless units are specified with their own self-explanatory identification. Except as otherwise indicated, provide a single line of text with 1/2-inch high lettering on 1-1/2-inch high label; where 2 lines of text are required, use lettering 2 inches high. Use white lettering on black field. Apply labels for each unit of the following categories of equipment:
    - a. Control devices.
    - b. Transformers.
    - c. Power-generating units.
    - d. Pull and splice boxes.
    - e. Overcurrent Protective devices.
  - 2. Apply designation labels of engraved plastic laminate for disconnect switches, breakers, pilot lights, and similar items for power distribution

and control components above, except panelboards and alarm/signal components where labeling is specified elsewhere. For panelboards, provide framed, typed circuit schedules with explicit description and identification of items controlled by each individual breaker.

END OF SECTION

## **SECTION 262416 - PANELBOARDS**

### **PART 1 - GENERAL**

#### 1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Owner Agreement, including General Conditions and Division 1 Specification Sections, apply to this and other Sections of Division 1

#### 1.02 SUMMARY

- A. This Section includes lighting and power panelboards and associated auxiliary equipment rated 600 V and less.
- B. Related Sections include the following:
  - 1. Division 16 Section 260500 - Basic Electrical Materials and Methods for general materials and installation methods.

#### 1.03 SUBMITTALS

- A. Product Data: For each type of panelboard, accessory item, and component specified.
- B. Shop Drawings: For panelboards. Include dimensioned plans, sections, and elevations. Show tabulations of installed devices, major features, and voltage rating. Include the following:
  - 1. Enclosure type with details for types other than NEMA 250, Type 1.
  - 2. Bus configuration and current ratings.
  - 3. Short-circuit current rating of panelboard.
  - 4. Features, characteristics, ratings, and factory settings of individual protective devices and auxiliary components.
  - 5. Wiring Diagrams: Details of schematic diagram including control wiring and differentiating between manufacturer-installed and field-installed wiring.
- C. Qualification Data: For firms and persons specified in "Quality Assurance" Article.
- D. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.
- E. Panelboard Schedules: For installation in panelboards. Submit final versions after load balancing.

- F. Maintenance Data: For panelboard components to include in the maintenance manuals specified in Division 1. Include manufacturer's written instructions for testing circuit breakers.

1.04 QUALITY ASSURANCE

- A. Testing Agency Qualifications: In addition to the requirements specified in Division 1 Section "Quality Control," an independent testing agency shall meet OSHA criteria for accreditation of testing laboratories, Title 29, Part 1907, or shall be a full member company of the International Electrical Testing Association.
  - 1. Testing Agency's Field Supervisor: Person currently certified by the International Electrical Testing Association or National Institute for Certification in Engineering Technologies, to supervise on-site testing specified in Part 3.
- B. Listing and Labeling: Provide products specified in this Section that are listed and labeled.
  - 1. The Terms "Listed" and "Labeled": As defined in the National Electrical Code, Article 100.
- C. Comply with NFPA 70.
- D. Comply with NEMA PB 1.

1.05 EXTRA MATERIALS

- A. Keys: 6 spares of each type for panelboard cabinet lock.
- B. Circuit Safe One-way Lockout Pins: 3 spares for each panel board provided.
- C. Circuit Safe Two-way Lockout Pins: 3 spares for each panel board provided.
- D. Circuit Safe Hook Pins: 3 spares for each panel board provided.

**PART 2 - PRODUCTS**

2.01 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by the same manufacturer as the switchgear.

2.02 PANELBOARD FABRICATION

- A. Enclosures: Code gage steel with welded finished seams. Flush- or surface-mounted cabinets as indicated. NEMA PB 1, Type 1, unless otherwise indicated to meet environmental conditions at installed location.
  - 1. Outdoor Locations: NEMA 250, Type 3R.

2. Other Wet or Damp Indoor Locations: NEMA 250, Type 4.
  - B. Front: Hinged Front Cover: Entire front trim hinged to box with standard door within hinged trim cover. Secured one side to box with continuous piano hinge. Secure other side with flush catches and tumbler lock, all keyed alike. Front for surface-mounted panelboards shall be same dimensions as box. Fronts for flush panelboards shall overlap box, unless otherwise indicated. Construct so that dead front covers are attached to and move with the front trim cover.
  - C. Directory Frame: Metal, mounted inside each panelboard door.
  - D. Bus: Hard drawn copper of 98 percent conductivity.
  - E. Main and Neutral Lugs: To accommodate two hole long barrel dual crimp Compression lugs.
  - F. Equipment Ground Bus: Hard drawn copper of 98 percent conductivity. Adequate for feeder and branch-circuit equipment ground conductors. Bonded to box. Provide brazed ground lug on each backbox.
  - G. Future Devices: Equip with mounting brackets, bus connections, and necessary appurtenances, for the overcurrent protective device ampere ratings indicated for future installation of devices.
  - H. Special Features: Include the following features for panelboards as indicated:
    1. Isolated Equipment Ground Bus: Adequate for branch-circuit equipment ground conductors; insulated from box.
    2. Split Bus: Vertical bus of indicated panelboards divided into 2 vertical sections with connections as indicated.
    3. Skirt for Surface-Mounted Panelboards: Same gage and finish as panelboard front with flanges for attachment to panelboard, wall, and floor.
  - I. Extra Gutter Space: Provide cabinets with double (minimum) the code required Gutter Space.

## 2.03 LOCKOUT/TAGOUT OF OVERCURRENT DEVICES

- A. Each Main and branch circuit overcurrent protective device shall be provided with the capability of being locked out in compliance with OSHA Standard 1910.147.
- B. Each lighting and branch circuit panelboard shall be provided with Stranco, Inc. Circuit Safe™ lockout system. Provide circuit safe unit with length to match the total length of the overcurrent protective devices, including the future devices. Coordinate the centerline separation of breakers and the distances from the panelboard center. Provide one pin holder and two of each type lockout pins for each panelboard. Provide mounting shims and offset brackets as required.

## 2.04 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS

- A. Overcurrent Protective Devices: Bolt-on circuit breakers, replaceable without disturbing adjacent units.
- B. Doors: Hinged Front Cover: Entire front trim hinged to box with standard door within hinged trim cover. Secured one side to box with continuous piano hinge. Secure other side with flush catches and tumbler lock, all keyed alike. Front for surface-mounted panelboards shall be same dimensions as box. Fronts for flush panelboards shall overlap box, unless otherwise indicated. Construct so that dead front covers are attached to and move with the front trim cover.

## 2.05 DISTRIBUTION PANELBOARDS

- A. Doors: In panelboard hinged front, except omit in fusible-switch panelboard, unless otherwise indicated. Secure door with vault-type latch with tumbler lock, all keyed alike.
- B. Breakers: Where overcurrent protective devices are indicated to be circuit breakers, use bolt-on circuit breakers.

## 2.06 OVERCURRENT PROTECTIVE DEVICES

- A. Molded-Case Circuit Breaker: NEMA AB 1, handle lockable.
  - 1. Characteristics: 100% rated. Frame size, trip rating, number of poles and auxiliary devices as indicated and interrupting capacity rating to meet available fault current in accordance with UL 67.
  - 2. Application Listing: Appropriate for application, including Type SWD for switching fluorescent lighting loads and Type HACR for heating, air-conditioning, and refrigerating equipment.
  - 3. Circuit Breakers, 100 A and Larger: Trip units interchangeable within frame size.
  - 4. Circuit Breakers, 200 A and Larger: True RMS sensing with field-adjustable long time, short-time,  $i^2t$  in/out and continuous current settings.
  - 5. Current-Limiting Trips: Let-through ratings less than NEMA FU 1, Class RK-5.
  - 6. Lugs: To accommodate compression lugs specified elsewhere in these specifications. Fully rated for 90°C and power-distribution connectors for number, size, and material of conductors indicated.
  - 7. Shunt Trip: Where indicated.

2.07 ACCESSORY COMPONENTS AND FEATURES

- A. Accessory Set: Include tools and miscellaneous items as required for overcurrent protective device test, inspection, maintenance, and operation.
- B. Portable Test Set: Arranged to permit testing of functions of solid-state trip devices without removal from panelboard.
- C. Lock-on devices for 1-pole circuit breaker handles.

**PART 3 - EXECUTION**

3.01 INSTALLATION

- A. Install panelboards and accessory items according to NEMA PB 1.1.
- B. Mounting Heights: Top of trim 74 inches above finished floor, unless otherwise indicated.
- C. Mounting: Plumb and rigid without distortion of box. Mount flush panelboards uniformly flush with wall finish. Secure panels using minimum size 3/8" bolts and vibration isolators.
- D. Circuit Directory: Typed directory to indicate installed circuit loads after balancing panelboard loads. Obtain approval before installing.
- E. Install filler plates in unused spaces.
- F. Provision for Future Circuits at Flush Panelboards: Stub four 1-inch empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Stub four 1-inch empty conduits into raised floor space or below slab not on grade.
- G. Wiring in Panelboard Gutters: Arrange conductors into groups, and bundle and wrap with wire ties after completing load balancing.
- H. Seismic Bracing: Provide seismic bracing in accordance with the manufacturer's recommendations and in compliance with the seismic zone requirements for the zone in which the equipment is located.

### 3.02 IDENTIFICATION

- A. Identify field-installed wiring and components and provide warning signs as specified in Division 16 Section "Electrical Identification."
- B. Panelboard Nameplates: Label each panelboard with engraved laminated-plastic or metal nameplates mounted with corrosion-resistant screws.
  - 1. Indicate panel designation, voltage ratings and phase.
  - 2. Indicate source of power (feeder origin).
  - 3. Indicate location of panelboard.
  - 4. Indicate date of installation.
  - 5. Feeder origin shall include source switchgear or panelboard designation, floor number and floor location number or nearest column number.
- C. Breaker Nameplates: Label each breaker, regardless of size, in distribution panelboards and switchboards with engraved laminated-plastic or metal nameplates mounted with corrosion-resistant screws.
  - 1. Indicate breaker rating.
  - 2. Indicate breaker number: Breakers shall be numbered sequentially from top to bottom and left to right.
  - 3. Indicate load served, location of load and date of installation.

### 3.03 GROUNDING

- A. Make equipment grounding connections for panelboards as indicated and/or specified.
- B. Provide ground conductor to main electrical ground bus as indicated and/or specified.
- C. Provide each back box with brazed ground studs. Provide ground conductor to bond the back box to the feeder ground and the equipment ground bus in the panel.

### 3.04 CONNECTIONS

- A. Tighten electrical connectors and terminals, including grounding connections, according to manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.05 FIELD QUALITY CONTROL

- A. Prepare for acceptance tests as follows:
  - 1. Make insulation-resistance tests of each panelboard bus, component, and connecting supply, feeder and control circuits.
  - 2. Make continuity tests of each circuit.
- B. Testing Agency: Provide services of a qualified independent testing agency to perform specified testing.
- C. Testing: After installing panelboards and after electrical circuitry has been energized, demonstrate product capability and compliance with requirements.
  - 1. Procedures: In addition to the requirements of division 16 “Acceptance testing”, Perform each visual and mechanical inspection and electrical test stated in NETA ATS, Section 7.5 for switches and Section 7.6 for molded-case circuit breakers. Certify compliance with test parameters.
  - 2. Manually exercise all switches, circuit breakers and other operating mechanisms.
  - 3. Test all breakers rated 100 Amperes and larger. Provide the services of a NETA certified testing agency. Test all functions and ranges of all over current protective devices.
  - 4. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, remove and replace with new units, and retest.
  - 5. Submit Certified final test report to the owner’s representative for record.
- D. Balancing Loads: After Substantial Completion, but not more than 2 months after Final Acceptance, conduct load-balancing measurements and make circuit changes as follows:
  - 1. Perform measurements during period of normal working load as advised by Owner.
  - 2. Perform load-balancing circuit changes outside normal occupancy/working schedule of the facility. Make special arrangements with Owner to avoid disrupting critical 24-hour services such as fax machines and on-line data processing, computing, transmitting, and receiving equipment.
  - 3. Recheck loads after circuit changes during normal load period. Record all load readings before and after changes and submit test records.

4. Tolerance: Difference exceeding 20 percent between phase loads, within a panelboard, is not acceptable. Rebalance and recheck as required to meet this minimum requirement.
  5. Update panel directory to reflect changes.
- E. Infrared Scanning: After Substantial Completion, but not more than 2 months after Final Acceptance, perform an infrared scan of each panelboard. Remove fronts to make joints and connections accessible to a portable scanner.
1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scanning of each panelboard 11 months after date of Substantial Completion.
  2. Instrument: Use an approved infrared scanning device designed to measure temperature or detect significant deviations from normal values. Provide calibration record for device used.
  3. Record of Infrared Scanning: Prepare a certified report identifying panelboards checked and describing results of scanning. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.06 ADJUSTING

- A. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

3.07 CLEANING

- A. On completion of installation, inspect interior and exterior of panelboards. Remove paint splatters and other spots, dirt and debris. Touch up scratches and mars of finish to match original finish.

END OF SECTION

## **SECTION 262726 - WIRING DEVICES**

### **PART 1 - GENERAL**

#### 1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Owner's Agreement, including General Conditions and Division 1 Specification Sections, apply to this and other Sections of Division 26.

#### 1.02 SUMMARY

- A. This Section includes various types of receptacles, connectors, switches and finish plates.

#### 1.03 SUBMITTALS

- A. Submit the following according to the Conditions of the Contract and Division 1 Specification Sections.
- B. Product data for each product specified.
- C. Samples of devices and device plates for color selection and evaluation of technical features.
- D. Operation and maintenance data for materials and products specified in this Section to include in the "Operating and Maintenance Manual" specified in Division 1.

#### 1.04 QUALITY ASSURANCE

- A. Comply with NFPA 70 "National Electrical Code" for devices and installation.
- B. Listing and Labeling: Provide products that are listed and labeled for their applications and installation conditions and for the environments in which installed.
  - 1. The Terms "Listed" and "Labeled": As defined in the "National Electrical Code," Article 100.

#### 1.05 COORDINATION

- A. Wiring Devices for Owner Furnished Equipment: Match devices to plug connectors for Owner-furnished equipment. Verify type, configuration, etc. prior to providing devices. Include all such costs in bid submission.

1.06 EXTRA MATERIALS

- A. Furnish the following extra materials, packaged with protective covering for storage, and identified with labels describing contents. Deliver extra materials to the Owner.
  - 1. Receptacles: 1 for each 10, but not less than 1 of each type.

**PART 2 - PRODUCTS**

2.01 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
  - 1. Wiring Devices
    - a. General Electric Company
    - b. Hubbell Inc.
    - c. Leviton Manufacturing Company, Inc.
    - d. Pass & Seymour/Legrand
  - 2. Wiring Devices for Hazardous (Classified) Locations
    - a. Crouse-Hinds Electrical Construction
    - b. Killark Electrical Manufacturing. Company
    - c. Pyle-National Company

2.02 WIRING DEVICES

- A. Comply with NEMA Standard WD 1, "General Purpose Wiring Devices."
- B. Enclosures: NEMA 1 equivalent, except as otherwise indicated.
  - 1. Color: As selected by the owners representative during shop drawing submissions except as otherwise indicated or required by Code
- C. Receptacles, Specification grade. Straight-Blade, Special Features: Comply with the basic requirements specified above for straight-blade receptacles of the class and type indicated, and with the following additional requirements:
  - 1. Ground-Fault Circuit Interrupter (GFCI) Receptacles: UL Standard 943, "Ground Fault Circuit Interrupters," feed-through type, with integral NEMA 5-20R duplex receptacle arranged to protect connected downstream receptacles on the same circuit. Design units for installation in a 2-3/4-inch deep outlet box without an adapter.
- D. Snap Switches: Specification grade. Quiet-type AC switches, NRTL listed and labeled as complying with UL Standard 20 "General Use Snap Switches," and

with Federal Specification W-S-896. Where indicated with pilot light provide illuminated handle switch where handle illuminates when load is activated.

- E. Receptacles: NEMA 5-20R Specification grade receptacle. NRTL listed and labeled as complying with UL Standard and with Federal Specifications. Where indicated as "WP" provide Red-Dot code keeper flip cover suitable for wet locations when in use.
- F. Wall Plates: Single and combination types that mate and match with corresponding wiring devices. Features include the following:
  - 1. Color: Matches wiring device except as otherwise indicated.
  - 2. Plate-Securing Screws: Metal with heads colored to match plate finish.
  - 3. Material for Finished Spaces: Steel with wrinkled finish, baked enamel, suitable for field painting, except as otherwise indicated.
  - 4. Material for Unfinished Spaces: Galvanized steel.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION**

- A. Install devices and assemblies plumb and secure.
- B. Install wall plates when painting is complete.
- C. Arrangement of Devices: Except as otherwise indicated, mount flush, with long dimension vertical, and grounding terminal of receptacles on top. Group adjacent switches under single, multi-gang wall plates.
- D. Protect devices and assemblies during painting.
- E. Do not connect switches in the neutral conductor. Install switches indicated by "S" with subletter to control the outlets indicated. However, if subletter is omitted, install switches to control lighting in the room or area. If there is only one switch indicated in the room, install the switch to control all lighting in the room even though they are not indicated by subletter. If two switches are shown in a room at the same location with no subletter, install each switch to control half the lamps in each fixture even though there is no subletter. For fixtures with 3 lamps one switch shall control the two outer lamps and the second shall control the inner lamp.
- F. Wall plates for devices in flush boxes, unless specified otherwise, shall be .040" thick beveled edge satin finish stainless steel plates, single or multi-gang as required by the outlet. Plates for FS or FD type boxes shall be zinc or cadmium plated sheet steel, specially designed to fit the type outlet box. Blank plates shall be furnished and installed on all empty, blanked or unused outlets.

- G. Install occupancy sensors on pendant-mounted boxes with seismic bracing to the ceiling slab. Install sensors so that the bottom of the sensor is below the bottom of the fixtures that it controls. Provide extension rings and covers to conceal and isolate the low voltage wiring and components.
- H. Provide UL listed wet location covers “while in use” for all switching and receptacles located outdoors.
- I. Softwired Switches and/or photocells shall be mounted in the spaces as indicated on the Reflected Ceiling Plans. Each low voltage wire shall be labeled clearly indicating which relay panel it connects to. Use only properly color coded, stranded #18 AWG (or larger) wire as indicated on the drawings. All relays and switches shall be tested after installation to confirm proper operation and the loads recorded on the directory card in each panel.
- J. The relay panels shall be mounted in electrical closets as indicated on the drawings. The numbered relays in the panel shall be wired to control the power to each load as indicated on the Panel Wiring Schedules included in the drawings. All power wiring will be identified with the circuit breaker number controlling the load. If multiple circuit breaker panels are feeding into a relay panel, wires shall clearly indicate the originating panel’s designation.
- K. Manufacturer shall provide a factory authorized technician to confirm proper installation and operation of all system components.

### 3.02 IDENTIFICATION

- A. Comply with Division 16 Electrical Identification.
  - 1. Switches: Where 3 or more switches are ganged, and elsewhere where indicated, identify each switch with approved legend engraved on wall plate.
  - 2. Receptacles: Identify the panelboard and circuit number from which served. Use machine-printed, pressure-sensitive, abrasion-resistant label tape on face of plate and durable wire markers or tags within outlet boxes.

### 3.03 GROUNDING

- A. Isolated Ground Receptacles: Connect to isolated grounding conductor routed to designated isolated equipment ground terminal of electrical system.

### 3.04 FIELD QUALITY CONTROL

- A. Testing: Test wiring devices for proper polarity and ground continuity. Operate each operable device at least 6 times.
- B. Test ground-fault circuit interrupter operation with both local and remote fault simulations according to manufacturer recommendations.

- C. Replace damaged or defective components.

3.05 CLEANING

- A. General: Internally clean devices, device outlet boxes and enclosures. Replace stained or improperly painted wall plates or devices.

END OF SECTION

## **SECTION 263213 –ENGINE GENERATOR AND ASSOCIATED WORK**

### PART 1 - GENERAL

#### 1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Owner's Agreement, including General Conditions and Division 1 Specification Sections, apply to this and other Sections of Division 26.

#### 1.02 SUMMARY

- A. The work under this section shall consist of all labor, materials, equipment and services necessary and required for providing complete stand by Generator in an Outdoor weatherproof sound attenuating enclosure. Provide associated equipment and/or modifications as specified herein and/or on the drawings.
- B. This section also includes the provision of all circuitry, feeders and empty raceway systems.
- C. This section includes all interconnections, power and control circuitry.

#### 1.03 EQUIPMENT

- A. The generator is a generator in an outdoor weather enclosure. Include the required modifications, installation, initial service, commissioning and on-site testing specified herein.
- B. Provide all rigging, transportation, storage, provisioning, commissioning, etc.. of the unit to accommodate the installation and work required under this contract.
- C. The generator is to include all other devices. Work associated with the installation shall be provided by this division
- D. Provide externally mounted control devices for operation of equipment, which have to be externally mounted apart from the internal controls.
- E. Provide internal modifications/devices for operation of equipment, which have to be internally mounted.

#### 1.04 DEFINITIONS

- A. Standby Rating: Power output rating equal to the power the generator set delivers continuously under normally varying load factors for the duration of a power outage.

- B. Operational Bandwidth: The total variation from the lowest to the highest value of a parameter over the range of conditions indicated, expressed as a percentage of the nominal value of the parameter.
- C. Steady-State Voltage Modulation: The uniform cyclical variation of voltage within the operational bandwidth, expressed in hertz.

1.05 GENERATOR-SET PERFORMANCE

- A. The generator is a "quiet" unit Level 1 acoustical unit. The installation and all modifications shall maintain this criteria.

1.06 SUBMITTALS

- A. This division shall be responsible for the coordination and processing (the provision) of shop drawings and submittals.
- B. Product Data: For each component. Include data on features, components, ratings, and performance. Include dimensioned outline plan and elevation drawings of engine generator set and other system components.
- C. Shop Drawings: Show details of fabrication, piping, wiring, and installation of field-installed portions of system. Include general arrangement drawings showing locations of auxiliary components in relation to engine generator set and duct, piping, and wiring connections between generator set and auxiliary equipment. Show connections, mounting, and support provisions and access and workspace requirements.
- D. Wiring Diagrams: Show details of power and control connections and differentiating between factory-installed and field-installed wiring.
- E. Qualification Data: For firms and persons specified in the "Quality Assurance" Article.
- F. Adjustment for Site Ambient: Provide criteria used to adjust ANSI standard ratings to specified site operating ambient conditions.
- G. Field Test and Observation Reports: Indicate and interpret test results for compliance with performance requirements.
- H. Certified summary of prototype-unit test report.
- I. Certified Test Reports of Components and Accessories: For devices that are equivalent, but not identical, to those tested on prototype unit.
- J. Certified Summary of Performance Tests: Demonstrate compliance with specified requirement to meet critical performance criteria.

- K. Factory Test Reports: For units to be shipped for this Project showing evidence of compliance with specified requirements. Provide list of products and serial numbers for this Project's equipment for comparison during factory and field tests.
- L. Exhaust Emissions Test Report: To show compliance with applicable regulations.
- M. Sound measurement test report.
- N. Certification of Torsional Vibration Compatibility: Comply with NFPA 110.
- O. Field test report of tests specified in Part 3.
- P. Maintenance data for system and components to include in the maintenance manuals specified. Include the following:
  - 1. List of special tools recommended to be stored at the site for ready access.
  - 2. Detail operating instructions for both normal and abnormal conditions.

1.07

QUALITY ASSURANCE

- A. Qualifications: Engage a firm experienced in the specific equipment of types and capacities similar to those indicated for this Project and with a service center factory authorized and maintained by engine generator set manufacturer capable of providing training, parts, and emergency maintenance and repairs.
- B. Testing Agency Qualifications: Provide an independent testing agency with the experience and capability to conduct testing indicated. Provide factory authorized representatives for each piece of equipment involved in any test and during all tests.
- C. Source Limitations: Obtain engine generator set and auxiliary components from the manufacturer with responsibility for entire system. Provide a representative product built from components that have proven reliable and compatible with each other and are coordinated to operate as a unit as evidenced by records of prototype testing.
  - 1. Vendor (source) organization and maintenance organization of engine generator set shall be the same organization and meet the following qualifications:
    - a. The vendor shall be an authorized factory distributor of the engine generator set and shall have complete parts and full service capability with factory certified Craftsman available 24 hours per day, 7 days a week. The vendor shall have an existing operational service facility within two hour drive of the installation site. Delegation of this service responsibility will not be considered fulfillment of these specifications.
    - b. The vendor shall have an adequate experienced staff to support project management, technical support, maintenance and training requirements

of the engine generator set. The staff shall have 5 years minimum experience in the items previously listed.

- c. The vendor shall have been successfully engaged in the assembly, installation and service of engine generator set equipment for emergency power purposes for a period of no less than 10 years.
- D. Comply with NFPA 70.
- E. Comply with NFPA 110 requirement for a Level 1 emergency power supply system.
- F. Engine Exhaust Emissions: Comply with applicable national, state and local government requirements.

#### 1.08 DELIVERY, STORAGE, AND HANDLING

- A. Transport/ ship the generator by dedicated carrier to the site, storage, modification shop. Include the costs of storing, shipping/rigging etc in the bid submission. . Deliver engine generator set and system components to their final locations in protective wrappings, containers, and other protection that will exclude dirt and moisture and prevent damage from construction operation. Remove protection only after equipment is safe from such hazards. Equipment shall be delivered, dismantled as required, to be directly rigged into its final mounting location.
- B. Generator shall be delivered to the site and rigged into place. Inspect all equipment.

#### 1.09 WARRANTY

- A. General Warranty: The special warranty specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.
- B. Special Warranty: Provide a warranty for all systems and components installed under this contract, signed by the Contractor and manufacturer, with single-source responsibility, authorized manufacturers representative for engine generator and auxiliary components, agreeing to repair or replace items that do not meet requirements or that deteriorate as defined in this Section within the specified warranty period. Include the cost for labor and material for the complete warranty period.
- C. Warranty Period: 1 year from date of Substantial Completion/issuance of CO for the project.

#### 1.10 MAINTENANCE SERVICE

- A. Maintenance: Beginning at Substantial Completion, submit a proposal to the owner for 12 months full maintenance by skilled employees of the manufacturer's designated

service organization. Include monthly generator exercising with Owner's Representative to check for proper, starting, load transfer, and running under load. Schedule visits with Owner's Representative two weeks prior to exercising. Include routine preventive maintenance as recommended by manufacturer and adjusting as required for proper operation. Provide parts and supplies as used in the manufacture and installation of original equipment.

1.11 EXTRA MATERIALS

- A. Provide extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents. Deliver extra materials to Owner.
1. Filters: 1 sets each of lubricating oil, fuel, and combustion air filters.
  2. Belts: 1 of each type.
  3. Hose: 1 of each type with clamp.

PART 2 - PRODUCTS

2.01 PRODUCTS

- A. Generator(s): Generac (or approved equal) 1000kw 3 Phase Outdoor stationary enclosed fuel oil fired generator with Level 1 acoustical enclosure. Complete with long run base mounted fuel tank with all required monitoring.
- B. Batteries: 12 volt sintered AGM lead acid storage batteries (in series as required) rated as recommended by the engine manufacturer for cyclic cranking of standby generating sets of this size shall be provided for the engine. Provide, inter-cell connections and cable connections with lugs and mounting supports shall be provided for each battery for mounting in the generator enclosure. Each battery shall have sufficient capacity to provide 120 seconds total cranking time without recharging. The batteries shall carry a two-year full replacement guarantee followed by a ten year prorated warranty. The battery manufacturer shall provide detailed battery sizing calculations for this project for review as a shop drawing.
- C. Engine Cooling System
1. Cooling system coolant solution of 50% inhibited long life ethylene glycol and 50% water.
  2. Coolant hoses with flexible silicon impregnated assemblies with non-porous rubber inside surface and aging, ultraviolet and abrasion resistant fabric outer covering. The ratings shall be 50 psig maximum working pressure with 180°F coolant, and non-collapsible under vacuum. Hoses and belts shall not be painted.
  3. Provide a complete coolant recovery system designed to collect and contain any coolant lost due to overflow of over pressure release.
- D. Air Cleaner

1. Element dry type engine inlet air. At full load operation, the allowable air inlet restriction shall not exceed the recommendations of the engine manufacturer.

E. Engine Protective and Indicating Devices

1. Functional Description: When the mode-selector switch on the control and monitoring panel is in the automatic position, remote control contacts in one or more separate automatic-transfer switches initiate starting and stopping of the generator set. When the mode-selector switch is switched to the on position, the generator set manually starts. The off position of the same switch initiates generator set shutdown. When the generator set is running, specified system or equipment failures or derangements automatically shutdown the generator set, trips the generator circuit breaker (in the building) and initiate alarms. Operation of any remote emergency-stop switch(es) also shuts down the generator set and trips circuit breaker
2. Operating and safety indications, protective devices, basic system controls, and engine gages are grouped on a common control and monitoring panel mounted on the generator set. Mounting method isolates the control from generator set vibration.
  - a. Shunt Trip Device: For building load output circuit breaker (located in service room), connected to trip circuit breaker when generator set is shut down by protective devices.
3. The remote panel annunciator shall mimic that on the generator mounted control panel. It shall contain fault lights for those items listed elsewhere and in addition shall have individual indication lamps for the mode selector switch (auto, on, and off) positions, low main fuel tank level and engine running. The remote panel annunciator shall be provided with a dry form C (NO & NC) contact for fault.
4. Remote Emergency Stop Switches: Provide Flush wall mounted, prominently labeled and protected from accidental operation. Provide one at each generator room exit. Cutler Hammer E22J2N8. Provide Safety Technologies STI6605 or equivalent protective cover to prevent accidental operation.

F. Jacket Water Heater

1. Provide automatic thermostatically controlled tank-type heated jacket water circulating system is included for operation at 208 volts AC, single phase. The system shall be rated to maintain 90°F ambient. A lube oil pressure cutout switch shall shut down the heater during engine operation. Provide all circuiting for the jacket heater.

2.02 SOURCE QUALITY CONTROL

A. Testing

1. Include testing of the final modified unit.
2. Include engine generator set as modified, exhaust silencers, radiators, voltage regulator control panel annunciators and remote panel annunciator and all accessories required for operation of the generator.
3. The tests shall be witnessed by representatives of, the Owner, architect/engineer, mechanical contractor, and the electrical contractor. Provide fourteen days advance notice of the witness factory tests.
4. The vendor shall submit to the architect/engineer for approval a detailed procedure of the proposed test three weeks prior to the scheduled factory tests.
5. All equipment shall be ready for operation prior to start of the witnessed tests.
6. The engine generator set shall then be operated at full rated load for at least two hours. During the full load tests, readings shall be recorded of the values listed below. The readings shall be made at 30-minute intervals, starting at the beginning of the test and including the values at the end of the cool-down period.
  - a. Ambient temperature, barometric pressure and humidity.
  - b. Generator kilowatt load.
  - c. Generator currents in all three phases.
  - d. Generator voltage across all three phases L-L and L-N.
  - e. Generator frequency.
  - f. Engine coolant temperature.
  - g. Engine lube oil pressure.
  - h. Engine lube oil temperature.
  - i. Engine fuel consumption.
7. During the full load tests, measurements shall be made at the exhaust silencer to ensure that the specified maximum sound level is not exceeded.
8. Provide demonstration of the following compliance to specified performance requirements:
  - a. Single step load pick-up.
  - b. Transient and steady state governing.
  - c. Transient and steady state voltage performance.
  - d. Safety shutdown devices.

9. If the equipment fails to meet specification requirements during the witnessed tests, the vendor shall correct the cause of the failure and repeat the tests to the satisfaction of prior to shipment at the expense of the manufacturer.
10. Four legible certified copies of the test results shall be provided to the architect/engineer. The test results shall include a log of all readings taken during the test run.

### 2.03 ACCESSORIES

- A. Provide the replacement fill of lubricating oil and 50% inhibited ethylene glycol solution coolant in the cooling loop.
- B. Start circuitry shall be compatible with the existing generator start circuitry. Provide all appurtenances to start generator set in the same fashion as the existing.
- C. Identify system components.
- F. Provide EPO Stations. Stations shall be Push/Pull maintained switches with mushroom type actuators with double throw multi-pole contact blocks mounted in a FD style back box with over all clear lexan flip cover. Provide legend plate indicating "GENERATOR #X EMERGENCY SHUTDOWN"... "PULL TO RESET". Switch is push on maintained and pull off maintained with a minimum of 2 double throw contacts. Similar to Square D ZB2BX4 with series ZB2 BZ105 base contact block. Circuit One pole to the associated generator shutdown circuit. Provide clear lexan flip cove is similar to the covers often provided for fire alarm pull stations except there is no audible alarm nor "fire" legend

## PART 3 – EXECUTION

### 3.01 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Provide services of a factory-authorized service representative to supervise installation, connection and on-site testing of units and to report results in writing.
- B. Supervised Adjusting and Pre-testing: Under supervision of factory-authorized service representative, pretest all system functions, operations, and protective features. Provide all instruments and equipment required for tests. Adjust to ensure operation is according to specifications.
- C. On-Site Tests: Under supervision of factory authorized service representative, conduct the following tests:
  1. Load Tests: provide a complete full load and step load test of the equipment. Test all specified responses indicated ion part 2. Record all teats and issue certified test reports. Perform all tests again to the satisfaction of the Engineer Conduct all tests as specified in "Source Quality Control" in this section.

2. Battery-Charger Tests: Verify specified rates of charge for both equalizing and float-charging conditions.
3. System Integrity Tests: Methodically verify proper installation, connection and integrity of each element of engine generator system before and during system operation. Check for air, exhaust and fluid leaks.
4. Exhaust System Back-Pressure Test: Use a manometer with a scale exceeding 40" of water. Connect to exhaust line close to engine exhaust manifold. Verify that back pressure at full-rated load is within manufacturer's written allowable limits for the engine.
5. Exhaust Emissions Test: Conform to applicable government test criteria.

3.02 DEMONSTRATION

- A. Training: Engage a factory-authorized service representative to demonstrate adjustment, operation, and maintenance of system and to train Owner's maintenance personnel as specified below:
  1. Conduct a minimum of 2 hours of training.
  2. Schedule training with at least 7 days advance notice.

3.03 OPERATION AND MAINTENANCE INSTRUCTIONS

- A. Six copies of the operation and service instructions shall be provided by the generator manufacturer in illustrated and bound form.
- B. All equipment provided in this Specification shall be guaranteed against defects in material or workmanship for a period of one (1) year from date of initial operation/acceptance.

3.04 INSTALLATION

- A. Provide the installation, final assembly and alignment of all components of the unit. The manufacturer shall provide everything necessary for the assembly and complete installation of the unit, and evacuate, test, charge and adjust the unit for satisfactory operation.
- B. Check the entire system and all controls and, in conjunction with the contractor, make all necessary tests to ensure proper operation of the unit and verify compliance with installation and performance specifications. A test log shall be submitted to the Architect/Engineer containing hourly test data for the machine for the duration of the test.
- C. Provide all control circuitry required.

- D. Provide a circuiting required for alarm points and engine generator control and shutdown. Including the shunt trip of the in building generator power breaker when the generator shuts down on response to a protective or emergency device.
- E. Provide EPO control circuiting and ancillary devices. Provide EPOs on the generator and at the main electric room.
- F. Provide all nuts, bolts, and gaskets required to connect all mating flanges. Nuts, bolts, and washers shall be stainless steel or case-hardened rated at 1100°F. All other materials and appurtenances, structural steel supports, anchors, and guides required to complete the installation, as specified and as indicated on the drawings, shall be furnished.
- G. In addition to the controls indicated on the drawings and herein, provide all control and circuitry for the following associated systems:
  - 1. Remote generator control panels.
  - 2. Mimic panels.
  - 8. All wiring for engine control indication alarm and monitoring shall be connected to terminal blocks in an accessible terminal cabinet located on the engine.

3.05 CLEANING

- A. Upon completion of installation, inspect system components. Remove paint splatters and other spots, dirt, and debris. Touch-up scratches and mars of finish to match original finish. Clean components internally using methods and materials recommended by manufacturer.

END OF SECTION

## **SECTION 265100 - INTERIOR LIGHTING**

### **PART 1 - GENERAL**

#### 1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

#### 1.02 SUMMARY

- A. This Section includes interior lighting fixtures, lamps, ballasts, emergency lighting units, and accessories.

#### 1.03 DEFINITIONS

- A. Emergency Lighting Unit: A fixture with integral AC/DC inverter fed from normal AC power, and a switch leg for lighting control.
- B. Fixture: A complete lighting unit, exit sign, or emergency lighting unit. Fixtures include lamps and parts required to distribute light, position and protect lamps, and connect lamps to power supply. Internal battery-powered exit signs and emergency lighting units also include a battery and the means for controlling and recharging the battery. Emergency lighting units include ones with and without integral lamp heads.
- C. Average Life: The time after which 50 percent fails and 50 percent survive under normal conditions.

#### 1.04 SUBMITTALS

- A. General: Submit each item in this Article according to the Conditions of the Contract and Division 1 Specification Sections.
- B. Product Data describing fixtures, lamps, ballasts, and emergency lighting units. Arrange Product Data for fixtures in order of fixture designation. Include data on features and accessories and the following:
  - 1. Outline drawings indicating dimensions and principal features of fixtures.
  - 2. Electrical Ratings and Photometric Data: Certified results of independent laboratory tests for fixtures and lamps.
  - 3. Battery and charger data for emergency lighting units.
- C. Shop Drawings detailing nonstandard fixtures and indicating dimensions, weights, method of field assembly, components, features and accessories.

- D. Wiring diagrams detailing wiring for control system showing both factory-installed and field-installed wiring for specific system of this Project, and differentiating between factory-installed and field-installed wiring.
- E. Coordination Drawings showing fixtures mounted on ceiling. Indicate coordination with other equipment installed in vicinity.
- F. Maintenance data for fixtures to include in the operation and maintenance manual specified in Division 1.

#### 1.05 QUALITY ASSURANCE

- A. Electrical Component Standard: Provide components that comply with NFPA 70 and that are listed and labeled by UL where available.
- B. Listing and Labeling: Provide fixtures, emergency lighting units, and accessory components specified in this Section that are listed and labeled for their indicated use and installation conditions on Project.
  - 1. Special Listing and Labeling: Provide fixtures for use in damp or wet locations, underwater, and recessed in combustible construction that are specifically listed and labeled for such use. Provide fixtures for use in hazardous (classified) locations that are listed and labeled for the specific hazard.
  - 2. The Terms "Listed" and "Labeled": As defined in the National Electrical Code, Article 100.
  - 3. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" (NRTL) as defined in OSHA Regulation 1910.7.
- C. Fixtures for Hazardous Locations: Conform to UL 844. Provide units that have Factory Mutual Engineering and Research Corporation (FM) certification for indicated class and division of hazard.
- D. Coordinate fixtures, mounting hardware, and trim with ceiling system and other items, including work of other trades, required to be mounted on ceiling or in ceiling space.

#### 1.06 WARRANTY

- A. General Warranty: The special warranty specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.
- B. Special Warranty: Provide a written warranty executed by the manufacturer agreeing to replace fixture components that fail within the specified warranty period. Such warranty shall include the placements as MOP items performed at the owner's convenience and during premium time.

- C. Special Warranty Period: Manufacturer's standard but not less than 1 years after date of Substantial Completion. Full warranty shall apply for first year, and prorated warranty for last 9 years.

1.07 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.
  - 1. Lamps: 10 lamps for every 100 of each type and rating installed. Furnish at least one of each type.
  - 2. Plastic Diffusers and Lenses: 1 for every 100 of each type and rating installed. Furnish at least one of each type.
  - 3. Ballasts: 1 for every 100 of each type and rating installed. Furnish at least one of each type.
  - 4. Globes and Guards: 1 for every 20 of each type and rating installed. Furnish at least once of each type.
  - 5. Mellinan Sleeves: Furnish at least one standard case.

**PART 2 - PRODUCTS**

2.01 MANUFACTURERS

- A. Available Products: Subject to compliance with requirements, fixtures that may be incorporated into the Work include, but are not limited to, the products specified in the Interior Lighting Fixture Schedule.

2.02 FIXTURES AND FIXTURE COMPONENTS, GENERAL

- A. Metal Parts: Free from burrs, sharp corners, and edges.
- B. Sheet Metal Components: Steel, except as indicated. Form and support to prevent warping and sagging.
- C. Doors, Frames and Other Internal Access: Smooth operating, free from light leakage under operating conditions, and arranged to permit relamping without use of tools. Arrange doors, frames, lenses, diffusers and other pieces to prevent accidental falling during relamping and when secured in operating position.
- D. Reflecting Surfaces: All fixtures shall be provided with a specular reflector designed to increase fixture efficiency to provide 80% the lighting level with half the lamps. Minimum reflectance as follows, except as otherwise indicated:
  - 1. White Surfaces: 85 percent.
  - 2. Specular Surfaces: 83 percent.

3. Diffusing Specular Surfaces: 75 percent.
  4. Laminated Silver Metalized Film: 90 percent.
- E. Lenses, Diffusers, Covers and Globes: 100 percent virgin acrylic plastic or water white, annealed crystal glass, except as otherwise indicated.
1. Plastic: High resistance to yellowing and other changes due to aging, exposure to heat and UV radiation.
  2. Lens Thickness: 0.125 inch minimum; except where greater thickness is indicated.
- F. Fixture Support Components: Comply with Division 16 Section "Basic Electrical Materials and Methods."
1. Single-Stem Hangers: 1/2-inch steel tubing with swivel ball fitting and ceiling canopy. Finish same as fixture.
  2. Twin-Stem Hangers: Two, 1/2-inch steel tubes with single canopy arranged to mount a single fixture. Finish same as fixture.
  3. Rod Hangers: 3/16-inch minimum diameter, cadmium-plated, threaded steel rod.
  4. Hook Hanger: Integrated assembly matched to fixture and line voltage and equipped with threaded attachment, cord, and locking-type plug.
  5. Recessed Fluorescent Fixtures: Support independent from the suspended ceiling with cable or chains at each corner of the fixture. Adjust supports to remove all fixture weight from the suspended ceiling structure.
- G. Fluorescent Fixtures: Conform to UL 1570.
- H. Fluorescent Ballasts: Electronic integrated circuit, solid-state, full-light-output, energy-efficient type compatible with lamps and lamp combinations to which connected. Prescolite Intellect ballasts including the P120-23RS and P277-23RS ballasts are not acceptable.
1. Certification by Electrical Testing Laboratory (ETL).
  2. Labeling by Certified Ballast Manufacturers Association (CBM).
  3. Type: Class P, high power factor, except as otherwise indicated.
  4. Sound Rating: "A" rating, except as otherwise indicated.
  5. Voltage: Match connected circuits.
  6. Lamp Flicker: Less than 1 percent.
  7. Minimum Power Factor: 90 percent.

8. Total Harmonic Distortion (THD) of Ballast Current: Less than 10 percent.
  9. Conform to FCC Regulations Part 15, Subpart J for electromagnetic interference.
  10. Conform to IEEE C62.41, Category A, for resistance to voltage surges for normal and common modes.
  11. Multilamp Ballasts: Use multiple single lamp ballasts for multilamp fixtures where possible.
  12. Lamp-ballast connection method does not reduce normal rated life of lamps.
  13. Low-Temperature Fluorescent Ballasts: Comply with above requirements, except ballast may be Class P electromagnetic type. Starting temperature is minus 20 degrees C or colder.
  14. Dimming Ballasts: Electronic type providing smooth dimming over a minimum range from 100 to 5 percent light output. Listed for use with specific fluorescent dimming system provided. Dimming systems are specified in Division 16 Section 16915 - Lighting Control Equipment. Fluorescent wall dimmers are specified in Division 16 Section 16140 - Wiring Devices.
- J. Electromagnetic Interference (EMI) Filters: Integral to fixture assembly. Provide one filter for each ballast. Suppress EMI as required by MIL-STD-461.
- K. High-Intensity-Discharge (HID) Fixtures: Conform to UL 1572.
- L. HID Ballasts: Conform to UL 1029 and ANSI C82.4. Include the following features, except as otherwise indicated.
1. Constant wattage autotransfer (CWA) or regulating high-power-factor type, unless otherwise indicated.
  2. Operating Voltage: Match system voltage.
  3. Single-Lamp Ballasts: Minimum starting temperature of minus 30 degrees C.
  4. Normal Ambient Operating Temperature: 40 degrees C.
  5. Open circuit operation will not reduce average life.
  6. High Pressure Sodium (HPS) Ballasts: Equip with a solid-state igniter/starter having an average life in pulsing mode of 10,000 hours at an igniter/starter case temperature of 90 degrees C.

7. Encapsulation: Manufacturer's standard epoxy-encapsulated model designed to minimize audible fixture noise.
- M. Instant Restrike Device: Solid-state, potted module, mounted inside HPS fixture and compatible with HPS lamps, ballasts and sockets up to 150 W.
1. Restrike Range: 105 to 130 VAC.
  2. Maximum Voltage: 250 V peak or 150 VAC RMS.
- N. Auxiliary, Instant-On, Quartz System: Automatically switches quartz lamp when fixture is initially energized and when momentary power outages occur. Turns quartz lamp off automatically when HID lamp reaches approximately 60 percent light output.
- O. Incandescent Fixtures: Conform to UL 1571.
- P. Exit Signs: Conform to UL 924 and the following:
1. Sign Colors: Green letters on a background.
  2. Minimum Height of Letters: 6" high letters with a uniform 3/4" stroke. Visible "dots" from LED sources are not acceptable.
  3. Arrows: Include as indicated.
  4. Illuminated faces: As indicated.
  5. Lamps for AC Operation: Light-emitting diodes (LED), 70,000 hours minimum rated life.
  6. Integral automatic high/low trickle charger in a self-contained power pack. Sealed, maintenance-free, nickel-cadmium type with special warranty.

## 2.03 LAMPS

- A. Comply with ANSI C78 series that is applicable to each type of lamp.
- B. Fluorescent Color Temperature and Minimum Color-Rendering Index (CRI): 4100 K and 85 CRI, except as otherwise indicated.
- C. Non-compact Fluorescent Lamp Life: Rated average is 20,000 hours at 3 hours per start when used on rapid start circuits.

## 2.04 FINISHES

- A. Manufacturer's standard, except as otherwise indicated, applied over corrosion-resistant treatment or primer, free of streaks, runs, holidays, stains, blisters, and similar defects.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Set units plumb, square and level with ceiling and walls, and secure according to manufacturer's written instructions and approved Shop Drawings. Support fixtures according to requirements of Division 16 Section "Basic Electrical Materials and Methods."
- B. Support for Suspended Fixtures: Seismically brace pendants and rods over 48 inches long to limit swinging. Provide unistrut braces every 10' on center along rows of fixtures mounted on common unistrut channels else brace each fixture independently. Support stem-mounted, single-unit, suspended fluorescent fixtures with twin-stem hangers. For continuous rows, use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of chassis, including one at each end.
  - 1. Install support clips for recessed fixtures, securely fastened to ceiling grid members, at or near each fixture corner.
  - 2. Fixtures Smaller than Ceiling Grid: Install a minimum of 4 rods or wires for each fixture. Do not support fixtures by ceiling acoustical panels.
  - 3. Fixtures of Sizes Less than Ceiling Grid: Center in acoustical panel. Support fixtures independently with at least two 3/4-inch metal channels spanning and secured to the structure above.
- C. Support for Suspended Fixtures: Seismically brace pendants and rods over 48 inches long to limit swinging. Provide Unistrut braces every 10' on center along rows of fixtures mounted on common Unistrut channels else brace each fixture independently. Support stem-mounted, single-unit, suspended fluorescent fixtures with two-stem hangers. For continuous rows, use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of chassis, including one at each end.
- D. Lamping: Where specific lamp designations are not indicated, lamp units according to manufacturer's instructions.

### **3.02 CONNECTIONS**

- A. Ground lighting units. Tighten electrical connectors and terminals, including grounding connections, according to manufacturer's published torque-tightening values. Where manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.
- B. Circuit Emergency inverter ballasts with unswitched AC source to provide power failure sensing allowing the ballast to automatically switch over to the DC source and illuminate the fixture upon AC power failure. Provide AC switch leg to each inverter ballast as well to accommodate standard switching functions as designated on the contract drawings. DC power to the inverter ballast shall be

constant DC power source. Switching to DC source shall be accomplished at each inverter ballast. Do not connect a switched DC power source to the inverter ballast.

3.03 FIELD QUALITY CONTROL

- A. Inspect each installed fixture for damage. Replaced damaged fixtures and components.
- B. Give advance notice of dates and times for field tests.
- C. Provide instruments to make and record test results.
- D. Tests: Verify normal operation of each fixture after fixtures have been installed and circuits have been energized with normal power source. Interrupt electrical energy to demonstrate proper operation of emergency lighting installation. Include the following information in tests of emergency lighting equipment:
  - 1. Normal transfer to battery source and retransfer to normal.
  - 2. Low supply voltage transfer.
- E. Replace or repair malfunctioning fixtures and components, then retest. Repeat procedure until all units operate properly.
- F. Report results of tests.
- G. Replace fixtures that show evidence of corrosion during Project warranty period.

3.04 ADJUSTING AND CLEANING

- A. Clean fixtures after installation. Use methods and materials recommended by manufacturer.
- B. Adjust amiable fixtures to provide required light intensities.

END OF SECTION

## **SECTION 265600 - EXTERIOR LIGHTING**

### **PART 1 - GENERAL**

#### **1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this section and all other sections of Division 26.

#### **1.2 SUMMARY**

- A. Section Includes:
  - 1. Exterior luminaires with lamps/modules, and drivers.
  - 2. Luminaire-mounted photoelectric relays.
  - 3. Poles and accessories.

#### **1.3 DEFINITIONS**

- A. CCT: Correlated color temperature.
- B. CRI: Color-rendering index.
- C. LER: Luminaire efficacy rating.
- D. Luminaire: Complete lighting fixture, including ballast housing if provided.
- E. Pole: Luminaire support structure, including tower used for large area illumination.
- F. Standard: Same definition as "Pole" above.

#### **1.4 SUBMITTALS**

- A. Product Data: For each luminaire, pole, and support component, arranged in order of lighting unit designation. Include data on features, accessories, finishes, and the following:
  - 1. Physical description of luminaire, including materials, dimensions, effective projected area, and verification of indicated parameters.
  - 2. Details of attaching luminaires and accessories.
  - 3. Details of installation and construction.
  - 4. Luminaire materials.

5. Photometric data based on laboratory tests of each luminaire type, complete with indicated lamps, ballasts, and accessories.
  6. Voltage drop calculations.
    - a. **Manufacturer Certified Data:** Photometric data shall be certified by manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.
  7. Photoelectric relays.
  8. Lamps, including life, output, CCT, CRI, lumens, and energy-efficiency data.
  9. Materials, dimensions, and finishes of poles.
  10. Means of attaching luminaires to supports, and indication that attachment is suitable for components involved.
  11. Anchor bolts for poles.
  12. Pole foundations.
  13. LED lamps/modules and drivers.
- B. **Shop Drawings:** Include plans, elevations, sections, details, and attachments to other work.
1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  2. Anchor-bolt templates keyed to specific poles and certified by manufacturer.
  3. Design calculations, certified by a qualified professional engineer, indicating strength of foundations and soil conditions on which they are based.
  4. **Wiring Diagrams:** For power, signal, and control wiring.
- C. **Qualification Data:** For qualified agencies providing photometric data for lighting fixtures.
- D. **Field quality-control reports.**
- E. **Operation and Maintenance Data:** For luminaires and poles to include in emergency, operation, and maintenance manuals. Provide data in electronic and hard-copy formats.
- F. **Warranty:** Sample of special warranty specified in this section
- G. **Coordination Drawings:** Provide coordination drawings by coordination with Civil and other trades.

## 1.5 QUALITY ASSURANCE

- A. **Luminaire Photometric Data Testing Laboratory Qualifications:** Provided by manufacturers' laboratory that is accredited under the National Volunteer Laboratory Accreditation Program for Energy Efficient Lighting Products.

- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency acceptable to the authority having jurisdiction, and marked for intended location and application.
- C. Comply with IEEE C2, "National Electrical Safety Code."
- D. Comply with NFPA 70.
- E. LED fixtures shall comply with the following:
  - 1. UL Standard 8750 "Light Emitting Diode Equipment for Use in Lighting Products".
  - 2. IES Standard LM-79 "Electrical and Photometric Measurements of Solid-State Lighting Products".
  - 3. IES Standard LM-80 "Measuring Lumen Maintenance of LED Light Sources".
  - 4. IES Standard TM-21 "Projecting Long term Lumen Maintenance of LED Light Sources".
  - 5. ANSI C78.377 "Specifications for the Chromaticity of Solid State Lighting Products" with LEDs binned within a maximum three-step MacAdam Ellipse to ensure color consistency amongst luminaires of the same type.

#### 1.6 DELIVERY, STORAGE, AND HANDLING

- A. Package aluminum poles for shipping according to ASTM B 660.
- B. Store poles on decay-resistant-treated skids at least twelve (12) inches above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.
- C. Retain factory-applied pole wrappings on metal poles until right before pole installation. For poles with nonmetallic finishes, handle with web fabric straps.

#### 1.7 EXTRA MATERIALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Glass and Plastic Lenses, Covers, and Other Optical Parts: One (1) for every one hundred (100) of each type and rating installed. Furnish at least one (2) of each type.
  - 2. Globes and Guards: One (1) for every twenty (20) of each type and rating installed. Furnish at least one (2) of each type.

3. LED Lamps/Modules: One (1) for every one hundred (100) (2) of each type and rating installed. Furnish at least one (1) of each type.
4. LED Drivers: One (1) for every one hundred (100) (2) of each type and rating installed. Furnish at least one (1) of each type.

## 1.8 WARRANTY/GUARANTEE

- A. See Division 26 Specification Section "Basic Electrical Requirements" for warranty and guarantee requirements.
- B. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace products that fail in materials or workmanship; that corrode; or that fade, stain, perforate, erode, or chalk due to effects of weather or solar radiation within specified warranty period. Manufacturer may exclude lightning damage, hail damage, vandalism, abuse, or unauthorized repairs or alterations from special warranty coverage.
  1. Warranty Period for Luminaires: Five (5) years from date of Substantial Completion.
  2. Warranty Period for Metal Corrosion: Five (5) years from date of Substantial Completion.
  3. Warranty Period for Color Retention: Five (5) years from date of Substantial Completion.
  4. Warranty Period for Poles: Repair or replace lighting poles and standards that fail in finish, materials, and workmanship within manufacturer's standard warranty period, but not less than three (3) years from date of Substantial Completion.

## PART 2 - PRODUCTS

### 2.1 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide one (1) of the products indicated on Drawings.

### 2.2 GENERAL REQUIREMENTS FOR LUMINAIRES

- A. Luminaires shall comply with UL 1598 and be listed and labeled for installation in wet locations by an NRTL acceptable to authorities having jurisdiction.
- B. : Comply with IESNA RP-8 for parameters of lateral light distribution patterns indicated for luminaires.
- C. Metal Parts: Free of burrs and sharp corners and edges.

- D. Sheet Metal Components: Corrosion-resistant aluminum unless otherwise indicated. Form and support to prevent warping and sagging.
- E. Housings: Rigidly formed, weather- and light-tight enclosures that will not warp, sag, or deform in use. Provide filter/breather for enclosed luminaires.
- F. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses. Designed to disconnect ballast when door opens.
- G. Exposed Hardware Material: Stainless steel.
- H. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
- I. Light Shields: Metal baffles, factory installed and field adjustable, arranged to block light distribution to indicated portion of normally illuminated area or field.
- J. Reflecting surfaces shall have minimum reflectance as follows unless otherwise indicated:
  - 1. White Surfaces: 85%.
  - 2. Specular Surfaces: 83%.
  - 3. Diffusing Specular Surfaces: 75%.
- K. Lenses and Refractors Gaskets: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses and refractors in luminaire doors.
- L. Luminaire Finish: Coordinate color with architect to match UMB standards factory-assembled and -tested luminaire before shipping. Where indicated, match the finish process and color of pole or support materials.
- M. Factory-Applied Finish for Steel Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
  - 1. Surface Preparation: Clean surfaces to comply with SSPC-SP 1, "Solvent Cleaning," to remove dirt, oil, grease, and other contaminants that could impair paint bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning," or SSPC-SP 8, "Pickling."
  - 2. Exterior Surfaces: Manufacturer's standard finish consisting of one or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.
    - a. Color: As selected by UMB from manufacturer's full range.

- N. Factory-Applied Finish for Aluminum Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
1. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
  2. Natural Satin Finish: Provide fine, directional, medium satin polish (AA-M32); buff complying with AA-M20; and seal aluminum surfaces with clear, hard-coat wax.
  3. Class I, Clear Anodic Finish: AA-M32C22A41 (Mechanical Finish: medium satin; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 611.
  4. Class I, Color Anodic Finish: AA-M32C22A42/A44 (Mechanical Finish: medium satin; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I, integrally colored or electrolytically deposited color coating 0.018 mm or thicker) complying with AAMA 611.
    - a. Color (other than Polson fixtures): As determined by the architect
- O. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps and ballasts. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.
1. Label shall include the following lamp and ballast characteristics:
    - a. "USES ONLY" and include specific lamp type.
    - b. Lamp/Module code configuration and nominal wattage for luminaires.
    - c. Driver type (dim, non-dim) for luminaires.
    - d. CCT and CRI for all luminaires.

## 2.3 LED Lighting Products:

### A. Acceptable Manufacturers:

1. Luminaires:
  - a. Refer to the Luminaires Schedule on the drawings.
2. Drivers:
  - a. Cree.
  - b. EldoLED.
  - c. Philips/Advance.
  - d. Thomas Research Products.
  - e. Or as supplied by the luminaire manufacturer, in compliance with these Specifications.
3. Dimmable Drivers:
  - a. Cree.

- b. EldoLED.
- c. Philips/Advance.
- d. Thomas Research Products.
- e. Or as supplied by the luminaire manufacturer, in compliance with these Specifications.

B. Luminaires:

1. Refer to Luminaire Schedule for specified parameters such as correlated color temperature (CCT) value(s), lumen output, efficiency, etc.
2. Products shall be fabricated to be Reduction of Hazardous Substances (RoHS) - compliant.
3. Must maintain their warrantied life while operating within the manufacturers' specified environmental parameters.
4. The lumen value specification listed in the Luminaire Schedule is a delivered lumen value specification. Products supplied shall deliver not less than the lumen value specified.
5. The lumen maintenance specification of any assembled LED based chip, array, module, driver, and luminaire combination shall be a minimum of L70, at 50,000 hours, as tested and measured in compliance with IES documents LM-79 and LM-80.
6. Except as otherwise stated in the Luminaire Schedule, the light source shall provide a minimum CRI of >85.
7. Operating temperature rating shall be between -40°C (-40°F) and 50°C (120°F).

C. Drivers: Listed and so labeled per UL 8750 and UL 1310, and shall meet or exceed the following general specification criteria:

1. Designed and tested to be compatible with the luminaire light source operating current, voltage, and output power requirements.
2. Inaudible above 27 dBA ambient sound level.
3. Designed, fabricated, and tested to operate at an input voltage of 120 – 480VAC, ±10%, at 60 Hz, with no perceptible change in light source output.
4. Contribute less than 20% total harmonic distortion, operating at full rated load, and shall not exceed the maximum allowable THD requirements allowed per standard ANSI C82.11.
5. Provided with integral short circuit, open circuit, and overload protection.
6. Have an operating power factor ≥ 0.9.
7. Limit conducted and radiated interference in compliance with FCC 47 CFR Part 18.
8. Housed in a UL compliant and listed enclosure, suitable for remote installation where required, as defined in NFPA 70 – the National Electrical Code.
9. Starting temperature -40°C (-40°F).
10. Power supplies Class I or II output.

11. Surge Protection: The system must survive 250 repetitive strikes of “C Low” wave forms at 1-minute intervals with less than 10% degradation in clamping voltage. “C Low” waveforms are as defined in IEEE/ANSI C62.41.2-2002, Scenario 1 Location Category C.

D. Dimmable Drivers - In addition to the general specification criteria specified above:

1. Have an operating power factor of  $\geq 0.9$  at full load, and not less than 0.8 at dimmed level.
2. Provide smooth, flicker-free, dimmable light output from 100% to less than 1%.
3. 0-10VDC "sinking" type dimming control protocol per enforced version of IEC Standard 60929, unless otherwise noted or required.

## 2.4 LUMINAIRE-MOUNTED PHOTOELECTRIC RELAYS

A. Comply with UL 773 or UL 773A.

B. Contact Relays: Factory mounted, single throw, designed to fail in the on position, and factory set to turn light unit on at one and one half (1.5) fc to three (3) fc and off at four and one half (4.5) fc to ten (10) fc with fifteen (15) second minimum time delay. Relay shall have directional lens in front of photocell to prevent artificial light sources from causing false turnoff.

1. Relay with locking-type receptacle shall comply with ANSI C136.10.
2. Adjustable window slide for adjusting on-off set points.

## 2.5 GENERAL REQUIREMENTS FOR POLES AND SUPPORT COMPONENTS

A. Luminaire Attachment Provisions: Comply with luminaire manufacturers' mounting requirements. Use stainless-steel fasteners and mounting bolts unless otherwise indicated.

B. Mountings, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.

1. Materials: Shall not cause galvanic action at contact points.
2. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication unless otherwise indicated.
3. Anchor-Bolt Template: Plywood or steel.

C. Hand hole: Oval-shaped, with minimum clear opening of two and one half (2-1/2) inches by five (5) inches, with cover secured by stainless-steel captive screws.

D. Concrete Pole Foundations: By general contractor; Cast in place, with anchor bolts to match pole-base flange.

- E. Breakaway Supports: Frangible breakaway supports, tested by an independent testing agency acceptable to authorities having jurisdiction, according to AASHTO LTS-4-M.

## 2.6 STEEL POLES

- A. Poles: Comply with ASTM A 500, as specified by catalog number on the lighting fixture schedule with access handhole in pole wall.
  - 1. Shape: see schedule
  - 2. Mounting Provisions: Butt flange for bolted mounting on foundation or breakaway support.
- B. Brackets for Luminaires: Detachable, cantilever, without underbrace.
  - 1. Adapter fitting welded to pole, allowing the bracket to be bolted to the pole mounted adapter, then bolted together with stainless steel bolts.
  - 2. Cross Section: Tapered oval, with straight tubular end section to accommodate luminaire.
  - 3. Match pole material and finish.
- C. Pole-Top Tenons: Fabricated to support luminaire or luminaires and brackets indicated, and securely fastened to pole top.
- D. Steps: Fixed steel, with nonslip treads, positioned for fifteen (15) inch vertical spacing, alternating on opposite sides of pole; first step at elevation ten (10) feet above finished grade.
- E. Grounding and Bonding Lugs: Welded one half (1/2) inch threaded lug, complying with requirements in Division 26 Section "Grounding and Bonding for Electrical Systems," listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole.
- F. Cable Support Grip: Wire-mesh type with rotating attachment eye, sized for diameter of cable and rated for a minimum load equal to weight of supported cable times a five (5.0) safety factor.
- G. Prime-Coat Finish: Manufacturer's standard prime-coat finish ready for field painting.
- H. Galvanized Finish: After fabrication, hot-dip galvanize complying with ASTM A 123/A 123M.
- I. Factory-Painted Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
  - 1. Surface Preparation: Clean surfaces to comply with SSPC-SP 1, "Solvent Cleaning," to remove dirt, oil, grease, and other contaminants that could impair

- paint bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning," or with SSPC-SP 8, "Pickling."
2. Interior Surfaces of Pole: One coat of bituminous paint, or otherwise treat for equal corrosion protection.
  3. Exterior Surfaces: Manufacturer's standard finish consisting of one (1) or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.
    - a. Color: As selected by Architect from manufacturer's full range.

## 2.7 ALUMINUM POLES

- A. Poles: ASTM B 209, 5052-H34 marine sheet alloy with access handhole in pole wall.
  1. Shape: Dual Round, straight .
  2. Mounting Provisions: Butt flange for bolted mounting on foundation or breakaway support.
- B. Pole-Top Tenons: Fabricated to support luminaire or luminaires and brackets indicated, and securely fastened to pole top.
- C. Grounding and Bonding Lugs: Welded one half (1/2) inch threaded lug, complying with requirements in Division 26 Section "Grounding and Bonding for Electrical Systems," listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole.
- D. Brackets for Luminaires: Detachable, with pole and adapter fittings of cast aluminum. Adapter fitting welded to pole and bracket, than bolted together with stainless-steel bolts.
  1. Tapered oval cross section, with straight tubular end section to accommodate luminaire.
  2. Finish: Same as luminaire.
- E. Prime-Coat Finish: Manufacturer's standard prime-coat finish ready for field painting.
- F. Aluminum Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
  - a. Color: As selected by Architect.

## 2.8 POLE ACCESSORIES

- A. Base Covers: Manufacturers' standard metal units, arranged to cover pole's mounting bolts and nuts. Finish same as pole.

## **PART 3 - EXECUTION**

### **3.1 LUMINAIRE INSTALLATION**

- A. Install lamps in each luminaire.
- B. Fasten luminaire to indicated structural supports.
- C. Adjust luminaires that require field adjustment or aiming. Include adjustment of photoelectric device to prevent false operation of relay by artificial light sources, favoring a north orientation.

### **3.2 POLE INSTALLATION**

- A. Alignment: Align pole foundations and poles for optimum directional alignment of luminaires and their mounting provisions on the pole.
- B. Clearances: Maintain the following minimum horizontal distances of poles from surface and underground features unless otherwise indicated on Drawings:
  - 1. Fire Hydrants and Storm Drainage Piping: Sixty (60) inches
  - 2. Water, Gas, Electric, Communication, and Sewer Lines: Ten (10) feet
  - 3. Trees: Fifteen (15) feet from tree trunk.
- C. Concrete Pole Foundations: Set anchor bolts according to anchor-bolt templates furnished by pole manufacturer. Concrete materials, installation, and finishing requirements are specified in Division 03 Section "Cast-in-Place Concrete."
- D. Foundation-Mounted Poles: Mount pole with leveling nuts, and tighten top nuts to torque level recommended by pole manufacturer.
  - 1. Grout void between pole base and foundation. Use nonshrink or expanding concrete grout firmly packed to fill space.
  - 2. Install base covers unless otherwise indicated.
  - 3. Use a short piece of one half (1/2) inch diameter pipe to make a drain hole through grout. Arrange to drain condensation from interior of pole.
  - 4. Orient hinged side of pole base facing the street.
- E. Raise and set poles using web fabric slings (not chain or cable).

### **3.3 BOLLARD LUMINAIRE INSTALLATION**

- A. Align units for optimum directional alignment of light distribution.
- B. Install on concrete base with top four (4) inches above finished grade or surface at bollard location. Cast conduit into base, and shape base to match shape of bollard base.

Finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Division 03 Section "Cast-in-Place Concrete."

### 3.4 INSTALLATION OF INDIVIDUAL GROUND-MOUNTING LUMINAIRES

- A. Install on concrete base with top four (4) inches above finished grade or surface at luminaire location. Cast conduit into base, and finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Division 03 Section "Cast-in-Place Concrete."

### 3.5 CORROSION PREVENTION

- A. Steel Conduits: Comply with Division 26 Section "Raceway and Boxes for Electrical Systems." In concrete foundations, wrap conduit with 0.010-inch- thick, pipe-wrapping plastic tape applied with a 50 % overlap. Aluminum shall not be used.

### 3.6 GROUNDING

- A. Ground metal poles and support structures according to Division 26 Section "Grounding and Bonding for Electrical Systems."
  - 1. Install grounding electrode for each pole unless otherwise indicated.
  - 2. Install grounding conductor pigtail in the base for connecting luminaire to grounding system.

### 3.7 FIELD QUALITY CONTROL

- A. Inspect each installed fixture for damage. Replace damaged fixtures and components.
- B. Illumination Observations: Verify normal operation of lighting units after installing luminaires and energizing circuits with normal power source.
  - 1. Verify operation of photoelectric controls.
- C. Illumination Tests:
  - 1. Measure light intensities at night. Use photometers with calibration referenced to NIST standards. Comply with the following IESNA testing guide(s):
    - a. IESNA LM-64, "Photometric Measurements of Parking Areas."
    - b. IESNA LM-72, "Directional Positioning of Photometric Data."
- D. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

3.8 DEMONSTRATION

- A. Train Owner's maintenance personnel to adjust, operate, and maintain luminaire lowering devices.

END OF SECTION 265600

## SECTION 283111 – FIRE ALARM SYSTEM

### PART 1 - GENERAL

#### 1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Agreement, including General Conditions and Division 1 Specification Sections, apply to this and other Sections of Division 16.

#### 1.02 SUMMARY

- A. This section includes a complete fire alarm system.
- B. A fire alarm system at this building is being upgraded and expanded. The scope under this contract includes:
  - The removal of specific equipment.
  - The upgrade of the FACP.
  - The upgrade of certain devices.
  - The re-integration of existing to remain devices.
  - Additional equipment and devices.
- C. The work under this specification section is the responsibility of the Electrical contract including work indicated as by the fire alarm system installing contractor.
- D. Related Sections: The following Sections contain requirements that relate to this Section:
  - 1. Section “Wire and Conduit”.
  - 2. Section “Acceptance Testing”.

#### 1.03 DEFINITION

- A. FACP: Fire Alarm Control Panel.
- B. FAA: Fire Alarm Annunciator.
- C. FAGA: Fire Alarm Graphic Annunciator.
- D. ADA: Americans with disabilities Act of 1990 and 2008.
- E. ICC/ANSI A117.1 2009

#### 1.04 SYSTEM DESCRIPTION

- A. General: Hybrid conventionally zoned hard wired and Analogue addressable detection. All work under this contract shall be Non-coded, Analogue addressable, microprocessor-based fire-detection and alarm system with manual and automatic alarm initiation, analog addressable smoke detectors, and automatic alarm verification for alarms initiated by certain smoke detector zones

as indicated. System is also listed and compatible with automatic suppression agent release. Hardwired zones shall be included as spares.

The existing system is serviced, maintained and warranted by Red Hawk, Contact: John Cirocco (914)418-9420 johncirocco@adt.com. maintain all existing warrantees for the system.

- B. Signal Transmission: Multiplex signal transmission dedicated to fire alarm service only.
- C. Alarm Indication: By actuation of audiovisual indicating appliances using strobes and tone generating speaker-horns.
- D. Visual Alarm Indication: By xenon-strobe-type units.
- E. System connections for alarm-initiating and alarm-indicating circuits. Class A wiring.
- F. The requirements of the Contract Documents, including the General and Supplementary General Condition and Division 1 - General Requirements shall apply to the work of this section.
- G. At the time of bid, all exceptions taken to these Specifications, all variances from these Specification and all substitutions of operating capabilities or equipment called for in these Specification shall be listed in writing and forwarded to the Engineer. Any such exception, variances or substitutions which were not listed at the time of bid and are identified in the submittal, shall be grounds for immediate disapproval without comment.
- H. The entire system shall be installed with aesthetics in mind. All control panels and remote annunciators installed shall be flush mounted with no exposed conduit or cable trays.

## 1.2 WORK INCLUDED

- A. The work covered by this Section of the Specification shall include all labor, equipment, materials and services to furnish and install a complete fire alarm system of the addressable, non-coded type. It shall be complete with all necessary hardware, software and memory specifically tailored for this installation. It shall be possible to permanently modify the software on site by using a plug-in programmer. The system shall consist of, but not be limited to, the following:
  - 1. Fire Alarm Control Panel and related remote data gathering panels.
  - 2. Remote Annunciators with flush backbox.
  - 3. Addressable manual fire alarm stations.
  - 4. Addressable analog area smoke detectors.
  - 5. Addressable analog duct smoke detectors.
  - 6. Addressable analog heat detectors.
  - 7. Magnetic door\card access release override control.
  - 8. Audible notification appliances - horns.
  - 9. Visual notification appliances - strobes.

10. Central station alarm connection control.
11. Air handling systems shutdown control.
12. Magnetic door holder release.
13. Dry pipe sprinkler release valve/deluge valve control.
14. Pre-Action Sprinkler System.
15. Sprinkler supervisory switches and tamper switch supervision.
16. Battery standby.

### 1.3 APPLICABLE CODES AND STANDARDS

- A. All equipment shall be UL listed for its intended use and conform to the latest UL Standards.
- B. Underwriters Laboratories Inc.: The system and all components shall be listed by Underwriters Laboratories Inc. for use in fire protective signaling system under the following standards as applicable:

UL 864/UOJZ, APOU Control Units for Fire Protective Signaling Systems.

UL 268 Smoke Detectors for Fire Protective Signaling Systems.

UL 268A Smoke Detectors for Duct Applications.

UL 217 Smoke Detectors Single Station.

UL 521 Heat Detectors for Fire Protective Signaling Systems.

UL 228 Door Holders for Fire Protective Signaling Systems.

UL 464 Audible Signaling Appliances.

UL 1638 Visual Signaling Appliances.

UL 38 Manually Activated Signaling Boxes.

UL 346 Waterflow Indicators for Fire Protective Signaling Systems.

UL 1971 Standard for Signaling Devices for the Hearing Impaired

UL 1481 Power Supplies for Fire Protective Signaling Systems.

UL 1711 Amplifiers for Fire Protective Signaling Systems.

UUKL The Fire Alarm system shall be UUKL for Smoke Control.

- C. This installation shall comply with:
  1. Americans with Disabilities Act (ADA)
  2. National Electric Code, Article 760.
  3. National Fire Protection Association Standards: NFPA72
  4. Local and State Building Codes and the Local Authorities Having Jurisdiction.
  5. International Standards Organization (ISO): ISO-9001

### 1.4 RELATED DOCUMENTS

- A. Secure permits and approvals prior to installation.
- B. Prior to commencement and after completion of work notify Authorities Having Jurisdiction.
- C. Submit letter of approval for installation before requesting acceptance of system.

### 1.5 RELATED WORK

- A. The Contractor shall coordinate work in this Section with all related trades. Work and/or equipment provided in other Sections and related to the fire alarm system shall include, but not be limited to:

1. Sprinkler waterflow and supervisory switches shall be furnished and installed by the fire protection contractor, but wired and connected by the electrical contractor. Modification of existing sprinkler devices to accommodate monitoring by the new fire alarm system shall be the responsibility of the fire alarm system installing contractor.
2. Duct smoke detectors shall be furnished, wired and connected by the electrical contractor. The HVAC contractor shall furnish necessary duct opening to install the duct smoke detectors.
3. New air handling and smoke exhaust system fan control circuits and status contacts to be furnished by the HVAC control equipment.
4. Elevator recall control circuits to be provided by the elevator control equipment. Modifications to the existing elevator controls to accommodate ANSI A17.1 shunt trip activation shall be provided by the elevator controls contractor. Any shunt trip circuit breakers and related wiring required for ANSI A17.1 compliance shall be provided by the electrical contractor (see power riser for more details).
5. Dry pipe/deluge sprinkler system release valve control circuits and supervision contacts shall be provided by the dry pipe/deluge sprinkler system control equipment.
5. Kitchen hood extinguishing systems status monitoring.
6. Emergency generator status monitoring
  - a. Running indication
  - b. Fail to start indication
7. Conduit: Section 16110.
8. Wire and Cables: Section 16120.
9. Installing dedicated outgoing RJ-31X telephone lines (2) shall be the responsibility of the Installing **Electrical Contractor**. Establishment and/or the reconnection to the existing central station monitoring account shall be the responsibility of the fire alarm equipment vendor.

## 1.6 SUBMITTALS

- A. Provide list of all types of equipment and components provided. This shall be incorporated as part of a Table of Contents, which will also indicate the manufacturer's part number, the description of the part, and the part number of the manufacturer's product datasheet on which the information can be found.
- B. Provide description of operation of the system (Sequence of Operation), similar to that provided in Part 2 of this Section of the Specifications, to include any and all exceptions, variances or substitutions listed at the time of bid. Any such exceptions, variances or substitutions that were not listed at the time of bid and are identified in the submittal, shall be grounds for immediate disapproval without comment. The sequence of operation shall be project specific, and shall provide individual sequences for every type of alarm, supervisory, or trouble condition which may occur as part of normal or off-normal system use.

- C. Provide manufacturer's ORIGINAL printed product data, catalog cuts and description of any special installation procedures. Photocopied and/or illegible product data sheets shall not be acceptable. All product datasheets shall be highlighted or stamped with arrows to indicate the specific components being submitted for approval.
- D. Provide manufacturer's installation instruction manual for specified system.
- E. Provide samples of various items when requested.
- F. Provide copy of state License to perform such work.
- G. Provide copies of NICET Level II Fire Alarm certifications for the two (2) technicians assigned to this project.
- H. Provide shop drawings as follows:
  - 1. Coversheet with project name, address and drawing index.
  - 2. General notes drawing with peripheral device backbox size information, part numbers, device mounting height information, and the names, addresses, point of contact, and telephone numbers of all contract project team members.
  - 3. Device riser diagram, which individually depicts all control panels, annunciators, addressable devices, and notification appliances. Shall include a specific, proposed point descriptor above each addressable device. Shall include a specific, discrete point address that shall correspond to addresses depicted on the device layout floor plans. Drawing shall provide wire specifications, and wire tags shown on all conductors depicted on the riser diagram. All circuits shall have designations that shall correspond with those require on the control panel and floor plan drawings. End-of-line resistors (and values) shall be depicted.
  - 4. Control panel termination drawing(s). Shall depict internal component placement and all internal and field termination points. Drawing shall provide a detail indicating where conduit penetrations shall be made, so as to avoid conflicts with internally mounted batteries. For each additional data gathering panel, a separate control panel drawing shall be provided, which clearly indicated the designation, service and location of the control enclosure. End-of-line resistors (and values) shall be depicted.
  - 5. See section 3.4 DOCUMENTATION AND TRAINING for other documents relating to this section.
  - 6. Device typical wiring diagram drawing(s) shall be provided which depict all system components, and their respective field wiring termination points. Wire type, gauge, and jacket shall also be indicated. When an addressable module is used in multiple configurations for monitoring or controlling various types of equipment, different device typical diagrams shall be provided. End-of-line resistors (and values) shall be depicted.
  - 7. Device layout floor plans shall be created for every area served by the fire alarm system. CAD Files (AutoCAD – latest edition) shall be provided by the consulting engineer for the fire alarm system equipment vendor in the preparation of the floor plans. Floor plans shall indicate accurate locations for all control and peripheral devices. Drawings shall be NO LESS THAN 1/8-INCH SCALE. All addressable devices shall be depicted with a discrete address that corresponds with that indicated on the Riser Diagram. All notification appliances shall also be provided with a circuit address that corresponds to that depicted on the Riser Diagram. If individual floors need to be segmented to accommodate the 1/8" scale

- requirements, KEY PLANS and BREAK-LINES shall be provided on the plans in an orderly and professional manner. End-of-line resistors (and values) shall be depicted.
8. Contained in the title block of each drawing shall be symbol legends with device counts, wire tag legends, circuit schedules for all addressable and notification appliance circuits, the project name/address, and a drawing description which corresponds to that indicated in the drawing index on the coversheet drawing. A section of each drawing title block shall be reserved for revision numbers and notes. The initial submission shall be Revision 0, with Revision A, B, or C as project modifications require.
  - I. Battery calculations shall be provided on a per power supply/charger basis. These calculations shall clearly indicated the quantity of devices, the device part numbers, the supervisory current draw, the alarm current draw, totals for all categories, and the calculated battery requirements (which reflect a 20% DEGRADE, for 24 Hour supervisory, 5 minute alarm operation). Battery calculations shall also reflect all control panel component, remote annunciator, and auxiliary relay current draws. Failure to provide these calculations shall be grounds for the complete rejection of the submittal package.
  - J. Table of contents, product data sheets, sequences of operation, battery calculations, installation instructions, licenses, NICET certifications and B-Size (blackline) reduced shop drawings shall be provided by the fire alarm vendor as part of a single, spiral bound submittal book. The submittal book shall have laminated covers indicating the project address, project number, system type, and contractor. The book shall consist of labeled dividers, and shall not exceed 9 ½” in width, and 11 ½” in height. No less than three (3) sets of submittal booklets shall be provided to the consulting engineer for review and comment. Additional copies may be required at no additional cost to the project.
  - K. Scale drawing sets shall be submitted along with the submittal booklets. These drawings may be either D-Size or E-Size Blueline drawings and of a sufficient resolution to be completely read. Sets shall be bound and folded so as to not take up more than 100 square inches of space. No less than three (3) sets of scale drawing sets shall be provided to the consulting engineer for review and comment. Additional copies may be required at no additional cost to the project.
  - L. Submit color graphics of all computer based display pages for device annunciation and monitoring.

## 1.7 WARRANTY

- A. Maintain the existing warrantee(s) for the system. In addition all work performed and all material and equipment furnished under this contract shall be free from defects and shall remain so for an additional period of at least one (1) year from the date of acceptance or approval by AHJ. The full cost of maintenance, labor and materials required to correct any defect during this one year period shall be included in the submittal bid.

## **PART II - PRODUCTS**

### **2.1 ACCEPTABLE MANUFACTURERS/Vendor**

- A. The catalog numbers used are those of Edwards EST-4. All new devices must be compatible with the existing system and maintain the existing warranties. The current system warrantee/vendor is Red Hawk Fire & Security in Hawthorne, NY. Contact John Cirocco (914-418-9420, johncirocco@adt.com)
- B. If equipment of another manufacturer is to be submitted for approval as equal, the contractor shall, at the time of bid, list all exceptions taken to these Specifications, all variances from these Specifications and all substitutions of operating capabilities or equipment called for in these Specifications and forward said list to the Engineer. Any such exceptions, variances or substitutions that were not listed at the time of bid and are identified in the submittal, shall be grounds for immediate disapproval without comment. Final determination of compliance with these Specifications shall rest with the Engineer, who, at his discretion, may require proof of performance.
- C. Alternate product submissions made without proof of no less than three (3) factory authorized and certified manufacturer's distributors residing within 50 miles of the project job site shall be rejected. These distributors must not only provide installation support but must have a service organization capable of 24-hour emergency call service and **MUST HAVE BEEN CONTRACTED AND DELIVERED NO LESS THAN FIVE (5) ACCEPTED PROJECTS USING THE SUBMITTED PRODUCT OVER THE PAST YEAR.**
- D. Alternate product submissions based upon use of a product line considered proprietary in its distribution, design, application software, or ongoing maintenance and repair shall not be acceptable. Proof of a product's non-proprietary nature shall be the burden of the contractor at the time of Bid and shall be in the form of written documentation. The determination of a product's compliance to this requirement shall be exclusively that of the Consulting Engineer.
- F. All products used shall be of a single manufacturer. Submission of notification appliances, auxiliary relays, or documentation from other than a single manufacturer shall not be acceptable and will be grounds for immediate disapproval without comment.

### **2.2 CIRCUITING GUIDELINES**

- A. Each addressable analog loop shall be circuited so device loading is not to exceed 80% of loop capacity in order to leave for space for future devices. The loop shall have Class B operation.
- B. Where it is necessary to interface conventional initiating devices provide intelligent input modules to supervise Class B zone wiring.
- C. Each of the following types of devices or equipment shall be provided with supervised circuits as shown on the drawings but shall be typically as follows:

1. Sprinkler Valve Supervisory Switches: Provide one (1) supervisory module circuit for each sprinkler valve supervisory switch.
  2. When waterflow and tamper switches exist at the same location, provide one (1) dual input addressable module. When odd numbers of devices exist at a single location, provide additional single input addressable modules.
- D. Each of the following types of alarm notification appliances shall be circuited as shown on the drawings but shall be typically as follows:
1. Audible Signals: Provide sufficient spare capacity to assure that the addition of five (5) audible devices can be supported without the need for addition control components (power supplies, signal circuit modules, batteries, etc.)
  2. Visual Signals Provide sufficient spare capacity to assure that the addition of three (3) audible devices can be supported without the need for addition control components (power supplies, signal circuit modules, batteries, etc.)
- E. Each of the following types of remote equipment associated with the fire alarm system shall be provided with a form 'C' control relay contact as shown on the drawings, but shall be typically as follows:
1. HVAC Fan Systems: Provide one (1) shutdown control relay contact for each HVAC fan system.
  2. HVAC Supply Fans: Provide one (1) shutdown control relay contact for each HVAC supply fan.
  3. HVAC Return Fans: Provide one (1) shutdown control relay contact for each HVAC return fan.
- F. Provide a dedicated 24VDC circuit to feed all auxiliary relays required for inductive loads. Circuits shall be supervised via an end-of-line relay and addressable input module. Auxiliary relays shall not derive their power from the starter or load being controlled.
- G. Each control or data gathering panel shall have a dedicated 20Amp-120VAC feed. This feed shall come from an emergency or lighting circuit breaker panel, and shall have a locked circuit breaker. Earth grounds shall also terminate to the same circuit breaker panel from each respective control panel.

### 2.3 FIRE ALARM SYSTEM SEQUENCE OF OPERATION

- A. The system shall identify any off normal condition and log each condition into the system database as an event.
1. The system shall automatically display on the control panel Liquid Crystal Display the first event of the highest priority by type. The priorities and types shall be alarm, supervisory, trouble, and monitor.
  2. The system shall have a Queue operation, and shall not require event acknowledgment by the system operator. The system shall have a labeled color coded indicator for each type of

- event; alarm - red, supervisory - yellow, trouble - yellow, monitor - yellow. When an unseen event exists for a given type, the indicator shall be lit.
3. For each event, the display shall include the current time, the total number of events, the type of event, the time the event occurred and up to a 42 character custom user description.
  4. The user shall be able to review each event by simply selecting scrolling keys (up-down) for each event type.
  5. New alarm, supervisory, or trouble events shall sound a silencing audible signal at the control panel.
- B. Operation of any alarm initiating device shall automatically:
1. Update the control/display as described above (A.1.)
  2. Sound all audible appliances in a Temporal-3 Pattern. ALL AUDIBLE APPLIANCES SHALL BE SYNCHRONIZED WITH EACH OTHER WHEN TWO OR MORE HORNS CAN BE HEARD. Audible devices shall have the ability to be silenced.
  3. Activate all strobe appliances throughout the facility. ALL STROBE APPLIANCES SHALL BE SYNCHRONIZED WITH EACH OTHER IN ANY LOCATION WITH TWO OR MORE DEVICES IN A COMMON FIELD OF VIEW. Visual devices shall be non-silenced unless the system is successfully reset.
  4. Operate control relay contacts to shutdown all HVAC units serving the floor of alarm initiation.
  5. Operate control relay contacts to return all elevators that serve the floor of alarm initiation to the ground floor. If the alarm originates from the ground floor, operate control circuits contacts to return all elevators to the floor above or to a level as directed by the local fire department.
  6. Operate control relay contacts to release all magnetically held smoke doors throughout the building.
  7. Visually annunciate the individual point of alarm on all remote annunciator panels. The visual indication shall remain on until the alarm condition is reset to normal.
  8. Transmit an alarm condition, via the integral central station communicator, to central station/Local Fire Department (as required by the AHJ).
- C. Elevator smoke and heat detector sequences shall comply with the ANSI A17.1 requirements for main/alternate floor recalls, and shunt trip activations.
- D. Activation of a sprinkler supervisory initiating device shall:
1. Update the control/display as described above (A.1.)
  2. Transmit a supervisory condition, via the integral central station communicator, to central station/Local Fire Department (as required by the AHJ).

3. Visually annunciate the individual point of alarm on all remote annunciator panels. The visual indication shall remain on until the alarm condition is reset to normal.
- E. The entire fire alarm system wiring shall be electrically supervised to automatically detect and report trouble conditions to the fire alarm control panel. Any opens, grounds or disarrangement of system wiring and shorts across alarm signaling wiring shall automatically:
1. Update the control/display as described above (A.1.)
  2. Transmit a trouble condition, via the integral central station communicator, to central station/Local Fire Department (as required by the AHJ).
  3. Visually and audibly annunciate a general trouble condition, on the remote annunciator panels. The visual indication shall remain on until the trouble condition is repaired.
- F. Purge / Smoke Control

The panel shall be UUKL listed specifically for smoke control operation to allow the smoke purge control to be housed in the FACP cabinet (if approved by the Local Authority). The smoke control switches shall be located behind a locked glass door.

#### 2.4 SUPPORT FOR INSTALLER AND OWNER MAINTENANCE

- A. Provide a coded one-man walk test feature. Allow audible or silent testing. Signal alarms and troubles during test. Allow receipt of alarms and programmed operations for alarms from areas not under test.
- B. Provide internal system diagnostics and maintenance user interface controls to display/report the power, communication, and general status of specific panel components, detectors, and modules.
- C. Provide loop controller diagnostics to identify common alarm, trouble, ground fault, Class A fault, and map faults. Map faults include wire changes, device type changes by location, device additions/deletions and conventional open, short, and ground conditions. Ground faults on the circuit wiring of remote module shall be identified by device address.
- D. Allow the user to display/report the condition of addressable analog detectors. Include device address, device type, percent obscuration, and maintenance indicator. The maintenance indicator shall provide the user with a measure of contamination of a device upon which cleaning decisions can confidently be made.
- E. Allow the user to report history for alarm, supervisory, monitor, trouble, smoke verification, watchdog, and restore activity. Include Facility Name, Licensee, Project Program Compilation date, Compiler Version, Project Revision Number, and the time and date of the History Report.
- F. Allow the user to disable/enable devices, zones, actions, timers and sequences. Protect the disable function with a password.
- G. Allow the user to activate/restore outputs, actions, sequences, and simulate detector smoke levels.
- H. Allow the service user to enter time and date, reconfigure an external port for download programming, initiate auto programming and change passwords. Protect these functions with a password.

- I. THE END-USER SHALL RETAIN COMPLETE OWNERSHIP TO THE PROGRAMMING DATABASE RUNNING IN THE SYSTEM. The fire alarm equipment vendor shall provide useable hard and soft copies of the software database to the End-User at the end of the warranty period. The database provided shall be useable by any authorized and certified distributor of the product line, and shall include all applicable passwords necessary for total and unrestricted use and modification of the database. The Consulting Engineer shall define the extent of hardcopy database documentation to be provided.

## 2.5 UL LISTED AND APPROVED EQUIPMENT

- A. Fire Command Station/ Fire Alarm Control Panel Requirements: The fire alarm control panel or panels and all system devices including speaker-strobes or Horn Strobes, strobes, pull stations, smoke and heat detectors, etc. shall be Edwards's type EST4 series. All under one label "**UL listed and approved**" for the use of fire alarm systems in this area of the United States of America. The operating controls shall be located behind locked door with viewing window. All modules shall be labeled, and all zone locations shall be identified.
- B. Main Central Processor, model 4-CPU: The main controller 4-CPU shall be supervised, site programmable, and of modular design supporting up to 125 detectors and 125 remote modules per addressable Signaling line Circuit (SLC). The CPU shall support up to 10 SLC's per network node for a total system capacity of 2500 Intelligent Addressable points. The system shall be designed with peer-to-peer IPV6 networking capability for enhanced survivability, with support for up to 40 nodes, each with up to 2500 points and an overall capacity of 100,000 points. The system shall include 8 Giga bytes of onboard memory which is used to store all system functionality and job specific data. All site specific and operating data shall survive a complete power failure intact. Passwords shall protect any changes to system operations. The system shall include a hot backup file, containing the entire systems database programming, for use in the unlikely event that the systems programs becomes corrupt. The system shall support a single standalone node or multiple nodes communicating on a TCP/IP, IPv6 network that supports mesh configuration. The network shall support physical media connections via fiber, twisted pair or CAT 5 in any combination. The Network shall support data transmission of panel-to-panel data, voice audio and firefighter telephone data on a single twisted pair or single fiber optic cable. The Network shall be configured as Class A or Class B or Class X configuration per the project plans. Networks restricted to Class N wiring shall not be permitted. Network shall support a back-to-back pass-through mode that shall maintain network connectivity on power down or catastrophic failure of a single panel. The network shall support twisted pair links to 5,000 ft., CAT 5 links to 3,280 ft., and fiber links to 130,994 ft. The network shall support hard copy report printing to a system printer connected to any panel in the network, systems that require reports be run from the panel that has a printer connection shall not be considered equal. The systems LCD display shall provide color graphics display of maintenance and sensitivity reports. The system shall support multiple languages/dialects and Unicode character set. The Control panel and network shall not use easily removable devices, such as SD cards or external storage devices for storage of system critical information including programming and project files. Communications outside the life safety network shall meet the requirements of FIPS Publication 197. Security-relevant information, such as: failed login attempts, failed unauthorized accesses, and user modification shall be logged to panel history. Unsuccessful authentication attempts shall not leak information regarding the presence of the system or users. Credentials shall only be transmitted that are encrypted. The system shall provide for multiple users, roles shall be provided for users to ensure proper access by user for the role they perform on the system. All passwords shall use a cypher algorithm for security purposes to protect any sensitive information. No passwords shall be

visible as plain text within the database or entire system. Sensitive information shall not be logged to history or displayed on service tools (e.g. passwords, PINs etc.). The system shall support configuration of multiple IP connections to external services including, central stations, email servers, web interfaces, reports, and third party integration. Email messages shall support multiple languages in native characters that match the languages supported in the panel. Email messages shall support symbolic and color alarm event highlighting. The system shall support logging of up to 20,000 chronological events using FIFO. It shall be possible to freeze or store the most recent 10,000 events separately from the FIFO log. It shall be supported to download all applications and firmware from the configuration computer at a single location on the fire network. The system shall support upload of a project file from any location on the fire network.

- C. Main Graphic Touch Screen Display, model 4-LCDLE: The system shall provide a user interface that displays system events on a color touch screen display in a text format. The display must be capable of supporting a minimum of two languages including but not limited to English, Spanish, Portuguese or French. The display design shall be simplified for emergency users so that main common controls are provided as switches/buttons that provide positive feedback of operation, common control buttons shall not be part of the touch screen display area. The Common Control Switches and LEDs provided through tactile buttons with indicators shall be; Reset switch and LED, Alarm Silence switch and LED, Panel Silence switch and LED, Acknowledge switch and LED. In addition the following LEDs shall be provided as discrete indicators, Alarm Indicator, CPU Fail Indicator, Trouble Indicator and Power Indicator. It must be possible to add additional common controls as required through the use of modular display units. The user interface must provide a color touchscreen LCD display with minimum resolution of VGA 640 x 480. The display shall provide a minimum of seven events displayed concurrently and support >200,000 colors. Hands free operations shall be provided for viewing the first eight highest priority events. Events of different priorities shall be automatically placed in easy to access queues. It shall be possible to view specific event types separately. Having to scroll through a mixed list of event types is not acceptable. The total number of active events by type must be displayed. Visual indication must be provided of any event type which has not been acknowledged or viewed. It must be possible to customize the designation of all user interface LEDs and Switches for local language requirements. The color LCD display must support scripts & ideograph style font types. It shall be possible to have a custom message for each device in addition to zone messages. Custom device messages must support a minimum of 42 characters each.
- D. Control Display Module(s), model 4-24L Series: The Life Safety system shall support up to 576 tactile switches and 576 indicators incorporating annunciation of Alarm, Supervisory, Trouble and Monitor operations. Annunciation must be through the use of LED display strips, complete with a means to custom label each LED/Switch position as to its function. The labels must support the ability to allow visual custom grouping of LEDs and switches. Where applicable, control of remote smoke control devices must be made available at the control center. Switches with LEDs must provide positive feedback to the operator of remote equipment status. All individual indicator LEDs shall be configurable for color including Red, Yellow, Blue, Green or White to facilitate identification from a distance and maximize display location usage. Where voice audio is required, a means of paging individual zones must be available. The status of each paging zone must be annunciated. It must be possible to selectively page into specific zones. It shall be possible to manipulate the evacuation of the building from the main control center. It must be possible for the emergency operator to put specific zones into evacuation manually. When being serviced or when it is necessary to disable switches, the system shall not 'remember' if a disabled switch is pressed. Switches' must be rubber to provide tactile feedback as well as a visual indication when a switch is activated.

- E. Common Relay Module, model 4-COMREL: The system shall support dedicated common alarm, trouble and supervisory relays.
- F. Network Controller, model 4-NET: The system shall support communicating on a TCP/IP, IPv6 network that supports multiple network topologies including any mix of ring, bus, star and mesh. The network shall support physical media connections via fiber, twisted pair or CAT5 in any combination. The Network shall support data transmission of panel-to-panel data, voice audio and firefighters' telephone data on a single twisted pair or single optical fiber. The Network shall be configured as Class A, Class B, or Class X (see project plans). Networks restricted to Class N wiring shall not be acceptable. Network shall support a back-to-back pass through mode that maintains network connectivity on power down for servicing or catastrophic failure of a single panel. For retrofit of existing installations the system shall support reuse of existing network wiring that meets the minimum wiring specification of the specified SFP controller, is electrically sound and is acceptable to the Authority Having Jurisdiction.
- G. Network Controller Adder, model 4-NET-AD: Network Adder, model 4-NET-AD: The panel network shall communicate on a TCP/IP based, multicast IPv6 network that supports mesh configuration. The network shall support physical media connections via fiber, twisted pair or CAT5 in any combination. The network shall support data transmission of panel-to-panel data, voice audio, and fire fighter telephone data on a single twisted pair or single fiber optic cable. The Network shall be configured as Class A or Class B or Class X configuration. Networks restricted to Class N wiring shall not be acceptable. The network shall support a back-to-back pass-through degraded- mode for any media type to any media type that shall maintain network connectivity on power down or catastrophic failure of a single panel. Communications outside the life safety network shall meet the requirements of FIPS publication 197. Security relevant information, such as failed login attempts, failed unauthorized accesses, and user modification shall be logged to panel history. Unsuccessful authentication attempts shall not leak information regarding the presence of the system or users. Credentials shall only be transmitted that are encrypted. The system shall provide for multiple users, roles shall be provided for users to ensure proper access by user for the role they perform on the system. All passwords shall use a Cypher Algorithm. Passwords must use a hash. No password or authentication shall be exposed in any format in the system database viewable as plain text. Sensitive information shall not be logged to history or displayed on service tools (e.g. passwords, PINs etc.).
- H. Ground Isolated USB Connections, model 4-USBHUB: The system shall provide USB connections for external peripheral devices including printers. Where a system printer is required the printer shall communicate to the system via USB, be supervised and support ground isolation. The event and status printer shall be a nine-pin, impact, dot matrix printer with a minimum print speed of 232 characters per second. Print parameters shall be set up with a menu drive program in the printer. The printer shall be capable of serial or USB communications protocol. The communications speed for RS-232 communications protocol shall be adjustable from 300 to 9600 Baud. The connection to the printer from the panel shall be supervised. The printer shall list the time, date, type and user defined message for each event printed. Alarm messages shall have a special character printed at the beginning of the message to allow easier location of alarm events on the print out. Where required, Audible notification appliances shall be coded using a microprocessor based Positive, Successive, Non Interfering (PSNI) coder module. The coder shall have a capacity for 1,000,000 unique codes and be capable of storing pending codes without a loss of an active code or interference from a new code. The coder shall output four rounds of two, three, or four digit code sequences. The coder shall provide both 1 KHz audio tone output as well as a dry relay contact output. The coder shall output a continuous, temporal, or 60/90 BPM March

time output as required at the end of the PSNI code sequence. In the event of a failure of the microprocessor, the coder shall automatically output a temporal code.

- I. Signaling Line Circuit (SLC) Controller Module, Model 3-SSDC1/3-SDDC1: Up to 125 detectors and 125 modules; 250 addressable devices in total, shall be supported over a single pair of wires by each Signaling Line Circuit (SLC) Controller circuit. Loop distances of 11,000 feet (3300m) shall be possible. Class B, Class A and Class X wiring shall be supported and selected based on the contract drawings. The SLC Controller Module shall use an advanced communication format that provide exceptional response using a "BROADCAST POLL" where the loop controller checks the entire device circuit for any changes of state. Should one or more devices report a change the SLC Controller shall use "DIRECT ADDRESS SEARCH" to find reporting device(s). Devices that have entered the alarm state or become active shall be located nearly instantaneously. The unique use of "BROADCAST POLLING" combined with "DIRECT ADDRESS SEARCH" ensures that only new information is transmitted allowing a reduced baud rate with fast response time. To enhance survivability of the system the SLC Controller shall support a standalone mode for Addressable devices. Two catastrophic failure modes are supported. If the main panel CPU fails, the loop controller will continue to poll its devices. If an alarm is detected it will be sent on the local rail communication bus and received by other local rail modules. A common alarm condition throughout the panel will result. If the SLC controller fails, and a device (smoke or module) detects an alarm, specialized circuitry will make the node aware of the alarm condition. The panel's main CPU will communicate the alarm condition to the rest of the network. Every time the SLC Controller Module communicates with a detector a green LED on the detector shall flash. Normal green LED activity is not disturbing to building occupants, but can be quickly spotted by a maintenance technician. A red LED on the detector turns on only in the alarm condition. The Controller shall also supervise the device wiring, physical location of each device and the programmed device characteristics. This characteristic is accomplished by "MAPPING" the SLC circuit and committing the map to memory. Upon power up the loop controller will scan device serial numbers and map their physical location sequence on the loop, including "T" taps. After mapping is complete the controller automatically addresses each detector and module through downloading over the loop. There shall be no switches or dials to set. Each device is assigned a unique soft address generated by the site specific program. The controller then compares the "Actual" physical device data to the "Expected" site specific program data. If any correlations are different, the loop controller issues a trouble to the CPU identifying the devices which do not match and posting a map fault. A graphical map of the loop can be uploaded depicting each device's location on the loop, including branches (T-Taps) and all of the physical attributes associated with the device. The SLC controller shall have the ability to locate ground faults by specific module, speeding up the troubleshooting process. The SLC controller shall include electronic addressing and mapping eliminating duplicate addresses, which are very difficult to locate. During maintenance, should groups of detector heads be removed for service and returned into the wrong smoke detector base (location), the SLC Controller Module will automatically detect the problem. If the attributes of the switched devices are the same, the system will automatically download the correct soft addresses and algorithms to the devices (maintaining location supervision). If the attributes are not the same the systems will send a map fault indication to the system's main CPU and post a trouble indicating the specific devices in fault. The SLC Loop controller shall also monitor the addressable devices for maintenance and trouble conditions. Each smoke detector contains intelligence to adjust with environmental changes. This expands the amount of time required between cleaning while maintaining a constant alarm threshold. As the detector begins to exhaust the environmental compensation, and reaches the 80% level, the controller shall indicate a maintenance alert or dirty condition to the system's main CPU and indicate the specific device requiring cleaning. If cleaning is not performed the detector will continue to operate until all of its environmental compensation is

utilized. At this point a dirty trouble indication shall be sent to the panels main CPU and post a trouble condition. If maintenance is still not performed the detector will automatically remove itself from service once the programmed threshold window has been breached (preventing a false alarm). When a detector includes carbon monoxide (CO) detection, the detector monitors its CO life remaining for the CO sensor element and provides this information automatically to the panel display. A unique CO maintenance signal is automatically generated by the panel when there is 8% (several months) of CO life remaining. Should the CO sensor not be replaced after the maintenance signal is reported, an "End of Life" trouble automatically posts on the panel when the CO sensor detection capability is exhausted. Remote test capability permits devices to be put in alarm, pre-alarm, supervisory, monitor, or security alarm, or trouble from the panel menu or controls. This facilitates testing of smoke and heat detectors as well as monitor and security devices. Fast test is also provided for CO detectors allowing these devices to be tested quickly in the field. The system shall have a UL Listed Detector Sensitivity test feature, which will be a function of the smoke detectors and performed automatically every 4 hours. The system shall support 100% of all remote devices in alarm and provide support for a 100% compliment of detector isolator bases. All panel modules shall be supervised for placement and return trouble if damaged or removed.

- J. Modular Digital Alarm Communicator Transmitter, model 3-MODCOM: The panel shall have an interface module for remote site monitoring. The control panel shall include built-in (part of the fire alarm control panel) Digital Alarm Communicator Transmitter (DACT)) module to transmit smoke, supervisory, waterflow, trouble, CO Alarm (if included), pump running, and pump trouble events to a Central monitoring Station (CMS) company. The DACT shall support dual telephones lines, Contact I.D. communications, and configured for dual tone multi-frequency (DTMF) or pulse modes. It shall be possible to delay AC power failure reports, auto test call, and be site programmable. The DACT shall be capable of transmitting every individual condition to the central station via Contact I.D. format. Selection of Contact I.D. format SHALL be of the discretion of the engineer and building owner but shall be an available option. Contractors who choose a separate dialer must meet all of the above options and are responsible for all necessary added connections such as power (with FCO/FDS), conduit, wire, addressable interface modules etc.
- K. Optional, IP with Cellular Interface Model DMP Model DUALCOMNF-L\*: The DUALCOMNF-L\*(LV for Verizon Cat M1 LTE or LA for AT&T Cat M1 LTE) is used in conjunction with the 3-MODCOM for applications where Plain Old Telephone (POTs) lines are not available or where Managed Facility Voice Network (MFVN) analog lines do not provide a stable interface. The DUALCOMNF shall capture the contact ID string from the 3-MODCOM and transmit the signal over IP to a UL-Listed central station. This connection captures Contact ID messages from the panel that are based on the SIA communication standard DC-05-1999.09-DCS. Messages are then formatted into a Serial 3 message and sent to an SCS-1R Receiver or SCS-VR Receiver. It shall include a red housing and be powered by regulated 24Vdc from the control panel. The Communicator shall be capable of supporting Network communication using existing Ethernet data networks, satellite communication, fiber optic networks, local area networks, wide area networks. The communicator shall also support LTE cellular communication using retail data networks. The communicator shall be configured as a dual path system with primary network communication, a single path system with network communication or a single path system with cellular communication based on local Authority Having Jurisdiction (AHJ) and NFPA 72.
- L. Network alphanumeric annunciators, Model 4-ANN Series: The Life Safety system shall incorporate annunciation of Alarm, Supervisory, Trouble and Monitor operations. Annunciation

must be through the use of both LED display strips complete with a means to custom label each LED as to its function. LED color shall be selectable at configuration time. Where applicable control switches must be provided. Switches with LEDs must provide positive feedback to the operator of remote equipment status. A color touchscreen LCD display with basic common control LEDs and switches shall be provided. Optionally a second color touchscreen display may be added to support audio and telephone operations. The Common Control Switches and LEDs provided as minimum will be: Reset switch and LED, Alarm Silence switch and LED, Panel Silence switch and LED, Drill switch and LED. It must be possible to add additional common controls as required through the use of modular display / control units. The LCD must provide the emergency user, hands free viewing of the first highest priority event. System events must automatically be placed in queues. It shall be possible to view specific event types separately. The total number of active events by type must be displayed. It must be possible to customize the designations of all user interface LEDs and switches for local language requirements. It must be possible to route system event messages to specific annunciator locations. It must be possible for the annunciator to contain a paging microphone and fire fighter telephone.

- M. Lobby Mount Cabinet Enclosure (4-CAB Series): The cabinets shall be 14 gauge rolled steel and available in various sizes based on the configuration and available in a Bronze or Red finish. Wallboxes have a black baked enamel finish. Lobby enclosure doors feature a modern contoured door design and integral viewing windows. They come with bronze or red baked enamel finishes. The door designs and colors ensure that there is a match to system annunciators and battery cabinets for a consistent look throughout the facility. Doors may be mounted as remote annunciators without the need to have large CAB enclosures behind. This allows larger equipment to be mounted remotely, minimizing wall penetrations in lobbies and public spaces, and removing the need to home-run all field wiring. The EST4 lobby enclosures backboxes, doors and chassis units are ordered and shipped separately for easy staging on project sites. With a variety of sizes available, customized installations offer the flexibility to support up to two color LCD touch screens, and LED and switch modules offering configurations of 576 5 color LED indicators, as well as 576 control switches along with microphone and firefighters' telephone options.
- N. Power Supplies: The power supply shall be a high efficiency switch mode type with line monitoring to automatically switch to batteries for power failure or brown out conditions. The automatic battery charger shall have low battery discharge protection. The power supply shall provide internal power and 24 Vdc at 7.0A continuous for notification appliance circuits. The power supply shall be capable of providing 7A to output circuits for a maximum period of 100 ms. All outputs shall be power limited. The battery shall be sized to support the system for 24 hours of supervisory and trouble signal current plus general alarm for 45 minutes.
- O. Auxiliary power supplies shall be a high efficiency switch mode type with line monitoring to automatically switch to batteries for power failure or brown out conditions. The automatic battery charger shall have low battery discharge protection. The power supply shall provide internal power and 24 Vdc at 7.0A continuous for notification appliance circuits. The power supply shall be capable of providing 7A to output circuits for a maximum period of 100 ms. All outputs shall be power limited. The battery shall be sized to support the system for 24 hours of supervisory and trouble signal current plus general alarm for 45 minutes.
- P. Firefighters Smoke Control System – FSCS: The FSCS shall be utilized for control of both Smoke Control and Post Fire Smoke Purge. Smoke control shall include Atrium, Stair, and Elevator Shaft Smoke Control as well as zoned smoke control per the project plans. Post Fire Smoke Purge shall include post fire smoke evacuation and control. The FSCS shall be integral to the Fire Command Station or Fire Alarm Control Panel. It shall include switch/LED modules that

provide three position (on/off/auto and open/closed/auto) switches and 4 LED's (normal, on, off, fault or normal, open, closed, fault) per each smoke control system. The FSCS shall be UL864 and UUKL listed and designed per the Building Code Chapter 9. The FSCS shall include 3 position switches for each smoke control system. Each switch shall include On/Off/Auto positions for control of smoke control fan systems and Open/Closed/Auto positions for Smoke Control Dampers systems. The FSCS shall include the following indicators for each smoke control system as required per section 909 of the NYC Building Code: Fans, Dampers, or other operating equipment in their normal status – White Indicator. Fans, Dampers, or other operating equipment in their off or closed position – Red Indicator. Fans, Dampers, or other operating equipment in their on or open Status – Green Indicator. Fans, Dampers, or other operating equipment in Fault - Yellow Indicator. Smoke Control switch and LED modules shall include a printable portion next to each switch and LED set for a custom descriptor of each smoke control system. The printable portion shall include text and graphical icons indicating the function of the smoke control system. Verification All Dampers that are part of the smoke control system shall include verification per section 909 of the Building code and NFPA 92A. Verification shall mean end switches (true open and true closed) for each smoke control damper. All fans used for smoke control shall include verification per section 909 of the Building code and NFPA 92A. Verification shall mean duct pressure, airflow, or equivalent sensors. The white normal indicator shall give the FSCS operator a clear indication that the smoke control equipment is operating properly. Dampers that are not open or not closed (mid point) shall extinguish the white indicator. When a smoke control fan is indexed to start manually or from the fire alarm system all dampers shall open. When fan is indexed to stop, all dampers shall close unless indicated differently on the project plans. Fire detection systems providing control input or output signals to mechanical smoke control systems or elements thereof shall comply with the requirements of Chapter 9 and NFPA 72.

- Q. The FSCS shall include manual post fire smoke purge per the Building Code. Manual smoke purge shall be integral to the FSCS or located on Led/Switch modules directly adjacent to the smoke control controls and indicators. Controls for smoke purge shall only be available after activation of a built in FDNY/NYC approved 2642 key. A 2-position On/Off switch shall be included by floor or area for manual evacuation of smoke. Each 2-position switch shall include a green indicator that displays when the purge fan is on and a yellow trouble indicator. The Purge Fan shall be interlocked with the Purge Dampers and shall not start until there is confirmation that the damper is open (true open). A graphic diagram indicating the portions of the building served by each post fire smoke purge system shall be included.
- i. 1 - All Purge Dampers shall be monitored for open status (true status – i.e. sail switch with Fire Alarm Monitor Module). LEDs shall be provided in the FSCS for each purge damper to indicate that a Damper is open.
  - ii. 2. - All Fans will not be affected upon system reset. Restarting the fans may be accomplished by turning them back on in an individual sequential fashion or through individual manual switches at the FSCS controls to eliminate the possibility of all fans turning on simultaneously.
  - iii. Under normal circumstances, smoke exhaust fans, respective fire-smoke dampers, motorized dampers shall be closed unless noted otherwise on the project plans.

## 2.6 COMPONENTS

- A. Intelligent Detectors — General: The System Intelligent Detectors shall be UL268 7<sup>th</sup> edition (May 2020 UL requirements) approved meeting the new test fires created by UL to target reducing nuisance alarms. They shall be capable of full digital communications using both broadcast and polling protocol. Detectors shall be multi-criteria optical sensing with a full array of detection options including Smoke, Heat, and Carbon Monoxide (CO). Model variations shall be available including Smoke and Heat, Smoke and CO, fixed or fixed and rate of rise Heat, Heat and CO, as well as a three chamber multi criteria multi sensor with Smoke, Heat and CO. Each detector shall be capable of performing independent fire detection algorithms. The fire detection algorithm shall measure sensor signal dimensions, time patterns and combine different fire parameters to increase reliability and distinguish real fire conditions from unwanted deceptive nuisance alarms. Signal patterns that are not typical of fires shall be eliminated by digital filters. Devices not capable of combining different fire parameters or employing digital filters shall not be acceptable. Each intelligent device shall have a microprocessor with non-volatile memory to support its functionality and serviceability. Each device shall store as required its functionality for the following data: device serial number, device address, device type, personality code, date of manufacture, hours in use, time and date of last alarm, amount of environmental compensation left/used, last maintenance date, job/project number, current detector sensitivity values, diagnostic information (trouble codes) and algorithms required to process sensor data and perform communications with the loop controller. Each device shall be capable of electronic addressing, either automatically or application programmed assigned, to support physical/electrical mapping and supervision by location. Setting a device's address by physical means shall not be necessary. Each detector shall contain an integral microprocessor which shall determine if the device is normal, in alarm, or has an internal trouble. The microprocessor's non-volatile memory shall permanently store the detector's serial number, device type and system address. It shall be possible to address each intelligent device without the use of switches. Devices requiring switches for addressing shall not be considered as equal. Memory shall automatically be updated with the hours of operation, last maintenance date, number of alarms and troubles, time of last alarm, and analog signal patterns for each sensing element just before the last alarm. Each detector shall be capable of identifying up to 32 diagnostic codes. This information shall be available for system maintenance. The diagnostic code shall be stored at the detector. Each addressable detector on the Signaling Line Circuit (SLC) shall transmit information regarding its location with respect to other intelligent devices on the signaling line circuit to the control panel, creating an "As-Built" circuit map. The circuit mapping function shall provide location supervision of all intelligent devices on the signaling line circuit. An intelligent detector's programmed system response functions shall be associated with the detector's actual *location* on the signaling line circuit and *not with the detector's address*. After system commissioning, detectors improperly installed in the wrong location shall function according to the mapped programmed response for its *location* on the circuit, not its detector's address. A status indicator shall be provided on each detector. Flashing green shall indicate normal operation; flashing RED shall indicate the alarm state. The indicator shall be visible from any direction. The system shall allow for changing of detector types for service replacement purposes without the need to reprogram the system. The replacement detector type shall automatically continue to operate with the same programmed sensitivity levels and functions as the detector it replaced, without the need for reprogramming. System shall display an off-normal condition until the proper detector type is installed or a change in the device type profile has been made. The detector shall also store pre-alarm and alternate pre-alarm sensitivity settings. Pre alarm sensitivity values shall be configurable in 5% increments of the alarm and alternate alarm sensitivity settings respectively. Each detector microprocessor shall contain an environmental compensation algorithm that identifies and sets ambient "Environmental Thresholds" approximately six times an hour. The microprocessor shall continually monitor the environmental impact of temperature, humidity, other contaminants as well as detector aging. The process shall employ digital compensation to adapt the detector to

both 24-hour long term and 4-hour short-term environmental changes. The microprocessor shall monitor the environmental compensation value and alert the system operator when the detector approaches 80% and 100% of the allowable environmental compensation value. Differential sensing algorithms shall maintain a constant differential between selected detector sensitivity and the “learned” base line sensitivity. The base line sensitivity information shall be updated and permanently stored at the detector approximately once every hour. The intelligent analog detectors shall be suitable for mounting on a variety of detector mounting bases; including, 3 ½ octagon or 4 inch square standard base, relay base, Isolator base, or Temporal 3 sounder base or Temporal 3 520 Hz sounder base. Intelligent Detectors shall clearly indicate from the outside of the device what type of sensor or sensors is within the device with letter description. An “O” designation shall indicate Optical Smoke, an “H” shall indicate a Heat detection device and a “C” shall indicate a Carbon Monoxide device. A combination of letters shall indicate an intelligent multi sensor detector.

- B. Multi Criteria Optical Smoke Detector, SIGA-OSD: Provide intelligent optical smoke detector, SIGA-OSD. The optical detector shall be an intelligent device that gathers analog information from multiple optical sensors converting the data into a digital signal. It shall use dual optical wavelengths combined with multiple detection angles to differentiate particles that are not representative of actual smoke. Particle data is input into digital filters which feed a series of ratios removing signal patterns. An integral microprocessor shall dynamically examine values from the sensor and initiate an alarm based on the analysis of data. Systems using central intelligence for alarm decisions shall not be acceptable. The detector shall continually monitor any changes in sensitivity due to the environmental effects of dirt, smoke, temperature, aging and humidity. The information shall be stored in the integral processor and transferred to the analog loop controller for retrieval using a laptop PC or the SIGA-PRO Signature Program/Service Tool. The Optical detector shall be rated for ceiling installation at a minimum of 30 ft (9.1m) centers and be suitable for wall mount applications. The Optical smoke detector shall be suitable for direct insertion into air ducts up to 3 ft (0.91m) high and 3 ft (0.91m) wide with air velocities up to 4,000 ft/min. (0-20.32 m/sec) without requiring specific duct detector housings or supply tubes. The percent smoke obscuration per foot alarm set point shall be field selectable to any of five sensitivity settings ranging from .5% to 4.36%. The Optical detector shall be suitable for operation in the following environment: Temperature: 32°F to 120°F (0°C to 49°C), Humidity: 0-93% RH, non-condensing, Elevation: no limit. Multi Criteria Optical Smoke detectors that have a fixed or limited life expectancy shall not be acceptable.
- C. Multi Sensor / Multi Criteria Optical Smoke Detector with built in Heat sensor or built-in Heat Sensor and Carbon Monoxide (CO) Sensor, SIGA-OSHD or SIGA-OSHCD: Provide intelligent optical smoke detector, SIGA-OSHD or SIGA-OSHCD. The Optical Smoke and heat multi sensor shall meet all of the above requirements for optical smoke detection and in addition include a low mass thermistor that shall act as fixed temperature 130 to 140 °F (54 to 60 °C) heat sensors and at a temperature rate-of-rise alarm point of 15°F per minute. The smoke/heat/CO sensor shall in addition include a Carbon Monoxide sensor. The percent smoke obscuration per foot alarm set point shall be field selectable to any of five sensitivity settings ranging from .5% to 4.36%. The Optical detector shall be suitable for operation in the following environment: Temperature: 32°F to 100°F (0°C to 38°C), Humidity: 0-93% RH, non-condensing, Elevation: no limit. Smoke and heat conditions shall be fully separated by the control panel and include the ability to program each sensor independently or combined. The smoke, heat and CO sensors shall have the ability to separate alarms (heat/smoke combined) and CO signals. Separated signals shall be fully programmable by the control panel.

- D. Fixed Temperature/Rate of Rise Heat Detector and Combination Heat and CO Detector, models SIGA-HRD and SIGA-HCD: Provide intelligent combination fixed temperature/rate-of-rise heat detectors SIGA-HRD. The heat detector shall have a low mass thermistor heat sensor and operate at a fixed temperature and at a temperature rate-of-rise. It shall continually monitor the temperature of the air in its surroundings to minimize thermal lag to the time required to process an alarm. The integral microprocessor shall determine if an alarm condition exists and initiate an alarm based on the analysis of the data. Systems using central intelligence for alarm decisions shall not be acceptable. The intelligent heat detector shall include a low mass thermistor that shall act as fixed temperature 130 to 140 °F (54 to 60 °C) heat sensors and at a temperature rate-of-rise alarm point of 15°F per minute. The heat detector shall be rated for ceiling installation at a minimum of 50 ft (15.24m) centers and be suitable for wall mount applications. Where shown on the project plans, include SIGA-HCD combination Heat and Carbon Monoxide (CO) detector. The combination Heat and CO device shall report separately to the control panel where a heat detection condition is considered a fire alarm and a CO condition is a supervisory alarm with separate and unique evacuation sequence.
- E. Sleeping Room Optical Smoke and CO Detection: Provide combination intelligent addressable Optical smoke and Carbon Monoxide (CO) detectors Edwards model SIGA-OSCD with 82 dB (per UL464) audible base SIGA-AB4GT-LF for installation inside each sleeping room and as indicated on the project plans. The "sleeping room" smoke and CO detection devices shall be fully addressable with a built in sounder. The detector shall be arranged so that a fire alarm condition shall sound the internal horn at a Low Frequency 520 Hz Temporal 3 pattern and a Carbon monoxide condition shall sound the internal horn at a Temporal 4 pattern per NFPA 720. All sounders within the dwelling shall sound together in tandem at the same temporal rate. The fire alarm control panel shall be UL-Listed UL2017 for general purpose signaling. The CO detector shall also be UL2075 listed and provide the control panel with an "end of life" signal for the CO element. The Optical detector shall utilize a light scattering type optical smoke sensor to sense changes in air samples from its surroundings. The integral microprocessor shall dynamically examine values from the sensor and initiate an alarm based on the analysis of data. Systems using central intelligence for alarm decisions shall not be acceptable. A smoke alarm or CO alarm from the sleeping room detector shall not cause automatic building evacuation; rather indicate the alarm condition at the main fire alarm panel and at designated remote displays. The CO detector shall report as a separate signal to the fire alarm control panel and be treated as a Supervisory signal. Rooms that include more than one detector (i.e. a single living space with two or more smoke/co detectors) shall be arranged so that all detectors within the space shall activate their built-in sounder bases in a common alarm fashion (if one detector alarms, the sounders from all detectors shall sound in the space) at the appropriate Temporal rate (Temporal 3 or Temporal 4). The detector shall continually monitor any changes in sensitivity due to the environmental effects of dirt, smoke, temperature, aging and humidity. The information shall be stored in the integral processor and transferred to the analog loop controller for retrieval using a laptop PC or the SIGA-HDT Signature Program/Service Tool. The percent smoke obscuration per foot alarm set point shall be field selectable to any of five sensitivity settings ranging from .5% to 4.36%. Sleeping rooms designated handicapped accessible, shall include a wall mounted strobe light meeting ADA code that is activated by the building alarm AND by the in-room addressable smoke detector. The fire alarm vendor shall provide control module(s) arranged so that rooms addressable smoke detectors can activate the strobe in the associated guest room independent of building strobe devices.
- F. Addressable Carbon Monoxide (CO) Detector, model SIGA-COD with sounder base. Provide intelligent addressable Carbon Monoxide Alarms as required the building code. The CO activation shall be programmable type as follows: Alarm, Supervisory Latching, Supervisory

Non-Latching, Monitor Latching, or Monitory Non-Latching. The electro-chemical CO sensor shall generate a CO alarm in compliance with UL-2034 requirements. The sensor shall have a nominal six but control panel dependent up to ten-year life. When the sensor approaches the end of its useful life, it shall transmit a maintenance condition to the control panel, indicating the CO sensor board replacement is required. Only when the sensor is no longer operational shall a trouble condition be sent to the control panel. Sensors that transmit a common trouble indication for both sensor end-of-life and other causes of detector trouble shall not be considered as equal. Performing a “sensitivity” check from the panel shall report the approximate number months of CO sensor life remaining.

- G. Standard Detector Mounting Bases, SIGA-SB / SIGA-SB4: Provide standard detector mounting bases SIGA-SB suitable for mounting on North American 1-gang, 3½” or 4” octagon box and 4” square box. The base shall, contain no electronics, support all Signature Series detector types and have the following minimum requirements: Removal of the respective detector shall not affect communications with other detectors, Terminal connections shall be made on the room side of the base, bases that must be removed to gain access to the terminals shall not be acceptable. The base shall be capable of supporting one (1) Signature Series SIGA-LED Remote Alarm LED Indicator. Provide remote LED alarm indicators where shown on the plans.
- H. Audible Detector Mounting Base, SIGA-AB4GT. Where shown on the project plans include detector audible/sounder base model SIGA-AB4GT. The sounder base shall be capable of two tones, Temporal 3 for a fire condition and Temporal 4 for a Carbon monoxide condition. The tones shall be fully programmable and also synchronize the sound with other sounder bases. The system shall be UL2017 listed for dual signaling for this purpose.
- I. Low Frequency Audible Detector Mounting Base, SIGA-AB4G-LF. Provide low frequency 520hz audible detector mounting bases suitable for mounting on 4” square x 2-1/8” (54 mm) deep box. The audible base shall produce tone sound within the frequency range of 520 Hz ±10% square wave tone. The operation of the audible base shall be controlled by its respective detector processor or under program control as required by the application. The base shall support all Signature Series detector types and be capable of single or group operation. The audible base shall emit a temporal 3 alarm tone and/or temporal 4 tone. The audible bases shall be UL268 and UL464 Listed as a system, and nominal sound level shall be 87dBA in anechoic chamber and 80 dBA in reverberant room, listed. All low frequency sounder bases audible temporal 3 tones shall be synchronized throughout the facility.
- J. Duct Detector Housing, SIGA-SD: Provide model SIGA-SD Low profile intelligent addressable DUCT smoke detector as indicated on the project plans. Provide for variations in duct air velocity between 100 and 4,000 feet per minute and include a wide sensitivity range of .79 to 2.46%/ft. Obscuration. Include one Form-C shut down relay rated 2.0 amps @ 30 Vdc and also include slave high contact relays if required. Provide an air exhaust tube and an air sampling inlet tube that extends into the duct air stream up to ten feet. The addressable DUCT housing shall be suitable for extreme environments, including a temperature range of -20 to 158 degrees F (-29 to 70 degrees Celsius) and offer a harsh environment gasket option. Provide Remote Alarm LED Indicators SIGA-LED and/or remote test station model SD-TRK as indicated on the project plans.
- K. Intelligent Modules — General: It shall be possible to address each Intelligent Signature Series module without the use of DIP or rotary switches. Devices using DIP switches for addressing shall not be acceptable. The personality of multifunction modules shall be programmable at site to suit conditions and may be changed at any time using a personality code downloaded from the Analog Loop Controller. Modules requiring EPROM, PROM, ROM changes or DIP switch and/or jumper changes shall not be acceptable. The modules shall have a minimum of 2

diagnostic LEDs mounted behind a finished cover plate. A green LED shall flash to confirm communication with the loop controller. A red LED shall flash to display alarm status. The module shall be capable of storing up to 24 diagnostic codes which can be retrieved for troubleshooting assistance. Input and output circuit wiring shall be supervised for open and ground faults. The module shall be suitable for operation in the following environment:

Temperature: 32<sup>o</sup>F to 120<sup>o</sup>F (0<sup>o</sup>C to 49<sup>o</sup>C), Humidity: 0-93% RH, non-condensing.

- L. Single Input Module, SIGA-CT1 (Waterflow Detectors, Tamper Switches etc.): Provide intelligent single input modules SIGA-CT1. The Single Input Module shall provide one (1) supervised Class B input circuit capable of a minimum of 4 personalities, each with a distinct operation. The module shall be suitable for mounting on North American 2 ½” (64mm) deep 1-gang boxes and 1 ½” (38mm) deep 4” square boxes with 1-gang covers. The single input module shall support the following circuit types: Normally-Open Alarm Latching (Manual Stations, Heat Detectors, etc.), Normally-Open Alarm Delayed Latching (Waterflow Switches), Normally-Open Active Non-Latching (Monitor, Fans, Dampers, Doors, etc.), Normally-Open Active Latching (Supervisory, Tamper Switches).
- M. Dual Input Module, SIGA-CT2: Provide intelligent dual input modules SIGA-CT2. The Dual Input Module shall provide two (2) supervised Class B input circuits each capable of a minimum of 4 personalities, each with a distinct operation. The module shall be suitable for mounting on North American 2 ½” deep 1-gang boxes and 1 ½” (38mm) deep 4” square boxes with 1-gang covers. The dual input module shall support the following circuit types: Normally-Open Alarm Latching (Manual Stations, Heat Detectors, etc.), Normally-Open Alarm Delayed Latching (Waterflow Switches), Normally-Open Active Non-Latching (Monitor, Fans, Dampers, Doors, etc.), Normally-Open Active Latching (Supervisory, Tamper Switches).
- N. Single Input Signal Module, SIGA-CC1: Provide intelligent single input signal modules SIGA-CC1. The Single Input (Single Riser Select) Signal Module shall provide one (1) supervised Class B output circuit capable of a minimum of 2 personalities, each with a distinct operation. When selected as a telephone power selector, the module shall be capable of generating its own “ring tone”. The module shall be suitable for mounting on North American 2 ½” (64mm) deep 2-gang boxes and 1 ½” (38mm) deep 4” square boxes with 2-gang covers, or European 100mm square boxes. The single input signal module shall support the following operations: Audible/Visible Signal Power Selector (Polarized 24 Vdc @ 2A).
- O. Control Relay Module, SIGA-CR: Provide intelligent control relay modules SIGA-CR. The Control Relay Module shall provide one form “R” dry relay contact rated at 2 amps @ 24 Vdc to control external appliances or equipment shutdown. The control relay shall be rated for pilot duty and releasing systems. The position of the relay contact shall be confirmed by the system firmware. The control relay module shall be suitable for mounting on North American 2 ½” (64mm) deep 1-gang boxes and 1 ½” deep 4” square boxes with 1-gang covers.
- P. Intelligent Manual Pull Stations — General: It shall be possible to address each Signature Series fire alarm pull station without the use of DIP or rotary switches. Devices using DIP switches for addressing shall not be acceptable. The manual stations shall have a minimum of 2 diagnostic LEDs mounted on their integral, factory assembled single or two stage input module. A green LED shall flash to confirm communication with the loop controller. A red LED shall flash to display alarm status. The station shall be capable of storing up to 24 diagnostic codes that can be retrieved for troubleshooting assistance. Input circuit wiring shall be supervised for open and ground faults. The fire alarm pull station shall be suitable for operation in the following

environment: Temperature: 32<sup>o</sup>F to 120<sup>o</sup>F (0<sup>o</sup>C to 49<sup>o</sup>C), Humidity: 0-93% RH, non-condensing.

- Q. Manual Pull Station, SIGA-270: Provide intelligent single action, single stage fire alarm stations SIGA-270. The fire alarm station shall be of metal construction with an internal toggle switch. Provide a locked test feature. Finish the station in red with silver "PULL IN CASE OF FIRE" English lettering. The manual station shall be suitable for mounting on North American 2 1/2" (64mm) deep 1-gang boxes and 1 1/2" (38mm) deep 4" square boxes with 1-gang covers.
- R. Notification Appliances – General: All appliances shall be UL Listed for Fire Protective Service. All strobe appliances or combination appliances with strobes shall be UL 1971 and ULC S526 Listed. All appliances shall be of the same manufacturer as the Fire Alarm Control Panel (**NO EXCEPTIONS**) specified to insure absolute compatibility between the appliances and the control panels, and to insure that the application of the appliances are done in accordance with the single manufacturers' instructions. Any appliances that do not meet the above requirements, and are submitted for use must show written proof of their compatibility for the purpose intended. Such proof shall be in the form of documentation from **THE CONTROL PANEL MANUFACTURER** clearly stating that the control equipment (as submitted) is 100% compatible with the submitted Notification Appliances.
- S. Strobes, Edwards Genesis "LED" Type: Provide Edwards G1VRF (Red) or G1VWF (White) low profile wall mounted LED strobes at the locations shown on the drawings. For 110 candela applications, provide G4VRF (Red) or G4VWF (White) as indicated on the project plans. Strobes shall provide synchronized flash outputs and shall be field selectable as indicated on the drawings in one of the following intensity levels; 15 candela, 30 candela, 75 candela, or 110 candela (use model G4V for 110 candela). Low profile strobes shall mount in a North American 1-gang box or 4 inch electrical box or optionally surface mounted on a matching back box provided by the manufacturer, as directed in the field.
- T. Temporal Horn Strobes, Edwards Genesis "LED" Type Strobe with Horn: Provide Edwards G1AVRF (Red) or G1AVWF (White) low profile wall mounted LED strobes at the locations shown on the drawings. For 110 candela applications, provide G4AVRF (Red) or G4AVWF (White) as indicated on the project plans. The horn/strobe shall provide an audible output of 86 dBA at 10 ft at the high setting and for smaller room size locations (as indicated on the plans) a low dB setting (field selectable) of 80 dB at 10 ft. when measured in reverberation room per UL-464. Strobes shall provide synchronized flash outputs. Strobes shall provide synchronized flash outputs and shall be field selectable as indicated on the drawings in one of the following intensity levels; 15 candela, 30 candela, 75 candela, or 110 candela (use model G4V for 110 candela). The horn shall have a selectable steady or synchronized temporal output. Low profile strobes shall mount in a North American 1-gang box or 4 inch electrical box or optionally surface mounted on a matching back box provided by the manufacturer, as directed in the field.
- U. Temporal Horn, Edwards Genesis G1ARF: Provide Edwards Series G1ARF low profile wall mount horn at the locations shown on the drawings. The horn shall provide an audible output of 88 dBA at 10 ft at the high setting and for smaller room size locations (as indicated on the plans) a low dB setting (field selectable) of 80 dB at 10 ft. when measured in reverberation room per UL-464. The horn shall have a selectable steady or synchronized temporal output. Low profile horn shall mount in a North American 1-gang box or surface mounted on a matching back box provided by the manufacturer, as directed in the field.
- V. Multi-Voltage Control Relays, MR-200 Series: Provide remote control relays connected to supervised ancillary circuits for control of fans, dampers, door releases, etc. Relay contact ratings

shall be DPDT and rated for 10 amperes at 115 Vac. A single relay may be energized from a voltage source of 24 Vdc, 24 Vac, 115 Vac, or 230 Vac. A red LED shall indicate the relay is energized. A metal enclosure shall be provided.

- W. Electromagnetic Doorholders – General: Electromagnetic doorholders submitted for use must have written proof of their compatibility for the purposes intended. Such proof shall be in the form of documentation from all manufacturers that clearly states that their equipment (as submitted) is 100% compatible with each other for the purposes intended.
- X. Wall Mounted, 1504/1505/1508/1509 Series: Provide flush, semi-flush or surface wall mounted electromagnetic doorholder/releases rated at 24 Vac/dc as directed by the Consulting Engineer. Finish shall be brushed zinc.
- Y. STI Stopper II Lexan Guards: Manual pull stations that are provided with STI Stopper II lexan guards shall include non-audible alarms as required on the plans. They shall be surface or flush mounting, as required for each individual device.
- Z. Projected Beam Detector – Edwards EC-5000R. The projected beam type smoke detector shall be a 4-wire 12/24 Vdc device monitored by the Fire Alarm control panel through a two circuit SIGA-CT2 monitor module (one zone for alarm and one for trouble). The projected beam type smoke detector shall be listed to UL 268 listed and shall consist of up to two integrated transmitters, receiver detector heads and single low level remote control unit. The detector shall operate between a range of 26.25 ft. to 330 ft. (8m to 100m). The temperature range of the system shall be -4°F to 131°F. The beam detector heads shall include an integral built-in laser pointer to assist prism mounting. The beam detector shall feature automatic gain control which will compensate for gradual signal deterioration from dirt accumulation on the lenses. The beams detector heads shall include AutoOptimise self-correcting motorized head feature to ensure unit is always receiving maximum signal available, and shall automatically compensate for building shift. The unit shall include a low level remote display and control unit with LCD read-out for set-up, reporting and testing of up to two separate detector heads. The system shall be capable of programming alarm thresholds of 10% to 60% in 1% increments. The system shall be capable of programming delay to fault and delay to alarm from 2 seconds to 30 seconds in 1 second increments. Test and acceptance of the system shall be carried out by using the UL approved internal electronic obscuration fire test. The contractor shall provide model 5000-004 prism kit for installations with the transmission distance greater than 165 ft. All beam detectors shall include a prism mounting plate (5000-007 or 5000-008) and a model 3000-201 360/180 degree adjustment bracket.

### **PART III - EXECUTION**

#### **INSTALLATION**

- A. The entire system shall be installed in a workmanlike manner, in accordance with approved manufacturer's wiring diagram. The contractor shall furnish all conduit, wiring, outlet boxes, junction boxes, cabinets and similar devices necessary for the complete installation. All wiring shall be of the type recommended by the manufacturer, approved by the local Fire Department and specified with in.
- B. All penetration of floor slabs and firewalls shall be sleeved (1" conduit minimum) fire stopped in accordance with all local fire codes.

- C. End of Line Resistors shall be furnished as required for mounting as directed by the manufacturer. Devices containing end-of-line resistors shall be appropriately labeled. Devices should be labeled so removal of the device is not required to identify the EOL device.
- D. All manual pull stations shall be mounted 48 inches above the finished floor, as measured to the handle.
- E. All audio/visual devices shall be mounted 80 inches above the finished floor, as measured to the lens. Devices shall be mounted no less than 6 inches from the ceiling. All audiovisual devices shall have lexan covers in all areas.
- F. No area smoke detectors shall be mounted within 36 inches of any HVAC supply, return air register or lighting fixture.
- G. No area smoke or heat detector shall be mounted within 12 inches of any wall. All detectors shall be installed in strict accordance with NFPA 72 (1999) guidelines for such devices.
- H. All mechanical rooms, boiler rooms, gymnasiums, wiring closets, custodian rooms, attic spaces, etc. or areas with no hung ceilings shall be piped with 3/4" conduit. All device plenum rated wiring shall be mechanically protected with conduit.  
  
All areas in public view shall be in metal V-700 wiremold (or equal). All boxes must be painted red and labeled "FIRE ALARM".
- I. All addressable modules shall be mounted within 36 inches of the monitored or controlled point of termination. This shall include, but is not necessarily limited to, fan shutdown, elevator recall, shunt trip, sprinkler status points, or door release. Label all addressable modules as to their function.
- J. New door holders shall derive their 24VAC/VDC power from a separate power supply housed in a dedicated, metal enclosure. The power supply shall have a 120VAC feed, and is to be centrally located to serve door holders on a per floor or area basis. All existing door holders shall be connected to new FACP. E.C. shall extend all existing wiring in order to make this work. Locations and quantities of door holder power supplies shall be referenced and submitted in the submission package for approval by the Consulting Engineer.
- K. All low voltage wiring terminated to the fire alarm system shall be PLENUM RATED with no exceptions and no less than No. 18 AWG in size, and solid copper.
- L. All line voltage (120VAC) wiring shall be no less than No. 12 AWG in size, and solid copper. This shall include all system grounding. FACP must have a DEDICATED 20 Amp circuit marked back at the power panel NO EXCEPTIONS.
- M. All wiring shall be color-coded throughout, to National Electrical Code standards.
- N. Power-limited/Non-power-limited NEC wiring standards SHALL BE OBSERVED.
- O. All junction box covers shall be painted federal safety red and labeled FIRE ALARM SYSTEM ONLY in black letters.
- P. Fire alarm system wiring shall not co-mingle with any other system wiring in the facility. Conduits shall not be shared under any circumstance. Only when fire alarm wiring enters the enclosure of a monitored or controlled system will co-habitation be permitted (i.e. at fan starters or elevator controllers). THIS WILL BE FIELD INSPECTED BY THE PROJECT ENGINEER.
- Q. Fire alarm control panel enclosures shall have engraved labels indicating, "FIRE ALARM SYSTEM", and the areas of the building served by that panel.

- R. Auxiliary relays shall be appropriately labeled to indicate "FIRE ALARM SYSTEM" and their specific function (i.e. FAN S-1 SHUTDOWN).
- S. All fire alarm wiring shall be continuous and unspliced. Terminations shall only occur at fire alarm devices or control panel enclosures under terminal screws. All other splicing methods are specifically disallowed (i.e. plastic wirenuts).
- T. All fire alarm wiring shall be installed using a dedicated system of supports (i.e. bridle rings). Fire alarm wiring shall not be bundled or strapped to existing conduit, pipe or wire in the facility. THIS WILL BE FIELD INSPECTED BY THE PROJECT ENGINEER
- U. All fire alarm wiring shall be sleeved when passing through any wall, using conduit sleeves (1" min.) with bushings, and fire stopped in accordance with Code.
- V. The system shall be arranged to receive power from one three wire 120 Vac, 20 A supply. All low voltage operation shall be provided from the fire alarm control panel.
- W. All fire alarm devices shall be accessible for periodic maintenance. Should a device location indicated on the Contract Drawings not meet this requirement, it shall be the responsibility of the installing contractor to bring it, in writing, to the attention of the Project Engineer. Failure to bring such issues to the attention of the Project Engineer shall be the exclusive liability of the installing Electrical Contractor.
- X. The existing fire alarm system shall remain in operation until such time that approval has been granted for its removal. The installing Electrical Contractor shall be responsible for the upkeep of the existing system until such time that it can be removed.
- Y. The installing Electrical Contractor shall be responsible for the removal of ENTIRE existing fire alarm system components and controls on the demolition drawing shown or not, upon approval of the AHJ and the Consulting Engineer. The End-User reserves the right to retain any existing fire alarm system components, upon their request. All existing fire alarm system components requiring special handling for disposal (due to radioactivity) shall be the responsibility of the installing contractor. Written proof of proper disposal by the installing contractor shall be required prior to release of outstanding retainage.

### 3.2 FIELD QUALITY CONTROL

- A. The system shall be installed and fully tested under the supervision of a trained manufacturer's representative. The system shall be demonstrated to perform all of the function as specified.
- B. The installing contractor or fire alarm equipment vendor shall have no less than two (2) NICET Level II fire alarm technicians dedicated to this project.
- C. The Installing Contract and the Fire Alarm System Vendor shall, upon the request of the Consulting Engineer or End-User, attend any and all project meetings for the purpose of accurately determining progress.
- D. It shall be the responsibility of the installing contractor to assure that construction debris does not adversely affect any sensing devices installed as part of this project. Should it be deemed necessary by the Consulting Engineer, End-User or AHJ, the installing contractor shall be responsible for the cleaning of all smoke detectors prior to final acceptance.

### 3.3 TESTS

- A. The fire alarm system vendor shall test the system in accordance with the manufacturer's requirements and NFPA 72. The vendor shall provide completed NFPA 72 reports to the Consulting Engineer for review and approval prior to final acceptance.
- B. Each individual system operation on a circuit by circuit basis shall be tested for its complete operation. The procedure for testing the entire fire alarm system shall be set forth with the consent of the code enforcement official, the Engineer and the manufacturer.

### 3.4 DOCUMENTATION AND TRAINING

- A. The contractor shall compile and provide to the owners three (3) complete manual on the completed system to include SITE SPECIFIC operating and maintenance instruction, catalog cuts of all equipment and components, as-built wiring diagrams and a manufacturer's suggested spare parts list. An operational Video, on DVD media, shall also be included.
- B. In addition to the above manuals, the Electrical Contractor shall provide the services of the manufacturer's trained representative for **two (2)** separate calendar days for a period of four **(4) hours** per day to instruct the owners' designated personnel on the operation and maintenance of the entire system.
- C. As-built drawings shall consist of the following:
  - 1. Complete revision of all previously submitted drawings
  - 2. Point-to-point depiction of all device wiring on the device layout floor plans.
  - 3. One (1) set of B-size, laminated as-built drawings.
  - 4. Two (2) sets of 30"x42"inch 1/16"=1' scale drawings showing all points of fire alarm. One set shall be submitted with the close-out documents. Second set shall be mounted in frame with a lexan cover. These drawing must be submitted to project Engineer or approval.
- D. Turnover of all software database hard/soft copies shall be required. This shall include all possible programming software logs, diskettes or CDs containing exported project files, hard copies of all device maps, the revision number of the version of programming utility used, and all required passwords. The turnover of all database information shall occur prior to the end of the One (1) warranty period (or period as amended earlier in this specification).

**END OF SECTION**

## SECTION 311000 - SITE CLEARING

### PART 1 - GENERAL

#### 1.1 GENERAL REQUIREMENTS

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
1. Protecting existing trees and vegetation to remain.
  2. Removing trees and other vegetation.
  3. Protection of existing utilities to remain.
  4. Protection of existing structures to remain.
  5. Temporary construction fencing and site protection.
  6. Recording site pre-construction condition.
  7. Clearing and grubbing.
  8. Topsoil stripping.
  9. Demolition and removal of all above-grade site improvements in conflict with the proposed construction and as indicated on the plans.
  10. Disconnecting, capping or sealing, and abandoning site utilities in place.
  11. Disconnecting, capping or sealing, and removing site utilities.
  12. Sealing and abandoning underground structures.
  13. Relocating existing salvable improvements identified on the plans.

#### 1.2 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.

#### 1.3 RELATED WORK SPECIFIED ELSEWHERE:

- |                                       |                 |
|---------------------------------------|-----------------|
| A. Existing Conditions                | Section 021000. |
| B. Earth Moving:                      | Section 312000. |
| C. Soil Erosion and Sediment Control: | Section 312500. |

#### 1.4 DEFINITIONS

- A. Topsoil: Natural or cultivated surface-soil layer containing organic matter and sand, silt, and clay particles; friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects more than 2 inches in diameter; and free of weeds, roots, and other deleterious materials.

#### 1.5 MATERIALS OWNERSHIP

- A. Except for materials indicated to be stockpiled or to remain Owner's property, cleared materials shall become Contractor's property and shall be removed from the site.

#### 1.6 SUBMITTALS

- A. Photographs or videotape, sufficiently detailed, of existing conditions of trees and plantings, adjoining construction, and site improvements that might be misconstrued as damage caused by site clearing.
- B. Record drawings according to Division 01 Section "Contract Closeout."
  - 1. Identify and accurately locate capped utilities and other subsurface structural, electrical, and mechanical conditions.
  - 2. Identify and record all existing pavement striping, pavement markings, and curb markings. This information shall be utilized to install new striping in areas of repair and/or resurfacing.
- C. At least 3-days before starting placement of flowable fill, the Contractor shall submit a mix-design for the flowable fill to the Owner's Representative.

#### 1.7 QUALITY ASSURANCE

- A. Tree Pruning Standards: Comply with ANSI A300, "Trees, Shrubs, and Other Woody Plant Maintenance--Standard Practices," unless requirements that are more stringent are indicated.

#### 1.8 PROJECT CONDITIONS

- A. All improvements shall be constructed on Owner's property.
- B. Salvable Improvements: Carefully remove items indicated to be salvaged and store on owner's premises and relocated as directed by the owner's representative.
- C. Notify utility locator service for area where Project is located before site clearing.
- D. The Contractor shall provide all necessary safeguards including the installation of shoring, structural supports, protective fencing, and barriers, etc. as required to prevent injury to

workmen, bystanders, and adjacent property. All work shall be completed in accordance with local building codes, rules and regulations of other governing bodies having jurisdiction over the project. The Owner, the Owner's Representative, the Architect, or the Engineer shall not be responsible for job site safety. Job and site safety shall be the sole responsibility of the Contractor.

- E. The Contractor, at his own expense, shall repair or replace all ground surfaces, pavements, sidewalks, curbs, landscaping, etc. which are to remain and which may become damaged during the completion of the Work. All repairs shall meet the approval of the Engineer.

## **PART 2 - PRODUCTS**

### **2.1 SOIL**

- A. Satisfactory Soil: Requirements for satisfactory soil are specified in Division 31 Section "Earth Moving."
  - 1. Obtain approved borrow soil off-site only when satisfactory soil is not available on-site.

### **2.2 CHAIN LINK FENCE**

- A. Previous temporary chain link fencing system as specified elsewhere in Division 01.
- B. If not specified under Division 01, provide temporary chain link fencing system of metallic-coated steel chain link fence fabric, 0.120-inch diameter wire size; 72-inches high, minimum; line posts, 1<sup>3</sup>/<sub>8</sub>-inches in diameter; terminal and corner posts, 1<sup>3</sup>/<sub>8</sub>-inches in diameter; top rail, 1<sup>3</sup>/<sub>8</sub> inches in diameter; bottom tension wire, 0.177-inch in diameter; with tie wires, hog ring ties, and other accessories for a complete fence system. Fence shall be founded by concrete block or sand bag ballast. The fence shall be stable, upright, continuous, and resist overturning.
- C. Provide access gates as directed by Owner's Representative.

### **2.3 CONCRETE FLOWABLE FILL**

- A. Flowable fill shall consist of a mixture of Portland cement, fly ash, mineral filler, water and admixtures proportioned to provide a non-segregating, free-flowing, self-consolidating material that will result in a hardened, dense backfill. The Contractor shall prepare a mix design as specified herein to determine the proportion of materials necessary to meet the Specification requirements.
- B. Mix Design:
  - 1. The flowable fill shall be proportioned to be non-segregating, free-flowing, self-consolidating, low-shrinkage slurry with a minimum unconfined compressive strength of 100 psi at 28 days, as determined in accordance with ASTM D 4832.

2. The flowable fill shall have a minimum unit weight of 70 pcf.
3. The mix design shall include, but not be limited to, the following information:
  - a. Certification of compliance of the design mix relative to the mix design requirements of this Specification.
  - b. Certification of compliance of the component materials used in the mix design relative to this Specification and referenced Specifications.
  - c. Representative gradations for aggregate from the designated aggregate source and proposed gradation limits for aggregates to be used in the flowable fill.
  - d. Plastic characteristics of the design mix including temperature, slump, air entrainment, wet unit weight, yield and cement factor.
  - e. Performance characteristics of the hardened flowable fill to include compressive strength of all specimens and the corresponding average compressive strength. Compressive strength test results shall be reported for ages of one (1) day, seven (7) days, and twenty-eight (28) days.
  - f. Unit weight of all compressive strength specimens at the time of testing and the corresponding average unit weight.
  - g. The moisture density relationship for the combined cement, fly ash, mineral filler (if used), as determined in accordance with ASTM D558.
4. No flowable backfill shall be placed until the mix design has been reviewed and accepted by the Owner's Representative. The Owner's Representative's acceptance of the mix design shall be understood to indicate conditional acceptance. Final acceptance will be based on conformance with these Specifications and satisfactory test results on field samples during placement as required by these Specifications or as required by the Owner's Representative.

C. Reference Standards:

- |    |                  |                |                |
|----|------------------|----------------|----------------|
| 1. | Portland Cement: | NYSDOT Section | 701-01, Type 5 |
| 2. | Fly Ash:         | NYSDOT Section | 711-10         |
| 3. | Water:           | NYSDOT Section | 712-01         |
| 4. | Mineral Filler:  | NYSDOT Section | 703-08         |
| 5. | Admixtures:      | NYSDOT Section | 711-08         |
| 6. | Concrete Brick:  | NYSDOT Section | 704-02         |

### **PART 3 - EXECUTION**

#### **3.1 PREPARATION**

- A. Protect and maintain benchmarks and survey control points from disturbance during construction.
- B. Provide erosion-control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties, roadways and walkways.
- C. Locate and clearly flag trees and vegetation to remain or to be relocated.

- D. Protect existing site improvements to remain from damage during construction.
  - 1. Restore damaged improvements to their original condition, as acceptable to the Owner's Representative.

### 3.2 TREE PROTECTION

- A. Tree protection shall be in accordance with Section 312500 of this specification.

### 3.3 UTILITIES

- A. The Contractor shall protect and/or support all existing utilities and/or piping during excavation operations that expose same.
- B. Contractor will arrange for disconnecting and sealing indicated utilities and/or piping that serve existing structures before site clearing.
  - 1. Verify that utilities and/or piping have been disconnected and capped before proceeding with site clearing.
- C. Locate, identify, disconnect, and seal or cap off utilities and/or piping indicated to be removed.
  - 1. Contractor will arrange to shut off indicated utilities and/or piping with utility companies.
- D. Existing Utilities: Do not interrupt utilities and/or piping serving facilities occupied by the owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility and/or piping services according to requirements indicated:
  - 1. Notify the Owner's Representative, Utility company with jurisdiction, and affected customers of Utility not less than three days in advance of proposed utility and/or piping interruptions.
  - 2. Do not proceed with utility and/or piping interruptions without the owner's written permission.
- E. The Contractor, at his own expense, shall perform test pits at all proposed utility and sewer crossings with existing facilities to verify the location and depth of those existing utilities shown on the plans. This work shall be performed prior to the Contractor beginning work on any proposed construction. Any discrepancies or perceived conflicts shall be reported to the Owner's Representative immediately prior to proceeding with construction.
- F. The Contractor is required to notify all utility owners and operators prior to the start of work so that the utility locations may be marked-out. The Contractor shall notify the Underground Facilities Protective Organization (UFPO) at (800) 962-7962 at least seventy-two (72) hours before the start of any construction work on site and as required by the utility owners and operators. The Contractor must coordinate with all impacted utilities, and may not start the work until the utilities have been located.

- G. The Contractor shall be held responsible for any claims arising from its failure to make this notification, or its failure to do the work in accordance with the local codes, rules and regulations relating to this work.
- H. Excavate for and remove underground utilities indicated to be removed.
- I. Excavation and backfill for the removal of underground utilities shall be performed in accordance with Division 31 "Earth Moving".

### 3.4 CONCRETE FLOWABLE FILL

- A. Batching, mixing and delivery shall conform to the requirements of either ASTM C94 or C685.
- B. Flowable fill shall be placed when the weather conditions are favorable and when the ambient temperature is above 40 degrees F and rising.
- C. Flowable fill placement shall stop when the ambient temperature is below 36 degrees and falling. At the time of placement, flowable fill shall have a temperature of at least 50 degrees F. Flowable fill shall be cured at a minimum temperature of 40 degrees F for a minimum of 24 hours after placement.
- D. Bulkheading shall be provided by masonry means at either end of the section to be filled with flowable fill. Bulkheads shall be at least eight inches thick and constructed of concrete brick and mortar. Bulkheads shall be allowed to cure prior to placement of flowable fill. Exterior faces of the bulkheads (*i.e.* not in contact with the cured flowable fill) shall be parged with mortar.
- E. The Contractor shall verify, through independent site investigation, that the appropriate drainage pipe is going to be filled. No functioning pipes shall be filled with flowable fill. The Contractor shall make a reasonable attempt, as determined by the Owner's Representative, to ascertain if the drainage pipe is clogged. Two methods of construction exist:
  - 1. If it is determined that the drainage pipe is not clogged or that the drainage pipe is sufficiently open to allow the flowable fill to gravity feed the entire length of the pipe, the Contractor shall seal the lower end of the pipe by masonry bulkhead means. The seal shall be vented such that air voids do not form in the pipe when the flowable fill is placed. The flowable fill shall be discharged from a mixer into the high end of the drainage pipe by any means acceptable to the owner's representative. No flowable fill shall be placed into the adjacent pipes or manholes to render these structures non-functional. After completing the work, both ends of the drainage pipe should be sealed in a neat, workmanlike manner that is acceptable to the Owner's Representative.
  - 2. If it is determined that the drainage pipe is clogged, the Contractor shall make a reasonable attempt, satisfactory to the Owner's Representative, to clear the obstruction. If the Owner's Representative determines that the obstruction(s) can not be removed, the Contractor shall first fill the low end of the pipe with flowable fill. The flowable fill shall be discharged from a mixer into the low end of the drainage pipe by any means acceptable to the Owner's Representative. A seal will

be required to fill the low end of the pipe. The Contractor shall seal the low end of the drainage pipe by any means suitable to the Owner's Representative. After completing work at the low end of the pipe, the Contractor shall place flowable fill in the high end of the pipe as indicated above.

- F. After completion of the Work, the Contractor shall remove from the project site any excess flowable fill that resulted from spillage, etc., and restore the project site to a condition that is acceptable to the Owner's Representative. If excavation is required to reach the abandoned pipe, the Contractor shall restore the area to its original condition as directed by the Owner's Representative.

### 3.5 TEMPORARY CONSTRUCTION FENCING

- A. The Contractor shall maintain, relocate, and provide additional temporary construction fencing as directed by the Owner's Representative to coordinate the work and protect staging areas, pedestrian areas, work areas, emergency routes, field office areas, stockpile areas, etc.
- B. Install chain link fence according to ASTM F 567 and the manufacturer's written instructions.
- C. The cost of all coordination, installation, relocation, dismantling, etc. of fencing shall be included in the price bid for the project.

### 3.6 CLEARING AND GRUBBING

- A. Remove obstructions, trees (as indicated on the plans, either individually or by clearing limit lines), as required to construct the improvement, or if less than 1.5" dbh), shrubs, grass, and other vegetation to permit installation of new construction. Removal includes digging out stumps and obstructions and grubbing roots.
  - 1. Do not remove trees, shrubs, and other vegetation indicated to remain or to be relocated.
  - 2. Cut minor roots and branches of trees indicated to remain in a clean and careful manner where such roots and branches obstruct installation of new construction.
  - 3. Completely remove stumps, roots, obstructions, and debris.
  - 4. Use only hand tools for grubbing within drip line of remaining trees.
- B. Fill depressions caused by clearing and grubbing operations with satisfactory soil, unless further excavation or earthwork is indicated.
  - 1. Place fill in horizontal layers not exceeding eight (8) inch loose depth, and compact each layer to a density equal to adjacent original ground.
- C. When performing the removal of roots, stumps, etc. from around subterranean utility facilities, the contractor shall notify and coordinate his work with the utility company.
- D. When performing the removal of tree limbs, vegetation, etc. from around aerial utility facilities, the contractor shall notify and coordinate his work with the utility company.

### 3.7 TREE PRUNING

- A. Perform maintenance pruning (MP) where pruning is indicated on the plans.
- B. Pruning Standards: Prune trees according to ANSI A300 as follows:
  - 1. Crown cleaning: shall consist of the selective removal of one or more of the following items: dead, dying or diseased branches, weak branches and watersprouts.
  - 2. Crown thinning: shall consist of the selective removal of branches of increase light penetration, air movement and reduce weight.
  - 3. Crown raising: shall consist of the removal of the lower branches of a tree to provide clearance.
- C. Prune remaining trees impacted by temporary and new construction and at locations indicated on the plans.
  - 1. All trees (protecting the branch collar): Crown cleaning and crown thinning limbs 2.0 inches or greater.
  - 2. Within contiguous wooded stands; Crown raising to a vertical clearance of 14 feet over finished grade.
  - 3. Tie back branches to provide temporary clearance.
  - 4. Do not prune if boring insects are present.
  - 5. All pruning shall be performed by qualified arborist (ISA Certified Arborist or Tree Worker).
  - 6. Interior branches shall remain.
  - 7. No live wood greater than 4 inches in diameter shall be cut.
  - 8. Heartwood shall not be exposed if possible.
  - 9. A maximum of 20% of live wood shall be removed.
  - 10. The arborist shall identify defects by performing aerial inspection, and report to the owner's representative.
- D. Prune remaining trees to compensate for root loss caused by damaging or cutting root system. Provide subsequent maintenance during Contract period as recommended by qualified arborist.
- E. Cut branches with sharp pruning instruments; do not break or chop.
- F. Chip branches removed from trees. Spread chips where indicated or as directed by the owner's representative; trunk shall be clear of mulch.

### 3.8 TOPSOIL STRIPPING

- A. Remove sod and grass before stripping topsoil; stockpile if directed.
- B. Strip topsoil to whatever depths are encountered in a manner to prevent mixing with underlying subsoil or other waste materials.
  - 1. Strip topsoil, trash, debris, weeds, roots, and waste.

- C. Stockpile topsoil away from edge of excavations. Grade and shape stockpiles to drain surface water. Cover to prevent windblown dust.
  - 1. Do not stockpile topsoil within drip line of remaining trees.
  - 2. Stockpile surplus topsoil and allow for re-spreading deeper topsoil.
    - a. Excess topsoil shall be evenly distributed over graded areas and shall not be removed from the site.

### 3.9 MAINTENANCE AND PROTECTION OF TRAFFIC

- A. The Contractor shall maintain traffic, as required during the course of the Work, in such a manner that is satisfactory to the owner's representative, and all authorities having jurisdiction. The Contractor shall comply with all rules and regulations of those permits and pay all fees, deposits, and charges in connection with these permits.
- B. The Contractor shall furnish, install, and maintain construction signage, barricades, steel roadway plates, and other protective devices as necessary and required to adequately maintain both vehicular and pedestrian traffic during the performance of the Work. The Contractor shall provide all personnel necessary for directing and controlling traffic. Emergency personnel and equipment shall have safe and adequate access to the site at all times. The Contractor must coordinate and cooperate with the Owner's Representative to maintain a level of service which is appropriate in the opinion of the Owner's Representative.
- C. If a Construction Sequencing Plan is included in the project documents, the conditions and directives indicated on same shall also be followed in addition to this specification.
- D. Channelization shall be provided by plastic traffic safety drums meeting FHWA MUTCD and New York State Supplement standards.

### 3.10 SITE IMPROVEMENTS

- A. Remove existing above- and below-grade improvements as indicated and as necessary to facilitate new construction.
  - 1. If the area where excavation for removal of pipes, inlets or manholes, lies outside of proposed pavements, backfill shall be with suitable materials excavated from the project. Backfill of excavated areas within proposed pavement areas shall be made with select soil.
  - 2. When the removal of a portion of pipe, chamber, vault, tunnel, or conduit is required, the pipe shall be sawcut with an approved power saw. No separate payment shall be made for sawcutting.
  - 3. All existing foundations shall be removed where in conflict with proposed construction as noted on the plans. Backfill of excavated areas of former foundations shall be made with select structural fill.
  - 4. Remove all above-grade site improvements where noted on the plans or in conflict with the proposed layout

5. Remove sub-surface asbestos-containing piping materials and appurtenances in accordance with the asbestos-abatement procedures provided under this project.
  6. Underground vaults and/or structures may exist within the property and are not shown on the plans. Abandonment and/or sealing of any structures shall be completed to the satisfaction of the Owner's Representative, agency, or authority having jurisdiction.
- B. Remove slabs, paving, curbs, gutters, and aggregate base as indicated.
1. Unless existing full-depth joints coincide with line of demolition, neatly saw-cut length of existing pavement to remain before removing existing pavement. Saw-cut faces vertically.
  2. No separate payment will be made for the removal of slabs, paving, curbs, gutters, or aggregate base.
- C. When or where any direct or indirect damage or injury is done to public or private property by, or on account of, any act, omission, neglect or misconduct on the part of the Contractor in the execution of the work, such property shall be restored by the Contractor, at this expense, to a condition equal to that existing before such damage or injury was done or he shall make good such damage or injury in such other manner as may be acceptable to the Owner's Representative.
- D. Relocation and/or conflict with operations: As indicated on the plans, remove all site improvements (e.g., curb stops, benches, signs, flagpoles, utility poles) indicated to be relocated or in conflict with the proposed construction activity. Store these improvements on site at no cost of the owner. Reinstall improvements in kind at new or original location once construction activity has been completed at that location. Any damage to the improvements as a direct result of improper storage shall be repaired or replaced at the direction of the Owner's Representative and at no cost to the Owner.
- E. If a separate section is not provided for the removal and/or relocation of hedges, fences, and privately owned signs, the Contractor shall be responsible to contact the Owner's Representative of said hedge, shrub, fence or sign to determine if the Owner's Representative desires to reclaim it. If the Owner's Representative should desire to reclaim the items, the Contractor shall then use reasonable care and relocate and reset the item beyond the work limits. No separate payment shall be made for this coordination, removal or relocation.

### 3.11 DISPOSAL

- A. Disposal: Remove surplus soil, unsuitable topsoil (suitability to be determined by the Owner's Representative), obstructions, demolished materials, waste materials, trash, and debris, and legally dispose of them off the Owner's property.
1. All regulated materials accumulated during the clearing of the site described above, or any excess materials, shall be disposed of by the Contractor at a New York Department of Environmental Conservation approved landfill site, to be provided by the Contractor.
  2. Burning of debris will not be allowed.

3.12 RESTORATION AND CLEANING UP

- A. Unless otherwise required by the Drawings, all roadway and sidewalk pavements, crosswalks, curbs, etc., along the line of the work, which are removed, destroyed, lost or injured on account of any act or omission on the part of the Contractor, his agent, servants or employees, in the prosecution of the work will be restored to their original condition at the expense of the Contractor.
- B. On paved surfaces, the Contractor shall not use or operate tractors, bulldozers or other power operated equipment, the treads, tracks, or wheels of which are so shaped as to cut or otherwise damage such surfaces.
- C. At such times as may be directed, all gutters, sidewalks, and lawns, etc., affected by the work completed under contract shall be restored by the Contractor to the same condition in which they were at the time of the opening of the bids for this contract. Any necessary topsoiling and seeding shall be completed in accordance with the requirements of this specification.
- D. Cultivated hedges, shrubs, and plants that might be damaged by the Contractor's operations shall be protected by suitable means or shall be dug up and temporarily replaced and cared for. After the construction operations have been substantially completed, they shall be replanted in their original positions and cared for until growth is re-established. If cultivated hedges, shrubs, and plants are injured to such a degree as to affect their growth or diminish their beauty or usefulness, they shall be replaced by items of kind and quality at least equal to kind and quality existing at the start of the work.
- E. At such times as may be directed, the Contractor shall remove from the site all materials which were placed thereon by him because of performing this work and which are not required by the contract to be left as part of the finished work. The entire work and portions of the site affected thereby shall be left in a satisfactory condition. The sidewalks and crosswalks shall be swept clean of the work performed under this contract, and, if required, they shall be sprinkled with water during the sweeping.
- F. No separate payment shall be made for the work involved in Restoration and Cleaning-Up as described above. The cost of this work shall be included in the prices bid for the various items scheduled in the proposal.

END OF SECTION 311000

## **SECTION 312000 - EARTH MOVING**

### **PART 1 - GENERAL**

#### **1.1 GENERAL REQUIREMENTS**

A. Work of this Section includes all labor, materials, equipment, and services, to be performed by the General Contractor, necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:

1. Stake out entire site for buildings, roads, storm sewers, utilities, asphalt paving, curbs, walks, equipment pads, access roads, parking areas, etc.
2. Provide temporary access roads with parking, shanty/storage areas, maintain access to the building, establish tree protection lines, etc.
3. Stripping, removal, and stockpiling of topsoil, unsuitable soils, unsuitable materials and rough grading of the site within the disturbance limits shown on the plans or dictated by the construction.
4. Establish proper sub-grade elevations.
5. Dewatering of excavations as required by site conditions.
6. Preparing and proof-rolling sub-grades for walks, pavements, turf areas, plantings, etc and protect against accumulation of water in excavation areas.
7. Drainage course for slabs-on-grade, sub-base for walks and pavements, subsurface drainage backfill for walls and trenches.
8. Temporary retaining walls, shoring, or bracing to support excavations, facilities, and construction sequencing.
9. Provide all NYSDOT-approved imported fill required in conformance with site grading plans and details and include the cost of said approved imported fill in the proposal amount.
10. Replacement of unsuitable soils encountered as determined by the Owner's Owner's Representative and replacement with approved, controlled, compacted fill.
11. Excavating, filling, backfilling and drainage fill course for sidewalk, proofing and grading.
12. Excavating, trenching, filling and backfilling, compaction, and drainage fill course for building foundations, slabs on grade, underground storm and sanitary sewage piping, water service and fire service piping, mechanical and electrical utilities and buried mechanical and electrical pits, utility structures and other appurtenances, proofing and grading.
13. Removal from site of debris, other unsuitable materials and any excess materials that cannot be properly stored on site.

B. Rock meeting the definition provided herein shall be removed as a change order to the Owner.

#### **1.2 RELATED DOCUMENTS**

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.
- C. New York State Standards and Specifications for Erosion and Sediment Control, revised and adopted through 2016, and the latest revisions thereto.
- D. Subsurface investigation results are included in the project SWPPP appendices.

1.3 RELATED WORK SPECIFIED ELSEWHERE:

- A. Site Clearing: Section 311000.
- B. Soil Erosion and Sediment Control: Section 312500.
- C. Turf and Grasses: Section 329200.
- D. Soil Management: Section 313100.
- E. Asbestos Abatement Design Section 028213.
- F. Lead Paint Management Section 028333.
- G. PCB Material Removal Section 028400.
- H. Landscape Irrigation Section 328000.
- I. Water Utilities Section 331000.
- J. Sanitary Sewerage Utilities Section 333000.
- K. Storm Drainage Utilities Section 334000.

1.4 DEFINITIONS

- A. The following terms shall have the meanings ascribed to them in this Article, wherever they appear in this Section.
  - 1. Earth Excavation: The removal of all surface and subsurface material not classified as rock (as defined below).
  - 2. Rock: Limestone, sandstone, shale, granite, and similar material in solid beds or masses in its original or stratified position which cannot be broken or removed by mechanical equipment (*e.g.* excavators or heavy duty ripping equipment at least as powerful as a Caterpillar D9L with a Kelly Ripper KR400D-1 single shank ripper attachment) without the use of explosives, drills, wedges, or pneumatic tools; and single boulders with a volume greater than 2.0 cu yd. Subsurface concrete building foundations and subsurface concrete slabs, not indicated on the plans, with a volume greater than 2.0 cubic yards, shall be classified as rock. This classification does not include materials such as loose rock, concrete or other materials that can be removed by means other than extraordinary rock excavation techniques, but which for reasons of economy in excavating, the General Contractor chooses to

remove by extraordinary rock excavation techniques. Materials which can be loosened with a pick or backhoe, frozen materials, soft laminated shale or hardpan, pavements, curbs, and similar materials shall be classified as earth excavation. Concrete building foundations and concrete slabs, where indicated, shall be classified as earth excavation. Masonry building foundations, whether indicated or not, shall be classified as earth excavation.

3. Subgrade Surface: Surface upon which subbase or topsoil is placed.
4. Subbase: Structural material or NYSDOT Item 304.12 (where allowed) which is placed immediately beneath pavement or concrete slabs.
5. Maximum Density: The dry unit weight in pounds per cubic foot of the soil at "Optimum Moisture Content" when determined by ASTM D 1557.
6. Landscaped Areas: Areas not covered by structures, walks, roads, paving, or parking.
7. Unauthorized Excavation: The removal of material below required elevation indicated on the Drawings or beyond lateral dimensions indicated or specified without specific written direction by the Owner's Representative.
8. Unsuitable material: In-situ fill material that contains materials (asphalt and concrete debris, metals, plastics, manufactured materials, wood, organic, or any other deleterious materials) other than non-organic soil.

## 1.5 SUBMITTALS

### A. Product Data:

1. Permanent Sheeting, Shoring, and Bracing: Specifications for materials and accessories.
2. Filter Fabric: Manufacturer's catalog sheets, specifications, and installation instructions.

### B. Certification: Submit certification for the following materials:

1. Select Fill.
2. Crushed Stone.
3. Pea Gravel.
4. Sand.
5. Subbase Course Type 2.
6. Underdrain Filter, Type 1.

### C. Quality Control Submittals:

1. Sheeting, Shoring, and Bracing (Not shown on the Drawings): Submit a detailed plan of intended sheeting, shoring and bracing, signed by a New York licensed Professional Engineer for information. This submittal will not relieve the Contractor of responsibility for the successful performance of the intended sheeting, shoring and bracing methods.
2. Excavation Procedure: Submit a lay out drawing or detailed outline of intended excavation procedure for information. This submittal will not relieve the Contractor of responsibility for the successful performance of intended excavation methods.

- D. Samples: Submit samples as follows. Take the samples in the presence of the Owner's Representative and complete a Granular Material Sample Information Form for each sample. Forms and field sample designation numbers will be furnished by the Owner's Representative.
1. Select Fill: 50 - 60 lb. (Two Samples).
  2. Subbase Course NYSDOT Item 304.12: 50 - 60 lb. (One Sample).
  3. Crushed Stone: 30 lb.
  4. Underdrain Filter, Type 1, Item 650.0901: 30 lb.
- E. Quality Control Submittals:
1. Subbase Materials: Name and location of source, stockpile number, and latest NYSDOT test results and approval.
  2. Other Aggregates: Name and location of source, and latest NYSDOT source number, test number, and date.
- F. Acceptance of Materials: Samples of materials proposed for use shall be submitted by the Contractor to the Owner's Representative at least three days prior to using that material. The material shall not be used until approved by the Owner's Representative. By submitting the samples of materials, the Contractor agrees that the fill materials used for construction will conform to the samples supplied. If the test results show that the materials do not meet the specifications, the Contractor shall be responsible for all costs associated with the additional sampling and re-testing of materials from a different stockpile or source. Final acceptance of fill material rests with the Owner's Representative.
1. The fact that the moisture of a satisfactory soil is not optimum shall not render it unsatisfactory. The Contractor shall plan and execute his work, and do what is necessary to bring the moisture within the specified limits. It is the Contractor's responsibility to determine the economics of using, or disposing and replacing, such materials. Material determined by the Contractor to be uneconomical for use may be disposed of as specified and replaced with other material at no additional cost to the owner and required amendment shall be performed by the Contractor at no additional cost to the Owner. All excavated unsatisfactory soil is to be removed from site, unless directed otherwise.
- G. The Owner's Representative has the right to revise the type of materials for various portions of the construction as may be required for the satisfactory execution of the work.
- H. Earthwork Analysis: The Contractor shall prepare, at his expense, an earthwork analysis outlining the material volume to be excavated and removed from the site, all project cut volume and all project fill volume. The Contractor shall be responsible for obtaining and executing all permits required for earthwork operations.

## 1.6 QUALITY CONTROL

- A. Shoring, and bracing shall be performed by a specialty contractor familiar with this type of work and having a minimum of five (5) years experience. Foremen directing this work

shall have at least three (3) years experience and have directed at least five (5) similar projects.

## 1.7 PROJECT CONDITIONS

- A. Contractor shall protect existing trees and plants during performance of the Work unless otherwise indicated. Box trees and plants indicated to remain within the grading limit line with temporary fencing as detailed and required. Protect root systems from smothering. Do not store excavated material, or allow vehicular traffic or parking within the branch drip line. Restrict foot traffic to prevent excessive compaction of soil over root systems.
- B. Cold Weather Requirements:
  - 1. When freezing temperatures are predicted, do not excavate to final required elevations for concrete Work unless concrete can be placed immediately. Retain enough earth over the bottom elevation of footings to prevent frost penetration. If excavation has progressed to final footing elevations and concrete cannot be placed immediately, cover the bottom of the excavations with protective material to adequately insulate the exposed earth surface from frost. Remove protective material immediately before placing concrete.
  - 2. Do not backfill between November 1 and April 1, except with written permission of the owner.
- C. Thru-traffic or fill placement with heavy construction vehicles or equipment which causes rutting or weaving to occur within the perimeter of a building will not be permitted. If rutting or weaving occurs during placement of fill, deposit specified fill in a stable area outside building perimeter and spread into the footprint with tracked equipment to the specified layer thickness at no additional cost to the Owner.
- D. Existing Utilities: Prior to performing any excavation, the Contractor must call Underground Facilities Protective Organization (UFPO) at (800) 962-7962, at least seventy-two (72) hours in advance of starting work to locate and mark-out existing utilities in areas of excavation work. If utilities are required to remain in place and/or in service, provide adequate means of support and protection during earthwork operations. Repair any damage to utilities to the satisfaction of the Owner's Representative at no expense to the Owner.
- E. Should uncharted, or incorrectly charted, piping or other utilities be encountered during excavation, Contractor shall consult Utility Owner immediately for directions. Cooperate with Owner and Utility Owner's in keeping respective services and facilities in operation. Repair damaged utilities to satisfaction of Utility Owner at no expense to the Owner.
- F. Additional test borings and other exploratory operations may be performed by Contractor, at no additional cost to the Owner.
- G. Where dry construction practices are required and sub-surface conditions do not permit same, the Contractor shall design, install, and operate a dewatering system to keep sub-grades dry and convey ground water away from excavations. Maintain until dewatering is no longer required.

1. Contractor shall retain the services of a qualified Professional Engineer licensed in the State of New York to design the dewatering system.
2. Contractor shall be responsible for obtaining all permits for the dewatering system.

## 1.8 SITE LAYOUT

- A. Employ at Contractor's expense, an approved, Professional Land Surveyor licensed in the State of New York to establish contract limit lines and bench mark; layout access road, detention ponds, storm sewers, utilities, bituminous paving areas, building pads, concrete walks, curbs and pads, parking area, contractor Trailer/Storage area, etc.; set building floor elevations; stake out for sub-grade and finished grade elevations, etc.
  1. Land Surveyor shall be approved by Owner.
- B. Should Land Surveyor encounter discrepancies in grades and/or conditions noted on Contract Documents, he shall contact the Owner's Representative in writing before proceeding with further work. This work shall be done immediately upon execution of the contract for construction prior to the submittals process and prior to the commencement of any excavation or construction on the site and shall include, but not be limited to, checking and verification of grades on the Contract Documents.
- C. The Land Surveyor shall provide a plan of the stakeout of the structure(s) to the Owner's Representative prior to any concrete placement.
- D. At completion, Land Surveyor will submit sealed and certified as-built mylar drawings of grades, locations, invert elevations, pipe sizes, etc. to the Owner's Representative.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Select Fill: Imported, sound, durable, sand, gravel, stone, or blends of these materials, free from organic and other deleterious materials to meet the following gradation:

<b>Sieve</b>	<b>Percent Passing</b>
3 inch	100
¼ inch	30-70
No. 40	5-40
No. 200	0-10

1. Subbase Course Type 2 material in accordance with NYSDOT Article 304-2 may be used for select fill.

2. On-site soil shall not be used as select fill or structural fill and shall be removed and disposed of from the site in accordance with this specification.
- B. Suitable Soil (Fill and Backfill for Landscaped Areas): Material consisting of mineral soil (inorganic), blasted or broken rock and similar materials of natural or man-made origin, including mixtures thereof. Maximum particle size shall not exceed the lesser of four (4) inches or 2/3 of the specified layer thickness prior to compaction.
1. Material containing cinders, industrial waste, sludge, building rubble, land fill, muck, and peat shall be considered unsuitable for fill and backfill, except topsoil and organic silt may be used as suitable material in landscaped areas provided it is placed in the top layer of the subgrade surface.
  2. The on-site soils are generally suitable for reuse as fill in landscape areas outside the footprint of buildings and site improvements (*e.g.* parking lots, driveways, sidewalks, pads, etc.).
- C. Crushed Stone, Crushed Gravel, or Screened Gravel: Comply with applicable portions of NYS DOT Section 703-02, except as otherwise indicated.
1. Gradation: ¾ inches to 1- ½ inches.
- D. No. 2 Crushed Stone: washed stone; free of shale, clay, friable material and debris; graded in accordance with ASTM C136.

Sieve	Percent Passing
1-½ inch	100
1 inch	90-100
½ inch	0-15

- E. Pea Gravel: Aggregate Type: Natural stone; washed, free of clay, shale, organic matter; graded in accordance with ASTM C136.
- F. Underdrain Filter: NYSDOT Item 605.0901, Type 1

2.2 BRICK AND MORTAR

- A. Manhole Brick: Standard size, ASTM C 32, Grade MS.
- B. Mortar Materials: Dry packaged, proportioned for Type M unit masonry mortar, complying with ASTM C 387.

**PART 3 - EXECUTION**

### 3.1 EXCAVATION

- A. Excavate earth as required for the Work.
- B. Maintain sides and slopes of excavations in a safe condition until completion of backfilling. Comply with Code of Federal Regulations Title 29 - Labor, Part 1926 (OSHA).
  - 1. Trenches: Deposit excavated material on one side of trench only. Trim banks of excavated material to prevent cave-ins and prevent material from falling or sliding into trench. Keep a clear footway between excavated material and trench edge. Maintain areas to allow free drainage of surface water.
- C. Stockpile excavated materials classified as suitable material where directed, until required for fill. Place, grade, and shape stockpiles for proper drainage as approved by the Owner's Representative.
- D. Excavation for Structures: Conform to elevations, lines, and limits indicated. Excavate to a vertical tolerance of plus or minus 1 inch. Extend excavation a sufficient lateral distance to provide clearance to execute the Work.
- E. Excavation for Slopes: Shall be limited to a maximum of 3-feet horizontal to 1-foot vertical.
- F. Pipe Trenches: Open only enough trench length to facilitate laying pipe sections. Unless otherwise indicated on the Drawings, excavate trenches approximately 24 inches wide plus the outside pipe diameter, equally divided on each side of pipe centerline. Cut trenches to cross section, elevation, profile, line, and grade indicated. Accurately grade and shape trench bottom for uniform bearing of pipe in undisturbed earth. Excavate at bell and coupling joints to allow ample room for proper pipe connections.
  - 1. Trench in Rock: Excavate an additional 6 inches below bottom of pipe for bed of cushion material under the piping.
  - 2. Where unsuitable materials are encountered, excavate and remove unsuitable material below the footing bottoms beneath the footing footprints plus the area a minimum of 2 feet beyond the edges of footings or greater to allow for the specified proofrolling. The limits of removal of unsuitable material shall have a minimum depth of 2 feet below the footing bottom and shall extend a minimum distance beyond the edge of footing equivalent to the depth of removal below the footing. Place compacted select fill in the resulting excavation after proofrolling the full excavation bottom.
  - 3. All subgrades shall be proofrolled by the Contractor using a vibratory roller having a minimum static weight of ten tons and inspected by the Owner's Owner's Representative to verify the acceptability of the subgrade before placement of fill or concrete. Unsuitable materials shall be removed as determined by the owner's representative based on visual inspection and observation of proof rolling. The existing fill subgrades should be compacted to at least 95 percent of the maximum dry density value determined by ASTM D 1557.
- G. Open Ditches: Cut ditches to cross sections and grades indicated.

- H. Pavement: Excavate to subgrade surface elevation as shown on the plans.
- I. Hand Excavation: Excavate by manual methods at locations and depths indicated on the plans or as required to prevent damage to utilities and/or to prevent harm to the public and the Contractor's employees or assigns.
- J. Unauthorized Excavations: Unless otherwise directed, backfill unauthorized excavation under footings, foundation bases, and retaining walls with compacted structural material without altering the required footing elevation. Elsewhere, backfill and compact unauthorized excavation as specified for authorized excavation of the same classification, unless otherwise directed by the Owner's Representative.
  - 1. Unauthorized excavations under structural Work such as footings, foundation bases, and retaining walls shall be reported immediately to the Owner's Representative before any concrete or backfilling Work commences.
- K. Notify the Owner's Representative upon completion of excavation operations. Do not proceed with the Work until the excavation is inspected and approved. Inspection of the excavation by the owner's representative will be made on 3 working days notice.
- L. Where the natural soils consist of both silty sands and silty clays (which are susceptible to softening and disturbance from excess moisture and construction equipment traffic), the Contractor should expect additional excavation of soft natural soils to be required if the earthwork is being performed during the traditionally wet seasons or following extended periods of inclement weather. Over-excavation of unsuitable soils would be minimized if the earthwork is performed during favorable weather conditions and prudent earthwork procedures are used. The Contractor shall maintain favorable soil conditions at no additional cost to the owner.
- M. Manholes: Excavate to the following depths below bottom of concrete for addition of Subbase Course Type 2:
  - 1. Exterior: 12 inches unless otherwise indicated.

### 3.2 SHORING AND BRACING

- A. Shoring and Bracing: Where required, provide and install materials for shoring and bracing (sheet piling, uprights, stringers, cross braces, etc.), ensuring good, serviceable material condition. Shoring and Bracing shall accommodate the staging of the work and shall not adversely impact existing subsurface utilities or structures. Maintain shoring and bracing throughout the life of the excavations. Extend shoring and bracing as excavation progresses. Shop drawings of the shoring and bracing shall be prepared by a licensed professional engineer and submitted for review prior to proceeding with the work.
- B. The Contractor shall not install shoring and bracing where vibrations will be created during normal working hours without the Owner's written permission prior to the start of work.

### 3.3 SETTLEMENT DETECTION

- A. Establish a settlement detection method approved by the Owner's Representative for structures subject to settlement from excavation, underpinning, sheeting or shoring operations. Maintain surveillance to detect any settlement. At a minimum, follow this procedure:
  - 1. Before starting any excavating, survey and record the position of the structure to be monitored in relation to an approved remote permanent bench mark. At least twice each day during the operations and for a period of not less than 7 days after completion of the Work, carefully check the position of the existing structure to detect any settlement. Furnish a written record of each position check to the Owner's Representative on the same day the check is made. Should any settlement be detected, immediately correct this condition by means of temporary shoring.
- B. Maximum permissible deflection (horizontal/vertical):
  - 1. Adjacent to permanent structure: 1/4-inch / 1/4-inch.
  - 2. Adjacent to temporary structure: 1-inch / 1-inch

### 3.4 DEWATERING

- A. Prevent surface and subsurface water from flowing into excavations and trenches and from flooding the site and surrounding area.
- B. Do not allow water to accumulate in excavations or trenches. Remove water from all excavations immediately so as not to adversely affect construction procedures or cause excessive disturbance of underlying natural soil, to prevent softening of foundation bottoms, to prevent undercutting footings, and to prevent soil changes detrimental to the stability of subgrades and foundations. Furnish and maintain pumps, sumps, suction and discharge piping systems, and other system components at own expense as necessary to convey the water away from the Site.
- C. Where necessary, lower groundwater level in advance of excavation to facilitate construction in accordance with these specifications.
- D. Convey water removed from excavations, and rain water, to collecting or run-off area. Cut and maintain temporary drainage ditches and provide other necessary diversions outside excavation limits for each structure. Do not use trench excavations as temporary drainage ditches.
- E. Provide temporary controls to restrict the velocity of discharged water as necessary to prevent erosion and siltation of receiving areas.

### 3.5 PLACING FILL AND BACKFILL

- A. Preparation of Fill Areas: Strip vegetation, topsoil, subsoil with organic material and other deleterious materials prior to placement of fill. Remove old pavements. Prior to

placement of fill, smooth out and compact areas where wheel rutting has occurred due to stripping or earthwork operations.

- B. Backfill excavations as promptly as Work permits, but not until acceptance by the Owner's Representative of construction below finish grade including suitability of subgrade and pipe bedding.
- C. Place backfill and fill materials in layers not more than eight (8) inches thick in loose depth unless otherwise specified. Before compaction, moisten or aerate each layer as necessary to facilitate compaction to the required density. Do not place backfill or fill material on surfaces that are muddy, frozen, or covered with ice.
  - 1. Place fill and backfill against foundation walls and in confined areas (such as trenches) not easily accessible by larger compaction equipment, in maximum 4 inch thick (loose depth) layers.
- D. Under Pavements and Walks:
  - 1. Up to Subgrade Surface Elevation: Place on-site soil when fill or backfill is required.
  - 2. Subbase Material: Place as indicated.
- E. Landscaped Areas: Place suitable soil when required to complete fill or backfill areas up to subgrade surface elevation. Do not use material containing rocks over 4 inches in diameter within the top 12 inches of suitable soil.
- F. Rigid and Flexible Pipe in Trenches: Place bedding material as specified on the plans.
  - 1. Place cushion material a minimum of 4 inches deep under pipe, 4 inches on either side and 12 inches above top of pipe. Complete balance of backfill as specified. Compact all backfill in layers.
  - 2. Trench in Rock: Place a minimum 6 inch deep bed of cushion material under pipe.
- G. Under manholes:
  - 1. Up to Subgrade Surface Elevation: Place selected fill when fill or backfill is required.
  - 2. Subbase Material: Place 12 inches of Subbase Course Type 2 over subgrade surface.
- H. Backfilling Excavation Resulting from Removal of Unsuitable Material beneath Structures and Other Improvements: Backfill the excavation with compacted select fill.
- I. Boulders may be spread out at the bottom of any proposed deep fills outside of building areas and a minimum of 10 feet from other foundations, retaining wall systems, or underground utilities, provided that fill materials can be completely compacted around the boulders. Boulders should not be placed within 3 feet of finished grade.

### 3.6 COMPACTION

- A. Compact each layer of fill and backfill for the following area classifications to the percentage of maximum density specified below and at a moisture content suitable to obtain the required densities, but at not less than 2 percent drier or more than 2 percent wetter than the optimum content as determined by ASTM D 1557.
- |   |             |
|---|-------------|
| 1. Landscaped Areas:  | 92 percent. |
| 2. Pavements and Walks:                                     | 95 percent. |
| 3. Pipe Trenches:   | 95 percent. |
| 4. Pipe Bedding:  | 95 percent. |
| 5. Manholes (entire area within 10 feet outside perimeter): | 95 percent. |
- B. When the existing ground surface to be compacted has a density less than that specified for the particular area classification, break up and pulverize, and moisture condition to facilitate compaction to the required percentage of maximum density.
- C. Moisture Control:
1. Where fill or backfill must be moisture conditioned before compaction, uniformly apply water to the surface and to each layer of fill or backfill. Prevent ponding or other free water on surface subsequent to, and during compaction operations.
  2. Remove and replace, or scarify and air dry, soil that is too wet to permit compaction to specified density. Soil that has been removed because it is too wet to permit compaction may be stockpiled or spread and allowed to dry. Assist drying by discing, harrowing or pulverizing, until moisture content is reduced to a value which will permit compaction to the percentage of maximum density specified.
  3. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.

### 3.7 ROUGH GRADING

- A. Exterior Grading: Trim and grade area within the Limit of Disturbance and excavations outside the limit line, required by this Contract, to a level of 4 inches below the finish grades indicated unless otherwise specified herein or where greater depths are indicated. Provide smooth uniform transition to adjacent areas.
1. Landscaped Areas: Provide uniform subgrade surface within 1 inch of required level to receive topsoil thickness specified. Compact fill as specified to within 3 inches of subgrade surface. Remove objectionable material detrimental to proper compaction or to placing full depth of topsoil. If the top 3 inches of subgrade has become compacted before placement of topsoil, harrow or otherwise loosen rough graded surface to receive topsoil to a depth of 3 inches immediately prior to placing topsoil.

### 3.8 SUBGRADE SURFACE FOR WALKS AND PAVEMENT

- A. Shape and grade subgrade surface as follows:

1. Pavements: Shape the surface of areas under pavement to required line, grade and cross section, with the finish surface not more than 1/2 inch above or below the required subgrade surface elevation.
- B. Grade Control: During construction, maintain lines and grades including crown and cross-slope of subbase course.
- C. Thoroughly compact subgrade surface for walks and pavement by mechanical rolling, tamping, or with vibratory equipment as approved to the density specified.

### 3.9 FINISH GRADING

- A. Uniformly grade rough graded areas within limits of the Limit of Disturbance to finish grade elevations indicated.
- B. Grade and compact to smooth finished surface within tolerances specified, and to uniform levels or slopes between points where finish elevations are indicated or between such points and existing finished grade.
- C. Grade areas adjacent to building lines so as to drain away from structures and to prevent ponding.
- D. Finish surfaces free from irregular surface changes, and as follows:
  1. Grassed Areas: Finish areas to receive topsoil to within 1 inch above or below the required subgrade surface elevations.
  2. Pavements: Place and compact subbase material as specified. Shape surface of areas under pavement to required line, grade and cross section, with the finish surface not more than 1/2 inch above or below the required subbase elevation.
- E. Spread topsoil directly upon prepared subgrade surface to a depth measuring 4 inches after natural settlement of the topsoil has occurred in areas to be seeded or to receive sod. Place to greater depth when necessary to adjust grades to required elevations.
  1. Approved existing topsoil excavated from within the Limit of Work may be used. Provide additional topsoil from outside sources as required.
- F. Finish topsoil surface free of depressions which will trap water, free of stones over 1 inch in any dimension, and free of debris.

### 3.10 MAINTENANCE AND RESTORATION

- A. Restore grades to indicated levels where settlement or damage due to performance of the Work has occurred. Correct conditions contributing to settlement. Remove and replace improperly placed or poorly compacted fill materials.
- B. Restore pavements, walks, curbs, lawns, and other exterior surfaces damaged during performance of the Work to match the appearance and performance of existing corresponding surfaces as closely as practicable.

- C. Topsoil and seed or sod damaged lawn areas. Water as required until physical completion of the Work.

### 3.11 DISPOSAL OF EXCESS AND UNSUITABLE MATERIALS

- A. Remove from the Owner's property and dispose of excess and unsuitable materials, including materials resulting from clearing and grubbing and removal of existing improvements.
- B. Transport excess topsoil to areas on the owner's property designated by the Owner's Representative. Smooth grade deposited topsoil and establish turf.
- C. Burning shall not be permitted.

### 3.12 FIELD QUALITY CONTROL

- A. Compaction Testing: Notify the Owner's Representative at least 3 working days in advance of all phases of clearing, stripping, filling and backfilling operations. Compaction testing will be performed by the Owner's Representative to ascertain the compacted density of the proofrolled existing soil, fill and backfill materials. Compaction testing will be performed on certain layers of the fill and backfill as determined by the Owner's Representative. If a compacted layer fails to meet the specified percentage of maximum density, the layer shall be recompacted and will be retested. No additional material may be placed over a compacted layer until the specified density is achieved.
  - 1. Contractor shall provide the testing results to the Owner's Representative.
- B. Proofrolling
  - 1. Soil sungrades, should be proofrolled under the observation of the Owner's Owner's Representative. Proofrolling should consist of four (4) passes with a vibratory roller having a static weight of at least ten (10) tons in open areas and a 1.5 ton trench roller in confined areas.
  - 2. Proofrolling should not be performed in wet areas until they are dewatered and allowed to dry. Proofrolling soils that are too wet to compact may create more unstable conditions.
  - 3. Any soil deemed unsuitable by the Owner's Owner's Representative (areas found to be soft and yielding during proofrolling), should be removed at the direction of the Owner's Owner's Representative. Over excavated areas should be backfilled with an approved, compacted fill.
  - 4. All costs associated with proofrolling and remediate disclosed by same shall be borne by the Contractor.

### 3.13 SUBCONTRACTING OF UTILITY INSTALLATION

- A. Unless otherwise noted, General Contractor shall be responsible for site trenching, including, but not limited to, excavation and excavation of backfill material.

- B. Once trench has been constructed by the General Contractor, subcontractor shall perform utility installation prior to the General Contractor backfilling trench for the following:
1. Water utilities
  2. Sanitary Sewerage Utilities
  3. Storm Drainage Utilities
  4. Electric Conduit
  5. Gas conduit
  6. Irrigation

3.14 PROTECTION

- A. Protect graded areas from traffic and erosion and keep them free of trash and debris.

END OF SECTION 312000

## SECTION 312500 - EROSION AND SEDIMENTATION CONTROL

### PART 1 - GENERAL

#### 1.1 GENERAL REQUIREMENTS

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
1. Soil Erosion and Sediment Control shall include implementation and maintenance of soil erosion and sediment control devices and construction methods, as shown on the Plans, as required under the Guidelines or as directed by the Owner's Representative, State or Municipality, which will reduce or prevent soil losses and associated damages from sedimentation during construction of this project. All costs associated with the provision of Soil Erosion and Sediment Control acceptable to the above parties shall be included in the price bid for the project. Work shall include, but not necessarily be limited to the following:
    - a. Install and maintain silt fence as required by the Contractor's staging of construction, or as directed.
    - b. Install and maintain construction entrance pad(s) at all access points.
    - c. Install and maintain inlet protection as required by the Contractor's staging of construction, or as directed.
    - d. Install and maintain diversion swales and/or berms as required by the Contractor's staging of construction, or as directed.
    - e. Install and maintain sediment traps/ponds as required by the Contractor's staging of construction, or as directed.
    - f. Plant and maintain temporary seeding to control surface runoff by site conditions.
    - g. Construct and maintain stockpile areas as required by the Contractor's staging of construction, or as directed.
    - h. Install and maintain tree protection during construction as required by the Contractor's staging of construction, or as directed.
    - i. Implement ongoing dust control.
  2. All work under this item must comply with the New York State Guidelines for Urban Erosion and Sediment Control, revised and adopted through 2016, and the latest revisions thereto. Additionally, this work is subject to the review and inspection by the owner's representative, and the Contractor shall comply with all corrective directives issued by these entities without additional payment. Any penalties levied by the Municipality, County, or State, or any direct or consequential damages arising out of a Stop Work Order issued by the Municipality, County, or State, if due to inaction by the Contractor, shall be borne solely by the Contractor, at no additional cost to the Owner.
- B. The Owner's Representative has the authority to limit the surface area of erodible earth exposed by earthwork operations and to direct the Contractor to provide immediate

temporary or permanent erosion or pollution control measures to minimize damage to property.

## 1.2 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.
- C. New York State Standards and Specifications for Erosion and Sediment Control, revised and adopted through 2016, and the latest revisions thereto.
- D. Stormwater Pollution Prevention Plan prepared for this project.

## 1.3 RELATED WORK SPECIFIED ELSEWHERE:

- A. Site Clearing: Section 311000.
- B. Earth Moving: Section 312000.

## 1.4 SUBMITTALS:

- A. Product Data:
  - 1. Silt fence: Manufacturer's catalog sheets, specifications, and installation instructions.
  - 2. Filter Fabric: Manufacturer's catalog sheets, specifications, and installation instructions.
- B. Certifications:
  - 1. Proof of current endorsed NYSDEC 4-hour training for Contractor's trained individual
  - 2. Completed Contractor's SPDES certification (see SWPPP appendix).
  - 3. Completed Subcontractor's SPDES certification(s) as applicable (see SWPPP appendix).

## **PART 2 - PRODUCTS**

### 2.1 EROSION CONTROL DEVICES

- A. Hay or Straw bales shall conform to NYS DOT Section 713-18 or 713-19 and shall be bound with wire or baling twine. The twine shall be polypropylene which has a knot strength of 170 pounds and straight break strength of 300 pounds, minimum.

- B. Silt Fence may be commercially available silt fence systems, consisting of synthetic geotextile fabrics and hardwood stakes. The height of the fence shall be a minimum of two (2) feet, and the fabric shall be wide enough to allow for a minimum embedment in the ground of two (2) feet of fabric. Sections shall be joined in a manner such that the fence shall function continuously.
- C. Rapid germination grasses such as fescue or rye.
- D. Stakes for securing bales may either be steel or wood and shall conform to the sizes shown on the Plans.
- E. Mulches: Hay, straw, wood cellulose, fiber mats, geotextiles, and other materials approved by the owner's representative.
- F. Stone: Well-graded aggregate compliant with NYSDOT Section 703.
- G. Filter Fabric shall be commercially available non-woven geotextile with the following properties:
  - 1. Grab Tensile Strength ASTM D4632: 120 lbs.
  - 2. Mullen Burst Strength ASTM D3786: 225 psi.
  - 3. Trapezoidal Tear Strength ASTM D4355: 50 lbs.
  - 4. Puncture Strength ASTM D4833: 70 lbs.
  - 5. UV Resistance after 500 hours ASTM D4355: 70% strength
  - 6. Apparent Opening Size ASTM D4751: US Sieve #70
  - 7. Permittivity ASTM D4491: 1.8 sec-1

### **PART 3 - EXECUTION**

#### **3.1 GENERAL**

- A. The contractor shall incorporate all temporary soil erosion and sediment control measures into the project at the earliest practicable time, to maintain the maximum protection against soil erosion and sedimentation possible, throughout the life of the contract.
- B. All erosion and sediment control practices shall conform to the Standards for Soil Erosion and Sediment Control in the State of New York.
- C. A schedule of construction operations shall be submitted to the Owner's Representative for approval. Said schedule shall outline construction phasing and shall indicate how and where erosion control measures will be utilized. The schedule shall include indications of locations for construction staging, soil stockpiles, etc., and any disturbances outside the limit of excavation shown on the Plans.
- D. Prior to initial clearing of the area to be excavated, erosion control measures shall be installed, such as stone construction entrance, hay bales, silt fence, and inlet protection.
- E. The smallest practicable area of land shall be disturbed at any one time during the project and, whenever feasible, natural vegetation shall be retained and protected. Stripping of

vegetation, grading and other soil disturbances shall be completed in a manner that will minimize soil erosion and sedimentation.

1. The Owner's Representative may limit the area of clearing and grubbing and earthwork operations in progress commensurate with the Contractor's demonstrated capability in protecting erodible earth surfaces with temporary or permanent erosion control measures.
  2. Under no circumstances will the area of erodible material exposed at one time exceed five (5) acres without prior written approval of the Owner's Representative and NYSDEC.
  3. The Owner's Representative may increase or decrease the area of erodible earth material exposed at one time as determined by his analysis of project, weather and other conditions.
- F. All other construction procedures shall conform to the NYS DOT Standard Specifications Section 209.
- G. Incorporate permanent control features into the work at the earliest practical time.
- H. Sweeping of hardscape shall be performed weekly (as a minimum), at the end of a work day when construction activity results in the tracking of sediment onto hardscape, or as directed by the Owner's Representative to remove accumulated sediment generated by construction operations.

### 3.2 STOCKPILE

- A. Stockpile topsoil in storage piles in areas where directed by the Owner's Representative. Construct storage piles to freely drain surface water. Cover storage piles if required to prevent windblown dust.
- B. Protect all soil and topsoil stockpiles as directed by the Owner's Representative or other authority having jurisdiction over the project.

### 3.3 TREE PROTECTION

- A. Fencing or other barrier will be installed at the drip line of the tree branches.
- B. Boards will not be nailed to trees during building operations.
- C. Feeder root should not be cut in an area inside the drip line of tree branches.
- D. Damaged trunks or exposed roots will be painted immediately with a good grade of "tree paint". Care of serious injury should be prescribed by a professional forester or licensed tree expert.
- E. Tree limb removal, where necessary, will be done flush to trunk or main branch and that area painted with a good grade of "tree paint".
- F. Water trees and other vegetation to remain within limits of contract work as required to maintain their health during course of construction.

- G. Additional requirements are provided on the details shown on the project plans.

#### 3.4 SPDES COMPLIANCE PROVISIONS

- A. The Contractor shall install, maintain and service as needed all construction run-off collection/prevention measures as indicated on the drawings and the Stormwater Pollution Prevention Plan (SWPPP) or as directed by the Owner's Representative.
- B. The Contractor must have at least one trained person responsible for implementation of the SWPPP, and have at least one trained person on site on a daily basis when soil disturbance activities are being performed. Trained contractors must have 4 hours of training in the principles and practices of erosion and sediment control endorsed by NYS DEC. Proof of training shall be submitted to the Owner's Representative prior to commencing construction.
- C. A qualified person from the Owner will perform SPDES-compliance inspections required by the Permit on a weekly basis. All recommendations and suggested modifications must be addressed by the Contractor within 1 working day of issuance of notice by the Owner's Representative. Under certain circumstances, the Owner and/or the NYSDEC has the right to direct more than one weekly inspection and visit the project construction site at any point over the course of construction.

## PREFACE

Important Note: This SWPPP shall be treated as part of the contract documents. Pursuant to Section 402 of the Clean Water Act (CWA), stormwater discharges from certain construction activities are unlawful unless they are authorized by a National Pollutant Discharge Elimination System (NPDES) permit or by a state permit program. The New York's State Pollutant Discharge Elimination System (SPDES) is an approved NPDES program with permits issued in accordance with the Environmental Conservation Law (ECL).

This SWPPP has been developed in compliance with all requirements of the SPDES General Permit for Stormwater Discharges from Construction Activity (GP-0-20-001) and conforms to all New York State Department of Environmental Conservation (NYSDEC) technical standards. A copy of GP-0-20-001 (the Permit) has been included in Appendix A and is considered part of the SWPPP. Prior to the commencement of construction activity, the owner(s) or operator(s) must identify the contractor(s) and subcontractor(s) that will be responsible for installing, constructing, repairing, inspecting, and maintaining the erosion and sediment control practices included in the SWPPP; and the contractor(s) and subcontractor(s) that will be responsible for the construction of all post-construction stormwater management practices included in the SWPPP. The owner(s) or operator(s) shall have each of these contractors or subcontractors identify at least one trained individual from their company that will be responsible for implementation of the SWPPP. The owner(s) or operator(s) shall ensure that at least one trained individual is on site on a daily basis when soil disturbance activities are being performed.

All contractors and subcontractors identified in the SWPPP, in accordance with the Permit must agree to implement applicable provisions of the SWPPP and satisfy the certification requirement of the Permit. The owner(s) or operator(s) shall have each of these contractors and subcontractors identified sign a copy of the certification statement included in Appendix H, extracted from Part III.A.5 of the Permit, before they commence any construction activity and shall be retained at the project site for the duration of construction. Contractors and subcontractors; however, who are not operator(s), as defined in the Permit, are not required to submit a Notice of Intent (NOI) in addition to the NOI submitted by the operator(s). The owner(s) or operator(s) shall ensure that the provisions of the SWPPP are implemented from the commencement of construction activity until all areas of disturbance have achieved final stabilization and the Notice of Termination (NOT) has been submitted to the Department.

## REVISION SCHEDULE

This Stormwater Pollution Prevention Plan (SWPPP) should be revised and updated to address changes in site conditions, new or revised government regulations, and additional on-site stormwater pollution controls.

All revisions to the SWPPP must be documented on the SWPPP Revision Documentation Form, which should include the information shown below. The authorized facility representative who approves the SWPPP should be an individual at or near the top of the facility’s management organization, such as the president, vice president, construction manager, site supervisor, or environmental manager. The signature of this representative attests that the SWPPP revision information is true and accurate. Previous authors and facility representatives are not responsible for the revisions.

## 1.0 INTRODUCTION

This SWPPP has been developed in compliance with all NYSDEC technical standards for the construction of the proposed site. The primary purposes for this plan are to:

- Identify the SWPPP coordinator and their duties;
- Identify any SWPPP team members that will assist in the implementation of the SWPPP during construction;
- Define the site characteristics and type of construction;
- Identify the receiving bodies of water for the site's stormwater;
- Introduce the site plan for the proposed site;
- Identify potential pollutants and sources within the site's drainage area;
- Describe practices that will be implemented for erosion and sediment control;
- Describe any temporary or permanent, structural or non-structural, BMPs (Best Management Practices) that will be utilized to manage stormwater quality and quantity.
- Create an implementation schedule for the practices within this SWPPP;
- Outline a monitoring plan to ensure this plans effectiveness and provide provisions for necessary revisions; and
- Describe and provide support for the final stabilization design to ensure water quality and quantity management after the construction of the site.

This SWPPP evaluates the existing (pre-construction) and proposed (post-construction) conditions and recommends measures to mitigate stormwater quantity and quality impacts that will result from the proposed site during construction and upon final stabilization. Review of this plan should be in conjunction with the engineering drawings for this project prepared by Tectonic Engineering Consultants, Geologists & Land Surveyors, D.P.C.

## 2.0 PROJECT BACKGROUND

### 2.1 PROJECT OVERVIEW

The Orangetown Town Hall Addition and Alterations project consists of demolition of an existing building, construction of a new addition to the building, redesign of the existing landscaped and parking areas, and the associated utilities including stormwater infrastructure to mitigate impacts. The project is considered a redevelopment project with increased

impervious that will be treated as new development according to the NYS Stormwater Management Design Manual, dated January 2015. The total project area is 5.09 acres, and the associated disturbed area is 2.93 acres. The disturbed area results in a net increase of 0.57 acres of impervious area across the project site. This project disturbs more than (1) acre and is therefore required to have a stormwater pollution prevention plan associated with it. The maximum soil exposure limit is 14 days. This plan includes a detention design to regulate post-construction flow rates back to their pre-construction values, and a green infrastructure plan involving the irrigation of captured stormwater run-off using a cistern (Recommended in section 5.3.10 of SWDM). Additionally, cascade hydrodynamic separators (Recommended in section 9.4.2 of SWDM) will be used as an alternative practice to meet water quality and quantity demands.

## **2.2 SITE LOCATION**

The proposed project site is the expansion of the Orangetown Town Hall, a municipal building located at 26 Orangeburg Road, Orangeburg, NY 10962. Located immediately east of exit 6E on the Palisades Interstate Parkway. There is no 100-year floodplain or other Special Flood Hazard Areas on the property.

## **2.3 SOILS AND SURFACE COVER**

The soils of the site consist approximately ninety-two percent (92%) of Wethersfield gravelly silt loam soils, 3 to 8 percent slopes, approximately two percent (2%) of Wethersfield urban land complex, 8 to 15 percent slopes, and approximately six (6%) Urban land, according to the United States Department of Agriculture (USDA), Soil Conservation Service's Soil Survey of Rockland County, New York. The report for the hydrological group of these soils is considered primarily C with smaller areas of urban land that were not given a group. The groundwater level was observed at 205.5 feet. The nearest surface water to the site is Sparkill Creek. The surface water is not within the area of disturbance or close enough to impact the hydrological analysis.

## **2.4 POST DEVELOPMENT SITE CONDITIONS**

The proposed development at the Town Hall includes the removal of an existing building. A new building will be constructed and connected to the west face of the existing building. A new parking lot is to be constructed to the east of the building in the grassy field area, and an existing parking lot is to be removed in order for the new building to be constructed. The entrance

ramp to the town hall is to be modified. Overall impervious land area will increase. A cistern is to be implemented for irrigation and to provide run-off reduction. The cistern will capture run-off from the site to be used later for lawn and landscaping irrigation. Cascade separators will be used to provide WQv as an alternative treatment method for the redevelopment requirement. Separators are most useful on space limited sites where there is not enough room for other structural control methods. The water quantity storage is provided by ACF Environmental LD-Double-Mini storage units.

## **2.5 VEGETATION CLEARING AND PLANTING**

Existing vegetation onsite that is to be removed is grass as well as some shrubbery at the North end of the Property. There are 51 trees surrounding the property are also being removed where the parking pavement is being constructed and where grading is necessary. Fourteen (14) trees will be planted as indicated on the landscaping plan. New trees (Acre Saccharum and Gleditisia Triacanthos "Shade Master) and shrubs (Euonymus Patens "Manhattan", Ilex Crenata Hetzi, and Juniperus Procumbens Nana) are to be planted in accordance with C-106: Lighting and Landscaping Plan.

## **3.0 POST-CONSTRUCTION STORMWATER MANAGEMENT**

The approach to the stormwater management design requires compliance with the New York State Standards for Erosion and Sediment Control and the quantity control requirements included in the New York State Stormwater Management Design Manual (SWDM).

### **3.1 EXISTING HYDROLOGY**

The site has been analyzed as two (2) existing drainage areas under current conditions and is shown on the Existing Drainage Area Map included in Appendix B. The area is composed of existing buildings, existing parking lots, and existing lawn. Hydrologic calculations have been performed for these drainage areas and are included in Appendix D. Stormwater run-off will ultimately be received by the town's drainage system and will not be received by any local water bodies. Review of Rockland County GIS wetland mapping indicates that the site has no known wetlands associated with the project site. Table 1 below shows the rainfall intensity of the project site according to the National Weather Service NOAA Atlas. The extreme precipitation was downloaded from Cornell University's Precipitation tool indicating a 24-hour, 100-year rainfall depth of 8.93 inches. A copy of the precipitation data is included in Appendix D-I. A more conservative value of 9.07 inches provided by the Town of Orangetown was used in the analysis.

**Table 1 : Rainfall Parameters**

Storm Recurrence Interval	Rainfall Depth for 24hr Storm (inch)
1-Year	2.85 (NOAA)
10-Year	5.51 (NOAA)
100-Year	9.07 (Orangetown Directive)

The peak runoff flows were calculated for the existing conditions of the site at the discharge points for each drainage area. The methodology utilized for this analysis is based upon the USDA, Soil Conservation Service’s Technical Release No. 20 and Technical Release No. 55, as utilized by the software entitled HydroCAD version 10.00. HydroCAD, developed by Autodesk is a CAD based program for analyzing the hydrology and hydraulics of stormwater runoff. It utilizes the latest techniques to predict the consequences of a given storm event. Hydro CAD has the capability of computing hydrographs (representing discharge rates characteristic of specific watershed conditions, precipitation, and geologic factors), combining hydrographs, and routing flows through pipes and detention. For this analysis, the property was analyzed for both the existing and proposed conditions. A summary of the parameters results is tabulated below in Table 2.

**Table 2 Existing Hydrology Parameters**

Drainage Area ID	Area (acres)	Description of Cover	CN	Tc (min)	To Drainage Point
A	0.87	Northern Portion of the Existing Building Pavement/Parking Grass along fence	90	8.0	DP-1
B	4.28	Existing Buildings Pavement/Parking Grass areas East of the Building Sidewalk along streets	86	8.0	

### 3.2 PROPOSED HYDROLOGY

The site, under proposed conditions, will include a new building conjoined with the existing building, increase of the parking lot area, and a reduction in the lawn area. The design point, at the southeast corner of the site, by the roadway intersection, was maintained. The roof drainage from the addition and the drainage of the western entrance and parking lot are collected as sub- catchment B1 and routed to the cistern for rainwater harvesting and subsurface storage controlled with an outlet control structure. The remaining

area of sub-catchment B, B2, utilizes the existing stormwater infrastructure. The proposed drainage areas are shown in the Proposed Drainage Area Map included in Appendix B. Hydrologic calculations have been performed for each drainage area as described in the prior section and are included in Appendix D-1. A summary of the drainage areas is tabulated below in Table 3.

**Table 3: Proposed Hydrology Parameters**

Drainage Area ID	Area (acres)	Description of Cover	CN	Tc (min)	To Drainage Point
A	0.69	Existing Building Pavement/Parking Grass along fence Additional parking area added in grass area	91	8	DP-1
B1	1.09	Proposed Building Addition Pavement/Parking Detention Storage Area	91	6	
B2	3.43	Pavement/Parking Grass in front of building and by streets Sidewalk along streets	87	8	

### 3.3 OVERALL WATER QUALITY VOLUME (WQ<sub>v</sub>)

Water quality control, as outlined in the SWDM, was designed to mitigate the impacts of the redevelopment of the site resulting from the increase in impervious cover. The maximum soil exposure limit is 14 days. The water quality requirement for redevelopment was calculated from the existing impervious area being disturbed. The water quality requirement for new development was calculated from the increase in impervious area. The required water quality volumes were calculated for the site are summarized in Table 4 below.

**Table 4: Project Area Breakdown**

Existing Area		Proposed Area	
Area Type	Area (acres)	Area Type	Area (acres)
Parking/Pavement	0.91	Parking/Pavement	1.20
Buildings	0.23	Buildings	0.37
Sidewalks/Misc.	0.14	Sidewalks/Misc.	0.28
Grass/Landscaped	1.65	Grass/Landscaped	1.08
<b>Total Disturbed Area =</b>			2.93

Existing Area		Proposed Area	
Area Type	Area (acres)	Area Type	Area (acres)
<b>Total Existing Impervious Area (Redevelopment) =</b>			1.28
<b>Total Increase in Impervious Area (New Development) =</b>			0.57

### 3.4 WQ<sub>v</sub> –RUNOFF REDUCTION VOLUME- CISTERN

Runoff Reduction techniques were used to mitigate the impacts from the increased impervious. The minimum Runoff Reduction (S) required for the site’s hydrologic soil type C is  $0.3 \times WQ_v(\text{New Development})$ . Runoff Reduction is summarized in Table 5.

**Table 5: New Development WQ<sub>v</sub> Requirements**

New Development Requirement	Value	
New Development WQ <sub>v</sub> Requirement / RR <sub>v</sub>	3,241 ft <sup>3</sup>	
Minimum RR <sub>v</sub> Required (S) ( $0.3 \times RR_v$ )	972 ft <sup>3</sup>	
Rainwater Harvesting- Cistern Volume	3,700 ft <sup>3</sup>	27,678 gals
WQ <sub>v</sub> Credit towards Redevelopment	459 ft <sup>3</sup>	

The water quality required to mitigate the existing impervious area is summarized in Table 5. The cistern was sized to collect the WQ<sub>v</sub> generated from Drainage Area B2. The cistern is full after a WQ<sub>v</sub> storm. The cistern would be full for the 1-year, 10-year and 100-year storm events. There is a diversion structure upstream of the cistern to convey the larger storm event to the underground storage.

The cistern will provide irrigation to the areas identified on the Landscaping and Lighting Plan, Sheet C-106. The irrigated area is a minimum of 16,000 square feet with four zones. The irrigation system can utilize a spray, rotor, or drip system. The area will also have new tree plantings. The cistern is provided by Contech Engineering Solutions LLC, Model 72” Duromaxx Urbangreen RWH SRPE with a total capacity of 3,700 cf. A water budget analysis is included in Appendix D-III.

### 3.5 WQ<sub>v</sub> – HYDRODYNAMIC SEPARATOR (ALTERNATIVE PRACTICE)

The volume of the cistern in excess of the required WQ<sub>v</sub> for new development can be used as credit toward the redevelopment WQ<sub>v</sub> requirement. Based on Section 9.2.1.B.IV of the SWDM, the remaining

redevelopment WQv that could be treated by alternative measured is calculated using the following equation:

$$\%WQv \text{ Treatment by Alternative Practice} = (25 - \%Runoff \text{ Reduction}) * 3$$

Additional WQv required by redevelopment is provided through the alternative practice of cascade separators on the East and West side of the property. The western separator addresses the treatment of flows from the proposed building addition and associated paved walkways. The eastern separator provides treatment for the proposed eastern parking area. Each Cascade Separator™ is a CS-4 unit provided by Contech Engineering Solutions, LLC and provides a WQv capacity of 1.8 cfs, and a bypass capacity of 30 cfs. Together, the cistern and the cascade separators provide sufficient WQv based on Chapters 4 and 9 of the SWDM. A summary of the redevelopment WQv required and provided for the project is summarized in Table 6.

**Table 6: WQv Summary**

WQv Required/ Provided	Value
Redevelopment Volume Credit from Runoff Reduction (Percentage of Total)	459 ft <sup>3</sup> (7%)
Total Redevelopment WQv Required	6,620 ft <sup>3</sup>
<b>%WQv Treatment by Alternative Practice = (25 - %Runoff Reduction) * 3 =(25%-7%)*3= 54%</b>	
WQv Required by Alternative Practice (Percentage of Redevelopment Requirement)	3,575 ft <sup>3</sup> (54%)
WQv Treated by Cascade HDS (western portion)	567 ft <sup>3</sup>
WQv Treated by Cascade HDS (eastern portion)	3,089 ft <sup>3</sup>
Total WQv Provided by Cascade HDS	3,657 ft <sup>3</sup>
Water Quality Volume Peak Flow (western portion)	1.19 cfs
Water Quality Volume Peak Flow (eastern portion)	0.86 cfs

### 3.6 WATER QUANTITY CONTROL

Water quantity control, as outlined in the SWDM, was designed to mitigate the impacts of the increased runoff from the site resulting from the increase in impervious cover. The SWDM states that if 100% of the RRV is met than Channel Protection is not required. Channel Protection is also not required for redevelopment projects if the hydrology is consistent with predevelopment conditions and the post development flows are less than the predevelopment flows. The proposed peak discharges for the 10-year

and 100-year storms were also reduced from the existing peak discharge through the underground detention system and outlet control structure. The runoff from Drainage Area B1 is captured and stored on site with a controlled discharge. Controlling and reducing the runoff from the west side offsets the increase in runoff from the eastern parking area. Therefore, additional detention is unnecessary to reduce the peak flow. The pre vs. post peak flows for the design point as shown in Table 8 below. The underground detention system is comprised of 456 ACF Environmental LD-Double-Mini storage units with a cumulative capacity of 4,668 cf. The peak volumes and elevations within the underground storage for each storm are summarized in Table 7.

**Table 7: Peak Volumes and Elevations within Subsurface Storage**

Storm Recurrence	Peak Volume (cf)	Peak Elevation (ft)
1-Year	1,996 ft <sup>3</sup>	214.16'
10-Year	3,181 ft <sup>3</sup>	215.05'
100-Year	4,247 ft <sup>3</sup>	215.84'
Top of the System	4,668 ft <sup>3</sup>	216.16'

The capacities of the proposed stormwater pipes were analyzed using Autodesk Storm and Sanitary Analysis 2019 under the 100-year intensities. A copy of the output is included in Appendix D-V.

The peak discharges have been reduced in the proposed condition for the design storms. The existing peak flows and the proposed peak flows leaving the site are summarized in Table 8.

**Table 8: Existing and Proposed Peak Flows**

Drainage Point	Peak Flow Rates (cfs)					
	1-Year		10-Year		100-Year	
	Existing	Proposed	Existing	Proposed	Existing	Proposed
DP-1	8.82	8.54	21.86	21.59	39.34	39.29

### 3.7 DOWNSTREAM IMPACTS

The downstream impacts are successfully mitigated by the overall stormwater design for the site. Hydrodynamic separators, a cistern and stormwater detention provide runoff reduction, water quality and quantity controls to the runoff from the site where there were none previously.

## **4.0 IDENTIFICATION OF POTENTIAL STORMWATER CONTAMINANTS**

The purpose of this section is to identify pollutants that could impact stormwater during construction of the site.

### **4.1 SIGNIFICANT MATERIAL INVENTORY**

Pollutants resulting from clearing, grading, excavation, storage areas, and building materials, which have the potential to be present in stormwater runoff, are listed in Table 9 on the following page. This table includes information regarding material type, chemical and physical description, potential sources, and the specific regulated storm water pollutants associated with each material.

**Table 9: Potential Construction Site Stormwater Pollutants**

Trade Name Material	Chemical / Physical Description	Potential Source	Stormwater Pollutants	Storage	Containment	Disposal
				See Section of SWPPP <sup>1</sup> :		
Pesticides	Various colored to colorless liquid, powder, pellets, or grains	Landscaped areas	Chlorinated hydrocarbons, organophosphates, carbonates, arsenic	7.1 7.7.a 7.8.a	7.7.a <b>7.8.e</b> 7.9	7.7.b,c,d
Fertilizer	Liquid or solid grains	Landscaped areas	Nitrogen, phosphorous	7.1 7.7.a 7.8.a	7.7.a	7.7.b,c,d
Plaster	White granules or powder	Building construction	Calcium sulphate, calcium carbonate, sulfuric acid	7.1 7.7.a 7.8.a	7.7.a	7.7.b,c,d
Cleaning solvents	Colorless, blue, or yellow-green liquid	Building construction	Perchloroethylene, methylene chloride, trichloroethylene, petroleum distillates	7.1 7.7.a 7.8.a	7.7.a 7.9	7.7.b,c,d <b>7.8.g</b>
Asphalt	Black solid	Parking lot construction	Oil, petroleum distillates, solids	7.1	NA	7.7.b,c,d
Concrete	White solid	Building/parking lot const.	Limestone, sand	7.1	<b>5.2.e</b> <b>7.8.f</b>	<b>5.2.e</b> 7.7.b,c,d
Glue, adhesives	White or yellow liquid	Building construction	Polymers, epoxies	7.1 7.7.a 7.8.a	7.7.a 7.9	7.7.b,c,d
Paint	Various colored liquid	Building construction and parking lot markings	Metal oxides, Stoddard solvent, talc, calcium carbonate, arsenic	7.1 7.7.a 7.8.a	7.7.a 7.9	7.7.b,c,d
Curing compounds	Creamy white liquid	Building construction, curbing and structures	Naphtha	7.1 7.7.a 7.8.a	7.7.a <b>7.8.f</b> 7.9	7.7.b,c,d
Wastewater from equipment	Water	On-site equipment	Soil, oil and grease, solids	NA	<b>7.8.b,c,d</b>	7.7.b,c,d <b>7.8.c,d</b>
Wood preservatives	Clear amber or dark brown liquid	Building construction	Stoddard solvent, petroleum distillates, arsenic, copper, chromium	7.1 7.7.a 7.8.a	7.7.a	7.7.b,c,d

Trade Name Material	Chemical / Physical Description	Potential Source	Stormwater Pollutants	Storage	Containment	Disposal
				See Section of SWPPP <sup>1</sup> :		
Hydraulic oil/fluids	Brown oily petroleum hydrocarbon	On-site equipment	Mineral oil	7.1 7.7.a 7.8.a	7.7.a <b>7.8.b,c,l,k</b> 7.9	7.7.b,c,d <b>7.8.j</b>
Gasoline	Colorless, pale brown or pink petroleum hydrocarbon	On-site equipment	Benzene, ethyl benzene, toluene, xylene, MTBE	7.1 7.7.a <b>7.8.a,i</b>	7.7.a <b>7.8.b,c,l,k</b> 7.9	7.7.b,c,d <b>7.8.j</b>
Diesel Fuel	Clear, blue-green to yellow liquid	On-site equipment	Petroleum distillate, oil and grease, naphthalene, xylenes	7.1 7.7.a <b>7.8.a,i</b>	7.7.a <b>7.8.b,c,l,k</b> 7.9	7.7.b,c,d <b>7.8.j</b>
Kerosene	Pale yellow liquid petroleum hydrocarbon	On-site equipment	Coal oil, petroleum distillates	7.1 7.7.a 7.8.a	7.7.a <b>7.8.b,c,l,k</b> 7.9	7.7.b,c,d <b>7.8.j</b>
Antifreeze / coolant	Clear green/yellow liquid	On-site equipment	Ethylene glycol, propylene glycol, heavy metals	7.1 7.7.a 7.8.a	7.7.a <b>7.8.b,c,l,k</b> 7.9	7.7.b,c,d
Erosion	Solid particles	Cleared and graded areas and tree removal areas	Soil, sediment	5.0	5.0	<b>5.1.i</b>

<sup>1</sup>**Bold** indicates specific instruction for material listed.

## **4.2 POTENTIAL AREAS FOR STORMWATER CONTAMINATION**

There are five main potential sources for stormwater contamination: the construction debris from past demolitions, on site and new building construction, the parking lot construction, the sidewalk construction, and landscaped areas. During construction, all of the five areas mentioned will also contain the potential containment sources of cleared and graded areas, and on-site equipment. These main sources are located within the limits of disturbance and are shown on the Erosion Control Plan.

## **4.3 SUMMARY OF AVAILABLE STORMWATER SAMPLING DATA**

There is no existing stormwater sampling data available.

## **5.0 SOIL EROSION AND SEDIMENT CONTROLS**

The soil erosion and sediment control measures outlined herein are incorporated into the project site plans. Additionally, a construction schedule and phasing plan to aid in the proper implementation of erosion and sediment controls has been included with the Erosion Control Plan. General measures that will be implemented are as follows:

### **5.1 GENERAL MEASURES**

- a. There shall be no increase in turbidity that will cause a substantial visible contrast to natural conditions. There shall be no increase in suspended, colloidal and settleable solids that will cause deposition or impair the waters for their best usage. There shall be no residue from oil and floating substances, or visible oil film, or globules of grease.
- b. Site preparation activities shall be planned to minimize the area and duration of soil disruption.
- c. All facilities and systems of treatment and control shall be operated and maintained at all times to achieve compliance with the SWPPP.
- d. In no case shall erodible materials be stockpiled within 25 feet of any wetland, stream or other surface water body.
- e. All unnecessary removal of healthy trees shall be avoided. Materials shall not be stored nor machinery operated within the drip-line of the trees to remain.
- f. To facilitate final stabilization, intermediate silt fences/dikes/diversions may be removed upon initial catch of upslope final

seeding/mulching. Perimeter and base of slope silt fences/dikes shall remain in place until final stabilization is achieved to protect offsite discharge potential.

- g. The site shall be inspected daily by the Contractor and every seven (7) days by the Owner's Representative as a minimum. They shall inspect and maintain the integrity and function of all temporary erosion control measures throughout the duration of the development process.
- h. To assure proper function, siltation barriers shall be maintained in good condition and reinforced, extended, repaired or replaced as necessary. All accumulated sediment shall be removed and contained in appropriate spoil areas.
- i. Onsite soils removed from the site should follow all applicable local, state, and federal regulations as outlined in Specification Section 31-31-00: Soil Management included in Appendix N.
- j. The maximum time limit for any soil exposure shall be 14 days.

## 5.2 TEMPORARY STRUCTURAL MEASURES

Temporary structural practices are used during construction to prevent offsite sedimentation. The length of time that temporary practices are functional varies from project to project, since the sediment control strategy may change as construction activity progresses. Runoff control measures should be the first items constructed when grading begins, and be completely functional before downslope land disturbance takes place. Only after the runoff control structures are operational and sediment control measures are in place, should clearing and grading on the rest of the construction site begin.

- a. Silt Fence- Prior to the initiation of and during construction activities, a geotextile filter fabric (silt fence) will be established along the down slope perimeter of areas to be disturbed. To facilitate effectiveness of the silt fence, daily inspections, and inspections immediately after significant storm events will be performed by site personnel. Maintenance of the fence will be performed as needed.
- b. Straw Bale Dike- A temporary barrier of straw, or similar material, used to intercept sediment laden runoff from small drainage areas of disturbed soil. The purpose of a bale dike is to reduce runoff velocity and effect deposition of the transported sediment load. Straw bale dikes have an estimated design life of three (3) months.
- c. Stabilization Construction Entrance- Prior to construction, stabilized construction entrances will be installed at points of entry and egress

from the site to reduce the tracking of sediment onto public roadways. Construction traffic must enter and exit the site at the stabilized construction entrance. When necessary, the placement of additional aggregate atop the filter fabric will be done to assure the minimum thickness is maintained. All sediments and soils spilled, dropped, or washed onto the adjacent streets must be removed immediately. Periodic inspection and needed maintenance shall be provided after each substantial rainfall event.

- d. Temporary Soil Stockpile- Materials such as topsoil, will be temporarily stockpiled (if necessary) on-site during construction. Stockpiles will be located in an area away from storm drainage, water bodies, and/or courses, and will be properly protected from erosion by a surrounding silt fence.
- e. Concrete Truck Washout- A temporary excavated or above ground lined constructed pit where concrete truck mixers and equipment can be washed after their loads have been discharged, to prevent highly alkaline runoff from entering storm drainage systems or leaching into soil. The washout is required to have a minimum depth of 2-feet and 8-feet by 8-foot dimensions. The location of the washout should be sufficiently (minimum of 100 feet) from drainage structures and close to the gravel access drive and should have proper signage designating the "Concrete Washout Area". Material collected in concrete washout must be disposed of off-site. No burial of washout material is permitted on-site. Maintenance of the wash area is to include removal of hardened concrete.
- f. Sediment Trap- A temporary sediment device formed by excavation and/or embankment to intercept sediment-laden runoff and trap the sediment in order to protect drainageways, properties, and rights-of-way below the sediment trap from sedimentation. A stone weir sediment trap is being implemented. See Appendix E for calculations, storage requirements, and maintenance and cleanout procedures. Remove built up sediment when it reaches 50% of the design capacity.
- g. Dust Control- The control of dust resulting from land-disturbing activities. The purpose of dust control is to prevent surface and air movement of dust from disturbed soil surfaces that may cause off-site damage, health hazards, and traffic safety problems.
- h. Storm Drain Inlet Protection- A temporary barrier with low permeability, installed around inlets in the form of a fence, berm, or excavation around an opening, detaining water and thereby reducing the sediment content

of sediment laden water by settling thus preventing heavily sediment laden water from entering a storm drain system.

### 5.3 VEGETATIVE MEASURES

- a. As much as practical, existing vegetation shall be preserved. Following the completion of construction activities in any portion of the site, permanent vegetation shall be established on all exposed soils.
- b. Permanent vegetative cover: Immediately following the completion of construction activity in any portion of the site, permanent vegetation shall be established on all exposed soils.
- c. Washouts shall be immediately repaired, re-seeded and protected from further erosion.
- d. Permanent seeding shall occur in the spring or fall. The spring seeding window is from March 1<sup>st</sup> to May 15<sup>th</sup> and the fall seeding window is from August 15<sup>th</sup> to October 1<sup>st</sup>.
- e. Permanent seeding shall be applied at a rate of a minimum of 4.0 pounds total seed per 1000 square feet or approximately 175 pounds per acre. If hydroseeding will be the method of application, the seed rate should be increased by 25% and hydro seed areas must still receive straw and tackifier.
- f. An adequate seedbed shall be prepared by scarifying soil and removing surface debris and obstacles within the disturbed area to a depth of 4 inches.
- g. All landscaped/grassed areas will be seeded and mulched in a two-step hydraulic process to promote growth as soon as possible.
- h. All seeding shall be performed using hydroseeding. Hydroseeding slurry shall be comprised of a homogeneous mix of seed and fertilizer in water. Various specified seed mixes shall be independently mixed and applied.
- i. All disturbed areas shall be stabilized subsequent to seeding by applying 2 tons of straw mulch per acre. Straw mulch shall be anchored by applying 750 lbs of wood fiber mulch per acre with a hydroseeder. Hydromulching slurry shall be comprised of a homogeneous mix of non-asphaltic tackifier and fiber mulch in water.
- j. Deep ripping and Decompaction are key factors which help in restoring soil pore space and permeability for water infiltration. Conversely, the physical actions of cut-and-fill work, land grading, the ongoing movement of construction equipment and the transport of building

materials throughout a site alter the architecture and structure of the soil, resulting in: the mixing of layers (horizons) of soil materials, compression of those materials and diminished soil porosity which, if left unchecked, severely impairs the soil's water holding capacity and vertical drainage (rainfall infiltration), from the surface downward. The two-phase practice of 1) "Deep Ripping;" and 2) "Decompaction" (deep subsoiling), of the soil material as a step in the cleanup and restoration/landscaping of a construction site, helps mitigate the physically induced impacts of soil compression; i.e.: soil compaction or the substantial increase in the bulk density of the soil material.

#### **5.4 SWPPP MEASURES**

- a. Any modifications to the on-site SWPPP when there is a significant change in design, construction, operation, or maintenance should be submitted to the MS4 for review and approval. See Section 8.0, item d.
- b. If the SWPPP proves to be ineffective in eliminating or significantly minimizing pollutants identified in the SWPPP, or achieving the general objectives of controlling pollutants in stormwater discharged from construction activities.
- c. To identify any contractor or sub-contractor that will implement any measure of the SWPPP.
- d. All contractors and sub-contractors identified in the SWPPP as outlined above shall sign a copy of the Certification Statement before undertaking any construction activity at the site identified in the SWPPP.
- e. The developer/contractor or his builder shall have the site inspected and a log kept on site. The documents must be maintained in a secure location, such as a job trailer, on-site construction office, or a mailbox with lock; that is accessible during normal working hours to an individual performing a compliance inspection.
- f. Owner's qualified inspector shall conduct site inspections for all construction activities every 7 days and within 24 hours of any storm event producing 0.5 inch of precipitation or more. See section 7.11 and Appendix A- SPDES General Permit for Construction Activity, Part IV, Section C.
- g. To effectively control wind erosion, water shall be applied to all exposed soils as necessary of the project site as designed.

## 6.0 CONSTRUCTION SEQUENCE

Sequence of Construction Activities: The Contractor's work schedule and methods shall be consistent with the SWPPP or amended SWPPP. Once approved, the progress schedule shall become a part of the SWPPP. Throughout the entirety of construction, areas for contractor use shall be provided as described in the sequencing plan to allow for equipment parking (when not in use), storage, construction materials, stockpiles, debris, waste and borrow areas, and general staging areas.

The following list is a suggested sequence of major construction activities for the project to meet the NYSDEC erosion control requirements:

1. All approvals and permits shall be secured by the contractor.
2. A pre-construction meeting with the owner, owner's representative, municipal representative, and contractor present will be held.
3. Erosion control sequence of operations shall be coordinated with the Sequencing Plan on C-107.
4. Certifications obtained from contractors, subcontractors, and any others performing site disturbances, including underground utility contractors, be signed and maintained on site.
5. Construction entrance, silt fence storm drain inlets protection, construction fence, tree protection, and other temporary erosion control measures will be installed prior to construction, including clearing, grubbing, and demolition of the site, in accordance with the NYS Standards and Specifications for Erosion and Sediment Control, latest edition.
6. Install provisions for protection of existing facilities, where indicated on the plans.
7. Changes to the erosion and sediment control sequencing shall be approved by the owner's representative.
8. Active disturbance shall be limited to less than 5 acres maximum at any time without temporary stabilization. All non-active disturbance areas shall receive temporary or permanent stabilization. Non-active disturbed soil areas shall not remain exposed for longer than 14 days without being stabilized.
9. Any borrow or waste pit located on or off-site must immediately receive temporary stabilization, shall not be left unstabilized, and be maintained per the requirements of the General Construction Permit.
10. Drainage structures and pipes shall be installed along with energy dissipaters.
11. Roadways shall be graded and immediately stabilized with proposed stone surface.
12. Sequence 1 - Erosion and Sediment Control Schedule:
  - A. Install perimeter controls, inlet protection, tree protection, and fiber rolls in vicinity of work area as shown on the plans.

- B. Install stabilized construction access in northeast corner of site near entrance to Dutch Hill Road.
  - C. Install Sediment Trap B within limits shown on the plans.
  - D. Demolish existing parking lot as shown on the plans to create an area for contractor use.
  - E. Construct proposed utilities, pavement, and hardscape within limits shown on the plans. Immediately after subgrade is established, install stone subbase layers for pavement and hardscape areas (maintain stabilized construction access until stone subbase placement is complete for new pavement). Immediately after utility installation is complete, install utility bedding and perform final grading in vicinity. Reduce area for Sediment Trap B, while maintaining volumetric capacity, as proposed pavement along eastern edge of site progresses.
  - F. Apply temporary or permanent stabilization to all areas impacted by construction that are not planned to be disturbed in follow on sequences or will be inactive for greater than fourteen (14) days.
13. Sequence 2 - Erosion and Sediment Control Schedule:
- A. Install perimeter controls, inlet protection, tree protection, and fiber rolls in vicinity of work area as shown on the plans. Maintain all erosion and sediment control measures from Sequence 1 that are still required.
  - B. Demolish existing parking lot and temporary electric within limits shown on the plans.
  - C. Install Sediment Trap A within limits shown on the plans.
  - D. Install stabilized construction access off Orangeburg rd.
  - E. Transition area for contractor use to new location on pavement installed in Sequence 1 in limits approved by the owner's representative.
  - F. Construct proposed addition, utilities, pavement, and hardscape within limits shown on the plans. Immediately after subgrade is established, install stone subbase layers for pavement and hardscape areas (maintain stabilized construction access until stone subbase placement is complete for new pavement). Immediately after utility installation is complete, install utility bedding and perform final grading in vicinity.
  - G. Apply temporary or permanent stabilization to all areas impacted by construction that are not planned to be disturbed in follow on sequences or will be inactive for greater than fourteen (14) days.
  - H. Remove Sediment Trap A once all disturbance upstream of trap has been stabilized and install stormwater vault.
14. Sequence 3 - Erosion and Sediment Control Schedule:
- A. Install perimeter controls, inlet protection, tree protection, and fiber rolls in vicinity of work area as shown on the plans. Maintain all erosion

- and sediment control measures from Sequence 1-2 that are still required.
- B. Once existing south building demolition is completed (not in contract) and area has been handed over to owner, transition area for contractor use to this area.
  - C. Construct utilities, pavement, and hardscape within limits shown on the plans. Immediately after subgrade is established, install stone subbase layers for pavement and hardscape areas. Reduce area for Sediment Trap B while maintain Immediately after utility installation is complete, install utility bedding and perform final grading in vicinity.
  - D. Mill and overlay existing pavement areas as shown on the plans.
  - E. Apply temporary or permanent stabilization to all areas impacted by construction that are not planned to be disturbed in follow on sequences or will be inactive for greater than fourteen (14) days.
  - F. Remove Sediment Trap B once all disturbance upstream of trap has been stabilized. Stabilize area for trap once completely removed.
15. Sequence 4 - Erosion and Sediment Control Schedule:
- A. Install perimeter controls, inlet protection, tree protection, and fiber rolls in vicinity of work area as shown on the plans. Maintain all erosion and sediment control measures from Sequence 1-3 that are still required.
  - B. Construct hardscape within limits shown on the plan. Immediately after subgrade is established, install stone subbase layers for hardscape areas
  - C. Mill and overlay existing pavement areas as shown on the plans.
16. Decompact access and storage/stockpile areas.
17. All landscaped/grassed areas will be seeded and mulched in a two-step hydraulic process to promote growth as soon as possible and in accordance with Note 4 of the Erosion and Sedimentation Control Notes on Sheet C-105.
18. General contractor to remove Sediment Trap B and apply temporary stabilization to area.
19. Upon final stabilization, general contractor shall remove all erosion and sediment controls. Reapplication of hay and seed may be required in some areas if removal of temporary erosion and sediment control measures creates disturbance.
20. Remove all silt and sediment from site.
21. All debris, silt, and other obstructions are to be removed from the end of the drainage structures after all onsite work is complete and all disturbed areas have been stabilized.
22. Owner's representative to review site and direct any corrective actions deemed necessary to approve final stabilization and facilitate SPDES permit closeout.

23. Contractor to provide as-built of drainage network and post construction stormwater controls to owner's representative prior to SPDES permit closeout and in accordance with the project specifications.

## **7.0 NONSTRUCTURAL BMPS**

There are nonstructural BMPs that are included as parts of this plan to prevent the introduction of pollutants into stormwater.

### **7.1 GOOD HOUSEKEEPING**

All exposed areas of the site with the potential for stormwater pollutants (See Table 9) must be kept clean and orderly. Specific areas of concern for this site include, but are not limited to: storage areas, fueling areas, and equipment storage and cleaning areas. An inventory of all equipment and containers with hazardous or toxic materials should be kept on site and up to date. A schedule for Good Housekeeping practices should be created prior to construction and followed and altered as necessary throughout the project.

### **7.2 MINIMIZING EXPOSURE**

The exposure of pollutants to rain, ice, snow, and snowmelt should be minimized by utilizing practices to limit such exposure. For example, when possible, water resistant coverings should be used to minimize exposure.

### **7.3 DUST CONTROL**

Dust Control measures help to prevent surface and air movement of dust from disturbed soil surfaces that may cause off-site damage, health hazards, and traffic safety problems. Dust Control measures should be installed on construction roads, access points, and other disturbed, areas subject to surface dust movement and dust blowing where off-site damage may occur if dust is not controlled.

Water quality must be considered when materials are selected for dust control. Where there is a potential for the material to wash off to a stream, ingredient information must be provided to the local permitting authority.

### **7.4 NON-DRIVING AREAS**

These areas use products and materials applied or placed on soil surfaces to prevent airborne migration of soil particles.

- a. Vegetative Cover- For disturbed areas not subject to traffic, vegetation provides the most practical method of dust control
- b. Mulch (including gravel mulch) – Mulch offers a fast effective means of controlling dust. This can also include rolled erosion control blankets.

## **7.5 DRIVING AREAS**

These areas utilize water, polymer emulsions, and barriers to prevent dust movement from the traffic surface into the air.

Provision shall be made to control the amount of airborne dust released off site from construction operations, by wetting the construction material as necessary, provided wetting will not damage utility infrastructure or create any safety hazards. All construction material shall be sufficiently wetted to prevent dust from becoming airborne before loading into trucks, vehicles, or other containers. During transport, such material shall be enclosed or covered to prevent dust dispersion.

Trucks and other vehicles used to transport particulate matter shall be covered and any particulate matter kept on site shall be sufficiently wetted or stored to prevent particulate matter from becoming airborne.

## **7.6 SPILL PREVENTION AND RESPONSE PROCEDURES**

All potential pollutants (See Table 9) other than sediment will be handled and disposed of in a manner that does not cause contamination of stormwater. Non-sediment pollutants that may be present during construction activities have been identified in Section 4.0 of this report and refer to Appendix “E” NYSDEC Standards and Specifications for Site Pollution Prevention for Storage, Containment, and Disposal. These materials, and other materials used during construction with the potential to impact stormwater, will be stored, managed, used, and disposed of in a manner that minimizes the potential for release into the environment. Emergency contacts for the project will be posted at the project office and are included at the end of this section.

## **7.7 GENERAL MATERIAL AND HANDLING PRACTICES**

The following general practices will be used throughout construction to reduce the potential for spills.

- a. Material Safety Data Sheets (MSDS) for potential pollutants (See Table 9 and refer to Appendix “E” NYSDEC Standards and Specifications for Site Pollution Prevention for Storage, Containment, and Disposal) should be kept on site. Potential pollutants will be stored and used in a manner

consistent with the manufacturer's instructions in a secure location. To the extent practicable, material storage areas should not be located near storm drain inlets and should be equipped with covers, roofs, or secondary containment as needed to prevent stormwater from contacting stored materials. Chemicals that are not compatible shall be stored in segregated areas so that spilled materials cannot combine and react.

- b. Materials disposal will be in accordance with the manufacturer's instructions and applicable local, state, and federal regulations.
- c. Materials no longer required for construction will be removed from the site as soon as practicable.
- d. Adequate garbage, construction waste, and sanitary waste handling and disposal facilities will be provided to the extent necessary to keep the site clear of obstruction and BMPs clear and functional.

## **7.8 SPECIFIC MATERIAL AND HANDLING PRACTICES**

All pollutants, including waste materials and demolition debris, that occur on-site during construction will be handled in a way that does not contaminate stormwater (See Table 9 and refer to Appendix "E" NYSDEC Standards and Specifications for Site Pollution Prevention for Storage, Containment, and Disposal).

- a. All chemicals including liquid products, petroleum products, water treatment chemicals, and wastes stored on site will be covered and contained and protected from vandalism. Items should be stored in their original containers or approved containers in accordance with their respective MSDS and per all local state, and federal regulations. The container should be inspected regularly.
- b. Maintenance and repair of all equipment and vehicles involving oil changes, hydraulic system drain down, de-greasing operations, fuel tank drain down and removal, and other activities which may result in the accidental release of contaminants, will be conducted under cover during wet weather and on an impervious surface to prevent the release of contaminants onto the ground. Secondary containment (drain pan) to catch spills when removing or changing fluids. Materials spilled during maintenance operations will be cleaned up immediately and properly disposed of.
- c. All equipment and vehicles on-site shall be inspected for leaks regularly to ensure that gasoline, diesel fuel, antifreeze, oils and grease do not come in contact with soil or stormwater.

- d. Equipment wash wastewater will be settled and discharged on site by infiltration in a designated area setback from the wetlands and controlled by erosion measures.
- e. Application of agricultural chemicals, including fertilizers and pesticides, will be conducted in a manner and at application rates that will not result in loss of chemical to stormwater runoff. Manufacturers' recommendations will be followed for application rates and procedures.
- f. pH-modifying sources will be managed to prevent contamination of runoff and stormwater collected on site. The most common sources of pH-modifying materials are bulk cement, cement kiln dust (CKD), fly ash, new concrete washing and curing waters, waste streams generated from concrete grinding and sawing, exposed aggregate processes, and concrete pumping and mixer washout waters.
- g. Portable equipment must be stored in safe and secure locations under cover at the end of each work day.
- h. Solvents shall be disposed of in approved containers and removed from site at scheduled intervals.
- i. Fuel for construction equipment shall either be obtained from a licensed distributor of petroleum products or from an approved above ground storage tank on site (above ground storage tanks with a combined capacity of 1,100 gallons shall be installed pursuant to 6 NYCRR Part 614 Standards for New and Substantially Modified Petroleum Storage Facilities). A distributor may be contracted to arrive on site periodically and fill all equipment as necessary. All distributors of petroleum products must have appropriate permits and licenses from the NYSDEC and have adequate liability insurance to mitigate and clean up any spills that occur on site.
- j. Used oil and petroleum products shall be stored in approved containers in accordance with their respective MSDS and per all local state, and federal regulations until recycled or disposed of at an approved disposal facility.
- k. The proper equipment (pumps, funnels) should be used to transfer fluids in designated fueling areas. The fuel should not be "topped-off" in the tanks.
- l. Temporary sanitary facilities shall be leak and tip proof. A waste management company contracted to provide the routine maintenance of facilities shall have appropriate permits and licenses from the NYSDEC and adequate liability insurance to mitigate and clean up any spills that occur on site.

## 7.9 SPILL RESPONSE

The primary objective in responding to a spill is to quickly contain the material(s) and prevent or minimize their migration into stormwater runoff and conveyance systems. If the release has impacted on-site stormwater, it is critical to contain the released materials on site and prevent their release into receiving waters.

- a. If a spill of pollutants (See Table 9) threatens stormwater at the site, the spill response procedures outlined below must be implemented in a timely manner to prevent the release of pollutants.
- b. The site superintendent will be notified immediately when a spill, or the threat of a spill, is observed. The superintendent will assess the situation and determine the appropriate response.
- c. If spills represent an imminent threat of escaping facilities and entering the receiving waters, facility personnel will respond immediately to contain the release and notify the superintendent after the situation has been stabilized.
- d. Spill kits containing materials and equipment for spill response and cleanup will be maintained at the site. Each spill kit may contain:
  - e. Oil absorbent pads (one bale)
  - f. Oil absorbent booms (40 feet)
  - g. 55-gallon drums (2)
  - h. 9-mil plastic bags (10)
  - i. Personal protective equipment including gloves and goggles
  - j. If an oily sheen is observed on surface water (e.g., settling ponds, detention pond, and swales), absorbent pads and/or booms will be applied to contain and remove the oil. The source of the oil sheen will also be identified and removed or repaired as necessary to prevent further releases.
- k. The site superintendent, or his designee, will be responsible for completing the spill reporting form and for reporting the spill to the appropriate state or local agency.
- l. Facility personnel with primary responsibility for spill response and cleanup will receive training from the site superintendent. This training will include identifying the location of spill kits and other spill response equipment and the use of spill response materials.
- m. Spill response equipment will be inspected and maintained as necessary to replace any materials used in spill response activities.

## 7.10 NOTIFICATION

In the event of a spill, make the appropriate notification(s) consistent with the following procedures:

- a. Any spill of oil which a) violates water quality standards, b) produces a “sheen” on a surface water, or c) causes a sludge or emulsion must be reported immediately by telephone to the **National Response Center Hotline at (800) 424-8802**.
- b. Any oil, hazardous substance, or hazardous waste release which exceeds the reportable quantity must be reported immediately by telephone to the **National Response Center Hotline at (800) 424-8802**.
- c. Any spill of oil or hazardous substance to waters of the state must be reported immediately by telephone to the **NYSDEC spill hotline at (800) 457-7362**.
- d. Any release of a hazardous substance that may be a threat to human health or the environment must be reported to the **NYSDEC spill hotline at (800) 457-7362** immediately upon discovery.

#### **7.11 SITE INSPECTIONS**

Site inspections should be performed every seven (7) calendar days and within 24 hours of any storm event producing 0.5 inch of precipitation or more. Within one (1) business day of inspection, the qualified inspector must notify the owner or operator and the appropriate contractor or subcontractor of any corrective actions that need to be taken and that contractor or subcontractor must begin implementing the corrective actions within one (1) business day of the notification and complete within a reasonable amount of time. Inspection should be photo documented along with any corrective actions taken in response to deficiencies or opportunities for improvement.

Inspections for specific elements of the SWPPP in addition to the weekly site inspection are in accordance with New York State Standards and Specifications for Erosion and Sediment control. Copies of the applicable standards and specifications for erosion control are included in Appendix E and sample logs and checklist in Appendix J.

#### **7.12 EMPLOYEE TRAINING**

Employee training must be provided for all employees prior to their first day on site. Training must inform employees of components and goals of the SWPPP, such as: spill response, good housekeeping, material management practices, disposal and control of waste, equipment fueling, and proper storage, washing, maintenance, and inspection procedures.

## **8.0 GENERAL REQUIREMENTS FOR OWNERS OR OPERATORS**

- a. The owner or operator shall ensure that the provisions of the SWPPP are implemented from the commencement of construction activity until all areas of disturbance have achieved final stabilization and the Notice of Termination ("NOT") has been submitted to NYSDEC.
- b. Prior to the commencement of construction activity, the owner or operator must identify the contractor(s) and subcontractor(s) that will be responsible for installing, constructing, repairing, replacing, inspecting and maintaining the erosion and sediment control practices included in the SWPPP; and the contractor(s) and subcontractor(s) that will be responsible for constructing the post-construction stormwater management practices included in the SWPPP. The owner or operator shall have each of the contractors and subcontractors identify at least one person from their company that will be responsible for implementation of the SWPPP.
- c. The owner or operator shall maintain a copy of the General Permit (GP-0-20-001), NOI, NOI Acknowledgment Letter, SWPPP, MS4 SWPPP Acceptance form, inspection reports, responsible contractor's, or subcontractor's certification statement, and all documentation necessary to demonstrate eligibility with this permit at the construction site until all disturbed areas have achieved final stabilization and the NOT has been submitted to the Department. The documents must be maintained in a secure location, such as a job trailer, on-site construction office, or mailbox with lock. The secure location must be accessible during normal business hours to an individual performing a compliance inspection.
- d. The owner or operator shall notify the regulated, traditional land use control MS4 in writing of any planned amendments or modifications to the post-construction stormwater management practice component of the SWPPP. Unless otherwise notified by the regulated, traditional land use control MS4, the owner or operator shall have the SWPPP amendments or modifications reviewed and accepted by the regulated, traditional land use control MS4 prior to commencing construction of the post-construction stormwater management practice.
- e. The owner or operator is required to perform inspections as outlined in Section 7.11.
- f. The owner or operator is required to ensure the contractor and subcontractor are adhering to the SWPPP.

## **9.0 GENERAL REQUIREMENTS FOR CONTRACTORS AND SUBCONTRACTORS**

- a. All contractors and subcontractors associated with the project must comply with the terms of the SWPPP.
- b. The contractors and subcontractors shall identify at least one person from their company that will be responsible for implementation of the SWPPP. This

person shall be known as the trained contractor. At least one trained contractor shall be on site on a daily when soil disturbance activities are being performed.

- c. The trained contractor must complete the four (4) hours of NYSDEC endorsed training in proper erosion and sediment control principles from a Soil and Water Conservation District, or other Department endorsed entity. A copy of the certification should be submitted to the owner or operator.
- d. The trained contractor (and any trained subcontractors) shall sign a copy of the certification statement included in Appendix H and provide to the owner or operator.
- e. Any new or additional contractors hired to implement measures identified in the SWPPP after construction has commenced, must also sign the certification statement in Appendix H and provide to the owner or operator.
- f. Trained contractor must inspect the erosion and sediment control practices and pollution prevention measures being implemented within the active work area daily to ensure that they are being maintained in effective operating condition at all times. If deficiencies are identified, the contractor shall begin implementing corrective actions within one business day and shall complete the corrective actions in a reasonable time frame.
- g. Contractor/Trained Contractor also must review the Qualified Inspector's Report and the contractor or subcontractor shall begin implementing the corrective actions required within one business day of this notification and shall complete the corrective actions in a reasonable time frame.
- h. Contractors and subcontractors shall take all reasonable steps to minimize or prevent any discharge in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

## **10.0 NYSOPRHP AND T&E DOCUMENTATION**

In accordance with GP-O-20-001, documentation has been provided to the Office of Parks, Recreation and Historic Preservation (OPRHP) to determine if the project would affect a historic property. OPRHP determined that no properties, including archaeological and/or historic resources, listed in or eligible for the New York State and National Registers of Historic Places will be impacted by this project. A copy of the letter response indicating this is included in Appendix I.

A Rare, Threatened, and Endangered Species Report has been prepared by Tectonic and is included in Appendix K. The conclusion of the report is that the proposed project will have no effect on federal or state regulated Rare, Threatened or Endangered species.

## **11.0 MONITORING, REPORTING AND RETENTION OF RECORDS**

The owner and contractor are required to read, understand and comply with all monitoring, reporting and retention of records required by the SWPPP. Certification Signatures from the Owner, SWPPP preparer, Qualified Inspector and Contractor are to be kept in the SWPPP on site. Also, contractor's proof of completion for the required NYS DEC Endorsed 4-Hour Erosion and Sediment Control Course must also be supplied in the SWPPP on site.

## **12.0 OWNERSHIP AND MAINTENANCE OF PERMANENT STRUCTURES**

The permanent stormwater structures will be owned and maintained by the Town of Orangetown in accordance with the approved plans and this SWPPP. Procedures, checklists and sample logs for maintenance are included in Appendix M.

## ACRONYMS

BMP: Best Management Practice

CWA: Clean Water Act

DPW: Department of Public Works

EPA: Environmental Protection Agency

ECL: Environmental Conservation Law

HDS: Hydrodynamic Separator

MSDS: Material Safety Data Sheet

NOI: Notice of Intent

NOT: Notice of Termination

NPDES: National Pollution Discharge Elimination System

NYSDEC: New York State Department of Environmental Conservation

RRv: Runoff Reduction Volume

SWDM: Stormwater Management Design Manual

SPDES: State Pollution Discharge Elimination System

SWPPP: Storm Water Pollution Prevention Plan

WQv: Water Quality Volume

## GLOSSARY

Commencement of Construction – the initial disturbance of soils associated with clearing, grading, or excavating activities, or other construction activities.

Existing – for purposes of site conditions “existing” refers to the site prior to renovation.

Facility – the proposed addition.

Final Stabilization – all soil disturbing activities at the site have been completed, and that a uniform perennial vegetative cover with a density of 80% has been established, or equivalent stabilization measures (such as the use of mulches or geotextiles) have been employed on all unpaved areas and areas not covered by permanent structures.

Owner or Operator - means the person, persons or legal entity which owns or leases the property on which the construction activity is occurring; and/or an entity that has operational control over the construction plans and specifications, including the ability to make modifications to the plans and specifications.

Permit – GP-O-20-001

Proposed – for the purposes of site conditions “proposed” refers to the site post renovation.

Qualified professional – means a person that is knowledgeable in the principles and practices of stormwater management and treatment, such as a licensed Professional Engineer, licensed Landscape Architect or other Department endorsed individual(s). Individuals preparing SWPPPs that require the post-construction stormwater management practice component must have an understanding of the principles of hydrology, water quality management practice design, water quantity control design, and, in many cases, the principles of hydraulics in order to prepare a SWPPP that conforms to the Department’s technical standard. All components of the SWPPP that involve the practice of engineering, as defined by the NYS Education Law (see Article 145), shall be prepared by, or under the direct supervision of, a professional engineer licensed to practice in the State of New York.

Redevelopment Activity(ies) – means the disturbance and reconstruction of existing impervious area, including impervious areas that were removed from a project site within five (5) years of preliminary project plan submission to the local government (i.e. site plan, subdivision, etc.).

Stabilization – covering or maintaining an existing cover over soil. Cover can be vegetative (e.g. grass, trees, seed and mulch, shrubs, or turf) or non-vegetative (e.g. geotextiles, riprap, or gabions).

Trained Individual – means an employee from a contracting (construction) firm that has received four (4) hours of training, which has been endorsed by the Department, from a Soil and Water Conservation District, CPESC, Inc. or other Department endorsed entity, in proper erosion and sediment control principles no later than two (2) years from the date of project approval. After receiving the initial training, the trained individual shall receive four (4) hours of training every three (3) years. This individual will be responsible for implementation of the SWPPP.

---

Department of  
Environmental  
Conservation

NEW YORK STATE  
DEPARTMENT OF ENVIRONMENTAL CONSERVATION

SPDES GENERAL PERMIT  
FOR STORMWATER DISCHARGES

From

**CONSTRUCTION ACTIVITY**

Permit No. GP- 0-20-001

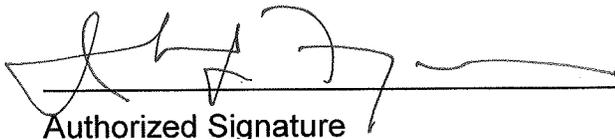

Issued Pursuant to Article 17, Titles 7, 8 and Article 70  
of the Environmental Conservation Law

Effective Date: January 29, 2020

Expiration Date: January 28, 2025

John J. Ferguson

Chief Permit Administrator

Authorized Signature

1-23-20

Date

Address: NYS DEC  
Division of Environmental Permits  
625 Broadway, 4th Floor  
Albany, N.Y. 12233-1750

## PREFACE

Pursuant to Section 402 of the Clean Water Act (“CWA”), stormwater *discharges* from certain *construction activities* are unlawful unless they are authorized by a *National Pollutant Discharge Elimination System (“NPDES”)* permit or by a state permit program. New York administers the approved State Pollutant Discharge Elimination System (SPDES) program with permits issued in accordance with the New York State Environmental Conservation Law (ECL) Article 17, Titles 7, 8 and Article 70.

An *owner or operator* of a *construction activity* that is eligible for coverage under this permit must obtain coverage prior to the *commencement of construction activity*. Activities that fit the definition of “*construction activity*”, as defined under 40 CFR 122.26(b)(14)(x), (15)(i), and (15)(ii), constitute construction of a *point source* and therefore, pursuant to ECL section 17-0505 and 17-0701, the *owner or operator* must have coverage under a SPDES permit prior to *commencing construction activity*. The *owner or operator* cannot wait until there is an actual *discharge* from the *construction site* to obtain permit coverage.

**\*Note: The italicized words/phrases within this permit are defined in Appendix A.**

## Part 1. PERMIT COVERAGE AND LIMITATIONS

### A. Permit Application

This permit authorizes stormwater *discharges to surface waters of the State* from the following *construction activities* identified within 40 CFR Parts 122.26(b)(14)(x), 122.26(b)(15)(i) and 122.26(b)(15)(ii), provided all of the eligibility provisions of this permit are met:

1. *Construction activities* involving soil disturbances of one (1) or more acres; including disturbances of less than one acre that are part of a *larger common plan of development or sale* that will ultimately disturb one or more acres of land; excluding *routine maintenance activity* that is performed to maintain the original line and grade, hydraulic capacity or original purpose of a facility;
2. *Construction activities* involving soil disturbances of less than one (1) acre where the Department has determined that a *SPDES* permit is required for stormwater *discharges* based on the potential for contribution to a violation of a *water quality standard* or for significant contribution of *pollutants to surface waters of the State*.
3. *Construction activities* located in the watershed(s) identified in Appendix D that involve soil disturbances between five thousand (5,000) square feet and one (1) acre of land.

### B. Effluent Limitations Applicable to Discharges from Construction Activities

*Discharges* authorized by this permit must achieve, at a minimum, the effluent limitations in Part I.B.1. (a) – (f) of this permit. These limitations represent the degree of effluent reduction attainable by the application of best practicable technology currently available.

1. Erosion and Sediment Control Requirements - The *owner or operator* must select, design, install, implement and maintain control measures to *minimize the discharge of pollutants* and prevent a violation of the *water quality standards*. The selection, design, installation, implementation, and maintenance of these control measures must meet the non-numeric effluent limitations in Part I.B.1.(a) – (f) of this permit and be in accordance with the New York State Standards and Specifications for Erosion and Sediment Control, dated November 2016, using sound engineering judgment. Where control measures are not designed in conformance with the design criteria included in the technical standard, the *owner or operator* must include in the *Stormwater Pollution Prevention Plan* (“SWPPP”) the reason(s) for the

deviation or alternative design and provide information which demonstrates that the deviation or alternative design is *equivalent* to the technical standard.

- a. **Erosion and Sediment Controls.** Design, install and maintain effective erosion and sediment controls to *minimize* the *discharge of pollutants* and prevent a violation of the *water quality standards*. At a minimum, such controls must be designed, installed and maintained to:
- (i) *Minimize* soil erosion through application of runoff control and soil stabilization control measure to *minimize pollutant discharges*;
  - (ii) Control stormwater *discharges*, including both peak flowrates and total stormwater volume, to *minimize* channel and *streambank* erosion and scour in the immediate vicinity of the *discharge* points;
  - (iii) *Minimize* the amount of soil exposed during *construction activity*;
  - (iv) *Minimize* the disturbance of *steep slopes*;
  - (v) *Minimize* sediment *discharges* from the site;
  - (vi) Provide and maintain *natural buffers* around surface waters, direct stormwater to vegetated areas and maximize stormwater infiltration to reduce *pollutant discharges*, unless *infeasible*;
  - (vii) *Minimize* soil compaction. Minimizing soil compaction is not required where the intended function of a specific area of the site dictates that it be compacted;
  - (viii) Unless *infeasible*, preserve a sufficient amount of topsoil to complete soil restoration and establish a uniform, dense vegetative cover; and
  - (ix) *Minimize* dust. On areas of exposed soil, *minimize* dust through the appropriate application of water or other dust suppression techniques to control the generation of pollutants that could be discharged from the site.
- b. **Soil Stabilization.** In areas where soil disturbance activity has temporarily or permanently ceased, the application of soil stabilization measures must be initiated by the end of the next business day and completed within fourteen (14) days from the date the current soil disturbance activity ceased. For construction sites that *directly discharge* to one of the 303(d) segments

listed in Appendix E or is located in one of the watersheds listed in Appendix C, the application of soil stabilization measures must be initiated by the end of the next business day and completed within seven (7) days from the date the current soil disturbance activity ceased. See Appendix A for definition of *Temporarily Ceased*.

- c. **Dewatering.** *Discharges* from *dewatering* activities, including *discharges* from *dewatering* of trenches and excavations, must be managed by appropriate control measures.
  
- d. **Pollution Prevention Measures.** Design, install, implement, and maintain effective pollution prevention measures to *minimize* the *discharge* of *pollutants* and prevent a violation of the *water quality standards*. At a minimum, such measures must be designed, installed, implemented and maintained to:
  - (i) *Minimize* the *discharge* of *pollutants* from equipment and vehicle washing, wheel wash water, and other wash waters. This applies to washing operations that use clean water only. Soaps, detergents and solvents cannot be used;
  
  - (ii) *Minimize* the exposure of building materials, building products, construction wastes, trash, landscape materials, fertilizers, pesticides, herbicides, detergents, sanitary waste, hazardous and toxic waste, and other materials present on the site to precipitation and to stormwater. Minimization of exposure is not required in cases where the exposure to precipitation and to stormwater will not result in a *discharge* of *pollutants*, or where exposure of a specific material or product poses little risk of stormwater contamination (such as final products and materials intended for outdoor use) ; and
  
  - (iii) Prevent the *discharge* of *pollutants* from spills and leaks and implement chemical spill and leak prevention and response procedures.
  
- e. **Prohibited Discharges.** The following *discharges* are prohibited:
  - (i) Wastewater from washout of concrete;
  
  - (ii) Wastewater from washout and cleanout of stucco, paint, form release oils, curing compounds and other construction materials;

- (iii) Fuels, oils, or other *pollutants* used in vehicle and equipment operation and maintenance;
  - (iv) Soaps or solvents used in vehicle and equipment washing; and
  - (v) Toxic or hazardous substances from a spill or other release.
- f. Surface Outlets. When discharging from basins and impoundments, the outlets shall be designed, constructed and maintained in such a manner that sediment does not leave the basin or impoundment and that erosion at or below the outlet does not occur.

### **C. Post-construction Stormwater Management Practice Requirements**

1. The *owner or operator of a construction activity* that requires post-construction stormwater management practices pursuant to Part III.C. of this permit must select, design, install, and maintain the practices to meet the *performance criteria* in the New York State Stormwater Management Design Manual (“Design Manual”), dated January 2015, using sound engineering judgment. Where post-construction stormwater management practices (“SMPs”) are not designed in conformance with the *performance criteria* in the Design Manual, the *owner or operator* must include in the SWPPP the reason(s) for the deviation or alternative design and provide information which demonstrates that the deviation or alternative design is *equivalent* to the technical standard.
2. The *owner or operator of a construction activity* that requires post-construction stormwater management practices pursuant to Part III.C. of this permit must design the practices to meet the applicable *sizing criteria* in Part I.C.2.a., b., c. or d. of this permit.

#### **a. Sizing Criteria for New Development**

- (i) Runoff Reduction Volume (“RRv”): Reduce the total Water Quality Volume (“WQv”) by application of RR techniques and standard SMPs with RRv capacity. The total WQv shall be calculated in accordance with the criteria in Section 4.2 of the Design Manual.
- (ii) Minimum RRv and Treatment of Remaining Total WQv: Construction activities that cannot meet the criteria in Part I.C.2.a.(i) of this permit due to site limitations shall direct runoff from all newly constructed impervious areas to a RR technique or standard SMP with RRv capacity unless infeasible. The specific site limitations that prevent the reduction of 100% of the WQv shall be documented in the SWPPP.

For each impervious area that is not directed to a RR technique or standard SMP with RRv capacity, the SWPPP must include documentation which demonstrates that all options were considered and for each option explains why it is considered infeasible.

**In no case shall the runoff reduction achieved from the newly constructed impervious areas be less than the Minimum RRv as calculated using the criteria in Section 4.3 of the Design Manual.**

The remaining portion of the total WQv that cannot be reduced shall be treated by application of standard SMPs.

- (iii) Channel Protection Volume (“Cpv”): Provide 24 hour extended detention of the post-developed 1-year, 24-hour storm event; remaining after runoff reduction. The Cpv requirement does not apply when:
  - (1) Reduction of the entire Cpv is achieved by application of runoff reduction techniques or infiltration systems, or
  - (2) The site discharges directly to tidal waters, or fifth order or larger streams.
  
- (iv) *Overbank* Flood Control Criteria (“Qp”): Requires storage to attenuate the post-development 10-year, 24-hour peak discharge rate (Qp) to predevelopment rates. The Qp requirement does not apply when:
  - (1) the site discharges directly to tidal waters or fifth order or larger streams, or
  - (2) A downstream analysis reveals that *overbank* control is not required.
  
- (v) Extreme Flood Control Criteria (“Qf”): Requires storage to attenuate the post-development 100-year, 24-hour peak discharge rate (Qf) to predevelopment rates. The Qf requirement does not apply when:
  - (1) the site discharges directly to tidal waters or fifth order or larger streams, or
  - (2) A downstream analysis reveals that *overbank* control is not required.

**b. Sizing Criteria for New Development in Enhanced Phosphorus Removal Watershed**

- (i) Runoff Reduction Volume (RRv): Reduce the total Water Quality Volume (WQv) by application of RR techniques and standard SMPs with RRv capacity. The total WQv is the runoff volume from the 1-year, 24 hour design storm over the post-developed watershed and shall be

calculated in accordance with the criteria in Section 10.3 of the Design Manual.

- (ii) Minimum RRv and Treatment of Remaining Total WQv: *Construction activities* that cannot meet the criteria in Part I.C.2.b.(i) of this permit due to *site limitations* shall direct runoff from all newly constructed *impervious areas* to a RR technique or standard SMP with RRv capacity unless *infeasible*. The specific *site limitations* that prevent the reduction of 100% of the WQv shall be documented in the SWPPP. For each *impervious area* that is not directed to a RR technique or standard SMP with RRv capacity, the SWPPP must include documentation which demonstrates that all options were considered and for each option explains why it is considered *infeasible*.

**In no case shall the runoff reduction achieved from the newly constructed *impervious areas* be less than the Minimum RRv as calculated using the criteria in Section 10.3 of the Design Manual.** The remaining portion of the total WQv that cannot be reduced shall be treated by application of standard SMPs.

- (iii) Channel Protection Volume (Cpv): Provide 24 hour extended detention of the post-developed 1-year, 24-hour storm event; remaining after runoff reduction. The Cpv requirement does not apply when:
  - (1) Reduction of the entire Cpv is achieved by application of runoff reduction techniques or infiltration systems, or
  - (2) The site *discharges* directly to tidal waters, or fifth order or larger streams.
- (iv) *Overbank* Flood Control Criteria (Qp): Requires storage to attenuate the post-development 10-year, 24-hour peak *discharge* rate (Qp) to predevelopment rates. The Qp requirement does not apply when:
  - (1) the site *discharges* directly to tidal waters or fifth order or larger streams, or
  - (2) A downstream analysis reveals that *overbank* control is not required.
- (v) Extreme Flood Control Criteria (Qf): Requires storage to attenuate the post-development 100-year, 24-hour peak *discharge* rate (Qf) to predevelopment rates. The Qf requirement does not apply when:
  - (1) the site *discharges* directly to tidal waters or fifth order or larger streams, or
  - (2) A downstream analysis reveals that *overbank* control is not required.

### c. Sizing Criteria for Redevelopment Activity

- (i) Water Quality Volume (WQv): The WQv treatment objective for *redevelopment activity* shall be addressed by one of the following options. *Redevelopment activities* located in an Enhanced Phosphorus Removal Watershed (see Part III.B.3. and Appendix C of this permit) shall calculate the WQv in accordance with Section 10.3 of the Design Manual. All other *redevelopment activities* shall calculate the WQv in accordance with Section 4.2 of the Design Manual.
- (1) Reduce the existing *impervious cover* by a minimum of 25% of the total disturbed, *impervious area*. The Soil Restoration criteria in Section 5.1.6 of the Design Manual must be applied to all newly created pervious areas, or
  - (2) Capture and treat a minimum of 25% of the WQv from the disturbed, *impervious area* by the application of standard SMPs; or reduce 25% of the WQv from the disturbed, *impervious area* by the application of RR techniques or standard SMPs with RRv capacity., or
  - (3) Capture and treat a minimum of 75% of the WQv from the disturbed, *impervious area* as well as any additional runoff from tributary areas by application of the alternative practices discussed in Sections 9.3 and 9.4 of the Design Manual., or
  - (4) Application of a combination of 1, 2 and 3 above that provide a weighted average of at least two of the above methods. Application of this method shall be in accordance with the criteria in Section 9.2.1(B) (IV) of the Design Manual.

If there is an existing post-construction stormwater management practice located on the site that captures and treats runoff from the *impervious area* that is being disturbed, the WQv treatment option selected must, at a minimum, provide treatment equal to the treatment that was being provided by the existing practice(s) if that treatment is greater than the treatment required by options 1 – 4 above.

- (ii) Channel Protection Volume (Cpv): Not required if there are no changes to hydrology that increase the *discharge* rate from the project site.
- (iii) *Overbank* Flood Control Criteria (Qp): Not required if there are no changes to hydrology that increase the *discharge* rate from the project site.
- (iv) Extreme Flood Control Criteria (Qf): Not required if there are no changes to hydrology that increase the *discharge* rate from the project site

**d. Sizing Criteria for Combination of Redevelopment Activity and New Development**

Construction projects that include both New Development and Redevelopment Activity shall provide post-construction stormwater management controls that meet the sizing criteria calculated as an aggregate of the Sizing Criteria in Part I.C.2.a. or b. of this permit for the New Development portion of the project and Part I.C.2.c of this permit for Redevelopment Activity portion of the project.

**D. Maintaining Water Quality**

The Department expects that compliance with the conditions of this permit will control *discharges* necessary to meet applicable *water quality standards*. It shall be a violation of the *ECL* for any discharge to either cause or contribute to a violation of *water quality standards* as contained in Parts 700 through 705 of Title 6 of the Official Compilation of Codes, Rules and Regulations of the State of New York, such as:

1. There shall be no increase in turbidity that will cause a substantial visible contrast to natural conditions;
2. There shall be no increase in suspended, colloidal or settleable solids that will cause deposition or impair the waters for their best usages; and
3. There shall be no residue from oil and floating substances, nor visible oil film, nor globules of grease.

If there is evidence indicating that the stormwater *discharges* authorized by this permit are causing, have the reasonable potential to cause, or are contributing to a violation of the *water quality standards*; the *owner or operator* must take appropriate corrective action in accordance with Part IV.C.5. of this general permit and document in accordance with Part IV.C.4. of this general permit. To address the *water quality standard* violation the *owner or operator* may need to provide additional information, include and implement appropriate controls in the SWPPP to correct the problem, or obtain an individual SPDES permit.

If there is evidence indicating that despite compliance with the terms and conditions of this general permit it is demonstrated that the stormwater *discharges* authorized by this permit are causing or contributing to a violation of *water quality standards*, or if the Department determines that a modification of the permit is necessary to prevent a violation of *water quality standards*, the authorized *discharges* will no longer be eligible for coverage under this permit. The Department may require the *owner or operator* to obtain an individual SPDES permit to continue discharging.

## **E. Eligibility Under This General Permit**

1. This permit may authorize all *discharges* of stormwater from *construction activity* to *surface waters of the State* and *groundwaters* except for ineligible *discharges* identified under subparagraph F. of this Part.
2. Except for non-stormwater *discharges* explicitly listed in the next paragraph, this permit only authorizes stormwater *discharges*; including stormwater runoff, snowmelt runoff, and surface runoff and drainage, from *construction activities*.
3. Notwithstanding paragraphs E.1 and E.2 above, the following non-stormwater discharges are authorized by this permit: those listed in 6 NYCRR 750-1.2(a)(29)(vi), with the following exception: “Discharges from firefighting activities are authorized only when the firefighting activities are emergencies/unplanned”; waters to which other components have not been added that are used to control dust in accordance with the SWPPP; and uncontaminated *discharges* from *construction site* de-watering operations. All non-stormwater discharges must be identified in the SWPPP. Under all circumstances, the *owner or operator* must still comply with *water quality standards* in Part I.D of this permit.
4. The *owner or operator* must maintain permit eligibility to *discharge* under this permit. Any *discharges* that are not compliant with the eligibility conditions of this permit are not authorized by the permit and the *owner or operator* must either apply for a separate permit to cover those ineligible *discharges* or take steps necessary to make the *discharge* eligible for coverage.

## **F. Activities Which Are Ineligible for Coverage Under This General Permit**

All of the following are **not** authorized by this permit:

1. *Discharges* after *construction activities* have been completed and the site has undergone *final stabilization*;
2. *Discharges* that are mixed with sources of non-stormwater other than those expressly authorized under subsection E.3. of this Part and identified in the SWPPP required by this permit;
3. *Discharges* that are required to obtain an individual SPDES permit or another SPDES general permit pursuant to Part VII.K. of this permit;
4. *Construction activities* or *discharges* from *construction activities* that may adversely affect an *endangered or threatened species* unless the *owner or*

*operator* has obtained a permit issued pursuant to 6 NYCRR Part 182 for the project or the Department has issued a letter of non-jurisdiction for the project. All documentation necessary to demonstrate eligibility shall be maintained on site in accordance with Part II.D.2 of this permit;

5. *Discharges* which either cause or contribute to a violation of *water quality standards* adopted pursuant to the *ECL* and its accompanying regulations;
6. *Construction activities* for residential, commercial and institutional projects:
  - a. Where the *discharges* from the *construction activities* are tributary to waters of the state classified as AA or AA-s; and
  - b. Which are undertaken on land with no existing *impervious cover*; and
  - c. Which disturb one (1) or more acres of land designated on the current United States Department of Agriculture (“USDA”) Soil Survey as Soil Slope Phase “D”, (provided the map unit name is inclusive of slopes greater than 25%), or Soil Slope Phase “E” or “F” (regardless of the map unit name), or a combination of the three designations.
7. *Construction activities* for linear transportation projects and linear utility projects:
  - a. Where the *discharges* from the *construction activities* are tributary to waters of the state classified as AA or AA-s; and
  - b. Which are undertaken on land with no existing *impervious cover*; and
  - c. Which disturb two (2) or more acres of land designated on the current USDA Soil Survey as Soil Slope Phase “D” (provided the map unit name is inclusive of slopes greater than 25%), or Soil Slope Phase “E” or “F” (regardless of the map unit name), or a combination of the three designations.

8. *Construction activities* that have the potential to affect an *historic property*, unless there is documentation that such impacts have been resolved. The following documentation necessary to demonstrate eligibility with this requirement shall be maintained on site in accordance with Part II.D.2 of this permit and made available to the Department in accordance with Part VII.F of this permit:
- a. Documentation that the *construction activity* is not within an archeologically sensitive area indicated on the sensitivity map, and that the *construction activity* is not located on or immediately adjacent to a property listed or determined to be eligible for listing on the National or State Registers of Historic Places, and that there is no new permanent building on the *construction site* within the following distances from a building, structure, or object that is more than 50 years old, or if there is such a new permanent building on the *construction site* within those parameters that NYS Office of Parks, Recreation and Historic Preservation (OPRHP), a Historic Preservation Commission of a Certified Local Government, or a qualified preservation professional has determined that the building, structure, or object more than 50 years old is not historically/archeologically significant.
    - 1-5 acres of disturbance - 20 feet
    - 5-20 acres of disturbance - 50 feet
    - 20+ acres of disturbance - 100 feet, or
  - b. DEC consultation form sent to OPRHP, and copied to the NYS DEC Agency Historic Preservation Officer (APO), and
    - (i) the State Environmental Quality Review (SEQR) Environmental Assessment Form (EAF) with a negative declaration or the Findings Statement, with documentation of OPRHP's agreement with the resolution; or
    - (ii) documentation from OPRHP that the *construction activity* will result in No Impact; or
    - (iii) documentation from OPRHP providing a determination of No Adverse Impact; or
    - (iv) a Letter of Resolution signed by the owner/operator, OPRHP and the DEC APO which allows for this *construction activity* to be eligible for coverage under the general permit in terms of the State Historic Preservation Act (SHPA); or
  - c. Documentation of satisfactory compliance with Section 106 of the National Historic Preservation Act for a coterminous project area:

- (i) No Affect
- (ii) No Adverse Affect
- (iii) Executed Memorandum of Agreement, or

d. Documentation that:

- (i) SHPA Section 14.09 has been completed by NYS DEC or another state agency.
9. *Discharges from construction activities* that are subject to an existing SPDES individual or general permit where a SPDES permit for *construction activity* has been terminated or denied; or where the *owner or operator* has failed to renew an expired individual permit.

## Part II. PERMIT COVERAGE

### A. How to Obtain Coverage

1. An *owner or operator* of a *construction activity* that is not subject to the requirements of a regulated, traditional land use control MS4 must first prepare a SWPPP in accordance with all applicable requirements of this permit and then submit a completed Notice of Intent (NOI) to the Department to be authorized to discharge under this permit.
2. An *owner or operator* of a *construction activity* that is subject to the requirements of a *regulated, traditional land use control MS4* must first prepare a SWPPP in accordance with all applicable requirements of this permit and then have the SWPPP reviewed and accepted by the *regulated, traditional land use control MS4* prior to submitting the NOI to the Department. The *owner or operator* shall have the “MS4 SWPPP Acceptance” form signed in accordance with Part VII.H., and then submit that form along with a completed NOI to the Department.
3. The requirement for an *owner or operator* to have its SWPPP reviewed and accepted by the *regulated, traditional land use control MS4* prior to submitting the NOI to the Department does not apply to an *owner or operator* that is obtaining permit coverage in accordance with the requirements in Part II.F. (Change of *Owner or Operator*) or where the *owner or operator* of the *construction activity* is the *regulated, traditional land use control MS4* . This exemption does not apply to *construction activities* subject to the New York City Administrative Code.

## B. Notice of Intent (NOI) Submittal

1. Prior to December 21, 2020, an owner or operator shall use either the electronic (eNOI) or paper version of the NOI that the Department prepared. Both versions of the NOI are located on the Department's website (<http://www.dec.ny.gov/>). The paper version of the NOI shall be signed in accordance with Part VII.H. of this permit and submitted to the following address:

**NOTICE OF INTENT  
NYS DEC, Bureau of Water Permits  
625 Broadway, 4<sup>th</sup> Floor  
Albany, New York 12233-3505**

2. Beginning December 21, 2020 and in accordance with EPA's 2015 NPDES Electronic Reporting Rule (40 CFR Part 127), the *owner or operator* must submit the NOI electronically using the *Department's* online NOI.
3. The *owner or operator* shall have the SWPPP preparer sign the "SWPPP Preparer Certification" statement on the NOI prior to submitting the form to the Department.
4. As of the date the NOI is submitted to the Department, the *owner or operator* shall make the NOI and SWPPP available for review and copying in accordance with the requirements in Part VII.F. of this permit.

## C. Permit Authorization

1. An *owner or operator* shall not *commence construction activity* until their authorization to *discharge* under this permit goes into effect.
2. Authorization to *discharge* under this permit will be effective when the *owner or operator* has satisfied all of the following criteria:
  - a. project review pursuant to the State Environmental Quality Review Act ("SEQRA") have been satisfied, when SEQRA is applicable. See the Department's website (<http://www.dec.ny.gov/>) for more information,
  - b. where required, all necessary Department permits subject to the *Uniform Procedures Act ("UPA")* (see 6 NYCRR Part 621), or the equivalent from another New York State agency, have been obtained, unless otherwise notified by the Department pursuant to 6 NYCRR 621.3(a)(4). *Owners or operators of construction activities* that are required to obtain *UPA* permits

must submit a preliminary SWPPP to the appropriate DEC Permit Administrator at the Regional Office listed in Appendix F at the time all other necessary *UPA* permit applications are submitted. The preliminary SWPPP must include sufficient information to demonstrate that the *construction activity* qualifies for authorization under this permit,

- c. the final SWPPP has been prepared, and
  - d. a complete NOI has been submitted to the Department in accordance with the requirements of this permit.
3. An *owner or operator* that has satisfied the requirements of Part II.C.2 above will be authorized to *discharge* stormwater from their *construction activity* in accordance with the following schedule:
- a. For *construction activities* that are not subject to the requirements of a *regulated, traditional land use control MS4*:
    - (i) Five (5) business days from the date the Department receives a complete electronic version of the NOI (eNOI) for *construction activities* with a SWPPP that has been prepared in conformance with the design criteria in the technical standard referenced in Part III.B.1 and the *performance criteria* in the technical standard referenced in Parts III.B., 2 or 3, for *construction activities* that require post-construction stormwater management practices pursuant to Part III.C.; or
    - (ii) Sixty (60) business days from the date the Department receives a complete NOI (electronic or paper version) for *construction activities* with a SWPPP that has not been prepared in conformance with the design criteria in technical standard referenced in Part III.B.1. or, for *construction activities* that require post-construction stormwater management practices pursuant to Part III.C., the *performance criteria* in the technical standard referenced in Parts III.B., 2 or 3, or;
    - (iii) Ten (10) business days from the date the Department receives a complete paper version of the NOI for *construction activities* with a SWPPP that has been prepared in conformance with the design criteria in the technical standard referenced in Part III.B.1 and the *performance criteria* in the technical standard referenced in Parts III.B., 2 or 3, for *construction activities* that require post-construction stormwater management practices pursuant to Part III.C.

- b. For *construction activities* that are subject to the requirements of a *regulated, traditional land use control MS4*:
  - (i) Five (5) business days from the date the Department receives both a complete electronic version of the NOI (eNOI) and signed “MS4 SWPPP Acceptance” form, or
  - (ii) Ten (10) business days from the date the Department receives both a complete paper version of the NOI and signed “MS4 SWPPP Acceptance” form.
4. Coverage under this permit authorizes stormwater *discharges* from only those areas of disturbance that are identified in the NOI. If an *owner or operator* wishes to have stormwater *discharges* from future or additional areas of disturbance authorized, they must submit a new NOI that addresses that phase of the development, unless otherwise notified by the Department. The *owner or operator* shall not *commence construction activity* on the future or additional areas until their authorization to *discharge* under this permit goes into effect in accordance with Part II.C. of this permit.

#### **D. General Requirements For Owners or Operators With Permit Coverage**

1. The *owner or operator* shall ensure that the provisions of the SWPPP are implemented from the *commencement of construction activity* until all areas of disturbance have achieved *final stabilization* and the Notice of Termination (“NOT”) has been submitted to the Department in accordance with Part V. of this permit. This includes any changes made to the SWPPP pursuant to Part III.A.4. of this permit.
2. The *owner or operator* shall maintain a copy of the General Permit (GP-0-20-001), NOI, *NOI Acknowledgment Letter*, SWPPP, MS4 SWPPP Acceptance form, inspection reports, responsible contractor’s or subcontractor’s certification statement (see Part III.A.6.), and all documentation necessary to demonstrate eligibility with this permit at the *construction site* until all disturbed areas have achieved *final stabilization* and the NOT has been submitted to the Department. The documents must be maintained in a secure location, such as a job trailer, on-site construction office, or mailbox with lock. The secure location must be accessible during normal business hours to an individual performing a compliance inspection.
3. The *owner or operator of a construction activity* shall not disturb greater than five (5) acres of soil at any one time without prior written authorization from the Department or, in areas under the jurisdiction of a *regulated, traditional land*

*use control MS4, the regulated, traditional land use control MS4* (provided the *regulated, traditional land use control MS4* is not the *owner or operator* of the *construction activity*). At a minimum, the *owner or operator* must comply with the following requirements in order to be authorized to disturb greater than five (5) acres of soil at any one time:

- a. The *owner or operator* shall have a *qualified inspector* conduct **at least** two (2) site inspections in accordance with Part IV.C. of this permit every seven (7) calendar days, for as long as greater than five (5) acres of soil remain disturbed. The two (2) inspections shall be separated by a minimum of two (2) full calendar days.
  - b. In areas where soil disturbance activity has temporarily or permanently ceased, the application of soil stabilization measures must be initiated by the end of the next business day and completed within seven (7) days from the date the current soil disturbance activity ceased. The soil stabilization measures selected shall be in conformance with the technical standard, New York State Standards and Specifications for Erosion and Sediment Control, dated November 2016.
  - c. The *owner or operator* shall prepare a phasing plan that defines maximum disturbed area per phase and shows required cuts and fills.
  - d. The *owner or operator* shall install any additional site-specific practices needed to protect water quality.
  - e. The *owner or operator* shall include the requirements above in their SWPPP.
4. In accordance with statute, regulations, and the terms and conditions of this permit, the Department may suspend or revoke an *owner's or operator's* coverage under this permit at any time if the Department determines that the SWPPP does not meet the permit requirements or consistent with Part VII.K..
  5. Upon a finding of significant non-compliance with the practices described in the SWPPP or violation of this permit, the Department may order an immediate stop to all activity at the site until the non-compliance is remedied. The stop work order shall be in writing, describe the non-compliance in detail, and be sent to the *owner or operator*.
  6. For *construction activities* that are subject to the requirements of a *regulated, traditional land use control MS4*, the *owner or operator* shall notify the

*regulated, traditional land use control MS4* in writing of any planned amendments or modifications to the post-construction stormwater management practice component of the SWPPP required by Part III.A. 4. and 5. of this permit. Unless otherwise notified by the *regulated, traditional land use control MS4*, the *owner or operator* shall have the SWPPP amendments or modifications reviewed and accepted by the *regulated, traditional land use control MS4* prior to commencing construction of the post-construction stormwater management practice.

#### **E. Permit Coverage for Discharges Authorized Under GP-0-15-002**

1. Upon renewal of SPDES General Permit for Stormwater Discharges from *Construction Activity* (Permit No. GP-0-15-002), an *owner or operator* of a *construction activity* with coverage under GP-0-15-002, as of the effective date of GP- 0-20-001, shall be authorized to *discharge* in accordance with GP- 0-20-001, unless otherwise notified by the Department.

An *owner or operator* may continue to implement the technical/design components of the post-construction stormwater management controls provided that such design was done in conformance with the technical standards in place at the time of initial project authorization. However, they must comply with the other, non-design provisions of GP-0-20-001.

#### **F. Change of Owner or Operator**

1. When property ownership changes or when there is a change in operational control over the construction plans and specifications, the original *owner or operator* must notify the new *owner or operator*, in writing, of the requirement to obtain permit coverage by submitting a NOI with the Department. For *construction activities* subject to the requirements of a *regulated, traditional land use control MS4*, the original *owner or operator* must also notify the MS4, in writing, of the change in ownership at least 30 calendar days prior to the change in ownership.
2. Once the new *owner or operator* obtains permit coverage, the original *owner or operator* shall then submit a completed NOT with the name and permit identification number of the new *owner or operator* to the Department at the address in Part II.B.1. of this permit. If the original *owner or operator* maintains ownership of a portion of the *construction activity* and will disturb soil, they must maintain their coverage under the permit.
3. Permit coverage for the new *owner or operator* will be effective as of the date the Department receives a complete NOI, provided the original *owner or*

*operator* was not subject to a sixty (60) business day authorization period that has not expired as of the date the Department receives the NOI from the new *owner or operator*.

### Part III. STORMWATER POLLUTION PREVENTION PLAN (SWPPP)

#### A. General SWPPP Requirements

1. A SWPPP shall be prepared and implemented by the *owner or operator* of each *construction activity* covered by this permit. The SWPPP must document the selection, design, installation, implementation and maintenance of the control measures and practices that will be used to meet the effluent limitations in Part I.B. of this permit and where applicable, the post-construction stormwater management practice requirements in Part I.C. of this permit. The SWPPP shall be prepared prior to the submittal of the NOI. The NOI shall be submitted to the Department prior to the *commencement of construction activity*. A copy of the completed, final NOI shall be included in the SWPPP.
2. The SWPPP shall describe the erosion and sediment control practices and where required, post-construction stormwater management practices that will be used and/or constructed to reduce the *pollutants* in stormwater *discharges* and to assure compliance with the terms and conditions of this permit. In addition, the SWPPP shall identify potential sources of pollution which may reasonably be expected to affect the quality of stormwater *discharges*.
3. All SWPPPs that require the post-construction stormwater management practice component shall be prepared by a *qualified professional* that is knowledgeable in the principles and practices of stormwater management and treatment.
4. The *owner or operator* must keep the SWPPP current so that it at all times accurately documents the erosion and sediment controls practices that are being used or will be used during construction, and all post-construction stormwater management practices that will be constructed on the site. At a minimum, the *owner or operator* shall amend the SWPPP, including construction drawings:
  - a. whenever the current provisions prove to be ineffective in minimizing *pollutants* in stormwater *discharges* from the site;

- b. whenever there is a change in design, construction, or operation at the *construction site* that has or could have an effect on the *discharge* of *pollutants*;
  - c. to address issues or deficiencies identified during an inspection by the *qualified inspector*, the Department or other regulatory authority; and
  - d. to document the final construction conditions.
5. The Department may notify the *owner or operator* at any time that the SWPPP does not meet one or more of the minimum requirements of this permit. The notification shall be in writing and identify the provisions of the SWPPP that require modification. Within fourteen (14) calendar days of such notification, or as otherwise indicated by the Department, the *owner or operator* shall make the required changes to the SWPPP and submit written notification to the Department that the changes have been made. If the *owner or operator* does not respond to the Department's comments in the specified time frame, the Department may suspend the *owner's or operator's* coverage under this permit or require the *owner or operator* to obtain coverage under an individual SPDES permit in accordance with Part II.D.4. of this permit.
6. Prior to the *commencement of construction activity*, the *owner or operator* must identify the contractor(s) and subcontractor(s) that will be responsible for installing, constructing, repairing, replacing, inspecting and maintaining the erosion and sediment control practices included in the SWPPP; and the contractor(s) and subcontractor(s) that will be responsible for constructing the post-construction stormwater management practices included in the SWPPP. The *owner or operator* shall have each of the contractors and subcontractors identify at least one person from their company that will be responsible for implementation of the SWPPP. This person shall be known as the *trained contractor*. The *owner or operator* shall ensure that at least one *trained contractor* is on site on a daily basis when soil disturbance activities are being performed.

The *owner or operator* shall have each of the contractors and subcontractors identified above sign a copy of the following certification statement below before they commence any *construction activity*:

"I hereby certify under penalty of law that I understand and agree to comply with the terms and conditions of the SWPPP and agree to implement any corrective actions identified by the *qualified inspector* during a site inspection. I also understand that the *owner or operator* must comply with

the terms and conditions of the most current version of the New York State Pollutant Discharge Elimination System ("SPDES") general permit for stormwater *discharges* from *construction activities* and that it is unlawful for any person to cause or contribute to a violation of *water quality standards*. Furthermore, I am aware that there are significant penalties for submitting false information, that I do not believe to be true, including the possibility of fine and imprisonment for knowing violations"

In addition to providing the certification statement above, the certification page must also identify the specific elements of the SWPPP that each contractor and subcontractor will be responsible for and include the name and title of the person providing the signature; the name and title of the *trained contractor* responsible for SWPPP implementation; the name, address and telephone number of the contracting firm; the address (or other identifying description) of the site; and the date the certification statement is signed. The *owner or operator* shall attach the certification statement(s) to the copy of the SWPPP that is maintained at the *construction site*. If new or additional contractors are hired to implement measures identified in the SWPPP after construction has commenced, they must also sign the certification statement and provide the information listed above.

7. For projects where the Department requests a copy of the SWPPP or inspection reports, the *owner or operator* shall submit the documents in both electronic (PDF only) and paper format within five (5) business days, unless otherwise notified by the Department.

## **B. Required SWPPP Contents**

1. Erosion and sediment control component - All SWPPPs prepared pursuant to this permit shall include erosion and sediment control practices designed in conformance with the technical standard, New York State Standards and Specifications for Erosion and Sediment Control, dated November 2016. Where erosion and sediment control practices are not designed in conformance with the design criteria included in the technical standard, the *owner or operator* must demonstrate *equivalence* to the technical standard. At a minimum, the erosion and sediment control component of the SWPPP shall include the following:
  - a. Background information about the scope of the project, including the location, type and size of project

- b. A site map/construction drawing(s) for the project, including a general location map. At a minimum, the site map shall show the total site area; all improvements; areas of disturbance; areas that will not be disturbed; existing vegetation; on-site and adjacent off-site surface water(s); floodplain/floodway boundaries; wetlands and drainage patterns that could be affected by the *construction activity*; existing and final contours ; locations of different soil types with boundaries; material, waste, borrow or equipment storage areas located on adjacent properties; and location(s) of the stormwater *discharge(s)*;
- c. A description of the soil(s) present at the site, including an identification of the Hydrologic Soil Group (HSG);
- d. A construction phasing plan and sequence of operations describing the intended order of *construction activities*, including clearing and grubbing, excavation and grading, utility and infrastructure installation and any other activity at the site that results in soil disturbance;
- e. A description of the minimum erosion and sediment control practices to be installed or implemented for each *construction activity* that will result in soil disturbance. Include a schedule that identifies the timing of initial placement or implementation of each erosion and sediment control practice and the minimum time frames that each practice should remain in place or be implemented;
- f. A temporary and permanent soil stabilization plan that meets the requirements of this general permit and the technical standard, New York State Standards and Specifications for Erosion and Sediment Control, dated November 2016, for each stage of the project, including initial land clearing and grubbing to project completion and achievement of *final stabilization*;
- g. A site map/construction drawing(s) showing the specific location(s), size(s), and length(s) of each erosion and sediment control practice;
- h. The dimensions, material specifications, installation details, and operation and maintenance requirements for all erosion and sediment control practices. Include the location and sizing of any temporary sediment basins and structural practices that will be used to divert flows from exposed soils;
- i. A maintenance inspection schedule for the contractor(s) identified in Part III.A.6. of this permit, to ensure continuous and effective operation of the erosion and sediment control practices. The maintenance inspection

schedule shall be in accordance with the requirements in the technical standard, New York State Standards and Specifications for Erosion and Sediment Control, dated November 2016;

- j. A description of the pollution prevention measures that will be used to control litter, construction chemicals and construction debris from becoming a *pollutant* source in the stormwater *discharges*;
  - k. A description and location of any stormwater *discharges* associated with industrial activity other than construction at the site, including, but not limited to, stormwater *discharges* from asphalt plants and concrete plants located on the *construction site*; and
  - l. Identification of any elements of the design that are not in conformance with the design criteria in the technical standard, New York State Standards and Specifications for Erosion and Sediment Control, dated November 2016. Include the reason for the deviation or alternative design and provide information which demonstrates that the deviation or alternative design is *equivalent* to the technical standard.
2. Post-construction stormwater management practice component – The *owner or operator* of any construction project identified in Table 2 of Appendix B as needing post-construction stormwater management practices shall prepare a SWPPP that includes practices designed in conformance with the applicable *sizing criteria* in Part I.C.2.a., c. or d. of this permit and the *performance criteria* in the technical standard, New York State Stormwater Management Design Manual dated January 2015

Where post-construction stormwater management practices are not designed in conformance with the *performance criteria* in the technical standard, the *owner or operator* must include in the SWPPP the reason(s) for the deviation or alternative design and provide information which demonstrates that the deviation or alternative design is *equivalent* to the technical standard.

The post-construction stormwater management practice component of the SWPPP shall include the following:

- a. Identification of all post-construction stormwater management practices to be constructed as part of the project. Include the dimensions, material specifications and installation details for each post-construction stormwater management practice;

- b. A site map/construction drawing(s) showing the specific location and size of each post-construction stormwater management practice;
- c. A Stormwater Modeling and Analysis Report that includes:
  - (i) Map(s) showing pre-development conditions, including watershed/subcatchments boundaries, flow paths/routing, and design points;
  - (ii) Map(s) showing post-development conditions, including watershed/subcatchments boundaries, flow paths/routing, design points and post-construction stormwater management practices;
  - (iii) Results of stormwater modeling (i.e. hydrology and hydraulic analysis) for the required storm events. Include supporting calculations (model runs), methodology, and a summary table that compares pre and post-development runoff rates and volumes for the different storm events;
  - (iv) Summary table, with supporting calculations, which demonstrates that each post-construction stormwater management practice has been designed in conformance with the *sizing criteria* included in the Design Manual;
  - (v) Identification of any *sizing criteria* that is not required based on the requirements included in Part I.C. of this permit; and
  - (vi) Identification of any elements of the design that are not in conformance with the *performance criteria* in the Design Manual. Include the reason(s) for the deviation or alternative design and provide information which demonstrates that the deviation or alternative design is *equivalent* to the Design Manual;
- d. Soil testing results and locations (test pits, borings);
- e. Infiltration test results, when required; and
- f. An operations and maintenance plan that includes inspection and maintenance schedules and actions to ensure continuous and effective operation of each post-construction stormwater management practice. The plan shall identify the entity that will be responsible for the long term operation and maintenance of each practice.

3. Enhanced Phosphorus Removal Standards - All construction projects identified in Table 2 of Appendix B that are located in the watersheds identified in Appendix C shall prepare a SWPPP that includes post-construction stormwater management practices designed in conformance with the applicable *sizing criteria* in Part I.C.2. b., c. or d. of this permit and the *performance criteria*, Enhanced Phosphorus Removal Standards included in the Design Manual. At a minimum, the post-construction stormwater management practice component of the SWPPP shall include items 2.a - 2.f. above.

### **C. Required SWPPP Components by Project Type**

Unless otherwise notified by the Department, *owners or operators of construction activities* identified in Table 1 of Appendix B are required to prepare a SWPPP that only includes erosion and sediment control practices designed in conformance with Part III.B.1 of this permit. *Owners or operators of the construction activities* identified in Table 2 of Appendix B shall prepare a SWPPP that also includes post-construction stormwater management practices designed in conformance with Part III.B.2 or 3 of this permit.

## **Part IV. INSPECTION AND MAINTENANCE REQUIREMENTS**

### **A. General Construction Site Inspection and Maintenance Requirements**

1. The *owner or operator* must ensure that all erosion and sediment control practices (including pollution prevention measures) and all post-construction stormwater management practices identified in the SWPPP are inspected and maintained in accordance with Part IV.B. and C. of this permit.
2. The terms of this permit shall not be construed to prohibit the State of New York from exercising any authority pursuant to the ECL, common law or federal law, or prohibit New York State from taking any measures, whether civil or criminal, to prevent violations of the laws of the State of New York or protect the public health and safety and/or the environment.

### **B. Contractor Maintenance Inspection Requirements**

1. The *owner or operator* of each *construction activity* identified in Tables 1 and 2 of Appendix B shall have a *trained contractor* inspect the erosion and sediment control practices and pollution prevention measures being implemented within the active work area daily to ensure that they are being maintained in effective operating condition at all times. If deficiencies are identified, the contractor shall

begin implementing corrective actions within one business day and shall complete the corrective actions in a reasonable time frame.

2. For construction sites where soil disturbance activities have been temporarily suspended (e.g. winter shutdown) and *temporary stabilization* measures have been applied to all disturbed areas, the *trained contractor* can stop conducting the maintenance inspections. The *trained contractor* shall begin conducting the maintenance inspections in accordance with Part IV.B.1. of this permit as soon as soil disturbance activities resume.
3. For construction sites where soil disturbance activities have been shut down with partial project completion, the *trained contractor* can stop conducting the maintenance inspections if all areas disturbed as of the project shutdown date have achieved *final stabilization* and all post-construction stormwater management practices required for the completed portion of the project have been constructed in conformance with the SWPPP and are operational.

### C. Qualified Inspector Inspection Requirements

The *owner or operator* shall have a *qualified inspector* conduct site inspections in conformance with the following requirements:

[Note: The *trained contractor* identified in Part III.A.6. and IV.B. of this permit **cannot** conduct the *qualified inspector* site inspections unless they meet the *qualified inspector* qualifications included in Appendix A. In order to perform these inspections, the *trained contractor* would have to be a:

- licensed Professional Engineer,
  - Certified Professional in Erosion and Sediment Control (CPESC),
  - New York State Erosion and Sediment Control Certificate Program holder
  - Registered Landscape Architect, or
  - someone working under the direct supervision of, and at the same company as, the licensed Professional Engineer or Registered Landscape Architect, provided they have received four (4) hours of Department endorsed training in proper erosion and sediment control principles from a Soil and Water Conservation District, or other Department endorsed entity].
1. A *qualified inspector* shall conduct site inspections for all *construction activities* identified in Tables 1 and 2 of Appendix B, with the exception of:
    - a. the construction of a single family residential subdivision with 25% or less *impervious cover* at total site build-out that involves a soil disturbance of one (1) or more acres of land but less than five (5) acres and is not located

in one of the watersheds listed in Appendix C and not directly discharging to one of the 303(d) segments listed in Appendix E;

- b. the construction of a single family home that involves a soil disturbance of one (1) or more acres of land but less than five (5) acres and is not located in one of the watersheds listed in Appendix C and not directly discharging to one of the 303(d) segments listed in Appendix E;
  - c. construction on agricultural property that involves a soil disturbance of one (1) or more acres of land but less than five (5) acres; and
  - d. *construction activities* located in the watersheds identified in Appendix D that involve soil disturbances between five thousand (5,000) square feet and one (1) acre of land.
2. Unless otherwise notified by the Department, the *qualified inspector* shall conduct site inspections in accordance with the following timetable:
- a. For construction sites where soil disturbance activities are on-going, the *qualified inspector* shall conduct a site inspection at least once every seven (7) calendar days.
  - b. For construction sites where soil disturbance activities are on-going and the *owner or operator* has received authorization in accordance with Part II.D.3 to disturb greater than five (5) acres of soil at any one time, the *qualified inspector* shall conduct at least two (2) site inspections every seven (7) calendar days. The two (2) inspections shall be separated by a minimum of two (2) full calendar days.
  - c. For construction sites where soil disturbance activities have been temporarily suspended (e.g. winter shutdown) and *temporary stabilization* measures have been applied to all disturbed areas, the *qualified inspector* shall conduct a site inspection at least once every thirty (30) calendar days. The *owner or operator* shall notify the DOW Water (SPDES) Program contact at the Regional Office (see contact information in Appendix F) or, in areas under the jurisdiction of a *regulated, traditional land use control MS4*, the *regulated, traditional land use control MS4* (provided the *regulated, traditional land use control MS4* is not the *owner or operator* of the *construction activity*) in writing prior to reducing the frequency of inspections.

- d. For construction sites where soil disturbance activities have been shut down with partial project completion, the *qualified inspector* can stop conducting inspections if all areas disturbed as of the project shutdown date have achieved *final stabilization* and all post-construction stormwater management practices required for the completed portion of the project have been constructed in conformance with the SWPPP and are operational. The *owner or operator* shall notify the DOW Water (SPDES) Program contact at the Regional Office (see contact information in Appendix F) or, in areas under the jurisdiction of a *regulated, traditional land use control MS4*, the *regulated, traditional land use control MS4* (provided the *regulated, traditional land use control MS4* is not the *owner or operator* of the *construction activity*) in writing prior to the shutdown. If soil disturbance activities are not resumed within 2 years from the date of shutdown, the *owner or operator* shall have the *qualified inspector* perform a final inspection and certify that all disturbed areas have achieved *final stabilization*, and all temporary, structural erosion and sediment control measures have been removed; and that all post-construction stormwater management practices have been constructed in conformance with the SWPPP by signing the “*Final Stabilization*” and “*Post-Construction Stormwater Management Practice*” certification statements on the NOT. The *owner or operator* shall then submit the completed NOT form to the address in Part II.B.1 of this permit.
  - e. For construction sites that directly *discharge* to one of the 303(d) segments listed in Appendix E or is located in one of the watersheds listed in Appendix C, the *qualified inspector* shall conduct at least two (2) site inspections every seven (7) calendar days. The two (2) inspections shall be separated by a minimum of two (2) full calendar days.
3. At a minimum, the *qualified inspector* shall inspect all erosion and sediment control practices and pollution prevention measures to ensure integrity and effectiveness, all post-construction stormwater management practices under construction to ensure that they are constructed in conformance with the SWPPP, all areas of disturbance that have not achieved *final stabilization*, all points of *discharge* to natural surface waterbodies located within, or immediately adjacent to, the property boundaries of the *construction site*, and all points of *discharge* from the *construction site*.
  4. The *qualified inspector* shall prepare an inspection report subsequent to each and every inspection. At a minimum, the inspection report shall include and/or address the following:

- a. Date and time of inspection;
- b. Name and title of person(s) performing inspection;
- c. A description of the weather and soil conditions (e.g. dry, wet, saturated) at the time of the inspection;
- d. A description of the condition of the runoff at all points of *discharge* from the *construction site*. This shall include identification of any *discharges* of sediment from the *construction site*. Include *discharges* from conveyance systems (i.e. pipes, culverts, ditches, etc.) and overland flow;
- e. A description of the condition of all natural surface waterbodies located within, or immediately adjacent to, the property boundaries of the *construction site* which receive runoff from disturbed areas. This shall include identification of any *discharges* of sediment to the surface waterbody;
- f. Identification of all erosion and sediment control practices and pollution prevention measures that need repair or maintenance;
- g. Identification of all erosion and sediment control practices and pollution prevention measures that were not installed properly or are not functioning as designed and need to be reinstalled or replaced;
- h. Description and sketch of areas with active soil disturbance activity, areas that have been disturbed but are inactive at the time of the inspection, and areas that have been stabilized (temporary and/or final) since the last inspection;
- i. Current phase of construction of all post-construction stormwater management practices and identification of all construction that is not in conformance with the SWPPP and technical standards;
- j. Corrective action(s) that must be taken to install, repair, replace or maintain erosion and sediment control practices and pollution prevention measures; and to correct deficiencies identified with the construction of the post-construction stormwater management practice(s);
- k. Identification and status of all corrective actions that were required by previous inspection; and

- I. Digital photographs, with date stamp, that clearly show the condition of all practices that have been identified as needing corrective actions. The *qualified inspector* shall attach paper color copies of the digital photographs to the inspection report being maintained onsite within seven (7) calendar days of the date of the inspection. The *qualified inspector* shall also take digital photographs, with date stamp, that clearly show the condition of the practice(s) after the corrective action has been completed. The *qualified inspector* shall attach paper color copies of the digital photographs to the inspection report that documents the completion of the corrective action work within seven (7) calendar days of that inspection.
5. Within one business day of the completion of an inspection, the *qualified inspector* shall notify the *owner or operator* and appropriate contractor or subcontractor identified in Part III.A.6. of this permit of any corrective actions that need to be taken. The contractor or subcontractor shall begin implementing the corrective actions within one business day of this notification and shall complete the corrective actions in a reasonable time frame.
6. All inspection reports shall be signed by the *qualified inspector*. Pursuant to Part II.D.2. of this permit, the inspection reports shall be maintained on site with the SWPPP.

## Part V. TERMINATION OF PERMIT COVERAGE

### A. Termination of Permit Coverage

1. An *owner or operator* that is eligible to terminate coverage under this permit must submit a completed NOT form to the address in Part II.B.1 of this permit. The NOT form shall be one which is associated with this permit, signed in accordance with Part VII.H of this permit.
2. An *owner or operator* may terminate coverage when one or more the following conditions have been met:
  - a. Total project completion - All *construction activity* identified in the SWPPP has been completed; and all areas of disturbance have achieved *final stabilization*; and all temporary, structural erosion and sediment control measures have been removed; and all post-construction stormwater management practices have been constructed in conformance with the SWPPP and are operational;

- b. Planned shutdown with partial project completion - All soil disturbance activities have ceased; and all areas disturbed as of the project shutdown date have achieved *final stabilization*; and all temporary, structural erosion and sediment control measures have been removed; and all post-construction stormwater management practices required for the completed portion of the project have been constructed in conformance with the SWPPP and are operational;
      - c. A new *owner or operator* has obtained coverage under this permit in accordance with Part II.F. of this permit.
      - d. The *owner or operator* obtains coverage under an alternative SPDES general permit or an individual SPDES permit.
3. For *construction activities* meeting subdivision 2a. or 2b. of this Part, the *owner or operator* shall have the *qualified inspector* perform a final site inspection prior to submitting the NOT. The *qualified inspector* shall, by signing the “*Final Stabilization*” and “*Post-Construction Stormwater Management Practice certification statements*” on the NOT, certify that all the requirements in Part V.A.2.a. or b. of this permit have been achieved.
4. For *construction activities* that are subject to the requirements of a *regulated, traditional land use control MS4* and meet subdivision 2a. or 2b. of this Part, the *owner or operator* shall have the *regulated, traditional land use control MS4* sign the “*MS4 Acceptance*” statement on the NOT in accordance with the requirements in Part VII.H. of this permit. The *regulated, traditional land use control MS4* official, by signing this statement, has determined that it is acceptable for the *owner or operator* to submit the NOT in accordance with the requirements of this Part. The *regulated, traditional land use control MS4* can make this determination by performing a final site inspection themselves or by accepting the *qualified inspector’s* final site inspection certification(s) required in Part V.A.3. of this permit.
5. For *construction activities* that require post-construction stormwater management practices and meet subdivision 2a. of this Part, the *owner or operator* must, prior to submitting the NOT, ensure one of the following:
  - a. the post-construction stormwater management practice(s) and any right-of-way(s) needed to maintain such practice(s) have been deeded to the municipality in which the practice(s) is located,

- b. an executed maintenance agreement is in place with the municipality that will maintain the post-construction stormwater management practice(s),
- c. for post-construction stormwater management practices that are privately owned, the *owner or operator* has a mechanism in place that requires operation and maintenance of the practice(s) in accordance with the operation and maintenance plan, such as a deed covenant in the *owner or operator's* deed of record,
- d. for post-construction stormwater management practices that are owned by a public or private institution (e.g. school, university, hospital), government agency or authority, or public utility; the *owner or operator* has policy and procedures in place that ensures operation and maintenance of the practices in accordance with the operation and maintenance plan.

## **Part VI. REPORTING AND RETENTION RECORDS**

### **A. Record Retention**

The *owner or operator* shall retain a copy of the NOI, NOI Acknowledgment Letter, SWPPP, MS4 SWPPP Acceptance form and any inspection reports that were prepared in conjunction with this permit for a period of at least five (5) years from the date that the Department receives a complete NOT submitted in accordance with Part V. of this general permit.

### **B. Addresses**

With the exception of the NOI, NOT, and MS4 SWPPP Acceptance form (which must be submitted to the address referenced in Part II.B.1 of this permit), all written correspondence requested by the Department, including individual permit applications, shall be sent to the address of the appropriate DOW Water (SPDES) Program contact at the Regional Office listed in Appendix F.

## **Part VII. STANDARD PERMIT CONDITIONS**

### **A. Duty to Comply**

The *owner or operator* must comply with all conditions of this permit. All contractors and subcontractors associated with the project must comply with the terms of the SWPPP. Any non-compliance with this permit constitutes a violation of the Clean Water

Act (CWA) and the ECL and is grounds for an enforcement action against the *owner or operator* and/or the contractor/subcontractor; permit revocation, suspension or modification; or denial of a permit renewal application. Upon a finding of significant non-compliance with this permit or the applicable SWPPP, the Department may order an immediate stop to all *construction activity* at the site until the non-compliance is remedied. The stop work order shall be in writing, shall describe the non-compliance in detail, and shall be sent to the *owner or operator*.

If any human remains or archaeological remains are encountered during excavation, the *owner or operator* must immediately cease, or cause to cease, all *construction activity* in the area of the remains and notify the appropriate Regional Water Engineer (RWE). *Construction activity* shall not resume until written permission to do so has been received from the RWE.

#### **B. Continuation of the Expired General Permit**

This permit expires five (5) years from the effective date. If a new general permit is not issued prior to the expiration of this general permit, an *owner or operator* with coverage under this permit may continue to operate and *discharge* in accordance with the terms and conditions of this general permit, if it is extended pursuant to the State Administrative Procedure Act and 6 NYCRR Part 621, until a new general permit is issued.

#### **C. Enforcement**

Failure of the *owner or operator*, its contractors, subcontractors, agents and/or assigns to strictly adhere to any of the permit requirements contained herein shall constitute a violation of this permit. There are substantial criminal, civil, and administrative penalties associated with violating the provisions of this permit. Fines of up to \$37,500 per day for each violation and imprisonment for up to fifteen (15) years may be assessed depending upon the nature and degree of the offense.

#### **D. Need to Halt or Reduce Activity Not a Defense**

It shall not be a defense for an *owner or operator* in an enforcement action that it would have been necessary to halt or reduce the *construction activity* in order to maintain compliance with the conditions of this permit.

### **E. Duty to Mitigate**

The *owner or operator* and its contractors and subcontractors shall take all reasonable steps to *minimize* or prevent any *discharge* in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

### **F. Duty to Provide Information**

The *owner or operator* shall furnish to the Department, within a reasonable specified time period of a written request, all documentation necessary to demonstrate eligibility and any information to determine compliance with this permit or to determine whether cause exists for modifying or revoking this permit, or suspending or denying coverage under this permit, in accordance with the terms and conditions of this permit. The NOI, SWPPP and inspection reports required by this permit are public documents that the *owner or operator* must make available for review and copying by any person within five (5) business days of the *owner or operator* receiving a written request by any such person to review these documents. Copying of documents will be done at the requester's expense.

### **G. Other Information**

When the *owner or operator* becomes aware that they failed to submit any relevant facts, or submitted incorrect information in the NOI or in any of the documents required by this permit, or have made substantive revisions to the SWPPP (e.g. the scope of the project changes significantly, the type of post-construction stormwater management practice(s) changes, there is a reduction in the sizing of the post-construction stormwater management practice, or there is an increase in the disturbance area or *impervious area*), which were not reflected in the original NOI submitted to the Department, they shall promptly submit such facts or information to the Department using the contact information in Part II.A. of this permit. Failure of the *owner or operator* to correct or supplement any relevant facts within five (5) business days of becoming aware of the deficiency shall constitute a violation of this permit.

### **H. Signatory Requirements**

1. All NOIs and NOTs shall be signed as follows:
  - a. For a corporation these forms shall be signed by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means:

- (i) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation; or
    - (ii) the manager of one or more manufacturing, production or operating facilities, provided the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;
  - b. For a partnership or sole proprietorship these forms shall be signed by a general partner or the proprietor, respectively; or
  - c. For a municipality, State, Federal, or other public agency these forms shall be signed by either a principal executive officer or ranking elected official. For purposes of this section, a principal executive officer of a Federal agency includes:
    - (i) the chief executive officer of the agency, or
    - (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of EPA).
2. The SWPPP and other information requested by the Department shall be signed by a person described in Part VII.H.1. of this permit or by a duly authorized representative of that person. A person is a duly authorized representative only if:
- a. The authorization is made in writing by a person described in Part VII.H.1. of this permit;
  - b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of plant manager, operator of a well or a well field,

superintendent, position of *equivalent* responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position) and,

- c. The written authorization shall include the name, title and signature of the authorized representative and be attached to the SWPPP.
3. All inspection reports shall be signed by the *qualified inspector* that performs the inspection.
4. The MS4 SWPPP Acceptance form shall be signed by the principal executive officer or ranking elected official from the *regulated, traditional land use control MS4*, or by a duly authorized representative of that person.

It shall constitute a permit violation if an incorrect and/or improper signatory authorizes any required forms, SWPPP and/or inspection reports.

## **I. Property Rights**

The issuance of this permit does not convey any property rights of any sort, nor any exclusive privileges, nor does it authorize any injury to private property nor any invasion of personal rights, nor any infringement of Federal, State or local laws or regulations. *Owners or operators* must obtain any applicable conveyances, easements, licenses and/or access to real property prior to *commencing construction activity*.

## **J. Severability**

The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

## **K. Requirement to Obtain Coverage Under an Alternative Permit**

1. The Department may require any owner or operator authorized by this permit to apply for and/or obtain either an individual SPDES permit or another SPDES general permit. When the Department requires any discharger authorized by a general permit to apply for an individual SPDES permit, it shall notify the discharger in writing that a permit application is required. This notice shall

include a brief statement of the reasons for this decision, an application form, a statement setting a time frame for the owner or operator to file the application for an individual SPDES permit, and a deadline, not sooner than 180 days from owner or operator receipt of the notification letter, whereby the authorization to discharge under this general permit shall be terminated. Applications must be submitted to the appropriate Permit Administrator at the Regional Office. The Department may grant additional time upon demonstration, to the satisfaction of the Department, that additional time to apply for an alternative authorization is necessary or where the Department has not provided a permit determination in accordance with Part 621 of this Title.

2. When an individual SPDES permit is issued to a discharger authorized to *discharge* under a general SPDES permit for the same *discharge(s)*, the general permit authorization for outfalls authorized under the individual SPDES permit is automatically terminated on the effective date of the individual permit unless termination is earlier in accordance with 6 NYCRR Part 750.

#### **L. Proper Operation and Maintenance**

The *owner or operator* shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the *owner or operator* to achieve compliance with the conditions of this permit and with the requirements of the SWPPP.

#### **M. Inspection and Entry**

The *owner or operator* shall allow an authorized representative of the Department, EPA, applicable county health department, or, in the case of a *construction site* which *discharges* through an *MS4*, an authorized representative of the *MS4* receiving the discharge, upon the presentation of credentials and other documents as may be required by law, to:

1. Enter upon the owner's or operator's premises where a regulated facility or activity is located or conducted or where records must be kept under the conditions of this permit;
2. Have access to and copy at reasonable times, any records that must be kept under the conditions of this permit; and

3. Inspect at reasonable times any facilities or equipment (including monitoring and control equipment), practices or operations regulated or required by this permit.
4. Sample or monitor at reasonable times, for purposes of assuring permit compliance or as otherwise authorized by the Act or ECL, any substances or parameters at any location.

#### **N. Permit Actions**

This permit may, at any time, be modified, suspended, revoked, or renewed by the Department in accordance with 6 NYCRR Part 621. The filing of a request by the *owner or operator* for a permit modification, revocation and reissuance, termination, a notification of planned changes or anticipated noncompliance does not limit, diminish and/or stay compliance with any terms of this permit.

#### **O. Definitions**

Definitions of key terms are included in Appendix A of this permit.

#### **P. Re-Opener Clause**

1. If there is evidence indicating potential or realized impacts on water quality due to any stormwater discharge associated with construction activity covered by this permit, the owner or operator of such discharge may be required to obtain an individual permit or alternative general permit in accordance with Part VII.K. of this permit or the permit may be modified to include different limitations and/or requirements.
2. Any Department initiated permit modification, suspension or revocation will be conducted in accordance with 6 NYCRR Part 621, 6 NYCRR 750-1.18, and 6 NYCRR 750-1.20.

#### **Q. Penalties for Falsification of Forms and Reports**

In accordance with 6NYCRR Part 750-2.4 and 750-2.5, any person who knowingly makes any false material statement, representation, or certification in any application, record, report or other document filed or required to be maintained under this permit, including reports of compliance or noncompliance shall, upon conviction, be punished in accordance with ECL §71-1933 and or Articles 175 and 210 of the New York State Penal Law.

**R. Other Permits**

Nothing in this permit relieves the *owner or operator* from a requirement to obtain any other permits required by law.

## **APPENDIX A – Acronyms and Definitions**

### **Acronyms**

APO – Agency Preservation Officer

BMP – Best Management Practice

CPESC – Certified Professional in Erosion and Sediment Control

Cpv – Channel Protection Volume

CWA – Clean Water Act (or the Federal Water Pollution Control Act, 33 U.S.C. §1251 et seq)

DOW – Division of Water

EAF – Environmental Assessment Form

ECL - Environmental Conservation Law

EPA – U. S. Environmental Protection Agency

HSG – Hydrologic Soil Group

MS4 – Municipal Separate Storm Sewer System

NOI – Notice of Intent

NOT – Notice of Termination

NPDES – National Pollutant Discharge Elimination System

OPRHP – Office of Parks, Recreation and Historic Places

Qf – Extreme Flood

Qp – Overbank Flood

RRv – Runoff Reduction Volume

RWE – Regional Water Engineer

SEQR – State Environmental Quality Review

SEQRA - State Environmental Quality Review Act

SHPA – State Historic Preservation Act

SPDES – State Pollutant Discharge Elimination System

SWPPP – Stormwater Pollution Prevention Plan

TMDL – Total Maximum Daily Load

UPA – Uniform Procedures Act

USDA – United States Department of Agriculture

WQv – Water Quality Volume

## Definitions

All definitions in this section are solely for the purposes of this permit.

**Agricultural Building** – a structure designed and constructed to house farm implements, hay, grain, poultry, livestock or other horticultural products; excluding any structure designed, constructed or used, in whole or in part, for human habitation, as a place of employment where agricultural products are processed, treated or packaged, or as a place used by the public.

**Agricultural Property** – means the land for construction of a barn, *agricultural building*, silo, stockyard, pen or other structural practices identified in Table II in the “Agricultural Management Practices Catalog for Nonpoint Source Pollution in New York State” prepared by the Department in cooperation with agencies of New York Nonpoint Source Coordinating Committee (dated June 2007).

**Alter Hydrology from Pre to Post-Development Conditions** - means the post-development peak flow rate(s) has increased by more than 5% of the pre-developed condition for the design storm of interest (e.g. 10 yr and 100 yr).

**Combined Sewer** - means a sewer that is designed to collect and convey both “sewage” and “stormwater”.

**Commence (Commencement of) Construction Activities** - means the initial disturbance of soils associated with clearing, grading or excavation activities; or other construction related activities that disturb or expose soils such as demolition, stockpiling of fill material, and the initial installation of erosion and sediment control practices required in the SWPPP. See definition for “*Construction Activity(ies)*” also.

**Construction Activity(ies)** - means any clearing, grading, excavation, filling, demolition or stockpiling activities that result in soil disturbance. Clearing activities can include, but are not limited to, logging equipment operation, the cutting and skidding of trees, stump removal and/or brush root removal. Construction activity does not include routine maintenance that is performed to maintain the original line and grade, hydraulic capacity, or original purpose of a facility.

**Construction Site** – means the land area where *construction activity(ies)* will occur. See definition for “*Commence (Commencement of) Construction Activities*” and “*Larger Common Plan of Development or Sale*” also.

**Dewatering** – means the act of draining rainwater and/or groundwater from building foundations, vaults or excavations/trenches.

**Direct Discharge (to a specific surface waterbody)** - means that runoff flows from a *construction site* by overland flow and the first point of discharge is the specific surface waterbody, or runoff flows from a *construction site* to a separate storm sewer system

and the first point of discharge from the separate storm sewer system is the specific surface waterbody.

**Discharge(s)** - means any addition of any pollutant to waters of the State through an outlet or *point source*.

**Embankment** – means an earthen or rock slope that supports a road/highway.

**Endangered or Threatened Species** – see 6 NYCRR Part 182 of the Department’s rules and regulations for definition of terms and requirements.

**Environmental Conservation Law (ECL)** - means chapter 43-B of the Consolidated Laws of the State of New York, entitled the Environmental Conservation Law.

**Equivalent (Equivalence)** – means that the practice or measure meets all the performance, longevity, maintenance, and safety objectives of the technical standard and will provide an equal or greater degree of water quality protection.

**Final Stabilization** - means that all soil disturbance activities have ceased and a uniform, perennial vegetative cover with a density of eighty (80) percent over the entire pervious surface has been established; or other equivalent stabilization measures, such as permanent landscape mulches, rock rip-rap or washed/crushed stone have been applied on all disturbed areas that are not covered by permanent structures, concrete or pavement.

**General SPDES permit** - means a SPDES permit issued pursuant to 6 NYCRR Part 750-1.21 and Section 70-0117 of the ECL authorizing a category of discharges.

**Groundwater(s)** - means waters in the saturated zone. The saturated zone is a subsurface zone in which all the interstices are filled with water under pressure greater than that of the atmosphere. Although the zone may contain gas-filled interstices or interstices filled with fluids other than water, it is still considered saturated.

**Historic Property** – means any building, structure, site, object or district that is listed on the State or National Registers of Historic Places or is determined to be eligible for listing on the State or National Registers of Historic Places.

**Impervious Area (Cover)** - means all impermeable surfaces that cannot effectively infiltrate rainfall. This includes paved, concrete and gravel surfaces (i.e. parking lots, driveways, roads, runways and sidewalks); building rooftops and miscellaneous impermeable structures such as patios, pools, and sheds.

**Infeasible** – means not technologically possible, or not economically practicable and achievable in light of best industry practices.

**Larger Common Plan of Development or Sale** - means a contiguous area where multiple separate and distinct *construction activities* are occurring, or will occur, under one plan. The term “plan” in “larger common plan of development or sale” is broadly defined as any announcement or piece of documentation (including a sign, public notice or hearing, marketing plan, advertisement, drawing, permit application, State Environmental Quality Review Act (SEQRA) environmental assessment form or other documents, zoning request, computer design, etc.) or physical demarcation (including boundary signs, lot stakes, surveyor markings, etc.) indicating that *construction activities* may occur on a specific plot.

For discrete construction projects that are located within a larger common plan of development or sale that are at least 1/4 mile apart, each project can be treated as a separate plan of development or sale provided any interconnecting road, pipeline or utility project that is part of the same “common plan” is not concurrently being disturbed.

**Minimize** – means reduce and/or eliminate to the extent achievable using control measures (including best management practices) that are technologically available and economically practicable and achievable in light of best industry practices.

**Municipal Separate Storm Sewer (MS4)** - a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains):

- (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, stormwater, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to surface waters of the State;
- (ii) Designed or used for collecting or conveying stormwater;
- (iii) Which is not a *combined sewer*, and
- (iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

**National Pollutant Discharge Elimination System (NPDES)** - means the national system for the issuance of wastewater and stormwater permits under the Federal Water Pollution Control Act (Clean Water Act).

**Natural Buffer** –means an undisturbed area with natural cover running along a surface water (e.g. wetland, stream, river, lake, etc.).

**New Development** – means any land disturbance that does not meet the definition of Redevelopment Activity included in this appendix.

**New York State Erosion and Sediment Control Certificate Program** – a certificate program that establishes and maintains a process to identify and recognize individuals who are capable of developing, designing, inspecting and maintaining erosion and sediment control plans on projects that disturb soils in New York State. The certificate program is administered by the New York State Conservation District Employees Association.

**NOI Acknowledgment Letter** - means the letter that the Department sends to an owner or operator to acknowledge the Department's receipt and acceptance of a complete Notice of Intent. This letter documents the owner's or operator's authorization to discharge in accordance with the general permit for stormwater discharges from *construction activity*.

**Nonpoint Source** - means any source of water pollution or pollutants which is not a discrete conveyance or *point source* permitted pursuant to Title 7 or 8 of Article 17 of the Environmental Conservation Law (see ECL Section 17-1403).

**Overbank** –means flow events that exceed the capacity of the stream channel and spill out into the adjacent floodplain.

**Owner or Operator** - means the person, persons or legal entity which owns or leases the property on which the *construction activity* is occurring; an entity that has operational control over the construction plans and specifications, including the ability to make modifications to the plans and specifications; and/or an entity that has day-to-day operational control of those activities at a project that are necessary to ensure compliance with the permit conditions.

**Performance Criteria** – means the design criteria listed under the “Required Elements” sections in Chapters 5, 6 and 10 of the technical standard, New York State Stormwater Management Design Manual, dated January 2015. It does not include the Sizing Criteria (i.e. WQv, RRv, Cpv, Qp and Qf ) in Part I.C.2. of the permit.

**Point Source** - means any discernible, confined and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, vessel or other floating craft, or landfill leachate collection system from which *pollutants* are or may be discharged.

**Pollutant** - means dredged spoil, filter backwash, solid waste, incinerator residue, sewage, garbage, sewage sludge, munitions, chemical wastes, biological materials, radioactive materials, heat, wrecked or discarded equipment, rock, sand and industrial, municipal, agricultural waste and ballast discharged into water; which may cause or might reasonably be expected to cause pollution of the waters of the state in contravention of the standards or guidance values adopted as provided in 6 NYCRR Parts 700 et seq .

**Qualified Inspector** - means a person that is knowledgeable in the principles and practices of erosion and sediment control, such as a licensed Professional Engineer, Certified Professional in Erosion and Sediment Control (CPESC), Registered Landscape Architect, New York State Erosion and Sediment Control Certificate Program holder or other Department endorsed individual(s).

It can also mean someone working under the direct supervision of, and at the same company as, the licensed Professional Engineer or Registered Landscape Architect, provided that person has training in the principles and practices of erosion and sediment control. Training in the principles and practices of erosion and sediment control means that the individual working under the direct supervision of the licensed Professional Engineer or Registered Landscape Architect has received four (4) hours of Department endorsed training in proper erosion and sediment control principles from a Soil and Water Conservation District, or other Department endorsed entity. After receiving the initial training, the individual working under the direct supervision of the licensed Professional Engineer or Registered Landscape Architect shall receive four (4) hours of training every three (3) years.

It can also mean a person that meets the *Qualified Professional* qualifications in addition to the *Qualified Inspector* qualifications.

Note: Inspections of any post-construction stormwater management practices that include structural components, such as a dam for an impoundment, shall be performed by a licensed Professional Engineer.

**Qualified Professional** - means a person that is knowledgeable in the principles and practices of stormwater management and treatment, such as a licensed Professional Engineer, Registered Landscape Architect or other Department endorsed individual(s). Individuals preparing SWPPPs that require the post-construction stormwater management practice component must have an understanding of the principles of hydrology, water quality management practice design, water quantity control design, and, in many cases, the principles of hydraulics. All components of the SWPPP that involve the practice of engineering, as defined by the NYS Education Law (see Article 145), shall be prepared by, or under the direct supervision of, a professional engineer licensed to practice in the State of New York.

**Redevelopment Activity(ies)** – means the disturbance and reconstruction of existing impervious area, including impervious areas that were removed from a project site within five (5) years of preliminary project plan submission to the local government (i.e. site plan, subdivision, etc.).

**Regulated, Traditional Land Use Control MS4** - means a city, town or village with land use control authority that is authorized to discharge under New York State DEC's

SPDES General Permit For Stormwater Discharges from Municipal Separate Stormwater Sewer Systems (MS4s) or the City of New York's Individual SPDES Permit for their Municipal Separate Storm Sewer Systems (NY-0287890).

**Routine Maintenance Activity** - means *construction activity* that is performed to maintain the original line and grade, hydraulic capacity, or original purpose of a facility, including, but not limited to:

- Re-grading of gravel roads or parking lots,
- Cleaning and shaping of existing roadside ditches and culverts that maintains the approximate original line and grade, and hydraulic capacity of the ditch,
- Cleaning and shaping of existing roadside ditches that does not maintain the approximate original grade, hydraulic capacity and purpose of the ditch if the changes to the line and grade, hydraulic capacity or purpose of the ditch are installed to improve water quality and quantity controls (e.g. installing grass lined ditch),
- Placement of aggregate shoulder backing that stabilizes the transition between the road shoulder and the ditch or *embankment*,
- Full depth milling and filling of existing asphalt pavements, replacement of concrete pavement slabs, and similar work that does not expose soil or disturb the bottom six (6) inches of subbase material,
- Long-term use of equipment storage areas at or near highway maintenance facilities,
- Removal of sediment from the edge of the highway to restore a previously existing sheet-flow drainage connection from the highway surface to the highway ditch or *embankment*,
- Existing use of Canal Corp owned upland disposal sites for the canal, and
- Replacement of curbs, gutters, sidewalks and guide rail posts.

**Site limitations** – means site conditions that prevent the use of an infiltration technique and or infiltration of the total WQv. Typical site limitations include: seasonal high groundwater, shallow depth to bedrock, and soils with an infiltration rate less than 0.5 inches/hour. The existence of site limitations shall be confirmed and documented using actual field testing (i.e. test pits, soil borings, and infiltration test) or using information from the most current United States Department of Agriculture (USDA) Soil Survey for the County where the project is located.

**Sizing Criteria** – means the criteria included in Part I.C.2 of the permit that are used to size post-construction stormwater management control practices. The criteria include; Water Quality Volume (WQv), Runoff Reduction Volume (RRv), Channel Protection Volume (Cpv), *Overbank Flood* (Qp), and *Extreme Flood* (Qf).

**State Pollutant Discharge Elimination System (SPDES)** - means the system established pursuant to Article 17 of the ECL and 6 NYCRR Part 750 for issuance of permits authorizing discharges to the waters of the state.

**Steep Slope** – means land area designated on the current United States Department of Agriculture (“USDA”) Soil Survey as Soil Slope Phase “D”, (provided the map unit name is inclusive of slopes greater than 25%) , or Soil Slope Phase E or F, (regardless of the map unit name), or a combination of the three designations.

**Streambank** – as used in this permit, means the terrain alongside the bed of a creek or stream. The bank consists of the sides of the channel, between which the flow is confined.

**Stormwater Pollution Prevention Plan (SWPPP)** – means a project specific report, including construction drawings, that among other things: describes the construction activity(ies), identifies the potential sources of pollution at the *construction site*; describes and shows the stormwater controls that will be used to control the pollutants (i.e. erosion and sediment controls; for many projects, includes post-construction stormwater management controls); and identifies procedures the *owner or operator* will implement to comply with the terms and conditions of the permit. See Part III of the permit for a complete description of the information that must be included in the SWPPP.

**Surface Waters of the State** - shall be construed to include lakes, bays, sounds, ponds, impounding reservoirs, springs, rivers, streams, creeks, estuaries, marshes, inlets, canals, the Atlantic ocean within the territorial seas of the state of New York and all other bodies of surface water, natural or artificial, inland or coastal, fresh or salt, public or private (except those private waters that do not combine or effect a junction with natural surface waters), which are wholly or partially within or bordering the state or within its jurisdiction. Waters of the state are further defined in 6 NYCRR Parts 800 to 941.

**Temporarily Ceased** – means that an existing disturbed area will not be disturbed again within 14 calendar days of the previous soil disturbance.

**Temporary Stabilization** - means that exposed soil has been covered with material(s) as set forth in the technical standard, New York Standards and Specifications for Erosion and Sediment Control, to prevent the exposed soil from eroding. The materials can include, but are not limited to, mulch, seed and mulch, and erosion control mats (e.g. jute twisted yarn, excelsior wood fiber mats).

**Total Maximum Daily Loads (TMDLs)** - A TMDL is the sum of the allowable loads of a single pollutant from all contributing point and *nonpoint sources*. It is a calculation of the maximum amount of a pollutant that a waterbody can receive on a daily basis and still meet *water quality standards*, and an allocation of that amount to the pollutant's sources. A TMDL stipulates wasteload allocations (WLAs) for *point source* discharges, load allocations (LAs) for *nonpoint sources*, and a margin of safety (MOS).

**Trained Contractor** - means an employee from the contracting (construction) company, identified in Part III.A.6., that has received four (4) hours of Department endorsed

training in proper erosion and sediment control principles from a Soil and Water Conservation District, or other Department endorsed entity. After receiving the initial training, the *trained contractor* shall receive four (4) hours of training every three (3) years.

It can also mean an employee from the contracting (construction) company, identified in Part III.A.6., that meets the *qualified inspector* qualifications (e.g. licensed Professional Engineer, Certified Professional in Erosion and Sediment Control (CPESC), Registered Landscape Architect, New York State Erosion and Sediment Control Certificate Program holder, or someone working under the direct supervision of, and at the same company as, the licensed Professional Engineer or Registered Landscape Architect, provided they have received four (4) hours of Department endorsed training in proper erosion and sediment control principles from a Soil and Water Conservation District, or other Department endorsed entity).

The *trained contractor* is responsible for the day to day implementation of the SWPPP.

**Uniform Procedures Act (UPA) Permit** - means a permit required under 6 NYCRR Part 621 of the Environmental Conservation Law (ECL), Article 70.

**Water Quality Standard** - means such measures of purity or quality for any waters in relation to their reasonable and necessary use as promulgated in 6 NYCRR Part 700 et seq.

## APPENDIX B – Required SWPPP Components by Project Type

**Table 1**  
**Construction Activities that Require the Preparation of a SWPPP That Only Includes Erosion and Sediment Controls**

<p><b>The following construction activities that involve soil disturbances of one (1) or more acres of land, but less than five (5) acres:</b></p> <ul style="list-style-type: none"><li>• Single family home <u>not</u> located in one of the watersheds listed in Appendix C or <u>not directly discharging</u> to one of the 303(d) segments listed in Appendix E</li><li>• Single family residential subdivisions with 25% or less impervious cover at total site build-out and <u>not</u> located in one of the watersheds listed in Appendix C and <u>not</u> directly discharging to one of the 303(d) segments listed in Appendix E</li><li>• Construction of a barn or other <i>agricultural building</i>, silo, stock yard or pen.</li></ul>
<p><b>The following construction activities that involve soil disturbances between five thousand (5000) square feet and one (1) acre of land:</b></p> <p>All construction activities located in the watersheds identified in Appendix D that involve soil disturbances between five thousand (5,000) square feet and one (1) acre of land.</p>
<p><b>The following construction activities that involve soil disturbances of one (1) or more acres of land:</b></p> <ul style="list-style-type: none"><li>• Installation of underground, linear utilities; such as gas lines, fiber-optic cable, cable TV, electric, telephone, sewer mains, and water mains</li><li>• Environmental enhancement projects, such as wetland mitigation projects, stormwater retrofits and stream restoration projects</li><li>• Pond construction</li><li>• Linear bike paths running through areas with vegetative cover, including bike paths surfaced with an impervious cover</li><li>• Cross-country ski trails and walking/hiking trails</li><li>• Sidewalk, bike path or walking path projects, surfaced with an impervious cover, that are not part of residential, commercial or institutional development;</li><li>• Sidewalk, bike path or walking path projects, surfaced with an impervious cover, that include incidental shoulder or curb work along an existing highway to support construction of the sidewalk, bike path or walking path.</li><li>• Slope stabilization projects</li><li>• Slope flattening that changes the grade of the site, but does not significantly change the runoff characteristics</li></ul>

**Table 1 (Continued) CONSTRUCTION ACTIVITIES THAT REQUIRE THE PREPARATION OF A SWPPP THAT ONLY INCLUDES EROSION AND SEDIMENT CONTROLS**

**The following construction activities that involve soil disturbances of one (1) or more acres of land:**

- Spoil areas that will be covered with vegetation
- Vegetated open space projects (i.e. recreational parks, lawns, meadows, fields, downhill ski trails) excluding projects that *alter hydrology from pre to post development* conditions,
- Athletic fields (natural grass) that do not include the construction or reconstruction of *impervious area* and do not *alter hydrology from pre to post development* conditions
- Demolition project where vegetation will be established, and no redevelopment is planned
- Overhead electric transmission line project that does not include the construction of permanent access roads or parking areas surfaced with *impervious cover*
- Structural practices as identified in Table II in the “Agricultural Management Practices Catalog for Nonpoint Source Pollution in New York State”, excluding projects that involve soil disturbances of greater than five acres and construction activities that include the construction or reconstruction of impervious area
- Temporary access roads, median crossovers, detour roads, lanes, or other temporary impervious areas that will be restored to pre-construction conditions once the construction activity is complete

**Table 2**  
**CONSTRUCTION ACTIVITIES THAT REQUIRE THE PREPARATION OF A SWPPP THAT INCLUDES**  
**POST-CONSTRUCTION STORMWATER MANAGEMENT PRACTICES**

**The following construction activities that involve soil disturbances of one (1) or more acres of land:**

- Single family home located in one of the watersheds listed in Appendix C or *directly discharging* to one of the 303(d) segments listed in Appendix E
- Single family home that disturbs five (5) or more acres of land
- Single family residential subdivisions located in one of the watersheds listed in Appendix C or *directly discharging* to one of the 303(d) segments listed in Appendix E
- Single family residential subdivisions that involve soil disturbances of between one (1) and five (5) acres of land with greater than 25% impervious cover at total site build-out
- Single family residential subdivisions that involve soil disturbances of five (5) or more acres of land, and single family residential subdivisions that involve soil disturbances of less than five (5) acres that are part of a larger common plan of development or sale that will ultimately disturb five or more acres of land
- Multi-family residential developments; includes duplexes, townhomes, condominiums, senior housing complexes, apartment complexes, and mobile home parks
- Airports
- Amusement parks
- Breweries, cideries, and wineries, including establishments constructed on agricultural land
- Campgrounds
- Cemeteries that include the construction or reconstruction of impervious area (>5% of disturbed area) or *alter the hydrology from pre to post development* conditions
- Commercial developments
- Churches and other places of worship
- Construction of a barn or other *agricultural building* (e.g. silo) and structural practices as identified in Table II in the "Agricultural Management Practices Catalog for Nonpoint Source Pollution in New York State" that include the construction or reconstruction of *impervious area*, excluding projects that involve soil disturbances of less than five acres.
- Golf courses
- Institutional development; includes hospitals, prisons, schools and colleges
- Industrial facilities; includes industrial parks
- Landfills
- Municipal facilities; includes highway garages, transfer stations, office buildings, POTW's, water treatment plants, and water storage tanks
- Office complexes
- Playgrounds that include the construction or reconstruction of impervious area
- Sports complexes
- Racetracks; includes racetracks with earthen (dirt) surface
- Road construction or reconstruction, including roads constructed as part of the construction activities listed in Table 1

Table 2 (Continued)

**CONSTRUCTION ACTIVITIES THAT REQUIRE THE PREPARATION OF A SWPPP THAT INCLUDES POST-CONSTRUCTION STORMWATER MANAGEMENT PRACTICES**

The following construction activities that involve soil disturbances of one (1) or more acres of land:

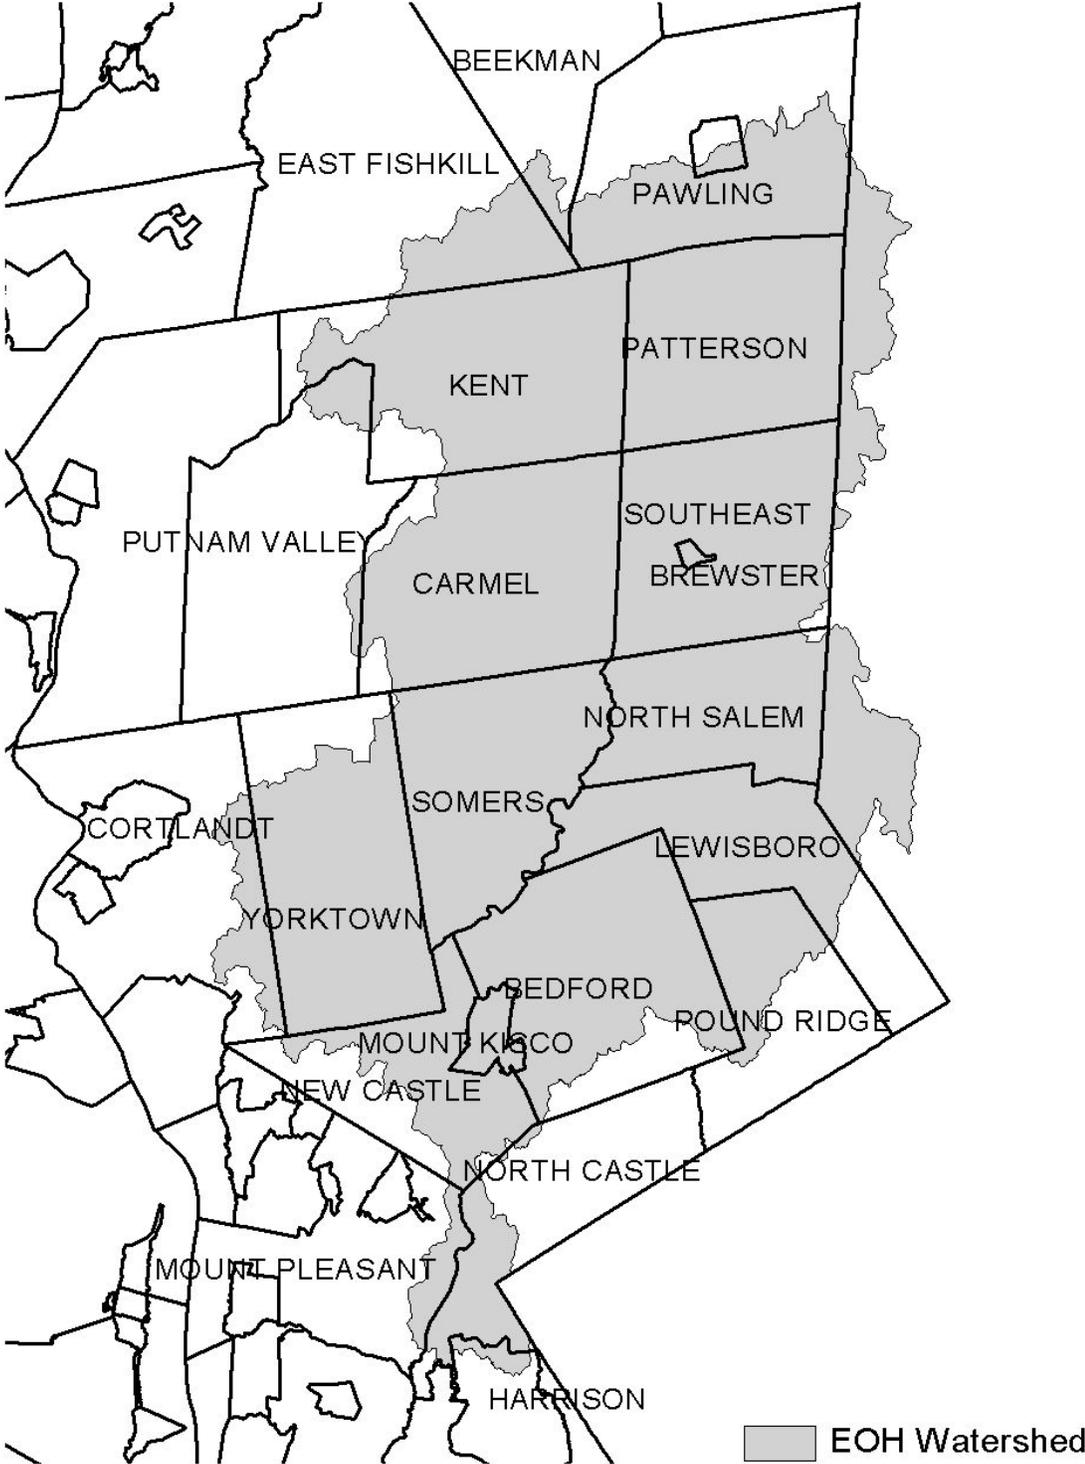

- Parking lot construction or reconstruction, including parking lots constructed as part of the construction activities listed in Table 1
- Athletic fields (natural grass) that include the construction or reconstruction of impervious area (>5% of disturbed area) or *alter the hydrology from pre to post development* conditions
- Athletic fields with artificial turf
- Permanent access roads, parking areas, substations, compressor stations and well drilling pads, surfaced with *impervious cover*, and constructed as part of an over-head electric transmission line project, wind-power project, cell tower project, oil or gas well drilling project, sewer or water main project or other linear utility project
- Sidewalk, bike path or walking path projects, surfaced with an impervious cover, that are part of a residential, commercial or institutional development
- Sidewalk, bike path or walking path projects, surfaced with an impervious cover, that are part of a highway construction or reconstruction project
- All other construction activities that include the construction or reconstruction of *impervious area* or *alter the hydrology from pre to post development* conditions, and are not listed in Table 1

## APPENDIX C – Watersheds Requiring Enhanced Phosphorus Removal

**Watersheds where *owners or operators* of construction activities identified in Table 2 of Appendix B must prepare a SWPPP that includes post-construction stormwater management practices designed in conformance with the Enhanced Phosphorus Removal Standards included in the technical standard, New York State Stormwater Management Design Manual (“Design Manual”).**

- Entire New York City Watershed located east of the Hudson River - Figure 1
- Onondaga Lake Watershed - Figure 2
- Greenwood Lake Watershed -Figure 3
- Oscawana Lake Watershed – Figure 4
- Kinderhook Lake Watershed – Figure 5

**Figure 1 - New York City Watershed East of the Hudson**

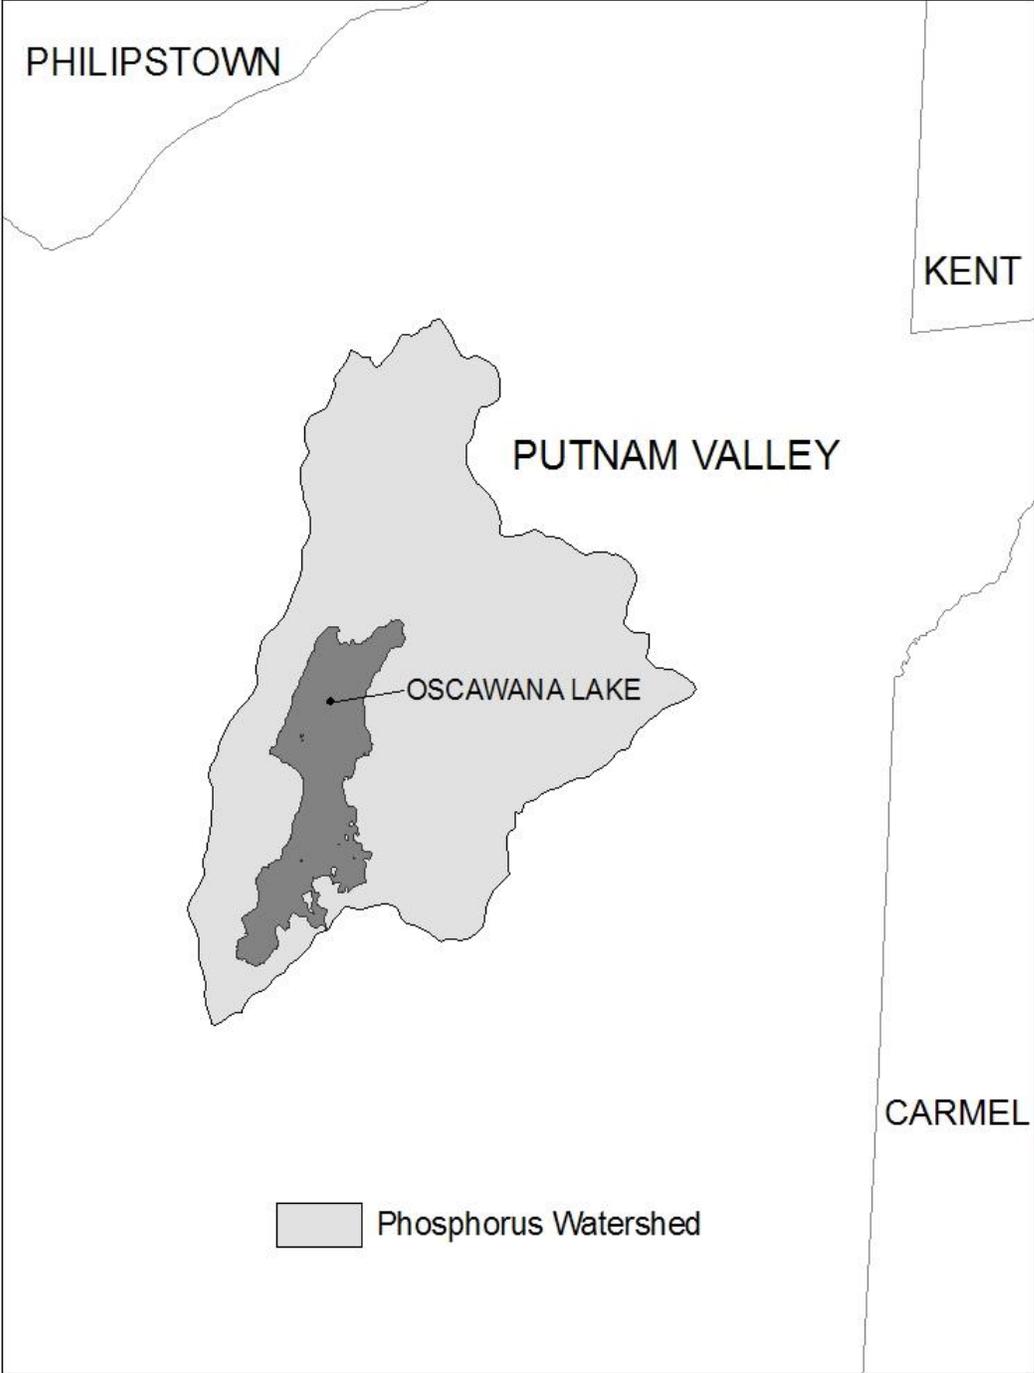

**Figure 2 - Onondaga Lake Watershed**

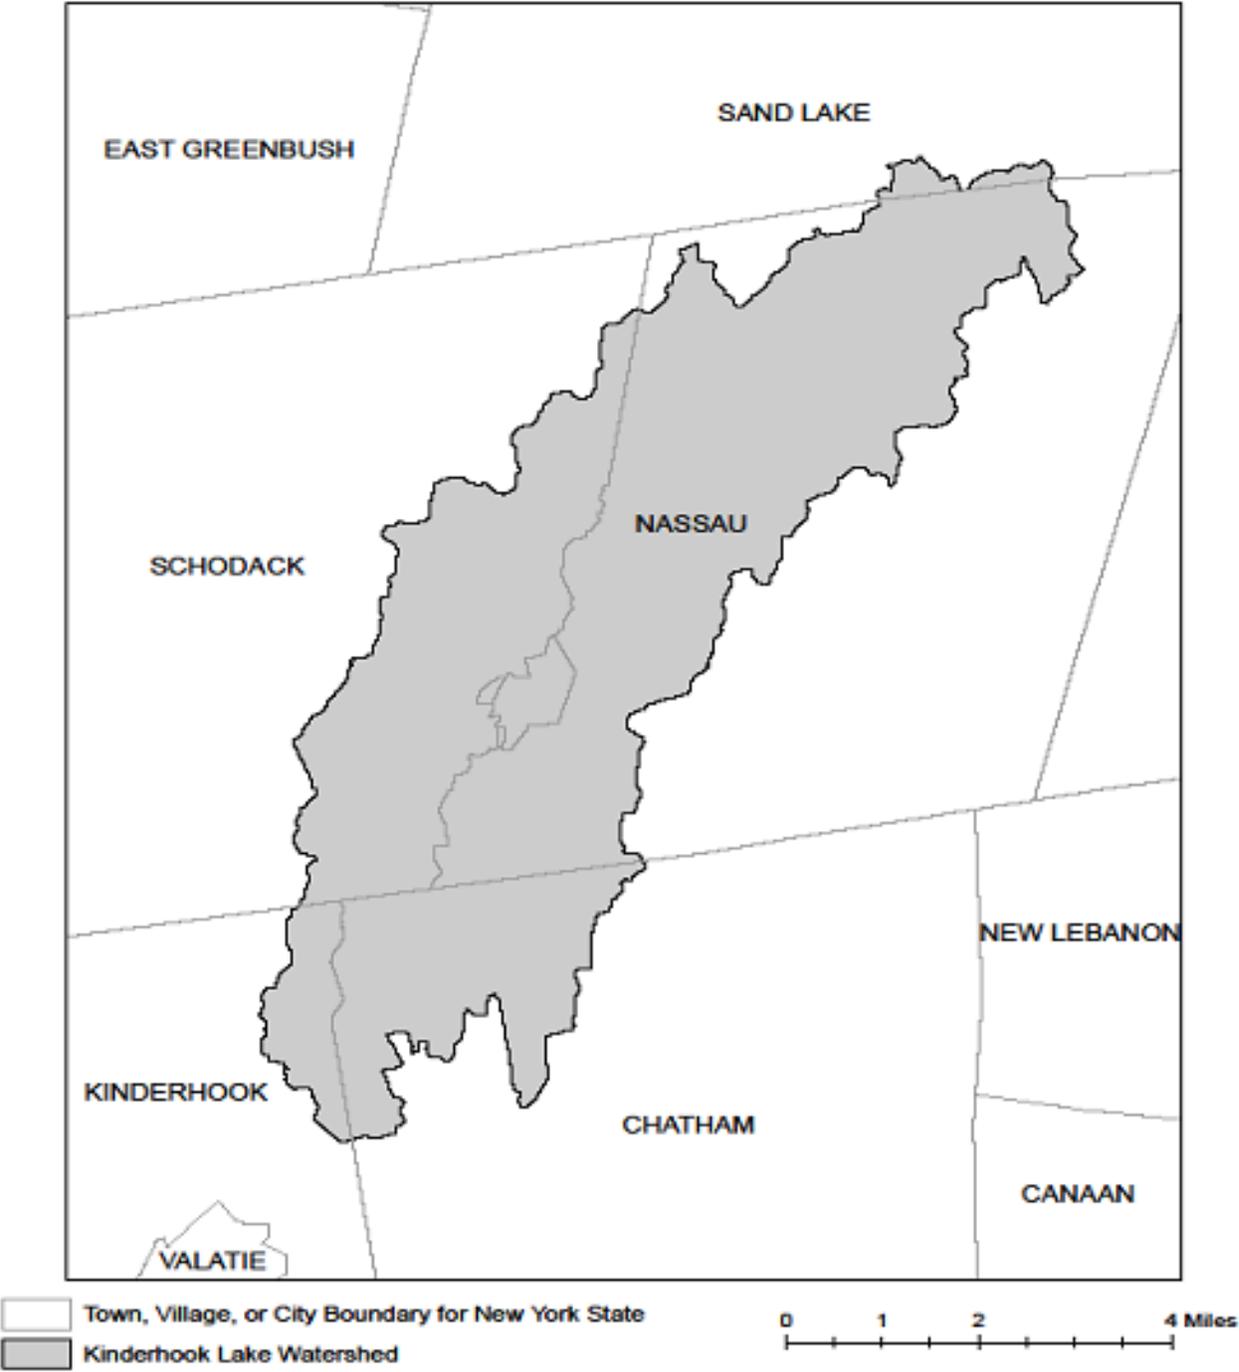

**Figure 3 - Greenwood Lake Watershed**

**Figure 4 - Oscawana Lake Watershed**

**Figure 5 - Kinderhook Lake Watershed**

## APPENDIX D – Watersheds with Lower Disturbance Threshold

**Watersheds where *owners or operators* of construction activities that involve soil disturbances between five thousand (5000) square feet and one (1) acre of land must obtain coverage under this permit.**

Entire New York City Watershed that is located east of the Hudson River - See Figure 1 in Appendix C

## APPENDIX E – 303(d) Segments Impaired by Construction Related Pollutant(s)

List of 303(d) segments impaired by pollutants related to *construction activity* (e.g. silt, sediment or nutrients). The list was developed using "The Final New York State 2016 Section 303(d) List of Impaired Waters Requiring a TMDL/Other Strategy" dated November 2016. *Owners or operators* of single family home and single family residential subdivisions with 25% or less total impervious cover at total site build-out that involve soil disturbances of one or more acres of land, but less than 5 acres, and *directly discharge* to one of the listed segments below shall prepare a SWPPP that includes post-construction stormwater management practices designed in conformance with the New York State Stormwater Management Design Manual ("Design Manual"), dated January 2015.

COUNTY	WATERBODY	POLLUTANT
Albany	Ann Lee (Shakers) Pond, Stump Pond	Nutrients
Albany	Basic Creek Reservoir	Nutrients
Allegany	Amity Lake, Saunders Pond	Nutrients
Bronx	Long Island Sound, Bronx	Nutrients
Bronx	Van Cortlandt Lake	Nutrients
Broome	Fly Pond, Deer Lake, Sky Lake	Nutrients
Broome	Minor Tribs to Lower Susquehanna (north)	Nutrients
Broome	Whitney Point Lake/Reservoir	Nutrients
Cattaraugus	Allegheny River/Reservoir	Nutrients
Cattaraugus	Beaver (Alma) Lake	Nutrients
Cattaraugus	Case Lake	Nutrients
Cattaraugus	Linlyco/Club Pond	Nutrients
Cayuga	Duck Lake	Nutrients
Cayuga	Little Sodus Bay	Nutrients
Chautauqua	Bear Lake	Nutrients
Chautauqua	Chadakoin River and tribs	Nutrients
Chautauqua	Chautauqua Lake, North	Nutrients
Chautauqua	Chautauqua Lake, South	Nutrients
Chautauqua	Findley Lake	Nutrients
Chautauqua	Hulburt/Clymer Pond	Nutrients
Clinton	Great Chazy River, Lower, Main Stem	Silt/Sediment
Clinton	Lake Champlain, Main Lake, Middle	Nutrients
Clinton	Lake Champlain, Main Lake, North	Nutrients
Columbia	Kinderhook Lake	Nutrients
Columbia	Robinson Pond	Nutrients
Cortland	Dean Pond	Nutrients

### 303(d) Segments Impaired by Construction Related Pollutant(s)

Dutchess	Fall Kill and tribs	Nutrients
Dutchess	Hillside Lake	Nutrients
Dutchess	Wappingers Lake	Nutrients
Dutchess	Wappingers Lake	Silt/Sediment
Erie	Beeman Creek and tribs	Nutrients
Erie	Ellicott Creek, Lower, and tribs	Silt/Sediment
Erie	Ellicott Creek, Lower, and tribs	Nutrients
Erie	Green Lake	Nutrients
Erie	Little Sister Creek, Lower, and tribs	Nutrients

## Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
Ux	Urban land		0.3	6.3%
WeB	Wethersfield gravelly silt loam, 3 to 8 percent slopes	C	4.8	91.9%
WuC	Wethersfield-Urban land complex, 8 to 15 percent slopes	C	0.1	1.8%
<b>Totals for Area of Interest</b>			<b>5.3</b>	<b>100.0%</b>

### Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

## Map Unit Description

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions in this report, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named, soils that are similar to the named components, and some minor components that differ in use and management from the major soils.

Most of the soils similar to the major components have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Some minor components, however, have properties and behavior characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. All the soils of a series have major horizons that are similar in composition, thickness, and arrangement. Soils of a given series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Additional information about the map units described in this report is available in other soil reports, which give properties of the soils and the limitations, capabilities, and potentials for many uses. Also, the narratives that accompany the soil reports define some of the properties included in the map unit descriptions.

## Rockland County, New York

### Ux—Urban land

#### Map Unit Setting

*National map unit symbol:* 9v5g

*Mean annual precipitation:* 47 to 50 inches

*Mean annual air temperature:* 48 to 52 degrees F

*Frost-free period:* 135 to 215 days

*Farmland classification:* Not prime farmland

## Rockland County, New York

### WeB—Wethersfield gravelly silt loam, 3 to 8 percent slopes

#### Map Unit Setting

*National map unit symbol:* 9v5l  
*Mean annual precipitation:* 47 to 50 inches  
*Mean annual air temperature:* 48 to 52 degrees F  
*Frost-free period:* 135 to 215 days  
*Farmland classification:* All areas are prime farmland

#### Map Unit Composition

*Wethersfield and similar soils:* 80 percent  
*Minor components:* 20 percent  
*Estimates are based on observations, descriptions, and transects of the mapunit.*

#### Description of Wethersfield

##### Setting

*Landform:* Hills, till plains  
*Landform position (two-dimensional):* Summit  
*Landform position (three-dimensional):* Crest  
*Down-slope shape:* Convex  
*Across-slope shape:* Convex  
*Parent material:* Loamy acid till derived mainly from reddish sandstone, shale, and conglomerate, with some basalt

##### Typical profile

*H1 - 0 to 13 inches:* gravelly silt loam  
*H2 - 13 to 22 inches:* gravelly loam  
*H3 - 22 to 60 inches:* gravelly fine sandy loam

##### Properties and qualities

*Slope:* 3 to 8 percent  
*Depth to restrictive feature:* 20 to 38 inches to densic material  
*Natural drainage class:* Well drained  
*Capacity of the most limiting layer to transmit water (Ksat):*  
Moderately low to moderately high (0.06 to 0.20 in/hr)  
*Depth to water table:* About 18 to 30 inches  
*Frequency of flooding:* None  
*Frequency of ponding:* None  
*Available water storage in profile:* Low (about 3.4 inches)

##### Interpretive groups

*Land capability classification (irrigated):* None specified  
*Land capability classification (nonirrigated):* 2e  
*Hydrologic Soil Group:* C  
*Hydric soil rating:* No

### **Minor Components**

#### **Charlton**

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

#### **Wallington**

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

#### **Cheshire**

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

#### **Riverhead**

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

## **Data Source Information**

## Engineering Properties

This table gives the engineering classifications and the range of engineering properties for the layers of each soil in the survey area.

*Hydrologic soil group* is a group of soils having similar runoff potential under similar storm and cover conditions. The criteria for determining Hydrologic soil group is found in the National Engineering Handbook, Chapter 7 issued May 2007(<http://directives.sc.egov.usda.gov/OpenNonWebContent.aspx?content=17757.wba>). Listing HSGs by soil map unit component and not by soil series is a new concept for the engineers. Past engineering references contained lists of HSGs by soil series. Soil series are continually being defined and redefined, and the list of soil series names changes so frequently as to make the task of maintaining a single national list virtually impossible. Therefore, the criteria is now used to calculate the HSG using the component soil properties and no such national series lists will be maintained. All such references are obsolete and their use should be discontinued. Soil properties that influence runoff potential are those that influence the minimum rate of infiltration for a bare soil after prolonged wetting and when not frozen. These properties are depth to a seasonal high water table, saturated hydraulic conductivity after prolonged wetting, and depth to a layer with a very slow water transmission rate. Changes in soil properties caused by land management or climate changes also cause the hydrologic soil group to change. The influence of ground cover is treated independently. There are four hydrologic soil groups, A, B, C, and D, and three dual groups, A/D, B/D, and C/D. In the dual groups, the first letter is for drained areas and the second letter is for undrained areas.

The four hydrologic soil groups are described in the following paragraphs:

*Group A.* Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

*Group B.* Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

*Group C.* Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

*Group D.* Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

*Depth* to the upper and lower boundaries of each layer is indicated.

*Texture* is given in the standard terms used by the U.S. Department of Agriculture. These terms are defined according to percentages of sand, silt, and clay in the fraction of the soil that is less than 2 millimeters in diameter. "Loam," for example, is soil that is 7 to 27 percent clay, 28 to 50 percent silt, and less than 52 percent sand. If the content of particles coarser than sand is 15 percent or more, an appropriate modifier is added, for example, "gravelly."

*Classification* of the soils is determined according to the Unified soil classification system (ASTM, 2005) and the system adopted by the American Association of State Highway and Transportation Officials (AASHTO, 2004).

The Unified system classifies soils according to properties that affect their use as construction material. Soils are classified according to particle-size distribution of the fraction less than 3 inches in diameter and according to plasticity index, liquid limit, and organic matter content. Sandy and gravelly soils are identified as GW, GP, GM, GC, SW, SP, SM, and SC; silty and clayey soils as ML, CL, OL, MH, CH, and OH; and highly organic soils as PT. Soils exhibiting engineering properties of two groups can have a dual classification, for example, CL-ML.

The AASHTO system classifies soils according to those properties that affect roadway construction and maintenance. In this system, the fraction of a mineral soil that is less than 3 inches in diameter is classified in one of seven groups from A-1 through A-7 on the basis of particle-size distribution, liquid limit, and plasticity index. Soils in group A-1 are coarse grained and low in content of fines (silt and clay). At the other extreme, soils in group A-7 are fine grained. Highly organic soils are classified in group A-8 on the basis of visual inspection.

If laboratory data are available, the A-1, A-2, and A-7 groups are further classified as A-1-a, A-1-b, A-2-4, A-2-5, A-2-6, A-2-7, A-7-5, or A-7-6. As an additional refinement, the suitability of a soil as subgrade material can be indicated by a group index number. Group index numbers range from 0 for the best subgrade material to 20 or higher for the poorest.

*Percentage of rock fragments* larger than 10 inches in diameter and 3 to 10 inches in diameter are indicated as a percentage of the total soil on a dry-weight basis. The percentages are estimates determined mainly by converting volume percentage in the field to weight percentage. Three values are provided to identify the expected Low (L), Representative Value (R), and High (H).

*Percentage (of soil particles) passing designated sieves* is the percentage of the soil fraction less than 3 inches in diameter based on an oven-dry weight. The sieves, numbers 4, 10, 40, and 200 (USA Standard Series), have openings of 4.76, 2.00, 0.420, and 0.074 millimeters, respectively. Estimates are based on laboratory tests of soils sampled in the survey area and in nearby areas and on estimates made in the field. Three values are provided to identify the expected Low (L), Representative Value (R), and High (H).

*Liquid limit and plasticity index* (Atterberg limits) indicate the plasticity characteristics of a soil. The estimates are based on test data from the survey area or from nearby areas and on field examination. Three values are provided to identify the expected Low (L), Representative Value (R), and High (H).

### Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

## Rating Options

*Aggregation Method: Dominant Condition*

*Component Percent Cutoff: None Specified*

<sup>1</sup> Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS). Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values. Please refer to NOAA Atlas 14 document for more information.

### Summary for Reach 4R: Design Point A

[40] Hint: Not Described (Outflow=Inflow)

Inflow Area = 0.724 ac, 72.79% Impervious, Inflow Depth > 1.93" for 1 Year event  
Inflow = 1.48 cfs @ 12.12 hrs, Volume= 0.116 af  
Outflow = 1.48 cfs @ 12.12 hrs, Volume= 0.116 af, Atten= 0%, Lag= 0.0 min

Routing by Stor-Ind+Trans method, Time Span= 0.00-24.00 hrs, dt= 0.06 hrs

### Reach 4R: Design Point A

### Summary for Reach 5R: Design Point B

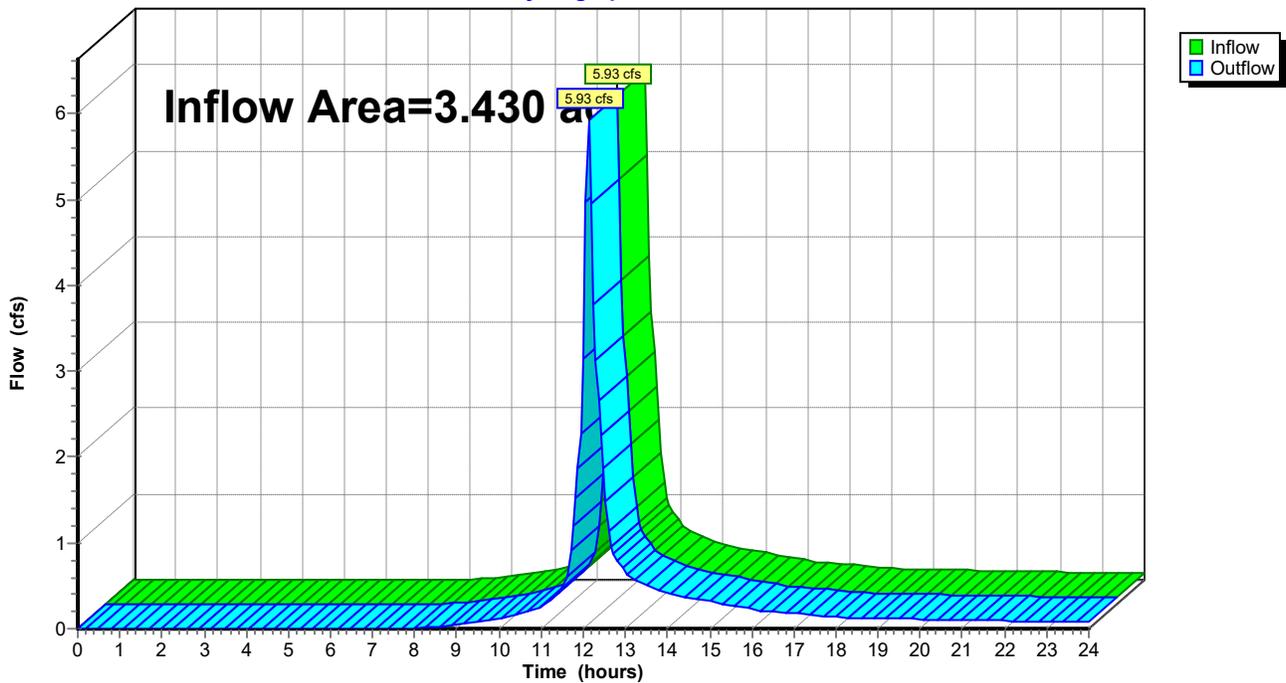

[40] Hint: Not Described (Outflow=Inflow)

Inflow Area = 3.430 ac, 56.15% Impervious, Inflow Depth > 1.61" for 1 Year event  
Inflow = 5.93 cfs @ 12.12 hrs, Volume= 0.459 af  
Outflow = 5.93 cfs @ 12.12 hrs, Volume= 0.459 af, Atten= 0%, Lag= 0.0 min

Routing by Stor-Ind+Trans method, Time Span= 0.00-24.00 hrs, dt= 0.06 hrs

**Summary for Subcatchment 3S: Detention Drainage Area B1**

[49] Hint:  $T_c < 2dt$  may require smaller  $dt$

Runoff = 5.26 cfs @ 12.08 hrs, Volume= 0.408 af, Depth> 4.48"

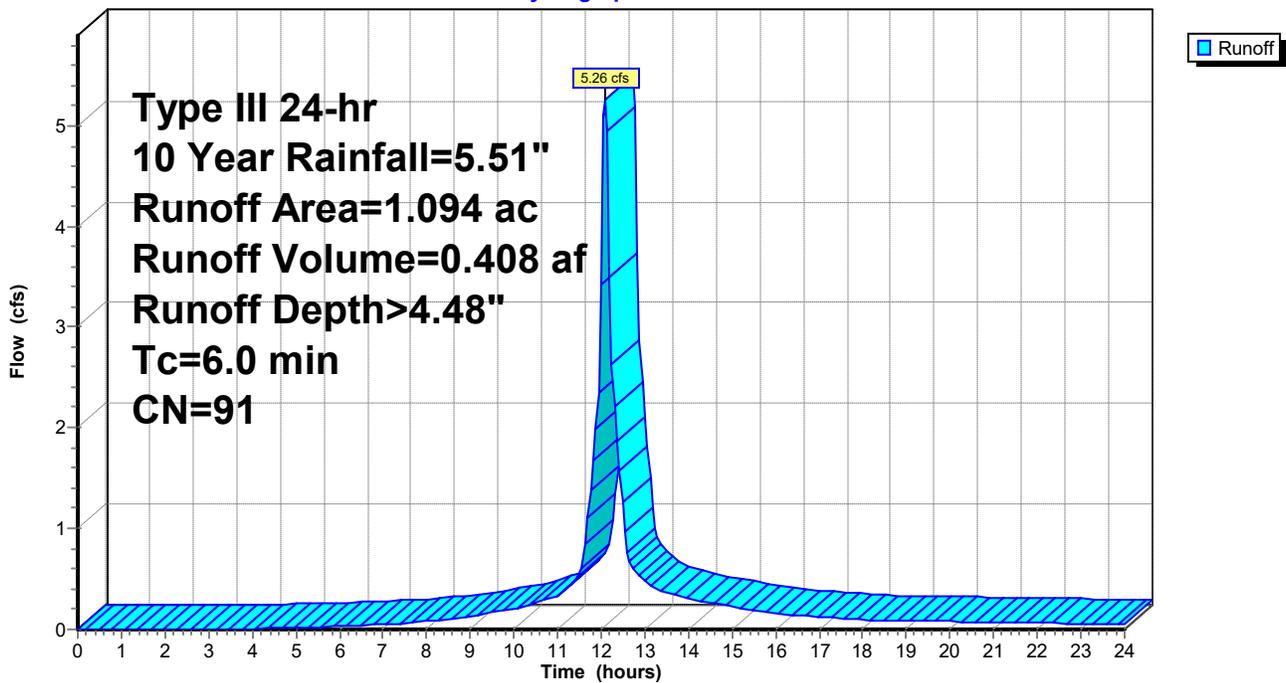

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 0.00-24.00 hrs,  $dt= 0.06$  hrs  
 Type III 24-hr 10 Year Rainfall=5.51"

Area (ac)	CN	Description
0.764	98	Roofs, HSG C
0.330	74	>75% Grass cover, Good, HSG C
1.094	91	Weighted Average
0.330		30.16% Pervious Area
0.764		69.84% Impervious Area

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
6.0					Direct Entry, minimum

### Summary for Reach 4R: Design Point A

[40] Hint: Not Described (Outflow=Inflow)

Inflow Area = 0.724 ac, 72.79% Impervious, Inflow Depth > 4.47" for 10 Year event  
Inflow = 3.31 cfs @ 12.11 hrs, Volume= 0.270 af  
Outflow = 3.31 cfs @ 12.11 hrs, Volume= 0.270 af, Atten= 0%, Lag= 0.0 min

Routing by Stor-Ind+Trans method, Time Span= 0.00-24.00 hrs, dt= 0.06 hrs

### Reach 4R: Design Point A

### Summary for Reach 5R: Design Point B

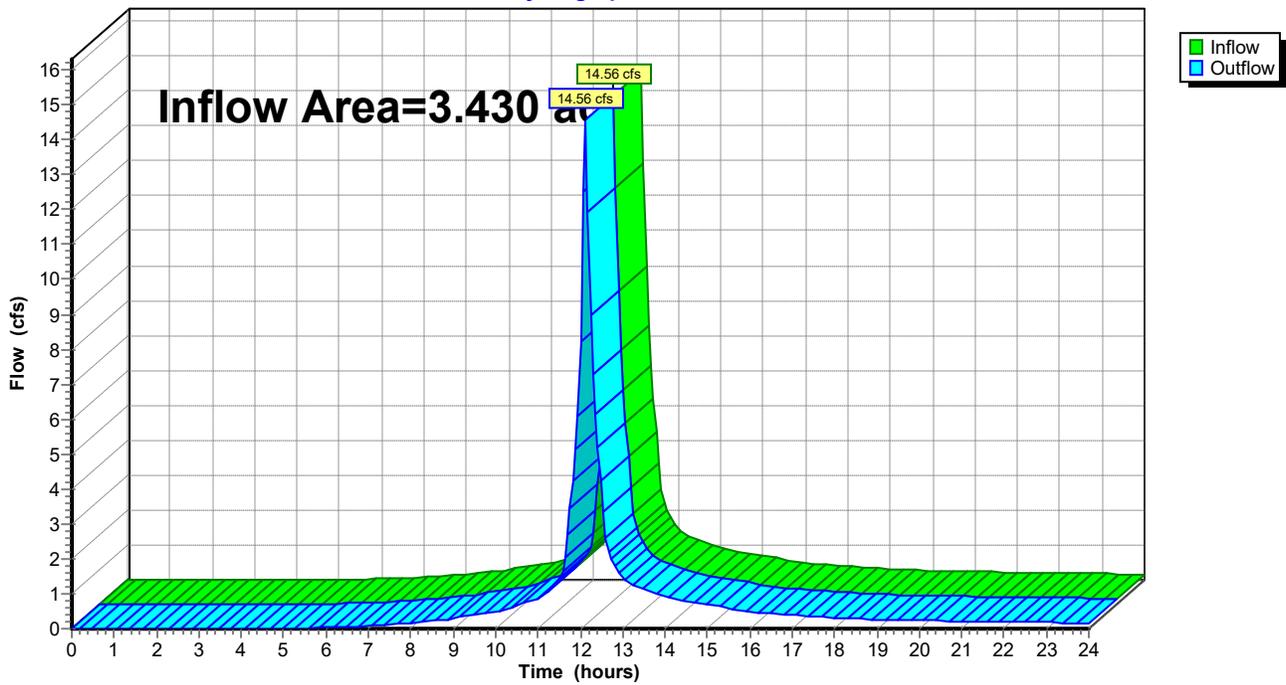

[40] Hint: Not Described (Outflow=Inflow)

Inflow Area = 3.430 ac, 56.15% Impervious, Inflow Depth > 4.05" for 10 Year event  
Inflow = 14.56 cfs @ 12.12 hrs, Volume= 1.156 af  
Outflow = 14.56 cfs @ 12.12 hrs, Volume= 1.156 af, Atten= 0%, Lag= 0.0 min

Routing by Stor-Ind+Trans method, Time Span= 0.00-24.00 hrs, dt= 0.06 hrs

### Summary for Link 10L: DP-1

Inflow Area = 5.248 ac, 61.30% Impervious, Inflow Depth > 4.18" for 10 Year event  
Inflow = 21.56 cfs @ 12.12 hrs, Volume= 1.829 af  
Primary = 21.56 cfs @ 12.12 hrs, Volume= 1.829 af, Atten= 0%, Lag= 0.0 min

Primary outflow = Inflow, Time Span= 0.00-24.00 hrs, dt= 0.06 hrs

### Summary for Reach 4R: Design Point A

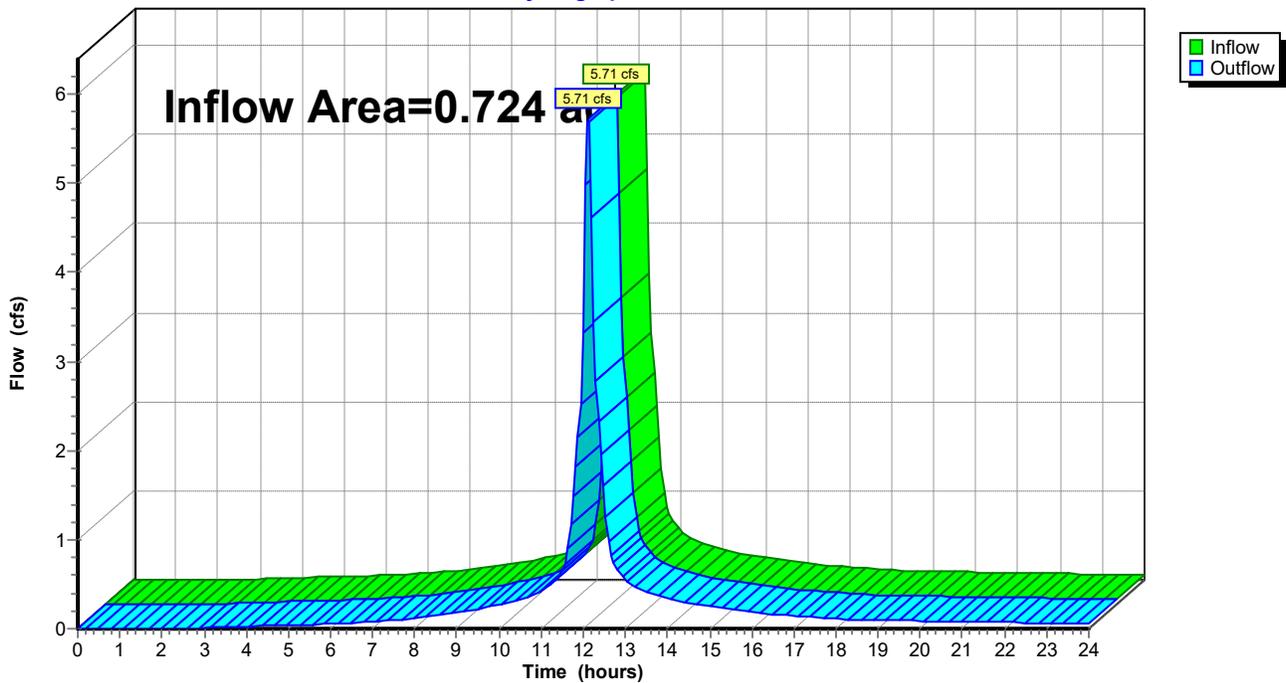

[40] Hint: Not Described (Outflow=Inflow)

Inflow Area = 0.724 ac, 72.79% Impervious, Inflow Depth > 7.98" for 100 Year event  
Inflow = 5.71 cfs @ 12.11 hrs, Volume= 0.481 af  
Outflow = 5.71 cfs @ 12.11 hrs, Volume= 0.481 af, Atten= 0%, Lag= 0.0 min

Routing by Stor-Ind+Trans method, Time Span= 0.00-24.00 hrs, dt= 0.06 hrs

### Reach 4R: Design Point A

### Summary for Reach 5R: Design Point B

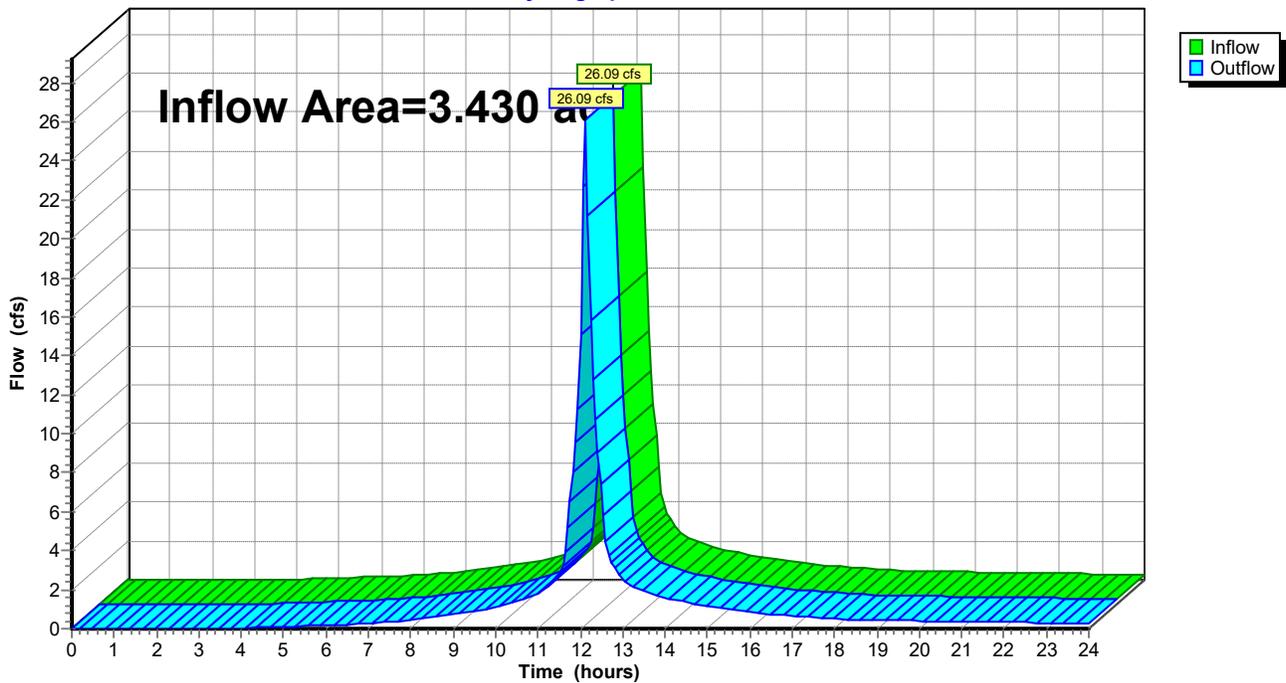

[40] Hint: Not Described (Outflow=Inflow)

Inflow Area = 3.430 ac, 56.15% Impervious, Inflow Depth > 7.49" for 100 Year event  
Inflow = 26.09 cfs @ 12.11 hrs, Volume= 2.140 af  
Outflow = 26.09 cfs @ 12.11 hrs, Volume= 2.140 af, Atten= 0%, Lag= 0.0 min

Routing by Stor-Ind+Trans method, Time Span= 0.00-24.00 hrs, dt= 0.06 hrs

APPENDIX D-III

## WATER QUALITY WORKSHEET

DATE: 3/25/2020	WO. NO. 10128	LOCATION: Orangetown, Rockland County, NY
--------------------	------------------	--

PROJECT TITLE: Orangetown Town Hall Expansion	ESTIMATED BY: JM	APPROVED BY: CO
--	---------------------	--------------------

Total Disturbance Area	<b>2.93</b>	<b>acres</b>
Total Disturbed Impervious Area	<b>1.28</b>	<b>acres</b>
Total Proposed Impervious	<b>1.85</b>	<b>acres</b>
Remaining Total Area	<b>1.65</b>	<b>acres</b>
Total New Impervious	<b>0.57</b>	<b>acres</b>

### New Development

90% Rainfall Event Number (Fig 4.1)	P =	1.50	in
0.05+0.009(I) (minimum Rv = 0.2)	R <sub>v</sub> =	0.3619	
Total Drainage Area (New Development)	A <sub>T</sub> =	1.65	Ac
Impervious Area	A <sub>I</sub> =	0.57	Ac
Impervious Area Percentage	I =	35	%
90% Rule	W <sub>Qv</sub> =	0.074	Ac-ft
Water Quality Volume	W <sub>qv</sub> =	3,241	ft <sup>3</sup>

$$W_{qv} = \frac{(P)(R_v)(A_T)}{12}$$

972

### Redevelopment

90% Rainfall Event Number (Fig 4.1)	P =	1.50	in
0.05+0.009(I) (minimum Rv = 0.2)	R <sub>v</sub> =	0.9535	
Total Drainage Area	A <sub>T</sub> =	1.28	Ac
Impervious Area	A <sub>I</sub> =	1.28	Ac
Impervious Area Percentage	I =	100	%
90% Rule	W <sub>Qv</sub> =	0.152	Ac-ft
Water Quality Volume	W <sub>QV</sub> =	6,620	ft <sup>3</sup>

$$W_{qv} = \frac{(P)(R_v)(A_T)}{12}$$

### Drainage to Underground System

90% Rainfall Event Number (Fig 4.1)	P =	1.50	in
0.05+0.009(I) (minimum Rv = 0.2)	R <sub>v</sub> =	0.7164	
Total Drainage Area	A <sub>T</sub> =	1.09	Ac
Impervious Area	A <sub>I</sub> =	0.81	Ac
Impervious Area Percentage	I =	74	%
90% Rule	W <sub>Qv</sub> =	0.098	Ac-ft
Water Quality Volume	W <sub>QV</sub> =	4,267	ft <sup>3</sup>

Water Quality Volume Provided in Cistern 3,700 ft<sup>3</sup>

WQv Credit Remaining 459 ft<sup>3</sup>

(25%-Runoff Reduction) \* 3 7%  
%WQv treatment by Alternative practice 54%

### WaterSense New Home Specification: Water Budget Tool (V 1.03)

This water budget tool shall be used to determine if the designed landscape meets Criteria 4.1.1 of the specification. Please refer to the WaterSense Water Budget Approach for additional information.

Your Name:   
Builder Name:   
Lot Number/Street Address:   
City, State, Zip Code:

Peak Watering Month:   
Obtain from Water Budget Data Finder at <https://www.epa.gov/watersense/water-budget-data-finder>

Is an irrigation system being installed on this site?

### This worksheet determines the baseline and the landscape water allowance (LWA) for a site based on its peak watering month.

The baseline is the amount of water required by the site during the peak watering month if watered at 100 percent of reference evapotranspiration (ET<sub>o</sub>). The following formula is used to calculate the baseline:

$$Baseline = ET_o \times A \times C_u$$

Where:

ET<sub>o</sub> = Local reference evapotranspiration (inches/month)

A = Landscaped area (square feet)

C<sub>u</sub> = Conversion factor (0.6233 for results in gallons/month)

The LWA is the water allotment for the site. The following formula is used to calculate the LWA:

$$LWA = 0.70 \times Baseline$$

Where:

LWA = Landscape water allowance (gallons/month)

Baseline = ET<sub>o</sub> x landscaped area x 0.6233

To calculate the Baseline and LWA for a site, enter the designed landscaped area and average monthly reference evapotranspiration for the site's peak watering month. (Enter data in white cells only.)

#### STEP 1A - ENTER THE LANDSCAPED AREA (A)

Area of the designed landscape (square feet)

#### STEP 1B - ENTER THE AVERAGE MONTHLY REFERENCE EVAPOTRANSPIRATION (ET<sub>o</sub>)

Average monthly reference ET (inches/month) for the site's peak watering month

Obtain from Water Budget Data Finder at <https://www.epa.gov/watersense/water-budget-data-finder>

#### OUTPUT - BASELINE FOR THE SITE

Monthly baseline (gallons/month) based on the site's peak watering month

#### OUTPUT - WATER ALLOWANCE FOR THE SITE

Monthly landscape water allowance (gallons/month) based on the site's peak watering month

Next Step: Click on the next tab labeled *Part 2 - LWR* to calculate the landscape water requirement.

**WaterSense New Home Specification: Water Budget Tool (V 1.03)**

This water budget tool shall be used to determine if the designed landscape meets Criteria 4.1.1 of the specification. Please refer to the WaterSense Water Budget Approach for additional information.

Your Name: \_\_\_\_\_  
 Builder Name: \_\_\_\_\_  
 Lot Number/Street Address: \_\_\_\_\_  
 City, State, Zip Code: \_\_\_\_\_  
 Peak Watering Month: June  
 Is an irrigation system being installed on this site? Yes

**This worksheet determines the monthly landscape water requirement (LWR) for a site based on its peak watering month.**

The monthly LWR is the water requirement specific to the designed landscape. The sum of the LWRs for each hydrozone equals the site LWR. The following formula is used to calculate the LWR for each hydrozone:

$$LWR_H = \frac{1}{DU_{LQ}} \times [(ET_o \times K_L) - R_a] \times A \times C_u$$

Where:  
 LWR<sub>H</sub> = Landscape water requirement for the hydrozone (gallons/month)  
 DU<sub>LQ</sub> = Lower quarter distribution uniformity  
 ET<sub>o</sub> = Local reference evapotranspiration (inches/month)  
 K<sub>L</sub> = Landscape coefficient for the type of plant in that hydrozone (dimensionless)  
 R<sub>a</sub> = Allowable rainfall, designated by WaterSense as 25% of average peak monthly rainfall (R)  
 A = Area of the hydrozone (square feet)  
 C<sub>u</sub> = Conversion factor (0.6233 for results in gallons/month)

To calculate the LWR for the site, enter the information requested below for the site's peak watering month. (Enter data in white cells only.)

**STEP 2A - ENTER THE AVERAGE MONTHLY RAINFALL (R) AT THE SITE FOR THE PEAK WATERING MONTH IDENTIFIED IN PART 1**  
3.42 Average monthly rainfall (inches/month) for the site's peak watering month

Obtain from Water Budget Data Finder at <https://www.epa.gov/watersense/water-budget-data-finder>

**STEP 2B - COMPLETE TABLE 1 BELOW (enter data in white cells only)**

Enter the area of the hydrozone (square feet). The total area must equal the landscaped area entered in Step 1A. Choose the plant type from the dropdown list (source data is displayed in Table 2).

Choose the irrigation type from the dropdown list (source data is displayed in Table 3; guidance is displayed in Table 4 and Table 5).

**Table 1. Landscape Water Requirement**

Zone	Hydrozone/Landscape Feature Area (sq. ft.)	Plant Type or Landscape Feature	Landscape Coefficient (K <sub>L</sub> )	Irrigation Type	Distribution Uniformity (DU <sub>LQ</sub> )	LWR <sub>H</sub> (gall/month)
1	15,500	Turfgrass - High water requirement	0.8	Fixed Spray	65%	61,017
2	500	Trees - High water requirement	0.9	Fixed Spray	65%	2,266

<b>Total Area =</b>	<b>16,000</b>					<b>63,283</b>

**Table 2. Plant Type or Landscape Feature and Associated Landscape Coefficient**

Plant Type or Landscape Feature	K <sub>L</sub> Water Requirements		
	Low	Medium	High
Trees	0.2	0.5	0.9
Shrubs	0.2	0.5	0.7
Groundcover	0.2	0.5	0.7
Turfgrass	0.6	0.7	0.8
Pool, Spa, or Water Feature			0.8
Permeable Hardscape			0
Nonvegetated Softscape			0

Source: Based on LEED for Homes Rating System 2008.

**Table 3. Distribution Uniformity**

Irrigation Type	DU <sub>LQ</sub> or EU*
Drip - Standard	70%
Drip - Press Comp	90%
Fixed Spray	65%
Microspray	70%
Rotor	70%
No Irrigation	NA

\*Lower quarter distribution uniformity (DU<sub>LQ</sub>) applies to sprinkler zones and emission uniformity (EU) applies to drip/microirrigation zones. Source: (The Irrigation Association, October 2001) in Landscape Irrigation Scheduling and Water Management, IA, 2005.

**Table 4. Appropriate Irrigation Types - Landscaped Areas with Irrigation Systems**

IF THE PLANT TYPE IS:	THEN THE IRRIGATION TYPE CAN BE:			
	Drip - Standard	Drip - Press Comp	Fixed Spray	Microspray*
Trees	x	x		x
Shrubs	x	x		x
Groundcover	x	x		x
Turfgrass	x	x	x	x

\*Microspray may only be used on vegetation other than turfgrass if it meets the definition according to the ASABE/ICC 882-2014 Landscape Irrigation Sprinkler and Emitter Standard. \*Microspray: A microirrigation emission device with one or more orifices to convert irrigation water pressure to water discharge with a flow rate not to exceed 30 gallons per hour (113.5 liters per hour) at the largest area of coverage available for the nozzle series when operated at 30 psi (208.9 kPa). Microsprays are inclusive of "microbubbles," "microspinners" and "microspray jets."

**Table 5. Appropriate Irrigation Types - Landscaped Areas without Irrigation Systems**

IF THE PLANT TYPE OR LANDSCAPE FEATURE IS:	THEN THE IRRIGATION TYPE SHALL BE:		
	Drip - Standard	Fixed Spray	No Irrigation
Trees, Shrubs, or Groundcover with Low Water Requirements (K <sub>L</sub> = 0.2)	x		
Trees, Shrubs, or Groundcover with Medium or High Water Requirements (K <sub>L</sub> > 0.2)		x	
Turfgrass with Low, Medium, or High Water Requirements (K <sub>L</sub> > 0.2)		x	
Pool, Spa, or Water Feature			x
Permeable Hardscape			x
Nonvegetated Softscape			x

\*Please see additional information in the WaterSense Water Budget Approach for landscapes installed without irrigation systems.

**OUTPUT - WATER REQUIREMENT FOR THE SITE**

63,283 Monthly landscape water requirement (gallons/month) based on the site's peak watering month

Next Step: Click on the next tab labeled **Part 3 - Results** to view the results.

### WaterSense New Home Specification: Water Budget Tool (V 1.03)

This water budget tool shall be used to determine if the designed landscape meets Criteria 4.1.1 of the specification. Please refer to the WaterSense Water Budget Approach for additional information.

Your Name:   
Builder Name:   
Lot Number/Street Address:   
City, State, Zip Code:

Peak Watering Month:

Is an irrigation system being installed on this site?

### This worksheet determines if the designed landscape meets the water budget.

If the landscape water requirement is LESS than the landscape water allowance, then the water budget criterion is met.  
If the landscape water requirement is GREATER than the landscape water allowance, then the landscape and/or irrigation system needs to be redesigned to use less water.

#### STEP 3A - REVIEW THE LWA AND LWR FROM PART 1 AND PART 2

LWA  (gallons/month) LWR  (gallons/month)

#### STEP 3B - REVIEW THE TOTAL AREA OF TURFGRASS\* IN THE DESIGNED LANDSCAPE FROM STEP 2B

The designed landscape contains  square feet of turfgrass.\* This is  of the landscaped area.

\*This includes the area of any pools, spas, and/or water features, designated by WaterSense to be counted as turfgrass.

### OUTPUT - DOES THE DESIGNED LANDSCAPE MEET THE WATER BUDGET?

If YES, then the water budget criterion is met.  
If NO, then the landscape and/or irrigation system needs to be redesigned to use less water.

The designed landscape water requirement is a  reduction in water use from the baseline calculated in Part 1.

Derek M. Berg  
Director – Stormwater Regulatory Management - East  
Contech Engineered Solutions LLC  
71 US Route 1, Suite F  
Scarborough, ME 04074

Re: MTD Lab Certification  
Cascade Separator™  
On-line Installation

### **TSS Removal Rate 50%**

Dear Mr. Berg:

The Stormwater Management rules under N.J.A.C. 7:8-5.5(b) and 5.7(c) allow the use of manufactured treatment devices (MTDs) for compliance with the design and performance standards at N.J.A.C. 7:8-5 if the pollutant removal rates have been verified by the New Jersey Corporation for Advanced Technology (NJCAT) and have been certified by the New Jersey Department of Environmental Protection (NJDEP). Contech Engineered Solutions, LLC (Contech) has requested an MTD Laboratory Certification for the Cascade Separator™ stormwater treatment system.

The project falls under the “Procedure for Obtaining Verification of a Stormwater Manufactured Treatment Device from New Jersey Corporation for Advance Technology” dated January 25, 2013. The applicable protocol is the “New Jersey Laboratory Testing Protocol to Assess Total Suspended Solids Removal by a Hydrodynamic Sedimentation Manufactured Treatment Device” dated January 25, 2013.

NJCAT verification documents submitted to the NJDEP indicate that the requirements of the aforementioned protocol have been met or exceeded. The NJCAT letter also included a recommended certification TSS removal rate and the required maintenance plan. The NJCAT Verification Report with the Verification Appendix (dated September 2019) for this device is published online at <http://www.njcat.org/verification-process/technology-verification-database.html>.

**The NJDEP certifies the use of the Cascade Separator™ stormwater treatment system at a TSS removal rate of 50% when designed, operated, and maintained in accordance with the information provided in the Verification Appendix and the following conditions:**

1. The maximum treatment flow rate (MTFR) for the manufactured treatment device (MTD) is calculated using the New Jersey Water Quality Design Storm (1.25 inches in 2 hrs) in N.J.A.C. 7:8-5.5.
2. The Cascade Separator™ shall be installed using the same configuration reviewed by NJCAT and shall be sized in accordance with the criteria specified in item 6 below.
3. This Cascade Separator™ cannot be used in series with another MTD or a media filter (such as a sand filter) to achieve an enhanced removal rate for total suspended solids (TSS) removal under N.J.A.C. 7:8-5.5.
4. Additional design criteria for MTDs can be found in Chapter 9.6 of the New Jersey Stormwater Best Management Practices (NJ Stormwater BMP) Manual, which can be found online at [www.njstormwater.org](http://www.njstormwater.org).
5. The maintenance plan for a site using this device shall incorporate, at a minimum, the maintenance requirements for the Cascade Separator™. A copy of the maintenance plan is attached to this certification. However, it is recommended to review the maintenance website at <https://www.conteches.com/Portals/0/Documents/Maintenance%20Guides/Cascade-Maintenance%20Guide.pdf?ver=2018-11-05-093254-300>, for any changes to the maintenance requirements.
6. Sizing Requirement:

The example below demonstrates the sizing procedure for the Cascade Separator™:

Example: A 0.25-acre impervious site is to be treated to 50% TSS removal using a Cascade Separator™. The impervious site runoff (Q) based on the New Jersey Water Quality Design Storm was determined to be 0.79 cfs.

Maximum Treatment Flow Rate (MTFR) Evaluation:

The site runoff (Q) was based on the following:

time of concentration = 10 minutes

$i = 3.2$  in/hr (page 5-8, Fig. 5-3 of the NJ Stormwater BMP Manual)

$c = 0.99$  (runoff coefficient for impervious)

$Q = ciA = 0.99 \times 3.2 \times 0.25 = 0.79$  cfs

Given the site runoff is 0.79 cfs and based on Table A-1 below, the Cascade Separator™ Model CS-4 with an MTFR of 1.80 cfs would be the smallest model approved that could be used for this site to remove 50% of the TSS from the impervious area without exceeding the MTFR.

The sizing table corresponding to the available system models is noted below. Additional specifications regarding each model can be found in the Verification Appendix under Table A-1.

**Table A-1 Cascade Separator™ Models and Associated MTFRs**

<b>Model</b>	<b>Manhole Diameter (ft)</b>	<b>MTFR (cfs)</b>	<b>50% Maximum Sediment Storage Area Volume (ft<sup>3</sup>)</b>
CS-4	4	1.80	9.4
CS-5	5	2.81	14.7
CS-6	6	4.05	21.2
CS-8	8	7.20	37.7
CS-10	10	11.3	58.9
CS-12	12	16.2	84.8

A detailed maintenance plan is mandatory for any project with a stormwater BMP subject to the Stormwater Management rules under N.J.A.C. 7:8. The plan must include all of the items identified in the Maintenance requirements section of the Stormwater Management rules under N.J.A.C. 7:8-5.8. Such items include, but are not limited to, the list of inspection and maintenance equipment and tools, specific corrective and preventative maintenance tasks, indication of problems in the system, and training of maintenance personnel. Additional information can be found in Chapter 8: Maintenance and Retrofit of Stormwater Management Measures.

If you have any questions regarding the above information, please contact Brian Salvo of my office at (609) 633-7021.

Sincerely,

Gabriel Mahon, Chief  
Bureau of Nonpoint Pollution Control

# Storage Nodes

## Storage Node : Diversion-1C

### Input Data

Invert Elevation (ft) ..... 212.70  
 Max (Rim) Elevation (ft) ..... 218.80  
 Max (Rim) Offset (ft) ..... 6.10  
 Initial Water Elevation (ft) ..... 212.70  
 Initial Water Depth (ft) ..... 0.00  
 Ponded Area (ft<sup>2</sup>) ..... 0.00  
 Evaporation Loss ..... 0.00

### Outflow Weirs

SN Element ID	Weir Type	Flap Gate	Crest Elevation (ft)	Crest Offset (ft)	Length (ft)	Weir Total Height (ft)	Discharge Coefficient
1 Diversion-Weir	Rectangular	No	214.20	1.50	3.00	4.60	2.70

### Outflow Orifices

SN Element ID	Orifice Type	Orifice Shape	Flap Gate	Circular Orifice Diameter (in)	Rectangular Orifice Height (in)	Rectangular Orifice Width (in)	Orifice Invert Elevation (ft)	Orifice Coefficient
1 Orifice-01	Side	CIRCULAR	No	6.00			212.70	0.61

### Output Summary Results

Peak Inflow (cfs) ..... 7.57  
 Peak Lateral Inflow (cfs) ..... 0.00  
 Peak Outflow (cfs) ..... 7.57  
 Peak Exfiltration Flow Rate (cfm) ..... 0.00  
 Max HGL Elevation Attained (ft) ..... 215.03  
 Max HGL Depth Attained (ft) ..... 2.33  
 Average HGL Elevation Attained (ft) ..... 213.02  
 Average HGL Depth Attained (ft) ..... 0.32  
 Time of Max HGL Occurrence (days hh:mm) ..... 0 00:05  
 Total Exfiltration Volume (1000-ft<sup>3</sup>) ..... 0.000  
 Total Flooded Volume (ac-in) ..... 0  
 Total Time Flooded (min) ..... 0  
 Total Retention Time (sec) ..... 0.00

## Project Description

File Name ..... 2021-07-20 East Hydraflow.SPF  
Description .....  
Orangetown Town Hall Additions and  
Alterations

## Project Options

Flow Units ..... CFS  
Elevation Type ..... Elevation  
Hydrology Method ..... Rational  
Time of Concentration (TOC) Method ..... User-Defined  
Link Routing Method ..... Kinematic Wave  
Enable Overflow Ponding at Nodes ..... YES  
Skip Steady State Analysis Time Periods ..... NO

## Analysis Options

Start Analysis On ..... Apr 07, 2020 00:00:00  
End Analysis On ..... Apr 07, 2020 01:00:00  
Start Reporting On ..... Apr 07, 2020 00:00:00  
Antecedent Dry Days ..... 0 days  
Runoff (Dry Weather) Time Step ..... 0 01:00:00 days hh:mm:ss  
Runoff (Wet Weather) Time Step ..... 0 00:05:00 days hh:mm:ss  
Reporting Time Step ..... 0 00:05:00 days hh:mm:ss  
Routing Time Step ..... 30 seconds

## Number of Elements

	Qty
Rain Gages .....	0
Subbasins.....	9

# Subbasin Hydrology

## Subbasin : Sub-01

### Input Data

Area (ac) ..... 0.13  
Weighted Runoff Coefficient ..... 0.8700

### Runoff Coefficient

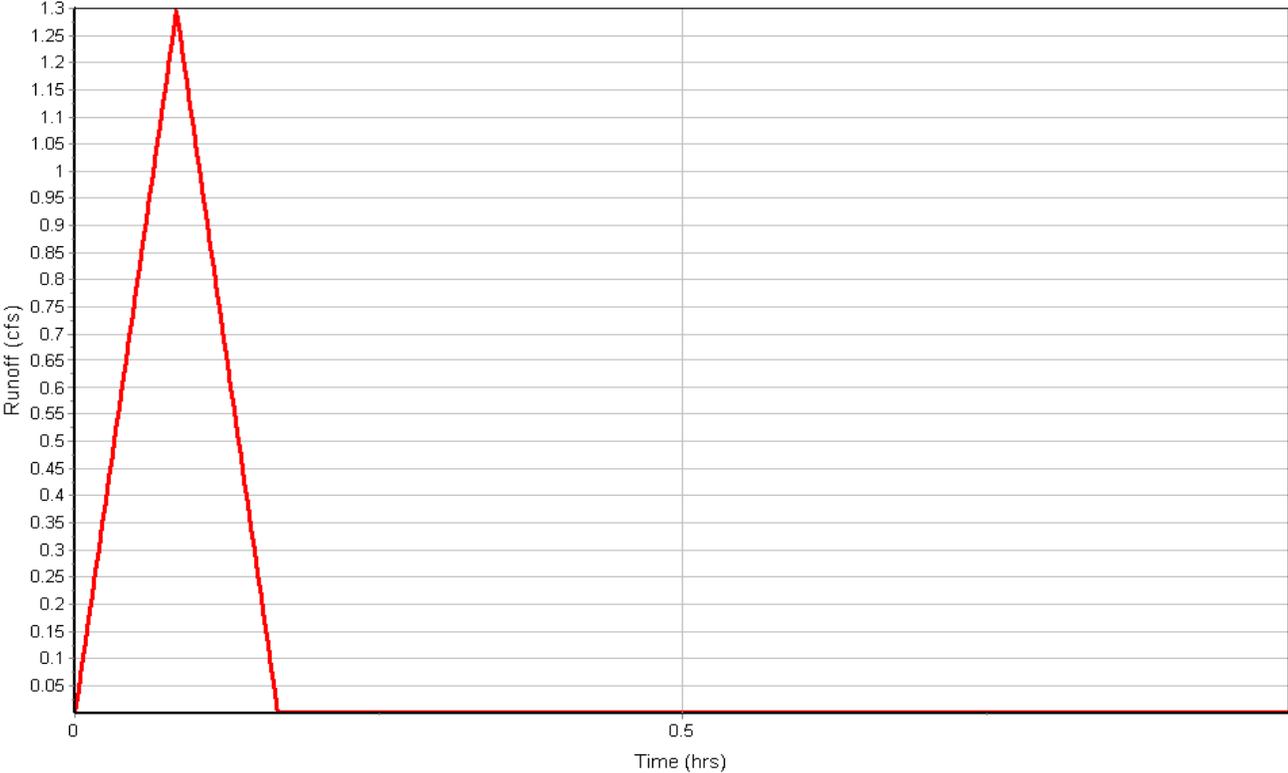

Soil/Surface Description	Area (acres)	Soil Group	Runoff Coeff.
-	0.10	-	0.99
-	0.03	-	0.51
Composite Area & Weighted Runoff Coeff.	0.13		0.87

### Subbasin Runoff Results

Total Rainfall (in) ..... 0.93  
Total Runoff (in) ..... 0.81  
Peak Runoff (cfs) ..... 1.30  
Rainfall Intensity ..... 11.200  
Weighted Runoff Coefficient ..... 0.8700  
Time of Concentration (days hh:mm:ss) ..... 0 00:05:00

Subbasin : Sub-01

Runoff Hydrograph

**Subbasin : Sub-02**

**Input Data**

Area (ac) ..... 0.17  
Weighted Runoff Coefficient ..... 0.9000

**Runoff Coefficient**

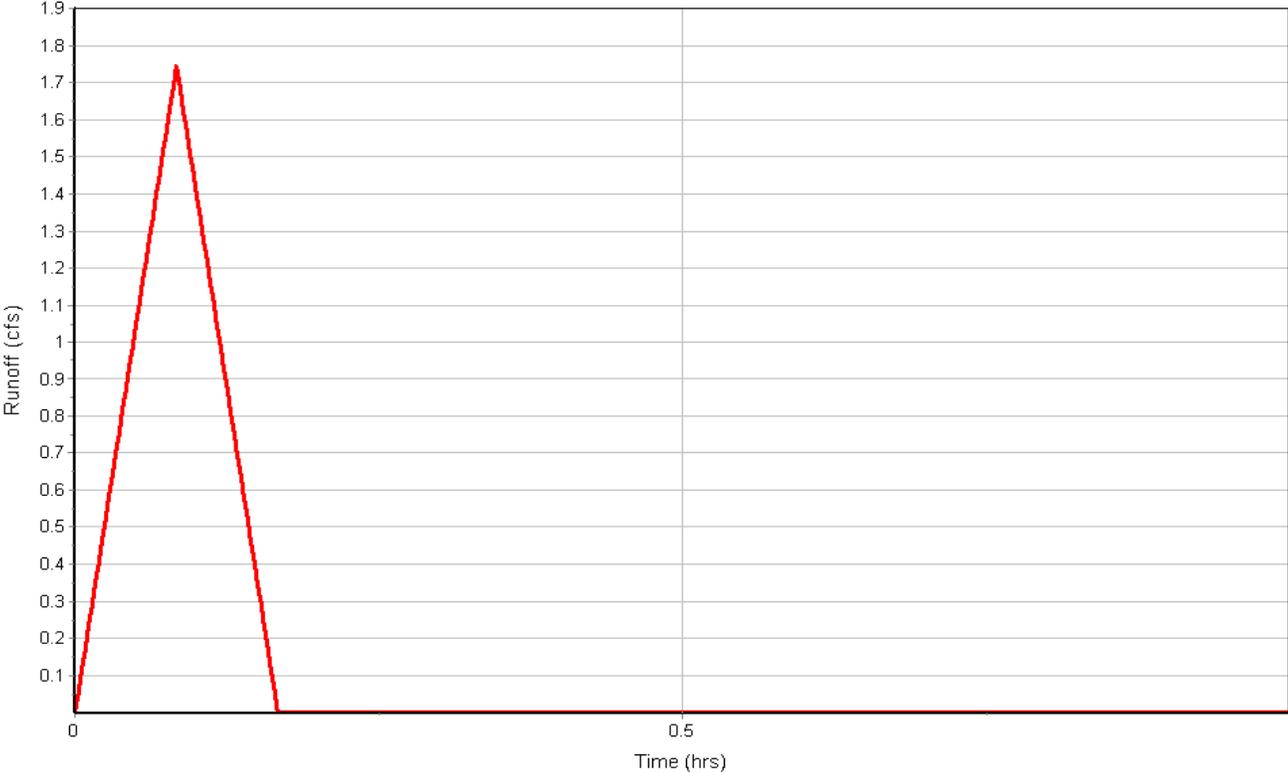

Soil/Surface Description	Area (acres)	Soil Group	Runoff Coeff.
-	0.03	-	0.51
-	0.14	-	0.99
Composite Area & Weighted Runoff Coeff.	0.17		0.90

**Subbasin Runoff Results**

Total Rainfall (in) ..... 0.93  
Total Runoff (in) ..... 0.84  
Peak Runoff (cfs) ..... 1.74  
Rainfall Intensity ..... 11.200  
Weighted Runoff Coefficient ..... 0.9000  
Time of Concentration (days hh:mm:ss) ..... 0 00:05:00

Subbasin : Sub-02

Runoff Hydrograph

**Subbasin : Sub-03**

**Input Data**

Area (ac) ..... 0.39  
Weighted Runoff Coefficient ..... 7.4000

**Runoff Coefficient**

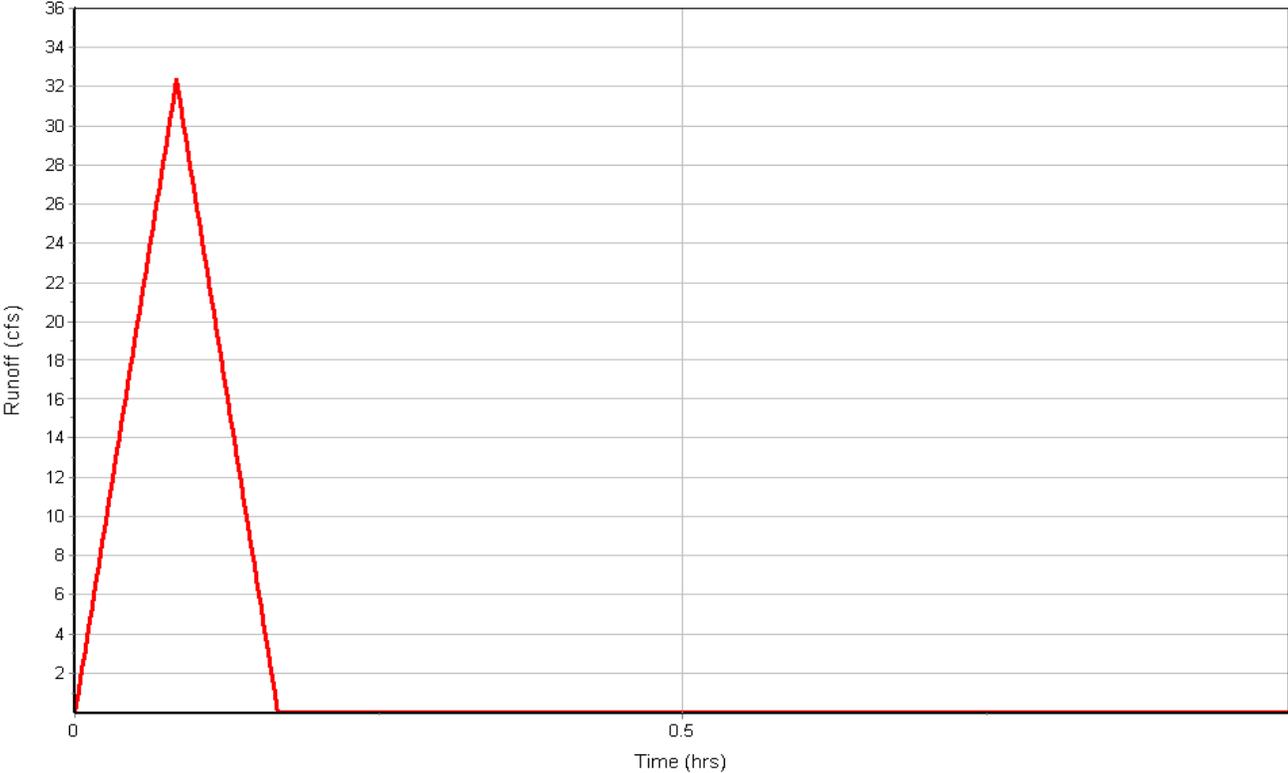

Soil/Surface Description	Area (acres)	Soil Group	Runoff Coeff.
-	0.34	-	0.99
-	0.05	-	51.00
Composite Area & Weighted Runoff Coeff.	0.39		7.40

**Subbasin Runoff Results**

Total Rainfall (in) ..... 0.93  
Total Runoff (in) ..... 6.91  
Peak Runoff (cfs) ..... 32.32  
Rainfall Intensity ..... 11.200  
Weighted Runoff Coefficient ..... 7.4000  
Time of Concentration (days hh:mm:ss) ..... 0 00:05:00

Subbasin : Sub-03

Runoff Hydrograph

**Subbasin : Sub-1B**

**Input Data**

Area (ac) ..... 0.89  
Weighted Runoff Coefficient ..... 0.9600

**Runoff Coefficient**

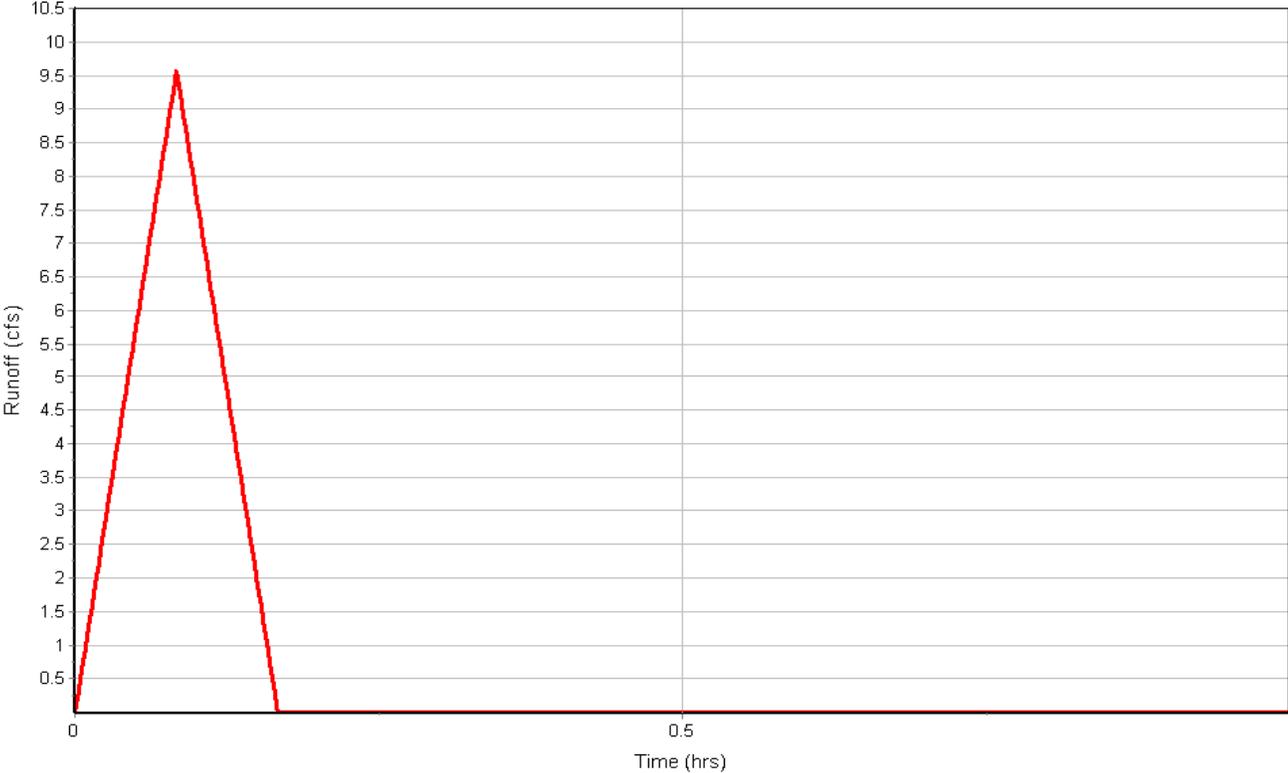

Soil/Surface Description	Area (acres)	Soil Group	Runoff Coeff.
-	0.06	-	0.51
-	0.83	-	0.99
Composite Area & Weighted Runoff Coeff.	0.89		0.96

**Subbasin Runoff Results**

Total Rainfall (in) ..... 0.93  
Total Runoff (in) ..... 0.90  
Peak Runoff (cfs) ..... 9.57  
Rainfall Intensity ..... 11.200  
Weighted Runoff Coefficient ..... 0.9600  
Time of Concentration (days hh:mm:ss) ..... 0 00:05:00

Subbasin : Sub-1B

Runoff Hydrograph

**Subbasin : Sub-7A-2**

**Input Data**

Area (ac) ..... 0.00  
Weighted Runoff Coefficient ..... 0.0000

**Runoff Coefficient**

Soil/Surface Description	Area (acres)	Soil Group	Runoff Coeff.
-	0.00	-	0.51
Composite Area & Weighted Runoff Coeff.	0.00		0

**Subbasin Runoff Results**

Total Rainfall (in) ..... 0.93

## APPENDIX E

# STANDARD AND SPECIFICATIONS FOR CONSTRUCTION ROAD STABILIZATION

## Definition & Scope

The stabilization of temporary construction access routes, on-site vehicle transportation routes, and construction parking areas to control erosion on temporary construction routes and parking areas.

## Conditions Where Practice Applies

All traffic routes and parking areas for temporary use by construction traffic.

## Design Criteria

Construction roads should be located to reduce erosion potential, minimize impact on existing site resources, and maintain operations in a safe manner. Highly erosive soils, wet or rocky areas, and steep slopes should be avoided. Roads should be routed where seasonal water tables are deeper than 18 inches. Surface runoff and control should be in accordance with other standards.

**Road Grade** – A maximum grade of 12% is recommended, although grades up to 15% are possible for short distances.

**Road Width** – 12 foot minimum for one-way traffic or 24 foot minimum for two-way traffic.

**Side Slope of Road Embankment** – 2:1 or flatter.

**Ditch Capacity** – On-site roadside ditch and culvert capacities shall be the 10 yr. peak runoff.

**Composition** – Use a 6-inch layer of NYS DOT sub-base Types 1,2,3, 4 or equivalent as specified in NYSDOT Standard Specifications.

## Construction Specifications

1. Clear and strip roadbed and parking areas of all vegetation, roots, and other objectionable material.
2. Locate parking areas on naturally flat areas as available. Keep grades sufficient for drainage, but not more than 2 to 3 percent.
3. Provide surface drainage and divert excess runoff to stabilized areas.
4. Maintain cut and fill slopes to 2:1 or flatter and stabilized with vegetation as soon as grading is accomplished.
5. Spread 6-inch layer of sub-base material evenly over the full width of the road and smooth to avoid depressions.
6. Provide appropriate sediment control measures to prevent offsite sedimentation.

## Maintenance

Inspect construction roads and parking areas periodically for condition of surface. Top dress with new gravel as needed. Check ditches for erosion and sedimentation after rainfall events. Maintain vegetation in a healthy, vigorous condition. Areas producing sediment should be treated immediately.

# STANDARD AND SPECIFICATIONS FOR SILT FENCE

## **Definition & Scope**

A **temporary** barrier of geotextile fabric installed on the contours across a slope used to intercept sediment laden runoff from small drainage areas of disturbed soil by temporarily ponding the sediment laden runoff allowing settling to occur. The maximum period of use is limited by the ultraviolet stability of the fabric (approximately one year).

## **Conditions Where Practice Applies**

A silt fence may be used subject to the following conditions:

1. Maximum allowable slope length and fence length will not exceed the limits shown in the Design Criteria for the specific type of silt fence used ; and
2. Maximum ponding depth of 1.5 feet behind the fence; and
3. Erosion would occur in the form of sheet erosion; and
4. There is no concentration of water flowing to the barrier; and
5. Soil conditions allow for proper keying of fabric, or other anchorage, to prevent blowouts.

## **Design Criteria**

1. Design computations are not required for installations of 1 month or less. Longer installation periods should be designed for expected runoff.
2. All silt fences shall be placed as close to the disturbed area as possible, but at least 10 feet from the toe of a slope steeper than 3H:1V, to allow for maintenance and

roll down. The area beyond the fence must be undisturbed or stabilized.

3. The type of silt fence specified for each location on the plan shall not exceed the maximum slope length and maximum fence length requirements shown in the following table:

		Slope Length/Fence Length (ft.)		
Slope	Steepness	Standard	Reinforced	Super
<2%	< 50:1	300/1500	N/A	N/A
2-10%	50:1 to 10:1	125/1000	250/2000	300/2500
10-20%	10:1 to 5:1	100/750	150/1000	200/1000
20-33%	5:1 to 3:1	60/500	80/750	100/1000
33-50%	3:1 to 2:1	40/250	70/350	100/500
>50%	> 2:1	20/125	30/175	50/250

**Standard Silt Fence (SF)** is fabric rolls stapled to wooden stakes driven 16 inches in the ground.  
**Reinforced Silt Fence (RSF)** is fabric placed against welded wire fabric with anchored steel posts driven 16 inches in the ground.  
**Super Silt Fence (SSF)** is fabric placed against chain link fence as support backing with posts driven 3 feet in the ground.

4. Silt fence shall be removed as soon as the disturbed area has achieved final stabilization.

The silt fence shall be installed in accordance with the appropriate details. Where ends of filter cloth come together, they shall be overlapped, folded and stapled to prevent sediment bypass. Butt joints are not acceptable. A detail of the silt fence shall be shown on the plan. See Figure 5.30 on page 5.56 for Reinforced Silt Fence as an example of details to be provided.

## **Criteria for Silt Fence Materials**

1. Silt Fence Fabric: The fabric shall meet the following specifications unless otherwise approved by the appropriate erosion and sediment control plan approval authority. Such approval shall not constitute statewide acceptance.

Fabric Properties	Minimum Acceptable Value	Test Method
Grab Tensile Strength (lbs)	110	ASTM D 4632
Elongation at Failure (%)	20	ASTM D 4632
Mullen Burst Strength (PSI)	300	ASTM D 3786
Puncture Strength (lbs)	60	ASTM D 4833
Minimum Trapezoidal Tear Strength (lbs)	50	ASTM D 4533
Flow Through Rate (gal/min/sf)	25	ASTM D 4491
Equivalent Opening Size	40-80	US Std Sieve ASTM D 4751
Minimum UV Residual (%)	70	ASTM D 4355

### Super Silt Fence

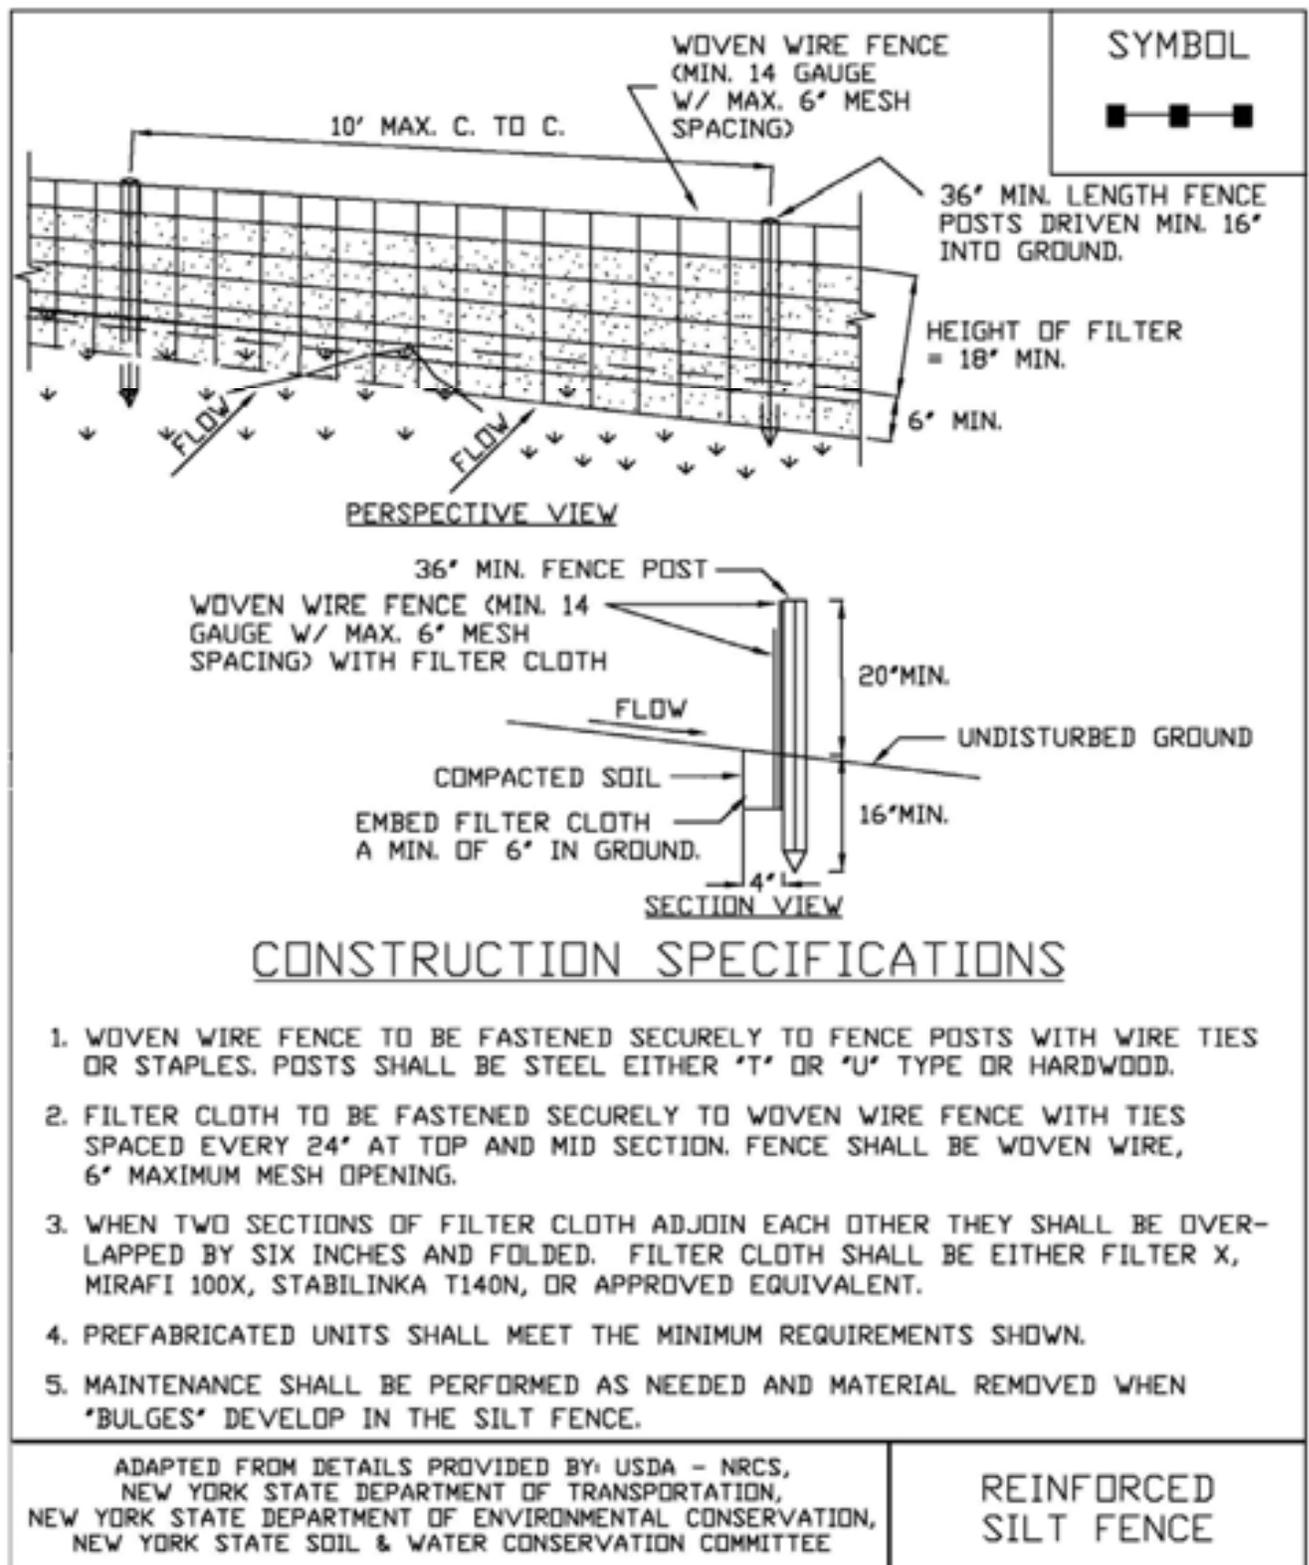

2. Fence Posts (for fabricated units): The length shall be a minimum of 36 inches long. Wood posts will be of sound quality hardwood with a minimum cross sectional area of 3.5 square inches. Steel posts will be standard T and U section weighing not less than 1.00 pound per linear foot. Posts for super silt fence shall be standard chain link fence posts.
3. Wire Fence for reinforced silt fence: Wire fencing shall be a minimum 14 gage with a maximum 6 in. mesh opening, or as approved.
4. Prefabricated silt fence is acceptable as long as all material specifications are met.

### Reinforced Silt Fence

**Figure 5.30  
Reinforced Silt Fence**

# STANDARD AND SPECIFICATIONS FOR PROTECTING VEGETATION DURING CONSTRUCTION

## **Definition & Scope**

The protection of trees, shrubs, ground cover and other vegetation from damage by construction equipment. In order to preserve existing vegetation determined to be important for soil erosion control, water quality protection, shade, screening, buffers, wildlife habitat, wetland protection, and other values.

## **Conditions Where Practices Applies**

On planned construction sites where valued vegetation exists and needs to be preserved.

## **Design Criteria**

### 1. Planning Considerations

#### A. Inventory:

1) Property boundaries, topography, vegetation and soils information should be gathered. Identify potentially high erosion areas, areas with tree windthrow potential, etc. A vegetative cover type map should be made on a copy of a topographic map which shows other natural and manmade features. Vegetation that is desirable to preserve because of its value for screening, shade, critical erosion control, endangered species, aesthetics, etc., should be identified and marked on the map.

2) Based upon this data, general statements should be prepared about the present condition, potential problem areas, and unique features of the property.

#### B. Planning:

1) After engineering plans (plot maps) are prepared, another field review should take place and

recommendations made for the vegetation to be saved. Minor adjustments in location of roads, dwellings, and utilities may be needed. Construction on steep slopes, erodible soils, wetlands, and streams should be avoided. Clearing limits should be delineated (See "Determine Limits of Clearing and Grading" on page 2.2).

2) Areas to be seeded and planted should be identified. Remaining vegetation should blend with their surroundings and/or provide special function such as a filter strip, buffer zone, or screen.

3) Trees and shrubs of special seasonal interest, such as flowering dogwood, red maple, striped maple, serviceberry, or shadbush, and valuable potential shade trees should be identified and marked for special protective treatment as appropriate.

4) Trees to be cut should be marked on the plans. If timber can be removed for salable products, a forester should be consulted for marketing advice.

5) Trees that may become a hazard to people, personal property, or utilities should be removed. These include trees that are weak-wooded, disease-prone, subject to windthrow, or those that have severely damaged root systems.

6) The vigor of remaining trees may be improved by a selective thinning. A forester should be consulted for implementing this practice.

### 2. Measures to Protect Vegetation

A. Limit soil placement over existing tree and shrub roots to a maximum of 3 inches. Soils with loamy texture and good structure should be used.

B. Use retaining walls and terraces to protect roots of trees and shrubs when grades are lowered. Lowered grades should start no closer than the dripline of the tree. For narrow-canopied trees and shrubs, the stem diameter in inches is converted to feet and doubled, such that a 10 inch tree should be protected to 20 feet.

C. Trenching across tree root systems should be the same minimum distance from the trunk, as in "B". Tunnels under root systems for underground utilities should start 18 inches or deeper below the normal ground surface. Tree roots which must be severed should be cut clean. Backfill material that will be in contact with the roots should be topsoil or a prepared planting soil mixture.

D. Construct sturdy fences, or barriers, of wood, steel, or other protective material around valuable

vegetation for protection from construction equipment. Place barriers far enough away from trees, but not less than the specifications in "B", so that tall equipment such as backhoes and dump trucks do not contact tree branches.

E. Construction limits should be identified and clearly marked to exclude equipment.

F. Avoid spills of oil/gas and other contaminants.

G. Obstructive and broken branches should be pruned properly. The branch collar on all branches whether living or dead should not be damaged. The 3 or 4 cut method should be used on all branches larger than two inches at the cut. First cut about one-third the way through the underside of the limb (about 6-12 inches from the tree trunk). Then (approximately an inch further out) make a second cut through the limb from the upper side. When the branch is removed, there is no splintering of the main tree trunk. Remove the stub. If the branch is larger than 5-6 inches in diameter, use the four cut system. Cuts 1 and 2 remain the same and cut 3 should be from the underside of the limb, on the outside of the branch collar. Cut 4 should be from the top and in alignment with the 3rd cut. Cut 3 should be 1/4 to 1/3 the way through the limb. This will prevent the bark from peeling down the trunk. Do not paint the cut surface.

H. Penalties for damage to valuable trees, shrubs, and herbaceous plants should be clearly spelled out in the contract.

#### **PROTECTING TREES IN HEAVY USE AREAS**

The compaction of soil over the roots of trees and shrubs by the trampling of recreationists, vehicular traffic, etc., reduces oxygen, water, and nutrient uptake by feeder roots. This weakens and may eventually kill the plants. Table 2.6 rates the "Susceptibility of Tree Species to Compaction."

Where heavy compaction is anticipated, apply and maintain a 3 to 4 inch layer of undecayed wood chips or 2 inches of No. 2 washed, crushed gravel. In addition, use of a wooden or plastic mat may be used to lessen compaction, if applicable.

## Table 2.6 Susceptibility of Tree Species to Compaction<sup>1</sup>

### Resistant:

Box elder.....	<i>Acer negundo</i>	Willows.....	<i>Salix spp.</i>
Green ash.....	<i>Fraxinus pennsylvanica</i>	Honey locust.....	<i>Gleditsia triacanthos</i>
Red elm.....	<i>Ulmus rubra</i>	Eastern cottonwood.....	<i>Populus deltoides</i>
Hawthornes.....	<i>Crataegus spp.</i>	Swamp white oak.....	<i>Quercus bicolor</i>
Bur oak.....	<i>Quercus macrocarpa</i>	Hophornbeam.....	<i>Ostrya virginiana</i>
Northern white cedar....	<i>Thuja occidentalis</i>		

### Intermediate:

Red maple.....	<i>Acer rubrum</i>	Sweetgum.....	<i>Liquidambar styraciflua</i>
Silver maple.....	<i>Acer saccharinum</i>	Norway maple.....	<i>Acer platanoides</i>
Hackberry.....	<i>Celtis occidentalis</i>	Shagbark hickory.....	<i>Carya ovata</i>
Black gum.....	<i>Nyssa sylvatica</i>	London plane.....	<i>Platanus x hybrida</i>
Red oak.....	<i>Quercus rubra</i>	Pin oak.....	<i>Quercus palustris</i>
Basswood.....	<i>Tilia americana</i>		

### Susceptible:

Sugar maple.....	<i>Acer saccharum</i>	Austrian Pine.....	<i>Pinus nigra</i>
White pine.....	<i>Pinus strobus</i>	White ash.....	<i>Fraxinus americana</i>
Blue spruce.....	<i>Picea pungens</i>	Paper birch.....	<i>Betula papyrifera</i>
White oak.....	<i>Quercus alba</i>	Moutain ash.....	<i>Sorbus aucuparia</i>
Red pine.....	<i>Pinus resinosa</i>	Japanese maple.....	<i>Acer palmatum</i>

<sup>1</sup> If a tree species does not appear on the list, insufficient information is available to rate it for this purpose.

# STANDARD AND SPECIFICATIONS FOR STORM DRAIN INLET PROTECTION

## Definition & Scope

A **temporary** barrier with low permeability, installed around inlets in the form of a fence, berm or excavation around an opening, detaining water and thereby reducing the sediment content of sediment laden water by settling thus preventing heavily sediment laden water from entering a storm drain system.

## Conditions Where Practice Applies

This practice shall be used where the drainage area to an inlet is disturbed, it is not possible to temporarily divert the storm drain outfall into a trapping device, and watertight blocking of inlets is not advisable. **It is not to be used in place of sediment trapping devices.** This practice shall be used with an upstream buffer strip if placed at a storm drain inlet on a paved surface. It may be used in conjunction with storm drain diversion to help prevent siltation of pipes installed with low slope angle.

## Types of Storm Drain Inlet Practices

There are five (5) specific types of storm drain inlet protection practices that vary according to their function, location, drainage area, and availability of materials:

- I. Excavated Drop Inlet Protection
- II. Fabric Drop Inlet Protection
- III. Stone & Block Drop Inlet Protection
- IV. Paved Surface Inlet Protection
- V. Manufactured Insert Inlet Protection

## Design Criteria

**Drainage Area** – The drainage area for storm drain inlets shall not exceed one acre. Erosion control/temporary stabilization measures must be implemented on the disturbed

drainage area tributary to the inlet. The crest elevations of these practices shall provide storage and minimize bypass flow.

### **Type I – Excavated Drop Inlet Protection**

This practice is generally used during initial overlot grading after the storm drain trunk line is installed.

Limit the drainage area to the inlet device to 1 acre. Excavated side slopes shall be no steeper than 2:1. The minimum depth shall be 1 foot and the maximum depth 2 feet as measured from the crest of the inlet structure. Shape the excavated basin to fit conditions with the longest dimension oriented toward the longest inflow area to provide maximum trap efficiency. The capacity of the excavated basin should be established to contain 900 cubic feet per acre of disturbed area. Weep holes, protected by fabric and stone, should be provided for draining the temporary pool.

Inspect and clean the excavated basin after every storm. Sediment should be removed when 50 percent of the storage volume is achieved. This material should be incorporated into the site in a stabilized manner.

### **Type II – Fabric Drop Inlet Protection**

This practice is generally used during final elevation grading phases after the storm drain system is completed.

Limit the drainage area to 1 acre per inlet device. Land area slope immediately surrounding this device should not exceed 1 percent. The maximum height of the fabric above the inlet crest shall not exceed 1.5 feet unless reinforced.

The top of the barrier should be maintained to allow overflow to drop into the drop inlet and not bypass the inlet to

unprotected lower areas. Support stakes for fabric shall be a minimum of 3 feet long, spaced a maximum 3 feet apart. They should be driven close to the inlet so any overflow drops into the inlet and not on the unprotected soil. Improved performance and sediment storage volume can be obtained by excavating the area.

Inspect the fabric barrier after each rain event and make repairs as needed. Remove sediment from the pool area as necessary with care not to undercut or damage the filter fabric. Upon stabilization of the drainage area, remove all materials and unstable sediment and dispose of properly. Bring the adjacent area of the drop inlet to grade, smooth and compact and stabilize in the appropriate manner to the site.

### **Type III – Stone and Block Drop Inlet Protection**

This practice is generally used during the initial and intermediate overlot grading of a construction site.

Limit the drainage area to 1 acre at the drop inlet. The stone barrier should have a minimum height of 1 foot and a maximum height of 2 feet. Do not use mortar. The height should be limited to prevent excess ponding and bypass flow.

Recess the first course of blocks at least 2 inches below the crest opening of the storm drain for lateral support. Subsequent courses can be supported laterally if needed by placing a 2x4 inch wood stud through the block openings perpendicular to the course. The bottom row should have a few blocks oriented so flow can drain through the block to dewater the basin area.

The stone should be placed just below the top of the blocks on slopes of 2:1 or flatter. Place hardware cloth of wire mesh with ½ inch openings over all block openings to hold stone in place.

As an optional design, the concrete blocks may be omitted and the entire structure constructed of stone, ringing the outlet (“doughnut”). The stone should be kept at a 3:1 slope toward the inlet to keep it from being washed into the inlet. A level area 1 foot wide and four inches below the crest will further prevent wash. Stone on the slope toward the inlet should be at least 3 inches in size for stability and 1 inch or smaller away from the inlet to control flow rate. The elevation of the top of the stone crest must be maintained 6 inches lower than the ground elevation down slope from the inlet to ensure that all storm flows pass over the stone into the storm drain and not past the structure. Temporary diking should be used as necessary to prevent bypass flow.

The barrier should be inspected after each rain event and repairs made where needed. Remove sediment as necessary to provide for accurate storage volume for subsequent rains. Upon stabilization of contributing drainage area, remove all

materials and any unstable soil and dispose of properly.

Bring the disturbed area to proper grade, smooth, compact and stabilize in a manner appropriate to the site.

### **Type IV – Paved Surface Inlet Protection**

This practice is generally used after pavement construction has been done while final grading and soil stabilization is occurring. These practices should be used with upstream buffer strips in linear construction applications, and with temporary surface stabilization for overlot areas, to reduce the sediment load at the practice. This practice includes sand bags, compost filter socks, geo-tubes filled with ballast, and manufactured surface barriers. Pea gravel can also be used in conjunction with these practices to improve performance. When the inlet is not at a low point, and is offset from the pavement or gutter line, protection should be selected and installed so that flows are not diverted around the inlet.

The drainage area should be limited to 1 acre at the drain inlet. All practices will be placed at the inlet perimeter or beyond to maximize the flow capacity of the inlet. Practices shall be weighted, braced, tied, or otherwise anchored to prevent movement or shifting of location on paved surfaces. Traffic safety shall be integrated with the use of this practice. All practices should be marked with traffic safety cones as appropriate. Structure height shall not cause flooding or by-pass flow that would cause additional erosion.

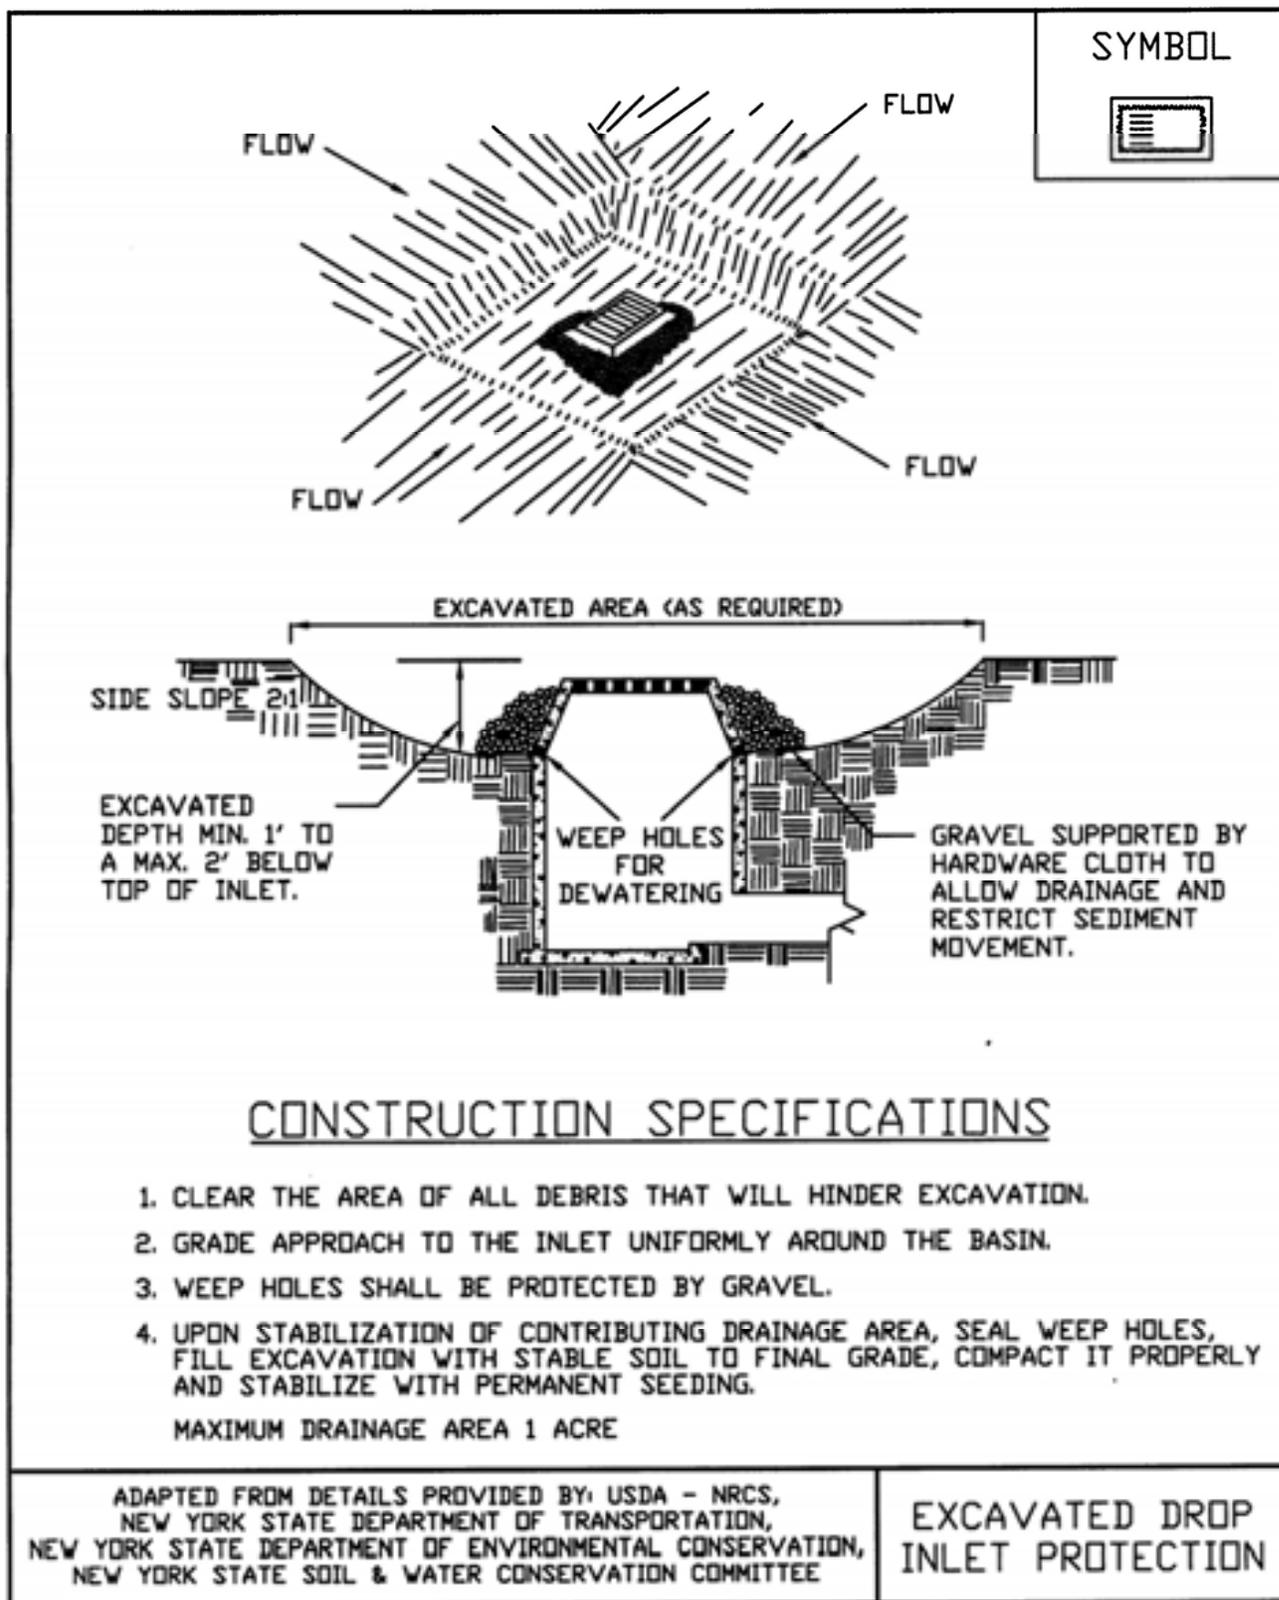

The structure should be inspected after every storm event. Any sediment should be removed and disposed of on the site. Any broken or damaged components should be replaced. Check all materials for proper anchorage and secure as necessary.

### **Type V - Manufactured Insert Inlet Protection**

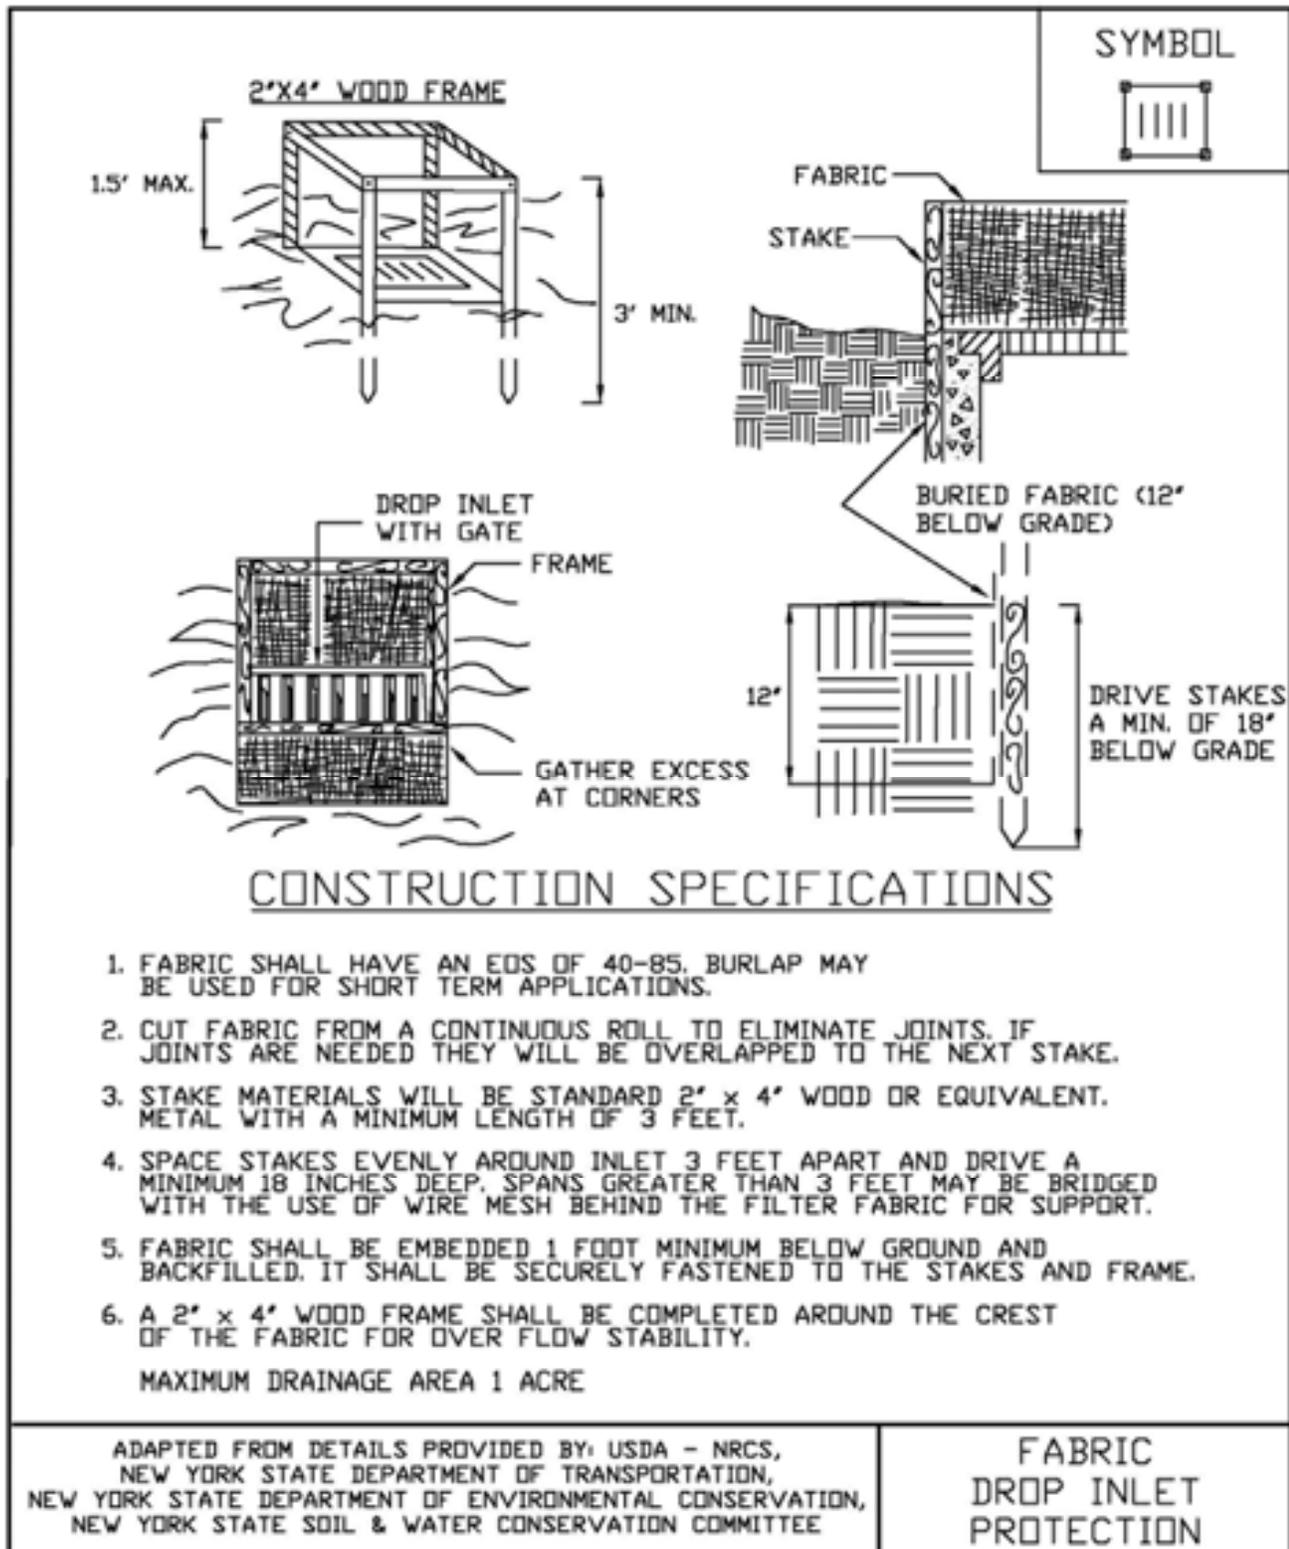

The drainage area shall be limited to 1 acre at the drain inlet. All inserts will be installed and anchored in accordance with the manufacturers recommendations and design details. The fabric portion of the structure will equal or exceed the performance standard for the silt fence fabric. The inserts will be installed to preserve a minimum of 50 percent of the open, unobstructed design flow area of the storm drain inlet opening to maintain capacity for storm events.

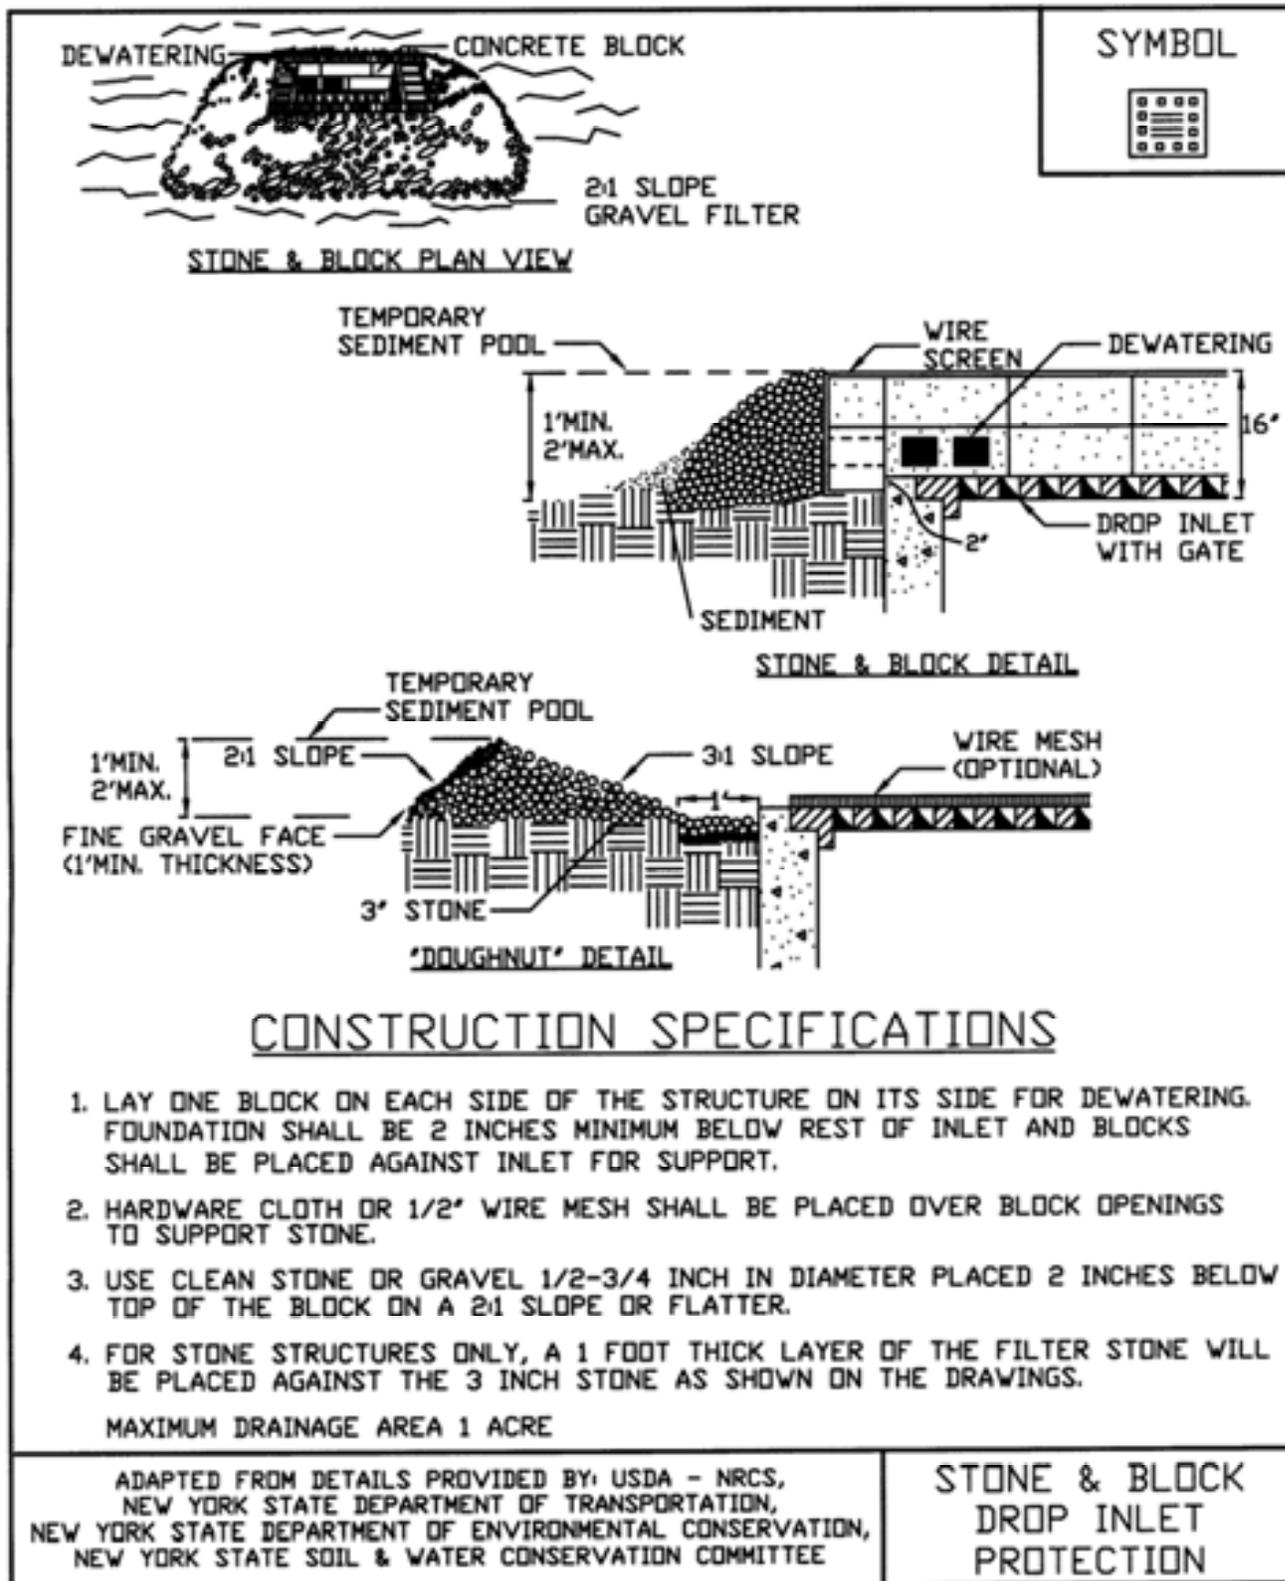

**Figure 5.31  
Excavated Drop Inlet Protection**

**Figure 5.32  
Fabric Drop Inlet Protection**

**Figure 5.33**  
**Stone & Block Drop Inlet Protection**

# STANDARD AND SPECIFICATIONS FOR CONCRETE TRUCK WASHOUT

## Definition & Scope

A temporary excavated or above ground lined constructed pit where concrete truck mixers and equipment can be washed after their loads have been discharged, to prevent highly alkaline runoff from entering storm drainage systems or leaching into soil.

## Conditions Where Practice Applies

Washout facilities shall be provided for every project where concrete will be poured or otherwise formed on the site. This facility will receive highly alkaline wash water from the cleaning of chutes, mixers, hoppers, vibrators, placing equipment, trowels, and screeds. Under no circumstances will wash water from these operations be allowed to infiltrate into the soil or enter surface waters.

## Design Criteria

**Capacity:** The washout facility should be sized to contain solids, wash water, and rainfall and sized to allow for the evaporation of the wash water and rainfall. Wash water shall be estimated at 7 gallons per chute and 50 gallons per hopper of the concrete pump truck and/or discharging drum. The minimum size shall be 8 feet by 8 feet at the bottom and 2 feet deep. If excavated, the side slopes shall be 2 horizontal to 1 vertical.

**Location:** Locate the facility a minimum of 100 feet from drainage swales, storm drain inlets, wetlands, streams and other surface waters. Prevent surface water from entering the structure except for the access road. Provide appropriate access with a gravel access road sloped down to the structure. Signs shall be placed to direct drivers to the facility after their load is discharged.

**Liner:** All washout facilities will be lined to prevent

leaching of liquids into the ground. The liner shall be plastic sheeting with a minimum thickness of 10 mils with no holes or tears, and anchored beyond the top of the pit with an earthen berm, sand bags, stone, or other structural appurtenance except at the access point.

If pre-fabricated washouts are used they must ensure the capture and containment of the concrete wash and be sized based on the expected frequency of concrete pours. They shall be sited as noted in the location criteria.

## Maintenance

- All concrete washout facilities shall be inspected daily. Damaged or leaking facilities shall be deactivated and repaired or replaced immediately. Excess rainwater that has accumulated over hardened concrete should be pumped to a stabilized area, such as a grass filter strip.
- Accumulated hardened material shall be removed when 75% of the storage capacity of the structure is filled. Any excess wash water shall be pumped into a containment vessel and properly disposed of off site.
- Dispose of the hardened material off-site in a construction/demolition landfill. On-site disposal may be allowed if this has been approved and accepted as part of the projects SWPPP. In that case, the material should be recycled as specified, or buried and covered with a minimum of 2 feet of clean compacted earthfill that is permanently stabilized to prevent erosion.
- The plastic liner shall be replaced with each cleaning of the washout facility.
- Inspect the project site frequently to ensure that no concrete discharges are taking place in non-designated areas.

# STANDARD AND SPECIFICATIONS FOR DUST CONTROL

dust control (see Section 3).

**Mulch** (including gravel mulch) – Mulch offers a fast effective means of controlling dust. This can also include rolled erosion control blankets.

**Spray adhesives** – These are products generally composed of polymers in a liquid or solid form that are mixed with water to form an emulsion that is sprayed on the soil surface with typical hydroseeding equipment. The mixing ratios and application rates will be in accordance with the manufacturer's recommendations for the specific soils on the site. In no case should the application of these adhesives be made on wet soils or if there is a probability of precipitation within 48 hours of its proposed use. Material Safety Data Sheets will be provided to all applicators and others working with the material.

## Definition & Scope

The control of dust resulting from land-disturbing activities, to prevent surface and air movement of dust from disturbed soil surfaces that may cause off-site damage, health hazards, and traffic safety problems.

## Conditions Where Practice Applies

On construction roads, access points, and other disturbed areas subject to surface dust movement and dust blowing where off-site damage may occur if dust is not controlled.

## Design Criteria

**Construction operations should be scheduled to minimize the amount of area disturbed at one time.** Buffer areas of vegetation should be left where practical. Temporary or permanent stabilization measures shall be installed. No specific design criteria is given; see construction specifications below for common methods of dust control.

Water quality must be considered when materials are selected for dust control. Where there is a potential for the material to wash off to a stream, ingredient information must be provided to the NYSDEC.

No polymer application shall take place without written approval from the NYSDEC.

## Construction Specifications

**A. Non-driving Areas** – These areas use products and materials applied or placed on soil surfaces to prevent airborne migration of soil particles.

**Vegetative Cover** – For disturbed areas not subject to traffic, vegetation provides the most practical method of

**B. Driving Areas** – These areas utilize water, polymer emulsions, and barriers to prevent dust movement from the traffic surface into the air.

**Sprinkling** – The site may be sprayed with water until the surface is wet. This is especially effective on haul roads and access route to provide short term limited dust control.

**Polymer Additives** – These polymers are mixed with water and applied to the driving surface by a water truck with a gravity feed drip bar, spray bar or automated distributor truck. The mixing ratios and application rates will be in accordance with the manufacturer's recommendations. Incorporation of the emulsion into the soil will be done to the appropriate depth based on expected traffic. Compaction after incorporation will be by vibratory roller to a minimum of 95%. The prepared surface shall be moist and no application of the polymer will be made if there is a probability of precipitation within 48 hours of its proposed use. Material Safety Data Sheets will be provided to all applicators working with the material.

**Barriers** – Woven geo-textiles can be placed on the driving surface to effectively reduce dust throw and particle migration on haul roads. Stone can also be used for construction roads for effective dust control.

**Windbreak** – A silt fence or similar barrier can control air currents at intervals equal to ten times the barrier height. Preserve existing wind barrier vegetation as much as practical.

## Maintenance

Maintain dust control measures through dry weather periods until all disturbed areas are stabilized.

# STANDARD AND SPECIFICATIONS FOR SEDIMENT TRAP

## Definition & Scope

A **temporary** sediment control device formed by excavation and/or embankment to intercept sediment-laden runoff and trap the sediment in order to protect drainageways, properties, and rights-of-way below the sediment trap from sedimentation.

## Conditions Where Practice Applies

A sediment trap is usually installed in a drainageway, at a storm drain inlet, or other points of collection from a disturbed area for one construction season.

Sediment traps should be used to artificially break up the natural drainage area into smaller sections where a larger device (sediment basin) would be less effective.

## Design Criteria

If the drainage area to the proposed trap location exceeds 5 acres, or the trap is in place beyond one construction season, or any of the additional design criteria presented here cannot be met, a full Sediment Basin must be used. See Standard and Specification for Sediment Basin on page 5.19.

## Drainage Area

The maximum drainage area for all sediment traps shall be 5 acres.

## Location

Sediment traps shall be located so that they can be installed prior to grading or filling in the drainage area they are to protect. Traps must **not be located any closer than 20 feet** from a proposed building foundation if the trap is to func-

tion during building construction. Locate traps to obtain maximum storage benefit from the terrain and for ease of cleanout and disposal of the trapped sediment.

## Trap Size

The volume of a sediment trap as measured at the elevation of the crest of the outlet shall be at least 3,600 cubic feet per acre of drainage area. A minimum length to width ratio of 2:1 should be provided. The volume of a constructed trap shall be calculated using standard mathematical procedures. The volume of a natural sediment trap may be approximated by the equation: Volume (cu.ft.) = 0.4 x surface area (sq.ft.) x maximum depth (ft.).

## Trap Cleanout

Sediment shall be removed and the trap restored to the original dimensions when the sediment has accumulated to  $\frac{1}{2}$  of the design depth of traps I-II, and  $\frac{1}{3}$  the depth for trap III. Sediment removed from the trap shall be deposited in a protected area and in such a manner that it will not erode.

## Embankment

All earth embankments for sediment traps shall not exceed five (5) feet in height as measured at the low point of the original ground along the centerline of the embankment. Embankments shall have a minimum four (4) foot wide top and side slopes of 2:1 or flatter. The embankment shall be compacted by traversing with equipment while it is being constructed. The embankment shall be stabilized with seed and mulch as soon as it is completed

The elevation of the top of any dike directing water to any sediment trap will equal or exceed the maximum height of the outlet structure along the entire length of the trap.

## Excavation

All excavation operations shall be carried out in such a manner that erosion and water pollution shall be minimal. Excavated portions of sediment traps shall have 1:1 or flatter slopes.

## Outlet

The outlet shall be designed, constructed, and maintained in such a manner that sediment does not leave the trap and that erosion at or below the outlet does not occur.

Sediment traps must outlet onto stabilized (preferable undisturbed) ground, into a watercourse, stabilized channel, or into a storm drain system. Distance between inlet and outlet should be maximized to the longest length practicable.

All traps must be seeded and mulched immediately after construction.

### **Trap Details Needed on Erosion and Sediment Control Plans**

Each trap shall be delineated on the plans in such a manner that it will not be confused with any other features. Each trap on a plan shall indicate all the information necessary to properly construct and maintain the structure. If the drawings are such that this information cannot be delineated on the drawings, then a table shall be developed. If a table is developed, then each trap on a plan shall have a number and the numbers shall be consecutive.

The following information shall be shown for each trap in a summary table format on the plans.

1. Trap number
2. Type of trap
3. Drainage area
4. Storage required
5. Storage provided (if applicable)
6. Outlet length or pipe sizes
7. Storage depth below outlet or cleanout elevation
8. Embankment height and elevation (if applicable)

### **Type of Sediment Traps**

There are three (3) specific types of sediment traps which vary according to their function, location, or drainage area.

- I. Pipe Outlet Sediment Trap
- II. Stone Outlet Sediment Trap
- III. Compost Filter Sock Sediment Trap

#### **I. Pipe Outlet Sediment Trap**

A Pipe Outlet Sediment Trap consists of a trap formed by embankment or excavation. The outlet for the trap is through a perforated riser and a pipe through the embankment. The outlet pipe and riser shall be made of steel, corrugated metal or other suitable material. The top of the embankment shall be at least 1 ½ feet above the crest of the riser. The preferred method of dewatering the sediment trap is by surface skimmer. See Dewatering Device Standard, page 5.10. If the riser alone is used for dewatering, the top 2/3 of the riser shall be perforated with one (1) inch nominal diameter holes or slits spaced six (6) inches vertically and horizontally placed in the concave portion of the corrugated pipe.

No holes or slits will be allowed within six (6) inches of the top of the horizontal barrel. All pipe connections shall be watertight. The riser shall be wrapped with ½ to ¼ inch hardware cloth wire then wrapped with filter cloth with a sieve size between #40-80 and secured with strapping or connecting band at the top and bottom of the cloth. The

cloth shall cover an area at least six (6) inches above the highest hole and six (6) inches below the lowest hole. The top of the riser pipe shall not be covered with filter cloth. The riser shall have a base with sufficient weight to prevent flotation of the riser. Two approved bases are:

1. A concrete base 12 in. thick with the riser embedded 9 in. into the concrete base, or
2. One quarter inch, minimum, thick steel plate attached to the riser by a continuous weld around the circumference of the riser to form a watertight connection. The plate shall have 2.5 feet of stone, gravel, or earth placed on it to prevent flotation. In either case, each side of the square base measurement shall be the riser diameter plus 24 inches.

Pipe outlet sediment traps shall be limited to a five (5) acre maximum drainage area. Pipe outlet sediment trap is interchangeable in the field with stone outlet provided that these sediment traps are constructed in accordance with the detail and specifications for that trap.

Select pipe diameter from the following table:  
See details for Pipe Outlet Sediment Trap ST-I in Figure 5.25 and 5.26 on pages 5.49 and 5.50.

Optional sediment trap dewatering devices are shown on Figure 5.29 on Page 5.53.

#### Minimum Sizes

<b>Barrel Diameter<sup>1</sup> (in.)</b>	<b>Riser Diameter<sup>1</sup> (in.)</b>	<b>Maximum Drainage Area (ac.)</b>
12	15	1
15	18	2
18	21	3
21	24	4
21	27	5
<sup>1</sup> Barrel diameter may be same size as riser diameter		

## II. Stone Outlet Sediment Trap

A Stone Outlet Sediment Trap consists of a trap formed by an embankment or excavation. The outlet of this trap is over a stone section placed on level ground. The minimum length (feet) of the outlet shall be equal to four (4) times the drainage area (acres).

Required storage shall be 3,600 cubic feet per acre of drainage area.

The outlet crest (top of stone in weir section) shall be level, at least one (1) foot below top of embankment and no more than one (1) foot above ground beneath the outlet. Stone used in the outlet shall be small riprap (4 in. x 8 in.). To provide more efficient trapping effect, a layer of filter cloth should be embedded one (1) foot back into the upstream face of the outlet stone or a one (1) foot thick layer of two (2) inch or finer aggregate shall be placed on the upstream face of the outlet.

Stone Outlet Sediment Traps may be interchangeable in the field with pipe outlet sediment traps provided they are constructed in accordance with the detail and specifications for those traps. Stone outlet sediment traps shall be limited to a five (5) acre maximum drainage area.

See details for Stone Outlet Sediment Trap ST-II in Figure 5.27 on page 5.51

## III. Compost Sock Sediment Trap

A compost sock sediment trap consists of a trap formed by creating an enclosure of geotextile mesh tubes filled with a compost filter media. These traps are used in locations where there is no opportunity to direct runoff into larger traps or well vegetated areas. This could occur at site entrances and access points or in tight areas due to construction boundary limits.

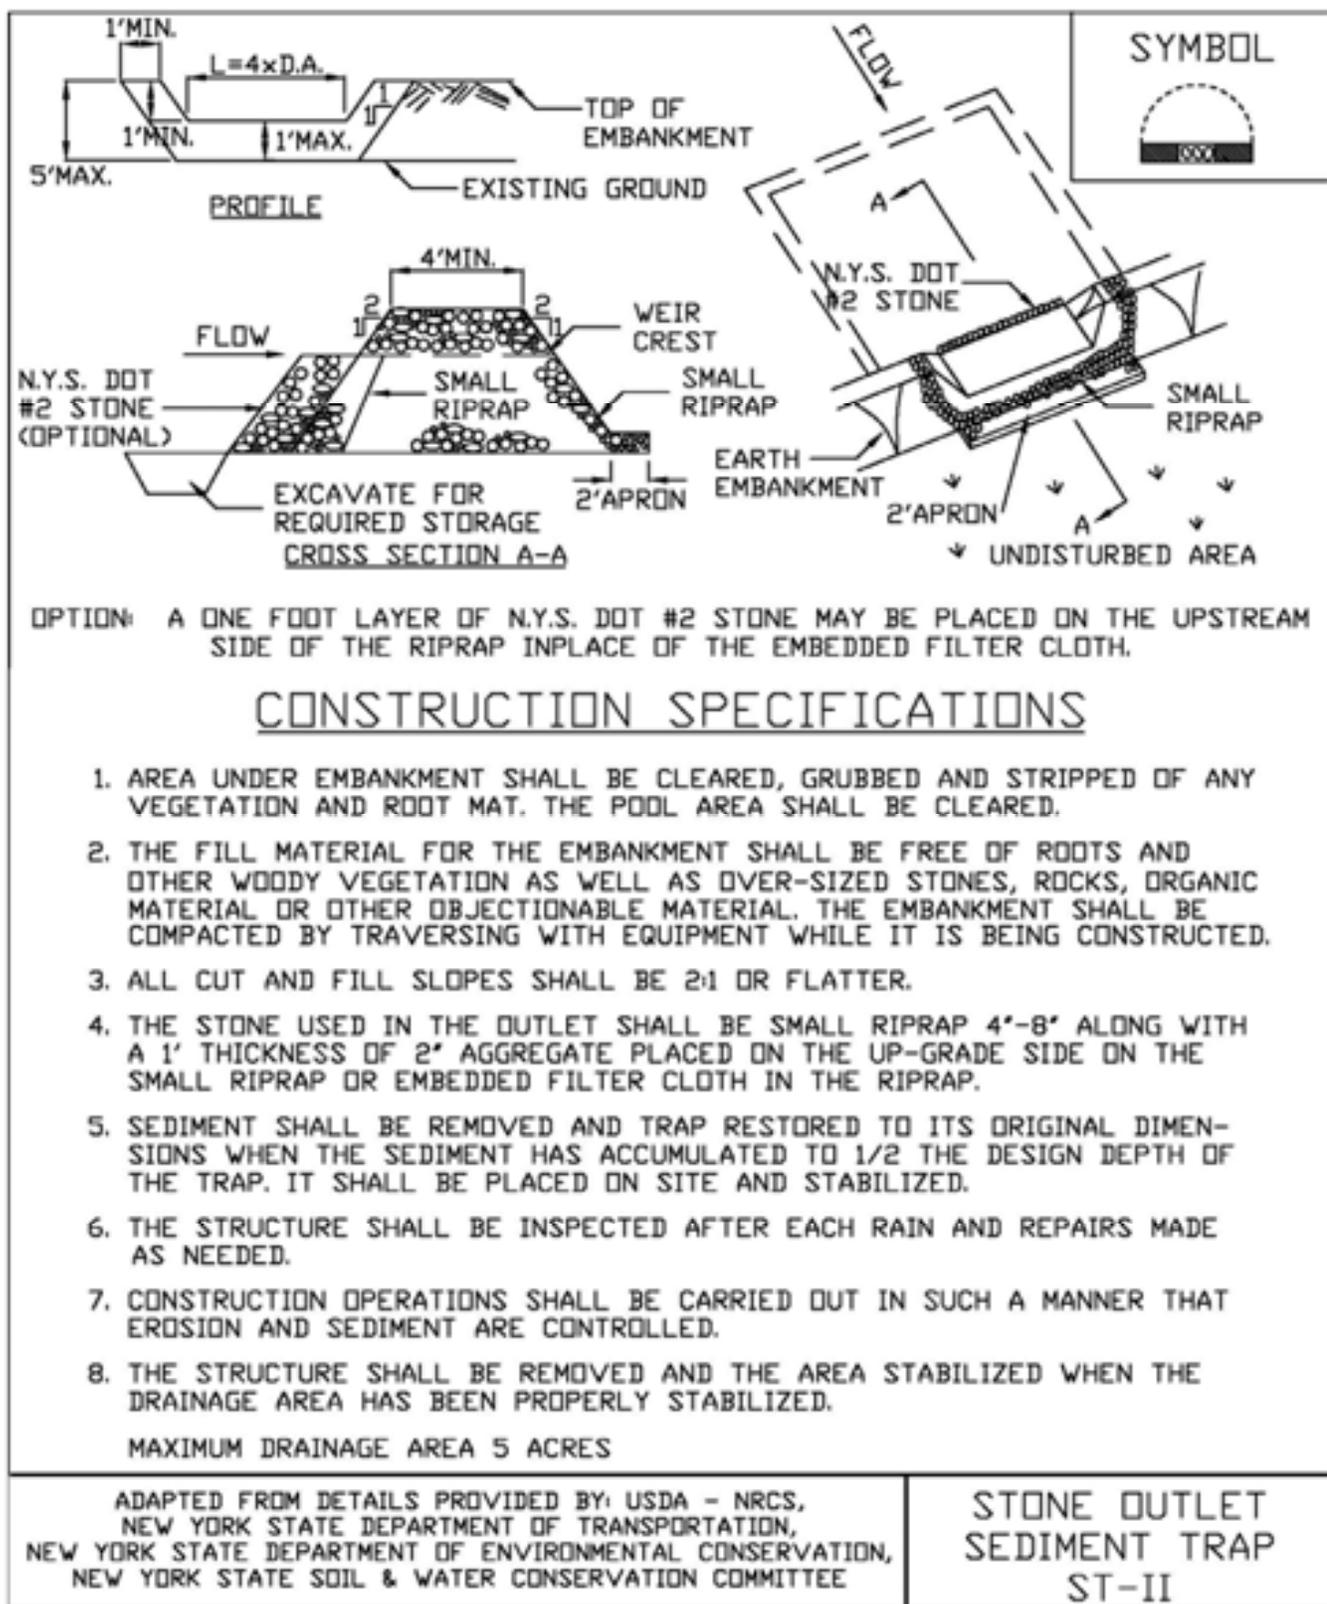

Surface runoff can be directed to the trap with standard conveyance practices. Groundwater or surface ponding in low areas can be pumped into the compost sock sediment trap with appropriate energy dissipation at the pump outlet to prevent scour.

Design criteria for Compost Sock Sediment Trap

1. The maximum drainage area tributary to the trap shall be 5 acres.
2. The minimum settled height above ground shall be 2.0 feet formed by staking 3 compost filter socks in a pyramid as shown in Figure 5.28 on page 5.52.
3. The storage volume provided in the compost sock sediment trap shall be 3,600 cubic feet per tributary drainage acre.
4. If necessary, additional storage area can be created by excavating a sump 1 foot deep beginning at least 5 feet away from the inside sock.
5. All compost filter sock materials, mesh, and compost, will meet the material specifications listed in the Compost Filter Sock standard. No spillway is required.
6. Compost filter sock sediment traps shall be inspected weekly and after every rainfall event. Sediment shall be removed when it reaches one third, 1/3, the height of the trap.
7. The maximum limit of use for a compost sock sediment trap is one (1) year. The existing trap shall be replaced if there is a need for a trap beyond that time limit.
8. Upon completion of the work, the compost sock sediment trap shall be removed. The compost within the socks may be used during cleanup as a vegetative growth medium in accordance with the site stabilization plan.

**Figure 5.27**  
**Stone Outlet Sediment Trap: ST-II**

# STANDARD AND SPECIFICATIONS FOR SITE POLLUTION PREVENTION

## **Definition & Scope**

A collection of management practices intended to control non-sediment pollutants associated with construction activities to prevent the generation of pollutants due to improper handling, storage, and spills and prevent the movement of toxic substances from the site into surface waters.

## **Conditions Where Practice Applies**

On all construction sites where the earth disturbance exceeds 5,000 square feet, and involves the use of fertilizers, pesticides, petroleum based chemicals, fuels and lubricants, as well as sealers, paints, cleared woody vegetation, garbage, and sanitary wastes.

## **Design Criteria**

The variety of pollutants on a particular site and the severity of their impacts depend on factors such as the nature of the construction activity, the physical characteristics of the construction site, and the proximity of water bodies and conveyances to the pollutant source.

1. All state and federal regulations shall be followed for the storage, handling, application, usage, and disposal of pesticides, fertilizers, and petroleum products.
2. Vehicle and construction equipment staging and maintenance areas will be located away from all drainage ways with their parking areas graded so the runoff from these areas is collected, contained and treated prior to discharge from the site.
3. Provide sanitary facilities for on-site personnel.
4. Store, cover, and isolate construction materials including topsoil, and chemicals, to prevent runoff of

pollutants and contamination of groundwater and surface waters.

5. Develop and implement a spill prevention and control plan. The plan should include NYSDEC's spill reporting and initial notification requirements.
6. Provide adequate disposal for solid waste including woody debris, stumps, and other construction waste and include these methods and directions in the construction details on the site construction drawings. Fill, woody debris, stumps and construction waste shall not be placed in regulated wetlands, streams or other surface waters.
7. Distribute or post informational material regarding proper handling, spill response, spill kit location, and emergency actions to be taken, to all construction personnel.
8. Refueling equipment shall be located at least 100 feet from all wetlands, streams and other surface waters.

## Alternative Stormwater Management Deep-Ripping and Decompaction

### Description

The two-phase practice of 1) “Deep Ripping;” and 2) “Decompaction” (deep subsoiling), of the soil material as a step in the cleanup and restoration/landscaping of a construction site, helps mitigate the physically induced impacts of soil compression; i.e.: soil compaction or the substantial increase in the bulk density of the soil material.

Deep Ripping and Decompaction are key factors which help in restoring soil pore space and permeability for water infiltration. Conversely, the physical actions of cut-and-fill work, land grading, the ongoing movement of construction equipment and the transport of building materials throughout a site alter the architecture and structure of the soil, resulting in: the mixing of layers (horizons) of soil materials, compression of those materials and diminished soil porosity which, if left unchecked, severely impairs the soil’s water holding capacity and vertical drainage (rainfall infiltration), from the surface downward.

In a humid climate region, compaction damage on a site is virtually guaranteed over the duration of a project. Soil in very moist to wet condition when compacted, will have severely reduced permeability. Figure 1 displays the early stage of the deep-ripping phase (Note that all topsoil was stripped prior to construction access, and it remains stockpiled until the next phase – decompaction – is complete). A heavy-duty tractor is pulling a three-shank ripper on the first of several series of incrementally deepening passes through the construction access corridor’s densely compressed subsoil material. Figure 2 illustrates the approximate volumetric composition of a loam surface soil when conditions are good for plant growth, with adequate natural pore space for fluctuating moisture conditions.

Fig. 1. A typical deep ripping phase of this practice, during the first in a series of progressively deeper “rips” through severely compressed subsoil.

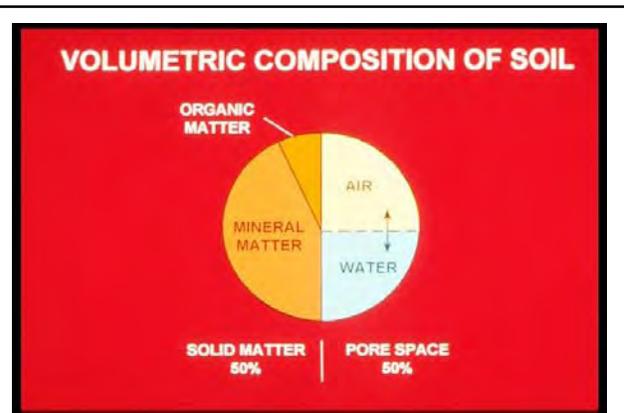

Fig. 2. About 50% of the volume of undisturbed loam surface soil is pore space, when soil is in good condition for plant growth. Brady, 2002.

## Recommended Application of Practice

The objective of Deep Ripping and Decompaction is to effectively fracture (vertically and laterally) through the thickness of the physically compressed subsoil material (see Figure 3), restoring soil porosity and permeability and aiding infiltration to help reduce runoff. Together with topsoil stripping, the “two-phase” practice of Deep Ripping and Decompaction first became established as a “best management practice” through ongoing success on commercial farmlands affected by heavy utility construction right-of-way projects (transmission pipelines and large power lines).

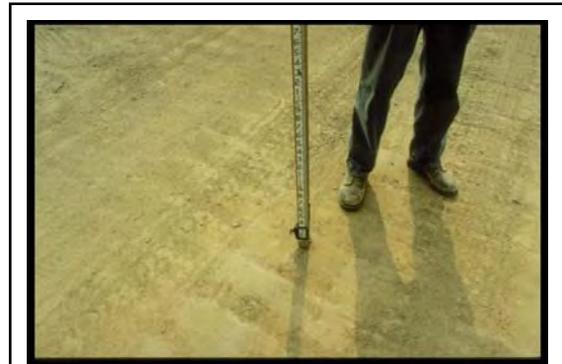

Fig. 3. Construction site with significant compaction of the deep basal till subsoil extends 24 inches below this exposed cut-and-fill work surface.

Soil permeability, soil drainage and cropland productivity were restored. For broader construction application, the two-phase practice of Deep Ripping and Decompaction is best adapted to areas impacted with significant soil compaction, on contiguous open portions of large construction sites and inside long, open construction corridors used as temporary access over the duration of construction. Each mitigation area should have minimal above-and-below-ground obstructions for the easy avoidance and maneuvering of a large tractor and ripping/decompacting implements. Conversely, the complete two-phase practice is not recommended in congested or obstructed areas due to the limitations on tractor and implement movement.

## Benefits

Aggressive “deep ripping” through the compressed thickness of exposed subsoil before the replacement/respreading of the topsoil layer, followed by “decompaction,” i.e.: “sub-soiling,” through the restored topsoil layer down into the subsoil, offers the following benefits:

- Increases the project (larger size) area’s direct surface infiltration of rainfall by providing the open site’s mitigated soil condition and lowers the demand on concentrated runoff control structures
- Enhances direct groundwater recharge through greater dispersion across and through a broader surface than afforded by some runoff-control structural measures
- Decreases runoff volume generated and provides hydrologic source control
- May be planned for application in feasible open locations either alone or in

conjunction with plans for structural practices (e.g., subsurface drain line or infiltration basin) serving the same or contiguous areas

- Promotes successful long-term revegetation by restoring soil permeability, drainage and water holding capacity for healthy (rather than restricted) root-system development of trees, shrubs and deep rooted ground cover, minimizing plant drowning during wet periods and burnout during dry periods.

## Feasibility/Limitations

The effectiveness of Deep Ripping and Decompaction is governed mostly by site factors such as: the original (undisturbed) soil's hydrologic characteristics; the general slope; local weather/timing (soil moisture) for implementation; the space-related freedom of equipment/implement maneuverability (noted above in **Recommended Application of Practice**), and by the proper selection and operation of tractor and implements (explained below in **Design Guidance**). The more notable site-related factors include:

### Soil

In the undisturbed condition, each identified soil type comprising a site is grouped into one of four categories of soil hydrology, Hydrologic Soil Group A, B, C or D, determined primarily by a range of characteristics including soil texture, drainage capability when thoroughly wet, and depth to water table. The natural rates of infiltration and transmission of soil-water through the undisturbed soil layers for Group A is "high" with a low runoff potential while soils in Group B are moderate in infiltration and the transmission of soil-water with a moderate runoff potential, depending somewhat on slope. Soils in Group C have slow rates of infiltration and transmission of soil-water and a moderately high runoff potential influenced by soil texture and slope; while soils in Group D have exceptionally slow rates of infiltration and transmission of soil-water, and high runoff potential.

In Figure 4, the profile displays the undisturbed horizons of a soil in Hydrologic Soil Group C and the naturally slow rate of infiltration through the subsoil. The slow rate of infiltration begins immediately below the topsoil horizon (30 cm), due to the limited amount of macro pores, e.g.: natural subsoil fractures, worm holes and root channels. Infiltration after the construction-induced mixing and compression of such subsoil material is virtually absent; but can be restored back to this natural level with the two-phase practice of deep ripping and decompaction, followed by the permanent establishment of an appropriate, deep taproot

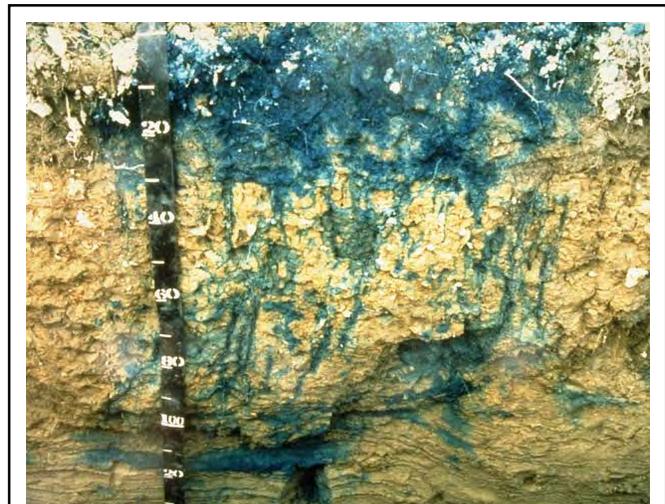

Fig. 4. Profile (in centimeters) displaying the infiltration test result of the natural undisturbed horizons of a soil in Hydrologic Soil Group C.

lawn/ground cover to help maintain the restored subsoil structure. Infiltration after construction-induced mixing and compression of such subsoil material can be notably rehabilitated with the Deep Ripping and Decompaction practice, which prepares the site for the appropriate long-term lawn/ground cover mix including deep taproot plants such as clover, fescue or trefoil, etc. needed for all rehabilitated soils.

Generally, soils in Hydrologic Soil Groups A and B, which respectively may include deep, well-drained, sandy-gravelly materials or deep, moderately well-drained basal till materials, are among the easier ones to restore permeability and infiltration, by deep ripping and decompaction. Among the many different soils in Hydrologic Soil Group C are those unique glacial tills having a natural fragipan zone, beginning about 12 to 18 inches (30 – 45cm), below surface. Although soils in Hydrologic Soil Group C do require a somewhat more carefully applied level of the Deep Ripping and Decompaction practice, it can greatly benefit such affected areas by reducing the runoff and fostering infiltration to a level equal to that of pre-disturbance.

Soils in Hydrologic Soil Group D typically have a permanent high water table close to the surface, influenced by a clay or other highly impervious layer of material. In many locations with clay subsoil material, the bulk density is so naturally high that heavy trafficking has little or no added impact on infiltration; and structural runoff control practices rather than Deep Ripping and Decompaction should be considered.

The information about Hydrologic Soil Groups is merely a general guideline. Site-specific data such as limited depths of cut-and-fill grading with minimal removal or translocation of the inherent subsoil materials (as analyzed in the county soil survey) or, conversely, the excavation and translocation of deeper, unconsolidated substratum or consolidated bedrock materials (unlike the analyzed subsoil horizons' materials referred to in the county soil survey) should always be taken into account.

Sites made up with significant quantities of large rocks, or having a very shallow depth to bedrock, are not conducive to deep ripping and decompaction (subsoiling); and other measures may be more practical.

### **Slope**

The two-phase application of 1) deep ripping and 2) decompaction (deep subsoiling), is most practical on flat, gentle and moderate slopes. In some situations, such as but not limited to temporary construction access corridors, inclusion areas that are moderately steep along a project's otherwise gentle or moderate slope may also be deep ripped and decompacted. For limited instances of moderate steepness on other projects, however, the post-construction land use and the relative alignment of the potential ripping and decompaction work in relation to the lay of the slope should be reviewed for safety and practicality. In broad construction areas predominated by moderately steep or steep slopes, the practice is generally not used.

### **Local Weather/Timing/Soil Moisture**

Effective fracturing of compressed subsoil material from the exposed work surface, laterally and vertically down through the affected zone is achieved only when the soil material is moderately dry to moderately moist. Neither one of the two-phases, deep ripping nor decompaction (deep

subsoiling), can be effectively conducted when the soil material (subsoil or replaced topsoil) is in either a “plastic” or “liquid” state of soil consistency. Pulling the respective implements legs through the soil when it is overly moist only results in the “slicing and smearing” of the material or added “squeezing and compression” instead of the necessary fracturing. Ample drying time is needed for a “rippable” soil condition not merely in the material close to the surface, but throughout the material located down to the bottom of the physically compressed zone of the subsoil.

The “poor man’s Atterberg field test” for soil plasticity is a simple “hand-roll” method used for quick, on-site determination of whether or not the moisture level of the affected soil material is low enough for: effective deep ripping of subsoil; respreading of topsoil in a friable state; and final decompaction (deep subsoiling). Using a sample of soil material obtained from the planned bottom depth of ripping, e.g.: 20 - 24 inches below exposed subsoil surface, the sample is hand rolled between the palms down to a 1/8-inch diameter thread. (Use the same test for stored topsoil material before respreading on the site.) If the respective soil sample crumbles apart in segments no greater than 3/8 of an inch long, by the time it is rolled down to 1/8 inch diameter, it is low enough in moisture for deep ripping (or topsoil replacement), and decompaction. Conversely, as shown in Figure 5, if the rolled sample stretches out in increments greater than 3/8 of an inch long before crumbling, it is in a “plastic” state of soil consistency and is too wet for subsoil ripping (as well as topsoil replacement) and final decompaction.

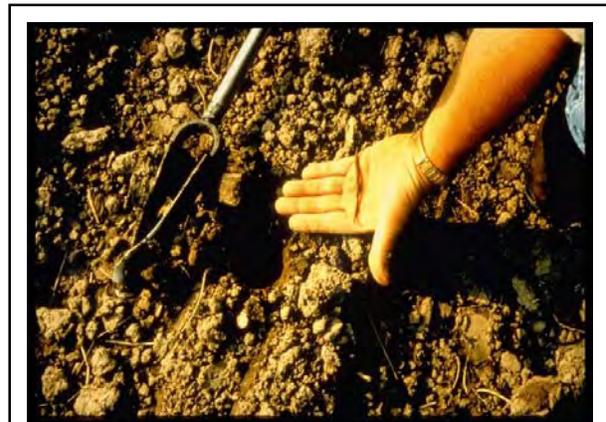

Fig. 5. Augered from a depth of 19 inches below the surface of the replaced topsoil, this subsoil sample was hand rolled to a 1/8-inch diameter. The test shows the soil at this site stretches out too far without crumbling; it indicates the material is in a plastic state of consistence, too wet for final decompaction (deep subsoiling) at this time.

## Design Guidance

Beyond the above-noted site factors, a vital requirement for the effective Deep Ripping and Decompaction (deep subsoiling), is implementing the practice in its distinct, two-phase process:

- 1) Deep rip the affected thickness of exposed subsoil material (see Figure 10 and 11), aggressively fracturing it before the protected topsoil is reapplied on the site (see Figure 12); and
- 2) Decompact (deep subsoil), simultaneously through the restored topsoil layer and the upper half of the affected subsoil (Figure 13). The second phase, “decompaction,” mitigates the partial recompaction which occurs during the heavy process of topsoil spreading/grading. Prior to deep ripping and decompacting the site, all construction activity, including construction equipment and material storage, site cleanup and trafficking (Figure 14), should be finished; and the site closed off to further disturbance. Likewise, once the practice is underway and the area’s soil permeability and

rainfall infiltration are being restored, a policy limiting all further traffic to permanent travel lanes is maintained.

The other critical elements, outlined below, are: using the proper implements (deep, heavy-duty rippers and subsoilers), and ample pulling-power equipment (tractors); and conducting the practice at the appropriate speed, depth and pattern(s) of movement.

Note that an appropriate plan for the separate practice of establishing a healthy perennial ground cover, with deep rooting to help maintain the restored soil structure, should be developed in advance. This may require the assistance of an agronomist or landscape horticulturist.

### Implements

Avoid the use of all undersize implements. The small-to-medium, light-duty tool will, at best, only “scarify” the uppermost surface portion of the mass of compacted subsoil material. The term “chisel plow” is commonly but incorrectly applied to a broad range of implements. While a few may be adapted for the moderate subsoiling of non-impacted soils, the majority are less durable and used for only lighter land-fitting (see Figure 6).

Fig. 6. A light duty chisel implement, not adequate for either the deep ripping or decompaction (deep subsoiling) phase.

Fig. 7. One of several variations of an agricultural ripper. This unit has long, rugged shanks mounted on a steel V-frame for deep, aggressive fracturing through Phase 1.

Use a “heavy duty” agricultural-grade, deep ripper (see Figures 7,9,10 and 11) for the first phase: the lateral and vertical fracturing of the mass of exposed and compressed subsoil, down and through, to the bottom of impact, prior to the replacement of the topsoil layer. (Any oversize rocks which are uplifted to the subsoil surface during the deep ripping phase are picked and removed.) Like the heavy-duty class of implement for the first phase, the decompaction (deep subsoiling) of Phase 2 is conducted with the heavy-duty version of the deep subsoiler. More preferable is the angled-leg variety of deep subsoiler (shown in Figures 8 and 13). It minimizes the inversion of the subsoil and topsoil layers while laterally and vertically fracturing the upper half of the previously ripped subsoil layer and all of the topsoil layer by delivering a momentary, wave-like “lifting and shattering” action up through the soil layers as it is pulled.

### **Pulling-Power of Equipment**

Use the following rule of thumb for tractor horsepower (hp) whenever deep ripping and decompacting a significantly impacted site: For both types of implement, have at least 40 hp of tractor pull available for each mounted shank/ leg.

Using the examples of a 3-shank and a 5-shank implement, the respective tractors should have 120 and 200 hp available for fracturing down to the final depth of 20-to-24 inches per phase. Final depth for the deep ripping in Phase 1 is achieved incrementally by a progressive series of passes (see Depth and Patterns of Movement, below); while for Phase 2, the full operating depth of the deep subsoiler is applied from the beginning.

The operating speed for pulling both types of implement should not exceed 2 to 3 mph. At this slow and managed rate of operating speed, maximum functional performance is sustained by the tractor and the implement performing the soil fracturing. Referring to Figure 8, the implement is the 6-leg version of the deep angled-leg subsoiler. Its two outside legs are “chained up” so that only four legs will be engaged (at the maximum depth), requiring no less than 160 hp, (rather than 240 hp) of pull. The 4-wheel drive, articulated-frame tractor in Figure 8 is 174 hp. It will be decompacting this unobstructed, former construction access area simultaneously through 11 inches of replaced topsoil and the upper 12 inches of the previously deep-ripped subsoil. In constricted areas of Phase 1) Deep Ripping, a medium-size tractor with adequate hp, such as the one in Figure 9 pulling a 3-shank deep ripper, may be more maneuverable.

Some industrial-grade variations of ripping implements are attached to power graders and bulldozers. Although highly durable, they are generally not recommended. Typically, the shanks or “teeth” of these rippers are too short and stout; and they are mounted too far apart to achieve the well-distributed type of lateral and vertical fracturing of the soil materials necessary to restore soil permeability and infiltration. In addition, the power graders and bulldozers, as pullers, are far less maneuverable for turns and patterns than the tractor.

Fig. 8. A deep, angled-leg subsoiler, ideal for Phase 2 decompaction of after the topsoil layer is graded on top of the ripped subsoil.

Fig. 9. This medium tractor is pulling a 3-shank deep ripper. The severely compacted construction access corridor is narrow, and the 120 hp tractor is more maneuverable for Phase 1 deep ripping (subsoil fracturing), here.

## Depth and Patterns of Movement

As previously noted both Phase 1 Deep Ripping through significantly compressed, exposed subsoil and Phase 2 Decompaction (deep subsoiling) through the replaced topsoil and upper subsoil need to be performed at maximum capable depth of each implement. With an implement's guide wheels attached, some have a "normal" maximum operating depth of 18 inches, while others may go deeper. In many situations, however, the tractor/implement operator must first remove the guide wheels and other non essential elements from the implement. This adapts the ripper or the deep subsoiler for skillful pulling with its frame only a few inches above surface, while the shanks or legs, fracture the soil material 20-to-24 inches deep.

There may be construction sites where the depth of the exposed subsoil's compression is moderate, e.g.: 12 inches, rather than deep. This can be verified by using a  $\frac{3}{4}$  inch cone penetrometer and a shovel to test the subsoil for its level of compaction, incrementally, every three inches of increasing depth. Once the full thickness of the subsoil's compacted zone is finally "pieced" and there is a significant drop in the psi measurements of the soil penetrometer, the depth/thickness of compaction is determined. This is repeated at several representative locations of the construction site. If the thickness of the site's subsoil compaction is verified as, for example, ten inches, then the Phase 1 Deep Ripping can be correspondingly reduced to the implement's minimum operable depth of 12 inches. However, the Phase 2 simultaneous Decompaction (subsoiling) of an 11 inch thick layer of replaced topsoil and the upper subsoil should run at the subsoiling implements full operating depth.

Fig. 10. An early pass with a 3-shank deep ripper penetrating only 8 inches into this worksite's severely compressed subsoil.

Fig. 11. A repeat run of the 3-shank ripper along the same patterned pass area as Fig. 9; here, incrementally reaching 18 of the needed 22 inches of subsoil fracture.

Typically, three separate series (patterns) are used for both the Phase 1 Deep Ripping and the Phase 2 Decompaction on significantly compacted sites. For Phase 1, each series begins with a moderate depth of rip and, by repeat-pass, continues until full depth is reached. Phase 2 applies the full depth of Decompaction (subsoiling), from the beginning.

Every separate series (pattern) consists of parallel, forward-and-return runs, with each progressive

pass of the implement's legs or shanks evenly staggered between those from the previous pass. This compensates for the shank or leg-spacing on the implement, e.g., with 24-to-30 inches between each shank or leg. The staggered return pass ensures lateral and vertical fracturing actuated every 12 to 15 inches across the densely compressed soil mass.

### Large, Unobstructed Areas

For larger easy areas, use the standard patterns of movement:

- The first series (pattern) of passes is applied lengthwise, parallel with the longest spread of the site; gradually progressing across the site's width, with each successive pass.
- The second series runs obliquely, crossing the first series at an angle of about 45 degrees.
- The third series runs at right angle (or 90 degrees), to the first series to complete the fracturing and shattering on severely compacted sites, and avoid leaving large unbroken blocks of compressed soil material. (In certain instances, the third series may be optional, depending on how thoroughly the first two series loosen the material and eliminate large chunks/blocks of material as verified by tests with a 3/4-inch cone penetrometer.)

Fig. 12. Moderately dry topsoil is being replaced on the affected site now that Phase 1 deep ripping of the compressed subsoil is complete.

Fig. 13. The same deep, angled-leg subsoiler shown in Fig. 7 is engaged at maximum depth for Phase 2, decompaction (deep soiling), of the replaced topsoil and the upper subsoil materials.

### Corridors

In long corridors of limited width and less maneuverability than larger sites, e.g.: along compacted areas used as temporary construction access, a modified series of pattern passes are used.

- First, apply the same initial lengthwise, parallel series of passes described above.

- A second series of passes makes a broad “S” shaped pattern of rips, continually and gradually alternating the “S” curves between opposite edges inside the compacted corridor.
- The third and final series again uses the broad, alternating S pattern, but it is “flip-flopped” to continually cross the previous S pattern along the corridor’s centerline. This final series of the S pattern curves back along the edge areas skipped by the second series.

## Maintenance and Cost

Once the two-phase practice of Deep Ripping and Decompaction is completed, two items are essential for maintaining a site’s soil porosity and permeability for infiltration. They are: planting and maintaining the appropriate ground cover with deep roots to maintain the soil structure (see Figure 15); and keeping the site free of traffic or other weight loads.

Note that site-specific choice of an appropriate vegetative ground-cover seed mix, including the proper seeding ratio of one or more perennial species with a deep taproot system and the proper amount of lime and soil nutrients (fertilizer mix) adapted to the soil-needs, are basic to the final practice of landscaping, i.e: surface tillage, seeding/planting/fertilizing and culti-packing or mulching is applied. The "maintenance" of an effectively deep-ripped and decompacted area is generally limited to the successful perennial (long-term) landscape ground cover; as long as no weight-bearing force of soil compaction is applied.

Fig. 14. The severely compacted soil of a temporary construction yard used daily by heavy equipment for four months; shown before deep ripping, topsoil replacement, and decompaction.

Fig. 15. The same site as Fig. 14 after deep ripping of the exposed subsoil, topsoil replacement, decompaction through the topsoil and upper subsoil and final surface tillage and revegetation to maintain soil permeability and infiltration.

The Deep Ripping and Decompaction practice is, by necessity, more extensive than periodic subsoiling of farmland. The cost of deep ripping and decompacting (deep subsoiling), will vary according to the depth and severity of soil-material compression and the relative amount of tractor and implement time that is required. In some instances, depending on open maneuverability, two-to-three acres of compacted project area may be deep-ripped in one day. In other situations of more severe compaction and - or less maneuverability, as little as one acre may be fully ripped in a day. Generally, if the Phase 1) Deep Ripping is fully effective, the Phase 2) Decompaction should be completed in  $2/3$  to  $3/4$  of the time required for Phase 1.

Using the example of two acres of Phase 1) Deep Ripping in one day, at \$1800 per day, the net cost is \$900 per acre. If the Phase 2) Decompacting or deep subsoiling takes  $3/4$  the time as Phase 1, it costs \$675 per acre for a combined total of \$1575 per acre to complete the practice (these figures do not include the cost of the separate practice of topsoil stripping and replacement). Due to the many variables, it must be recognized that cost will be determined by the specific conditions or constraints of the site and the availability of proper equipment.

## APPENDIX F

**NOTICE OF INTENT**

**New York State Department of Environmental Conservation  
 Division of Water  
 625 Broadway, 4th Floor  
 Albany, New York 12233-3505**

**NYR**        
 (For DEC use only)

**Stormwater Discharges Associated with Construction Activity Under State Pollutant Discharge Elimination System (SPDES) General Permit # GP-0-20-001**  
 All sections must be completed unless otherwise noted. Failure to complete all items may result in this form being returned to you, thereby delaying your coverage under this General Permit. Applicants must read and understand the conditions of the permit and prepare a Stormwater Pollution Prevention Plan prior to submitting this NOI. Applicants are responsible for identifying and obtaining other DEC permits that may be required.

Tax Map Numbers

1. Provide the Geographic Coordinates for the project site. To do this, go to the NYSDEC Stormwater Interactive Map on the DEC website at:

<https://gisservices.dec.ny.gov/gis/stormwater/>

Zoom into your Project Location such that you can accurately click on the centroid of your site. Once you have located the centroid of your project site, go to the bottom right hand corner of the map for the X, Y coordinates. Enter the coordinates into the boxes below. For problems with the interactive map use the help function.

**X Coordinates (Easting)**

-7 3 9 5 6 0 0

Ex. -73.749

**Y Coordinates (Northing)**

4 1 0 4 6 7

Ex. 42.652

2. What is the nature of this construction project?

New Construction

Redevelopment with increase in impervious area

Redevelopment with no increase in impervious area

15. Does the site runoff enter a separate storm sewer system (including roadside drains, swales, ditches, culverts, etc)?  Yes  No  Unknown

16. What is the name of the municipality/entity that owns the separate storm sewer system?

T o w n   o f   O r a n g e t o w n

17. Does any runoff from the site enter a sewer classified as a Combined Sewer?  Yes  No  Unknown

18. Will future use of this site be an agricultural property as defined by the NYS Agriculture and Markets Law?  Yes  No

19. Is this property owned by a state authority, state agency, federal government or local government?  Yes  No

20. Is this a remediation project being done under a Department approved work plan? (i.e. CERCLA, RCRA, Voluntary Cleanup Agreement, etc.)  Yes  No

21. Has the required Erosion and Sediment Control component of the SWPPP been developed in conformance with the current NYS Standards and Specifications for Erosion and Sediment Control (aka Blue Book)?  Yes  No

22. Does this construction activity require the development of a SWPPP that includes the post-construction stormwater management practice component (i.e. Runoff Reduction, Water Quality and Quantity Control practices/techniques)?  Yes  No  
**If No, skip questions 23 and 27-39.**

23. Has the post-construction stormwater management practice component of the SWPPP been developed in conformance with the current NYS Stormwater Management Design Manual?  Yes  No

**Post-construction Stormwater Management Practice (SMP) Requirements**

**Important: Completion of Questions 27-39 is not required if response to Question 22 is No.**

27. Identify all site planning practices that were used to prepare the final site plan/layout for the project.

- Preservation of Undisturbed Areas**
- Preservation of Buffers**
- Reduction of Clearing and Grading**
- Locating Development in Less Sensitive Areas**
- Roadway Reduction**
- Sidewalk Reduction**
- Driveway Reduction**
- Cul-de-sac Reduction**
- Building Footprint Reduction**
- Parking Reduction**

27a. Indicate which of the following soil restoration criteria was used to address the requirements in Section 5.1.6("Soil Restoration") of the Design Manual (2010 version).

- All disturbed areas will be restored in accordance with the Soil Restoration requirements in Table 5.3 of the Design Manual (see page 5-22).
- Compacted areas were considered as impervious cover when calculating the **WQv Required**, and the compacted areas were assigned a post-construction Hydrologic Soil Group (HSG) designation that is one level less permeable than existing conditions for the hydrology analysis.

28. Provide the total Water Quality Volume (WQv) required for this project (based on final site plan/layout).

**Total WQv Required**

.    **acre-feet**

29. Identify the RR techniques (Area Reduction), RR techniques (Volume Reduction) and Standard SMPs with RRv Capacity in Table 1 (See Page 9) that were used to reduce the Total WQv Required (#28).

Also, provide in Table 1 the total impervious area that contributes runoff to each technique/practice selected. For the Area Reduction Techniques, provide the total contributing area (includes pervious area) and, if applicable, the total impervious area that contributes runoff to the technique/practice.

**Note:** Redevelopment projects shall use Tables 1 and 2 to identify the SMPs used to treat and/or reduce the WQv required. If runoff reduction techniques will not be used to reduce the required WQv, skip to question 33a after identifying the SMPs.

Table 1 - Runoff Reduction (RR) Techniques and Standard Stormwater Management Practices (SMPs)

<input type="radio"/> Shallow Wetland (W-1) .....	<input type="text"/>	<input type="text"/>		<input type="text"/>
<input type="radio"/> Extended Detention Wetland (W-2) .....	<input type="text"/>	<input type="text"/>		<input type="text"/>
<input type="radio"/> Pond/Wetland System (W-3) .....	<input type="text"/>	<input type="text"/>		<input type="text"/>
<input type="radio"/> Pocket Wetland (W-4) .....	<input type="text"/>	<input type="text"/>		<input type="text"/>
<input type="radio"/> Wet Swale (O-2) .....	<input type="text"/>	<input type="text"/>		<input type="text"/>

33. Identify the Standard SMPs in Table 1 and, if applicable, the Alternative SMPs in Table 2 that were used to treat the remaining total WQv(=Total WQv Required in 28 - Total RRv Provided in 30).

Also, provide in Table 1 and 2 the total impervious area that contributes runoff to each practice selected.

**Note:** Use Tables 1 and 2 to identify the SMPs used on Redevelopment projects.

33a. Indicate the Total WQv provided (i.e. WQv treated) by the SMPs identified in question #33 and Standard SMPs with RRv Capacity identified in question 29.

**WQv Provided**  
   0 .  0  8  4 **acre-feet**

**Note:** For the standard SMPs with RRv capacity, the WQv provided by each practice = the WQv calculated using the contributing drainage area to the practice - RRv provided by the practice. (See Table 3.5 in Design Manual)

34. Provide the sum of the Total RRv provided (#30) and the WQv provided (#33a).    0 .  1  6  9

35. Is the sum of the RRv provided (#30) and the WQv provided (#33a) greater than or equal to the total WQv required (#28)?  **Yes**  **No**

**If Yes, go to question 36.**

**If No, sizing criteria has not been met, so NOI can not be processed. SWPPP preparer must modify design to meet sizing criteria.**

36. Provide the total Channel Protection Storage Volume (CPv) required and provided or select waiver (36a), if applicable.

**CPv Required**    .    **acre-feet**      **CPv Provided**    .    **acre-feet**

36a. The need to provide channel protection has been waived because:

- Site discharges directly to tidal waters or a fifth order or larger stream.
- Reduction of the total CPv is achieved on site through runoff reduction techniques or infiltration systems.

37. Provide the Overbank Flood (Qp) and Extreme Flood (Qf) control criteria or select waiver (37a), if applicable.

**Total Overbank Flood Control Criteria (Qp)**

**Pre-Development**    .    **CFS**      **Post-development**    .    **CFS**

**Total Extreme Flood Control Criteria (Qf)**

**Pre-Development**    .    **CFS**      **Post-development**    .    **CFS**

## MS4 SWPPP Acceptance Form - continued

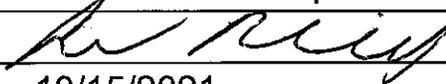

### V. Certification Statement - MS4 Official (principal executive officer or ranking elected official) or Duly Authorized Representative

I hereby certify that the final Stormwater Pollution Prevention Plan (SWPPP) for the construction project identified in question 5 has been reviewed and meets the substantive requirements in the SPDES General Permit For Stormwater Discharges from Municipal Separate Storm Sewer Systems (MS4s).

Note: The MS4, through the acceptance of the SWPPP, assumes no responsibility for the accuracy and adequacy of the design included in the SWPPP. In addition, review and acceptance of the SWPPP by the MS4 does not relieve the owner/operator or their SWPPP preparer of responsibility or liability for errors or omissions in the plan.

### VI. Additional Information

1. Please be advised that NO construction what-so-ever (including pre-construction SESC installation, demolition, etc.) can begin on the project until the signed Qualified Inspector and site Contractor's Certifications with Contractor's 4-hour - NYSDEC required and approved training certificate(s) have been provided to this Department and made part of all official SWPPPs (Town Copy, field copy, etc.)

2. Please also be advised that once a copy of the SPDES Permit for Construction is received from the NYS DEC, a copy shall be sent to this Department for inclusion in the SWPPP (as well as keeping a copy in all other required SWPPPs/ SWPPP locations).

625 Broadway, 4th Floor  
Albany, New York 12233-3505**

\*(NOTE: Submit completed form to address above)\*

**NOTICE OF TERMINATION for Storm Water Discharges Authorized  
under the SPDES General Permit for Construction Activity**

**Please indicate your permit identification number:** NYR \_\_\_\_\_

**I. Owner or Operator Information**

1. Owner/Operator Name:

2. Street Address:

3. City/State/Zip:

4. Contact Person:

4a. Telephone:

4b. Contact Person E-Mail:

**II. Project Site Information**

5. Project/Site Name:

6. Street Address:

7. City/Zip:

8. County:

**III. Reason for Termination**

9a.  All disturbed areas have achieved final stabilization in accordance with the general permit and SWPPP. \*Date final stabilization completed (month/year): \_\_\_\_\_

9b.  Permit coverage has been transferred to new owner/operator. Indicate new owner/operator's permit identification number: NYR \_\_\_\_\_

(Note: Permit coverage can not be terminated by owner identified in I.1. above until new owner/operator obtains coverage under the general permit)

9c.  Other (Explain on Page 2)

**IV. Final Site Information:**

10a. Did this construction activity require the development of a SWPPP that includes post-construction stormwater management practices?  yes  no (If no, go to question 10f.)

10b. Have all post-construction stormwater management practices included in the final SWPPP been constructed?  yes  no (If no, explain on Page 2)

10c. Identify the entity responsible for long-term operation and maintenance of practice(s)?

\_\_\_\_\_

**NOTICE OF TERMINATION for Storm Water Discharges Authorized under the  
SPDES General Permit for Construction Activity - continued**

10d. Has the entity responsible for long-term operation and maintenance been given a copy of the operation and maintenance plan required by the general permit?     yes     no

10e. Indicate the method used to ensure long-term operation and maintenance of the post-construction stormwater management practice(s):

- Post-construction stormwater management practice(s) and any right-of-way(s) needed to maintain practice(s) have been deeded to the municipality.
- Executed maintenance agreement is in place with the municipality that will maintain the post-construction stormwater management practice(s).
- For post-construction stormwater management practices that are privately owned, a mechanism is in place that requires operation and maintenance of the practice(s) in accordance with the operation and maintenance plan, such as a deed covenant in the owner or operator's deed of record.
- For post-construction stormwater management practices that are owned by a public or private institution (e.g. school, university or hospital), government agency or authority, or public utility; policy and procedures are in place that ensures operation and maintenance of the practice(s) in accordance with the operation and maintenance plan.

10f. Provide the total area of impervious surface (i.e. roof, pavement, concrete, gravel, etc.) constructed within the disturbance area? \_\_\_\_\_  
(acres)

11. Is this project subject to the requirements of a regulated, traditional land use control MS4?     yes  
 no  
(If Yes, complete section VI - "MS4 Acceptance" statement)

**V. Additional Information/Explanation:**  
(Use this section to answer questions 9c. and 10b., if applicable)

**VI. MS4 Acceptance - MS4 Official (principal executive officer or ranking elected official) or Duly Authorized Representative** (Note: Not required when 9b. is checked -transfer of coverage)

I have determined that it is acceptable for the owner or operator of the construction project identified in question 5 to submit the Notice of Termination at this time.

## APPENDIX H

**CONTRACTOR'S CERTIFICATION**  
**SPDES GENERAL PERMIT FOR STORMWATER DISCHARGES**

To be completed by Contractor and filed with Owner's on-site copy of the SWPPP

**CONTRACTOR IDENTIFICATION:**

Contractor responsible for installing, constructing, repairing, inspecting and maintaining the erosion and sediment control practices included in the SWPPP; and responsible for construction of all post-construction stormwater management practices included in the SWPPP:

Company: \_\_\_\_\_

Address: \_\_\_\_\_

Phone Number: \_\_\_\_\_

**SPECIFIC ELEMENTS OF THE SWPPP THAT THE CONTRACTOR IS RESPONSIBLE FOR:**

**CERTIFICATION:**

I hereby certify that I understand and agree to comply with the terms and conditions of the SWPPP and agree to implement any corrective actions identified by the qualified inspector during a site inspection. I also understand that the *owner or operator* must comply with the terms and conditions of the New York State Pollutant Discharge Elimination System ("SPDES") general permit for stormwater discharges from construction activities and that it is unlawful for any person to cause or contribute to a violation of water quality standards. Furthermore, I understand that certifying false, incorrect or inaccurate information is a violation of the referenced permit and the laws of the State of New York and could subject me to criminal, civil and/or administrative proceedings.

**SUBCONTRACTOR'S CERTIFICATION**  
**SPDES GENERAL PERMIT FOR STORMWATER DISCHARGES**

To be completed by each Subcontractor and filed with Owner's on-site copy of the SWPPP

**CONTRACTOR IDENTIFICATION:**

Company: \_\_\_\_\_  
Address: \_\_\_\_\_  
\_\_\_\_\_

**SUBCONTRACTOR IDENTIFICATION:**

Subcontractor responsible for some/all of the following: installing, constructing, repairing, inspecting and maintaining the erosion and sediment control practices included in the SWPPP; and responsible for construction of all post-construction stormwater management practices included in the SWPPP:

Company: \_\_\_\_\_  
Address: \_\_\_\_\_  
\_\_\_\_\_

Phone Number: \_\_\_\_\_

**SPECIFIC ELEMENTS OF THE SWPPP THAT THE SUBCONTRACTOR IS RESPONSIBLE FOR:**

**CERTIFICATION:**

I hereby certify that I understand and agree to comply with the terms and conditions of the SWPPP and agree to implement any corrective actions identified by the qualified inspector during a site inspection. I also understand that the *owner or operator* must comply with the terms and conditions of the New York State Pollutant Discharge Elimination System ("SPDES") general permit for stormwater discharges from construction activities and that it is unlawful for any person to cause or contribute to a violation of water quality standards. Furthermore, I understand that certifying false, incorrect or inaccurate information is a violation of the referenced permit and the laws of the State of New York and could subject me to criminal, civil and/or administrative proceedings.

**ERIK KULLESEID**  
Commissioner

March 12, 2020

Kristofer Mierisch  
Senior Environmental Analyst/CRM Specialist  
Tectonic Engineering and Surveying Consultants P. C.  
70 Pleasant Hill Road  
Mountainville, NY 10953

Re: DEC  
Orangetown Town Hall Expansion  
26 W Orangeburg Rd, Orangeburg, NY 10962  
20PR01491

Dear Kristofer Mierisch:

Thank you for requesting the comments of the Office of Parks, Recreation and Historic Preservation (OPRHP). We have reviewed the project in accordance with the New York State Historic Preservation Act of 1980 (Section 14.09 of the New York Parks, Recreation and Historic Preservation Law). These comments are those of the OPRHP and relate only to Historic/Cultural resources. They do not include potential environmental impacts to New York State Parkland that may be involved in or near your project. Such impacts must be considered as part of the environmental review of the project pursuant to the State Environmental Quality Review Act (New York Environmental Conservation Law Article 8) and its implementing regulations (6 NYCRR Part 617).

Based upon this review, it is the opinion of OPRHP that no properties, including archaeological and/or historic resources, listed in or eligible for the New York State and National Registers of Historic Places will be impacted by this project.

If further correspondence is required regarding this project, please be sure to refer to the OPRHP Project Review (PR) number noted above.

Sincerely,

R. Daniel Mackay

Deputy Commissioner for Historic Preservation  
Division for Historic Preservation

## APPENDIX J

**APPENDIX F  
CONSTRUCTION SITE INSPECTION  
AND MAINTENANCE LOG BOOK**

**STATE POLLUTANT DISCHARGE ELIMINATION SYSTEM FOR CONSTRUCTION  
ACTIVITIES**

**SAMPLE CONSTRUCTION SITE LOG BOOK**

Table of Contents

---

- I. Pre-Construction Meeting Documents
  - a. Preamble to Site Assessment and Inspections
  - b. Pre-Construction Site Assessment Checklist
  
- II. Construction Duration Inspections
  - a. Directions
  - b. Modification to the SWPPP

**I. PRE-CONSTRUCTION MEETING DOCUMENTS**

**Project Name** \_\_\_\_\_  
**Permit No.** \_\_\_\_\_ **Date of Authorization** \_\_\_\_\_  
**Name of Operator** \_\_\_\_\_  
**Prime Contractor** \_\_\_\_\_

**a. Preamble to Site Assessment and Inspections**

The Following Information To Be Read By All Person’s Involved in The Construction of Stormwater Related Activities:

The Operator agrees to have a qualified inspector<sup>1</sup> conduct an assessment of the site prior to the commencement of construction<sup>2</sup> and certify in this inspection report that the appropriate erosion and sediment controls described in the SWPPP have been adequately installed or implemented to ensure overall preparedness of the site for the commencement of construction.

Prior to the commencement of construction, the Operator shall certify in this site logbook that the SWPPP has been prepared in accordance with the State’s standards and meets all Federal, State and local erosion and sediment control requirements. A preconstruction meeting should be held to review all of the SWPPP requirements with construction personnel.

When construction starts, site inspections shall be conducted by the qualified inspector at least every 7 calendar days. The Operator shall maintain a record of all inspection reports in this site logbook. The site logbook shall be maintained on site and be made available to the permitting authorities upon request.

Prior to filing the Notice of Termination or the end of permit term, the Operator shall have a qualified inspector perform a final site inspection. The qualified inspector shall certify that the site has undergone final stabilization<sup>3</sup> using either vegetative or structural stabilization methods and that all temporary erosion and sediment controls (such as silt fencing) not needed for long-term erosion control have been removed. In addition, the Operator must identify and certify that all permanent structures described in the SWPPP have been constructed and provide the owner(s) with an operation and maintenance plan that ensures the structure(s) continuously functions as designed.

1 Refer to “Qualified Inspector” inspection requirements in the current SPDES General Permit for Stormwater Discharges from Construction Activity for complete list of inspection requirements.  
2 “Commencement of construction” means the initial removal of vegetation and disturbance of soils associated with clearing, grading or excavating activities or other construction activities.  
3 “Final stabilization” means that all soil-disturbing activities at the site have been completed and a uniform, perennial vegetative cover with a density of eighty (80) percent has been established or equivalent stabilization measures (such as the use of mulches or geotextiles) have been employed on all unpaved areas and areas not covered by permanent structures.

**b. Pre-construction Site Assessment Checklist**

**(NOTE: Provide comments below as necessary)**

1. Notice of Intent, SWPPP, and Contractors Certification:

**Yes No NA**

- Has a Notice of Intent been filed with the NYS Department of Conservation?
- Is the SWPPP on-site? Where? \_\_\_\_\_
- Is the Plan current? What is the latest revision date? \_\_\_\_\_
- Is a copy of the NOI (with brief description) onsite? Where? \_\_\_\_\_
- Have all contractors involved with stormwater related activities signed a contractor's certification?

2. Resource Protection

**Yes No NA**

- Are construction limits clearly flagged or fenced?
- Important trees and associated rooting zones, on-site septic system absorption fields, existing vegetated areas suitable for filter strips, especially in perimeter areas, have been flagged for protection.
- Creek crossings installed prior to land-disturbing activity, including clearing and blasting.

3. Surface Water Protection

**Yes No NA**

- Clean stormwater runoff has been diverted from areas to be disturbed.
- Bodies of water located either on site or in the vicinity of the site have been identified and protected.
- Appropriate practices to protect on-site or downstream surface water are installed.
- Are clearing and grading operations divided into areas <5 acres?

4. Stabilized Construction Access

**Yes No NA**

- A temporary construction entrance to capture mud and debris from construction vehicles before they enter the public highway has been installed.
- Other access areas (entrances, construction routes, equipment parking areas) are stabilized immediately as work takes place with gravel or other cover.
- Sediment tracked onto public streets is removed or cleaned on a regular basis.

5. Sediment Controls

**Yes No NA**

- Silt fence material and installation comply with the standard drawing and specifications.
- Silt fences are installed at appropriate spacing intervals
- Sediment/detention basin was installed as first land disturbing activity.
- Sediment traps and barriers are installed.

6. Pollution Prevention for Waste and Hazardous Materials

**Yes No NA**

- The Operator or designated representative has been assigned to implement the spill prevention avoidance and response plan.
- The plan is contained in the SWPPP on page \_\_\_\_\_
- Appropriate materials to control spills are onsite. Where? \_\_\_\_\_

## II. CONSTRUCTION DURATION INSPECTIONS

### a. Directions:

**Inspection Forms will be filled out during the entire construction phase of the project.**

Required Elements:

- 1) On a site map, indicate the extent of all disturbed site areas and drainage pathways. Indicate site areas that are expected to undergo initial disturbance or significant site work within the next 14-day period;
- 2) Indicate on a site map all areas of the site that have undergone temporary or permanent stabilization;
- 3) Indicate all disturbed site areas that have not undergone active site work during the previous 14-day period;
- 4) Inspect all sediment control practices and record the approximate degree of sediment accumulation as a percentage of sediment storage volume (for example, 10 percent, 20 percent, 50 percent);
- 5) Inspect all erosion and sediment control practices and record all maintenance requirements such as verifying the integrity of barrier or diversion systems (earthen berms or silt fencing) and containment systems (sediment basins and sediment traps). Identify any evidence of rill or gully erosion occurring on slopes and any loss of stabilizing vegetation or seeding/mulching. Document any excessive deposition of sediment or ponding water along barrier or diversion systems. Record the depth of sediment within containment structures, any erosion near outlet and overflow structures, and verify the ability of rock filters around perforated riser pipes to pass water; and
- 6) Immediately report to the Operator any deficiencies that are identified with the implementation of the SWPPP.

**SITE PLAN/SKETCH**

---

**Inspector (print name)**

---

**Date of Inspection**

---

**Qualified Inspector (print name)**

---

**Qualified Inspector Signature**

The above signed acknowledges that, to the best of his/her knowledge, all information provided on the forms is accurate and complete.

**Maintaining Water Quality**

**Yes No NA**

- Is there an increase in turbidity causing a substantial visible contrast to natural conditions at the outfalls?
- Is there residue from oil and floating substances, visible oil film, or globules or grease at the outfalls?
- All disturbance is within the limits of the approved plans.
- Have receiving lake/bay, stream, and/or wetland been impacted by silt from project?

**Housekeeping**

1. General Site Conditions

**Yes No NA**

- Is construction site litter, debris and spoils appropriately managed?
- Are facilities and equipment necessary for implementation of erosion and sediment control in working order and/or properly maintained?
- Is construction impacting the adjacent property?
- Is dust adequately controlled?

2. Temporary Stream Crossing

**Yes No NA**

- Maximum diameter pipes necessary to span creek without dredging are installed.
- Installed non-woven geotextile fabric beneath approaches.
- Is fill composed of aggregate (no earth or soil)?
- Rock on approaches is clean enough to remove mud from vehicles & prevent sediment from entering stream during high flow.

3. Stabilized Construction Access

**Yes No NA**

- Stone is clean enough to effectively remove mud from vehicles.
- Installed per standards and specifications?
- Does all traffic use the stabilized entrance to enter and leave site?
- Is adequate drainage provided to prevent ponding at entrance?

**Runoff Control Practices**

1. Excavation Dewatering

**Yes No NA**

- Upstream and downstream berms (sandbags, inflatable dams, etc.) are installed per plan.
- Clean water from upstream pool is being pumped to the downstream pool.
- Sediment laden water from work area is being discharged to a silt-trapping device.
- Constructed upstream berm with one-foot minimum freeboard.

**Runoff Control Practices (continued)**

2. Flow Spreader

**Yes No NA**

- Installed per plan.
- Constructed on undisturbed soil, not on fill, receiving only clear, non-sediment laden flow.
- Flow sheets out of level spreader without erosion on downstream edge.

3. Interceptor Dikes and Swales

**Yes No NA**

- Installed per plan with minimum side slopes 2H:1V or flatter.
- Stabilized by geotextile fabric, seed, or mulch with no erosion occurring.
- Sediment-laden runoff directed to sediment trapping structure

4. Stone Check Dam

**Yes No NA**

- Is channel stable? (flow is not eroding soil underneath or around the structure).
- Check is in good condition (rocks in place and no permanent pools behind the structure).
- Has accumulated sediment been removed?.

5. Rock Outlet Protection

**Yes No NA**

- Installed per plan.
- Installed concurrently with pipe installation.

**Soil Stabilization**

1. Topsoil and Spoil Stockpiles

**Yes No NA**

- Stockpiles are stabilized with vegetation and/or mulch.
- Sediment control is installed at the toe of the slope.

2. Revegetation

**Yes No NA**

- Temporary seedings and mulch have been applied to idle areas.
- 4 inches minimum of topsoil has been applied under permanent seedings

**Sediment Control Practices**

1. Silt Fence and Linear Barriers

**Yes No NA**

- Installed on Contour, 10 feet from toe of slope (not across conveyance channels).
- Joints constructed by wrapping the two ends together for continuous support.
- Fabric buried 6 inches minimum.
- Posts are stable, fabric is tight and without rips or frayed areas.

Sediment accumulation is \_\_\_% of design capacity.

**Sediment Control Practices (continued)**

2. Storm Drain Inlet Protection (Use for Stone & Block; Filter Fabric; Curb; or, Excavated; Filter Sock or Manufactured practices)

**Yes No NA**

- Installed concrete blocks lengthwise so open ends face outward, not upward.
  - Placed wire screen between No. 3 crushed stone and concrete blocks.
  - Drainage area is 1acre or less.
  - Excavated area is 900 cubic feet.
  - Excavated side slopes should be 2:1.
  - 2" x 4" frame is constructed and structurally sound.
  - Posts 3-foot maximum spacing between posts.
  - Fabric is embedded 1 to 1.5 feet below ground and secured to frame/posts with staples at max 8-inch spacing.
  - Posts are stable, fabric is tight and without rips or frayed areas.
  - Manufactured insert fabric is free of tears and punctures.
  - Filter Sock is not torn or flattened and fill material is contained within the mesh sock.
- Sediment accumulation \_\_\_% of design capacity.

3. Temporary Sediment Trap

**Yes No NA**

- Outlet structure is constructed per the approved plan or drawing.
  - Geotextile fabric has been placed beneath rock fill.
  - Sediment trap slopes and disturbed areas are stabilized.
- Sediment accumulation is \_\_\_% of design capacity.

4. Temporary Sediment Basin

**Yes No NA**

- Basin and outlet structure constructed per the approved plan.
  - Basin side slopes are stabilized with seed/mulch.
  - Drainage structure flushed and basin surface restored upon removal of sediment basin facility.
  - Sediment basin dewatering pool is dewatering at appropriate rate.
- Sediment accumulation is \_\_\_% of design capacity.

Note: Not all erosion and sediment control practices are included in this listing. Add additional pages to this list as required by site specific design. All practices shall be maintained in accordance with their respective standards.

Construction inspection checklists for post-development stormwater management practices can be found in Appendix F of the New York Stormwater Management Design Manual.

# Orangetown Town Hall Construction Inspection List

<b>Part a - Site Inspection</b>	<b>Y</b>	<b>N</b>	<b>Notes</b>	
1. Are there signs of pollution leaving site?				
2. Are discharge points and receiving waters free of sediment deposits?				
3. Are all structural Stormwater Management Practices (SMPs) working properly?				
4. Are all slopes and disturbed areas not actively being worked properly stabilized?				
5. Are all structural SMPs in good condition?				
6. Is there sediment in SMP structures?				
7. Are additional SMPs needed?				
8. Is the construction permit notice posted?				
9. Changes necessary to the SWPPP?				
10. Has site plan been completed as per SPDES permit requirements?				
<b>Part b - Hazardous Materials</b>	<b>Y</b>	<b>N</b>	<b>N/A</b>	<b>Notes</b>
1. Are there any signs of hazardous materials being exposed to stormwater runoff?				
2. Are washout facilities (e.g., paint, stucco, concrete) available, clearly marked, and maintained?				
3. Are equipment fueling, cleaning & maintenance areas free of spills, leaks, or any other deleterious material?				
4. Are materials that are potential stormwater contaminants stored inside or under cover?				
5. Have there been any reportable quantities releases of hazardous materials?				
6. Was the NYSDEC Spills Hotline notified?				
7. Was the SWPPP modified to include:				
a. Date of Release				
b. Circumstances leading to release				
c. Steps taken to prevent reoccurrence				
<b>Part c - Rain Effects</b>	<b>Y</b>	<b>N</b>	<b>N/A</b>	<b>Notes</b>
1. Are there any signs of significant amounts of mud in the street or outfalls from the rain event?				
2. Are there any erosion control structures (BMPs) damaged or overwhelmed by the rain event?				
3. Are there signs of new ruts, gullies, rills or other damage from the rain event?				
4. Are there any conditions that need immediate attention?

## 1.0 INTRODUCTION

Tectonic Engineering & Surveying Consultants P.C. (“Tectonic”) was retained by Lothrop Associates LLP to perform a Rare, Threatened, and Endangered (RTE) Species Assessment for the Orangetown Town Hall Expansion, which is located on a parcel of land designated as Tax ID: 74.10 – 1 – 26 and is located at 26 Orangeburg Road, hamlet of Orangeburg, Town of Orangetown, Rockland County, New York (the “Survey Area”). Maps of the Survey Area are included in **Appendix I**.

The RTE species report aids in the identification and subsequent documentation of potential adverse impacts to flora, fauna, and overall habitat characteristics in the Survey Area. The results of this study will supply general baseline data on the ecological characteristics and observed communities in the Survey Area in accordance with the following:

- Endangered Species Act of 1973 (ESA)
- Bald and Golden Eagle Protection Act (BGEPA)
- Migratory Bird Act (MBA)
- Magnuson-Stevens Act (MSA)
- Environmental Conservation Law Article 11 and 6 NYCRR Part 182

This formal habitat assessment and RTE species report was performed in order to determine what, if any, state and/or federally listed threatened and endangered species and/or other protected species or associated suitable and/or critical habitat may occur or potentially be impacted by construction activity in the Survey Area.

## 2.0 SITE CHARACTERIZATION

### 2.1 SITE DESCRIPTION

The Survey Area is located in the Glaciated Triassic Lowlands ecoregion, which is comprised of undulating plains underlain by erodible Triassic sandstones and shales and covered by glacial drift. Much of the native vegetation in much of this ecoregion has been replaced by urban development. Elevation within the Survey Area ranges from approximately 210 feet Above Mean Sea Level (AMSL) to 220 AMSL. According to the aerial map (**Appendix I**) and topographic map (**Appendix II**), the Survey Area appears to be comprised of a paved parking area and driveway, existing buildings, and mowed lawn with trees. The abutting land north of the Survey Area is comprised of residential development, the abutting land west of the Survey Area is the Palisades Interstate Parkway and associated highway on and off ramps; the abutting land east of the Survey Area is comprised of a municipal fire district building; and the abutting land south of the Survey Area is comprised of commercial properties.

tectonicengineering.com

## 2.2 SOILS

According to the Natural Resource Conservation Services (NRCS) online websoil survey, assessed February 25, 2020, a total of three (3) soil types occurs within the Survey Area (**Appendix III**). Each soil type identified within the Survey Area has a hydric soil rating of not hydric. A summary of the on-site soils is provided in Table 1.

Table 1: Soil Characterization

Soil Symbol	Soil Name	Approximate Percentage of Survey Area	Hydric Soil Rating
WeB	Wethersfield gravelly silt loam, 3 to 8 percent slopes	93.9	Not Hydric
Ux	Urban land	5.0	Not Hydric
WuC	Wethersfield-Urban land complex, 8 to 15 percent slopes	1.1	Not Hydric

## 3.0 METHODOLOGY

### 3.1 AGENCY CONSULTATION

An online review of information from federal and state agencies was performed to determine what, if any, critical habitats and/or state or federally protected species exist within the Survey Area. The desktop analysis was used to develop a habitat assessment plan.

#### 3.1.1 UNITED STATES FISH AND WILDLIFE SERVICE

The United States Fish and Wildlife Service (USFWS) Environmental Conservation Online System (ECOS) Information for Planning and Conservation (IPaC) webpage was searched to determine which federally protected species and critical habitats, if any, are potentially present within the Survey Area.

#### 3.1.2 NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION

The New York State Department of Environmental Conservation (NYSDEC) Environmental Resource Mapper (ERM) and Environmental Assessment Form (EAF) Summary Report were searched to determine which state protected species and significant natural communities, if any, are potentially present within the Survey Area.

## 3.2 HABITAT ASSESSMENT

A habitat assessment was performed to determine whether the Survey Area contains habitat for any RTE species. The goal of the habitat assessment was to provide a characterization of the quality and quantity of habitat available to support RTE species. A desktop review of the Survey Area and information obtained from agency consultations was utilized to provide a preliminary characterization of site conditions. Information from the USFWS and NYSDEC was analyzed to identify RTE species that may be found in the vicinity of the Survey Area. Information about the type of habitat preferred by the respective RTE species was compared to the habitats observed in the Survey Area.

## 4.0 RESULTS

### 4.1 AGENCY CONSULTATION

#### 4.1.1 UNITED STATES FISH AND WILDLIFE SERVICE

On January 24, 2020, Tectonic generated a USFWS Official Species List and IPaC Resource List for the Survey Area (**Appendix IV**). The results of the report are summarized below:

#### Proposed, Candidate, Threatened, and Endangered Species

The USFWS Official Species Lists from the New York and Long Island Field Offices indicate that there are no proposed, candidate, threatened, or endangered species that may occur at the proposed project location, and/or may be affected by the proposed project.

#### Critical Habitats

According to the USFWS Official Species List, the Survey Area does not contain any critical habitat areas.

#### Migratory Birds

According to the USFWS IPaC Resource List (**Appendix IV**), a total of thirteen (13) migratory bird species of concern may inhabit the Survey Area, including the bald eagle (*Haliaeetus leucocephalus*), black-billed cuckoo (*Coccyzus erythrophthalmus*), bobolink (*Dolichonyx oryzivorus*), Canada warbler (*Cardellina canadensis*), dunlin (*Calidris alpina arctica*), lesser yellowlegs (*Tringa flavipes*), long-eared owl (*Asio otus*), prairie warbler (*Dendroica discolor*), red-headed woodpecker (*Melanerpes erythrocephalus*), red-throated loon (*Gavia stellata*), rusty blackbird (*Euphagus carolinus*), semipalmated sandpiper (*Calidris pusilla*), and wood thrush (*Hylocichla mustelina*).

#### 4.1.2 NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION

According to the NYSDEC ERM, the NYSDEC has no records of rare plants and animals in the vicinity of the Survey Area. The NYSDEC ERM and NYSDEC EAF Mapper are included in **Appendix V**.

#### 4.2 HABITAT ASSESSMENT

Tectonic conducted a field assessment on February 18, 2020. Representative photographs of conditions observed during the field assessment are included in **Appendix VI**.

The land in the Survey Area was classified into ecological communities based on *Ecological Communities of New York State, Second Edition, March 2014*. The existing municipal buildings were classified as an urban structure exterior ecological community, which include the exterior surfaces of metal, wood, or concrete structures (such as commercial buildings, apartment buildings, houses, bridges). The unpaved mowed lawn with sporadic tree cover in the Survey Area was classified as a mowed lawn with trees ecological community, which includes residential, recreational, or commercial land in which the groundcover is dominated by clipped grasses and forbs, and it is shaded by at least 30% cover of trees. The paved driveway and parking lot was classified as a paved road / path ecological community, which includes a road or pathway that is paved with asphalt, concrete, brick, or stone. These ecological communities can be found throughout New York State and do not provide suitable habitat for any state or federally designated rare, threatened, or endangered species.

## 5.0 DISCUSSION AND RECOMMENDATIONS

Based on the preliminary review of the Survey Area and the field habitat assessment, the project is not anticipated to impact state or federally designated RTE species. According to the NYSDEC ERM and EAF Summary Report, the NYSDEC has no records of rare plants and animals in the vicinity of the Survey Area. According to USFWS Official Species Lists from the New York and Long Island Field Offices; there are no proposed, candidate, threatened, or endangered species that may occur at the proposed project location, and/or may be affected by the proposed project. Additionally, during a field habitat assessment, no suitable habitat for any state or federally designated rare, threatened, or endangered species was identified in the Survey Area. Therefore, Tectonic anticipates that the proposed project will have no effect on federal or state regulated rare, threatened or endangered species.

Should you have any questions, comments, concerns, or require any additional information, please do not hesitate to contact the undersigned by phone at (845) 534-5959, or by e-mail at [ccamacho@tectonicengineering.com](mailto:ccamacho@tectonicengineering.com) or [lbart@tectonicengineering.com](mailto:lbart@tectonicengineering.com).

# Custom Soil Resource Report for Rockland County, New York

# Preface

---

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (<http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/>) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (<https://offices.sc.egov.usda.gov/locator/app?agency=nrcs>) or your NRCS State Soil Scientist ([http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2\\_053951](http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951)).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

# How Soil Surveys Are Made

---

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

## Custom Soil Resource Report

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

## Custom Soil Resource Report

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

# Soil Map

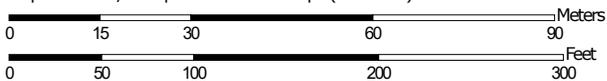

---

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

WuC	Wethersfield-Urban land complex, 8 to 15 percent slopes	0.1	1.1%
<b>Totals for Area of Interest</b>		<b>5.1</b>	<b>100.0%</b>

## Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or

## Custom Soil Resource Report

landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

## Rockland County, New York

### Ux—Urban land

#### Map Unit Setting

*National map unit symbol:* 9v5g  
*Mean annual precipitation:* 47 to 50 inches  
*Mean annual air temperature:* 48 to 52 degrees F  
*Frost-free period:* 135 to 215 days  
*Farmland classification:* Not prime farmland

#### Map Unit Composition

*Urban land:* 75 percent  
*Minor components:* 25 percent  
*Estimates are based on observations, descriptions, and transects of the mapunit.*

### Description of Urban Land

#### Interpretive groups

*Land capability classification (irrigated):* None specified  
*Land capability classification (nonirrigated):* 8s  
*Hydric soil rating:* Unranked

### Minor Components

#### Udorthents

*Hydric soil rating:* No

#### Udorthents, wet substratum

*Percent of map unit:* 5 percent  
*Hydric soil rating:* No

### WeB—Wethersfield gravelly silt loam, 3 to 8 percent slopes

#### Map Unit Setting

*National map unit symbol:* 9v5l  
*Mean annual precipitation:* 47 to 50 inches  
*Mean annual air temperature:* 48 to 52 degrees F

## Custom Soil Resource Report

*Frost-free period:* 135 to 215 days

*Farmland classification:* All areas are prime farmland

### Map Unit Composition

*Wethersfield and similar soils:* 80 percent

*Minor components:* 20 percent

*Estimates are based on observations, descriptions, and transects of the mapunit.*

### Description of Wethersfield

#### Setting

*Landform:* Hills, till plains

*Landform position (two-dimensional):* Summit

*Landform position (three-dimensional):* Crest

*Down-slope shape:* Convex

*Across-slope shape:* Convex

*Parent material:* Loamy acid till derived mainly from reddish sandstone, shale, and conglomerate, with some basalt

#### Typical profile

*H1 - 0 to 13 inches:* gravelly silt loam

*H2 - 13 to 22 inches:* gravelly loam

*H3 - 22 to 60 inches:* gravelly fine sandy loam

#### Properties and qualities

*Slope:* 3 to 8 percent

*Depth to restrictive feature:* 20 to 38 inches to densic material

*Natural drainage class:* Well drained

*Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)

*Depth to water table:* About 18 to 30 inches

*Frequency of flooding:* None

*Frequency of ponding:* None

*Available water storage in profile:* Low (about 3.4 inches)

#### Interpretive groups

*Land capability classification (irrigated):* None specified

*Land capability classification (nonirrigated):* 2e

*Hydrologic Soil Group:* C

*Hydric soil rating:* No

### Minor Components

#### Charlton

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

#### Wallington

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

#### Cheshire

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

#### Riverhead

*Percent of map unit:* 5 percent

*Hydric soil rating:* No

# Soil Information for All Uses

---

## Suitabilities and Limitations for Use

The Suitabilities and Limitations for Use section includes various soil interpretations displayed as thematic maps with a summary table for the soil map units in the selected area of interest. A single value or rating for each map unit is generated by aggregating the interpretive ratings of individual map unit components. This aggregation process is defined for each interpretation.

## Land Classifications

Land Classifications are specified land use and management groupings that are assigned to soil areas because combinations of soil have similar behavior for specified practices. Most are based on soil properties and other factors that directly influence the specific use of the soil. Example classifications include ecological site classification, farmland classification, irrigated and nonirrigated land capability classification, and hydric rating.

## Hydric Rating by Map Unit

This rating indicates the percentage of map units that meets the criteria for hydric soils. Map units are composed of one or more map unit components or soil types, each of which is rated as hydric soil or not hydric. Map units that are made up dominantly of hydric soils may have small areas of minor nonhydric components in the higher positions on the landform, and map units that are made up dominantly of nonhydric soils may have small areas of minor hydric components in the lower positions on the landform. Each map unit is rated based on its respective components and the percentage of each component within the map unit.

The thematic map is color coded based on the composition of hydric components. The five color classes are separated as 100 percent hydric components, 66 to 99 percent hydric components, 33 to 65 percent hydric components, 1 to 32 percent hydric components, and less than one percent hydric components.

In Web Soil Survey, the Summary by Map Unit table that is displayed below the map pane contains a column named 'Rating'. In this column the percentage of each map unit that is classified as hydric is displayed.

## Custom Soil Resource Report

Hydric soils are defined by the National Technical Committee for Hydric Soils (NTCHS) as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (Federal Register, 1994). Under natural conditions, these soils are either saturated or inundated long enough during the growing season to support the growth and reproduction of hydrophytic vegetation.

The NTCHS definition identifies general soil properties that are associated with wetness. In order to determine whether a specific soil is a hydric soil or nonhydric soil, however, more specific information, such as information about the depth and duration of the water table, is needed. Thus, criteria that identify those estimated soil properties unique to hydric soils have been established (Federal Register, 2002). These criteria are used to identify map unit components that normally are associated with wetlands. The criteria used are selected estimated soil properties that are described in "Soil Taxonomy" (Soil Survey Staff, 1999) and "Keys to Soil Taxonomy" (Soil Survey Staff, 2006) and in the "Soil Survey Manual" (Soil Survey Division Staff, 1993).

If soils are wet enough for a long enough period of time to be considered hydric, they should exhibit certain properties that can be easily observed in the field. These visible properties are indicators of hydric soils. The indicators used to make onsite determinations of hydric soils are specified in "Field Indicators of Hydric Soils in the United States" (Hurt and Vasilas, 2006).

In Reply Refer To:

January 24, 2020

Consultation Code: 05E1NY00-2020-SLI-1394

Event Code: 05E1NY00-2020-E-04308

Project Name: Orangeburg Town Hall Project

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 *et seq.*). This list can also be used to determine whether listed species may be present for projects without federal agency involvement. New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list.

Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the ESA, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC site at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list. If listed, proposed, or candidate species were identified as potentially occurring in the project area, coordination with our office is encouraged. Information on the steps involved with assessing potential impacts from projects can be found at: <http://www.fws.gov/northeast/nyfo/es/section7.htm>

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (<http://www.fws.gov/windenergy/>)

[eagle\\_guidance.html](#)). Additionally, wind energy projects should follow the Services wind energy guidelines (<http://www.fws.gov/windenergy/>) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: <http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm>; <http://www.towerkill.com>; and <http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html>.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the ESA. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Attachment(s):

- Official Species List

## Official Species List

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

**New York Ecological Services Field Office**

3817 Luker Road

Cortland, NY 13045-9385

(607) 753-9334

This project's location is within the jurisdiction of multiple offices. Expect additional species list documents from the following office, and expect that the species and critical habitats in each document reflect only those that fall in the office's jurisdiction:

**Long Island Ecological Services Field Office**

340 Smith Road

Shirley, NY 11967-2258

(631) 286-0485

---

## Project Summary

Consultation Code: 05E1NY00-2020-SLI-1394

Event Code: 05E1NY00-2020-E-04308

Project Name: Orangeburg Town Hall Project

Project Type: Federal Grant / Loan Related

Project Description: The proposed Project involves the installation of a two-story building with basement, demolition of the existing town hall building, and construction of a pedestrian plaza and parking area on a parcel of land located on 26 Orangetown Road, Town of Orangetown, Rockland County, New York

### Project Location:

Approximate location of the project can be viewed in Google Maps: <https://www.google.com/maps/place/41.046560698006004N73.95591050592895W>

Counties: Rockland, NY

---

## Endangered Species Act Species

There is a total of 0 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries<sup>1</sup>, as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

- 
1. [NOAA Fisheries](#), also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

## Critical habitats

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

Phone: (631) 286-0485 Fax: (631) 286-4003

In Reply Refer To:

January 24, 2020

Consultation Code: 05E1LI00-2020-SLI-0243

Event Code: 05E1LI00-2020-E-00558

Project Name: Orangeburg Town Hall Project

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

<http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF>

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan ([http://www.fws.gov/windenergy/eagle\\_guidance.html](http://www.fws.gov/windenergy/eagle_guidance.html)). Additionally, wind energy projects should follow the wind energy guidelines (<http://www.fws.gov/windenergy/>) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: <http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm>; <http://www.towerkill.com>; and <http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html>.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

## Endangered Species Act Species

There is a total of 0 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries<sup>1</sup>, as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

- 
1. [NOAA Fisheries](#), also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

## Critical habitats

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

---

# IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

## Location

Rockland County, New York

NOT FOR CONSULTATION

# Endangered species

**This resource list is for informational purposes only and does not constitute an analysis of project level impacts.**

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population, even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

## Listed species

<sup>1</sup> and their critical habitats are managed by the [Ecological Services Program](#) of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries<sup>2</sup>).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact [NOAA Fisheries](#) for [species under their jurisdiction](#).

- 
1. Species listed under the [Endangered Species Act](#) are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the [listing status page](#) for more information.
  2. [NOAA Fisheries](#), also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

THERE ARE NO ENDANGERED SPECIES EXPECTED TO OCCUR AT THIS LOCATION.

# Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act

[1](#) and the Bald and Golden Eagle Protection Act<sup>2</sup>.

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described [below](#).

1. The [Migratory Birds Treaty Act](#) of 1918.
2. The [Bald and Golden Eagle Protection Act](#) of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern <http://www.fws.gov/birds/management/managed-species/birds-of-conservation-concern.php>
- Measures for avoiding and minimizing impacts to birds <http://www.fws.gov/birds/management/project-assessment-tools-and-guidance/conservation-measures.php>
- Nationwide conservation measures for birds

The birds listed below are birds of particular concern either because they occur on the [USFWS Birds of Conservation Concern](#) (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ [below](#). This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the [E-bird data mapping tool](#) (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found [below](#).

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME

BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA SOMETIME WITHIN THE TIMEFRAME SPECIFIED, WHICH IS A VERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE")

INDICATES THAT THE BIRD DOES  
NOT LIKELY BREED IN YOUR  
PROJECT AREA.)

<b>Bald Eagle</b> <i>Haliaeetus leucocephalus</i> This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. <a href="https://ecos.fws.gov/ecp/species/1626">https://ecos.fws.gov/ecp/species/1626</a>	Breeds Oct 15 to Aug 31
<b>Black-billed Cuckoo</b> <i>Coccyzus erythrophthalmus</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. <a href="https://ecos.fws.gov/ecp/species/9399">https://ecos.fws.gov/ecp/species/9399</a>	Breeds May 15 to Oct 10
<b>Bobolink</b> <i>Dolichonyx oryzivorus</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds May 20 to Jul 31
<b>Canada Warbler</b> <i>Cardellina canadensis</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds May 20 to Aug 10
<b>Dunlin</b> <i>Calidris alpina arcticola</i> This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA	Breeds elsewhere
<b>Lesser Yellowlegs</b> <i>Tringa flavipes</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. <a href="https://ecos.fws.gov/ecp/species/9679">https://ecos.fws.gov/ecp/species/9679</a>	Breeds elsewhere
<b>Long-eared Owl</b> <i>asio otus</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. <a href="https://ecos.fws.gov/ecp/species/3631">https://ecos.fws.gov/ecp/species/3631</a>	Breeds elsewhere
<b>Prairie Warbler</b> <i>Dendroica discolor</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds May 1 to Jul 31
<b>Red-headed Woodpecker</b> <i>Melanerpes erythrocephalus</i> This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds May 10 to Sep 10

Red-throated Loon *Gavia stellata*

Breeds elsewhere

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Rusty Blackbird *Euphagus carolinus*

Breeds elsewhere

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Semipalmated Sandpiper *Calidris pusilla*

Breeds elsewhere

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Wood Thrush *Hylocichla mustelina*

Breeds May 10 to Aug 31

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

**Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.**

[Nationwide Conservation Measures](#) describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. [Additional measures](#) and/or [permits](#) may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

**What does IPaC use to generate the migratory birds potentially occurring in my specified location?**

The Migratory Bird Resource List is comprised of USFWS [Birds of Conservation Concern \(BCC\)](#) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the [Avian Knowledge Network \(AKN\)](#). The AKN data is based on a growing collection of [survey, banding, and citizen science datasets](#) and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle ([Eagle Act](#) requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the [AKN Phenology Tool](#).

**What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?**

The probability of presence graphs associated with your migratory bird list are based on data provided by the [Avian Knowledge Network \(AKN\)](#). This data is derived from a growing collection of [survey, banding, and citizen science datasets](#).

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

## How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: [The Cornell Lab of Ornithology All About Birds Bird Guide](#), or (if you are unsuccessful in locating the bird of interest there), the [Cornell Lab of Ornithology Neotropical Birds guide](#). If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

## What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are [Birds of Conservation Concern](#) (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the [Eagle Act](#) requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

## Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the [Northeast Ocean Data Portal](#). The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the [NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf](#) project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the [Diving Bird Study](#) and the [nanotag studies](#) or contact [Caleb Spiegel](#) or [Pam Loring](#).

## What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to [obtain a permit](#) to avoid violating the Eagle Act should such impacts occur.

## Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which

means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

## Facilities

### National Wildlife Refuge lands

Any activity proposed on lands managed by the [National Wildlife Refuge](#) system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS AT THIS LOCATION.

### Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

### Wetlands in the National Wetlands Inventory

Impacts to [NWI wetlands](#) and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local [U.S. Army Corps of Engineers District](#).

THERE ARE NO KNOWN WETLANDS AT THIS LOCATION.

#### Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

#### **Data exclusions**

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tubercid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

#### **Data precautions**

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

**Longitude/Latitude**

**Longitude:** -73.9559508415922

**Latitude:** 41.04654012202368

The approximate address of the point you clicked on is:

Orangetown Police Department

**County:** Rockland

**Town:** Orangetown

**USGS Quad:** NYACK

**DEC Region**

**Region 3:**

(Lower Hudson Valley) Dutchess, Orange, Putnam, Rockland, Sullivan, Ulster and Westchester counties. For more information visit <http://www.dec.ny.gov/about/607.html>.

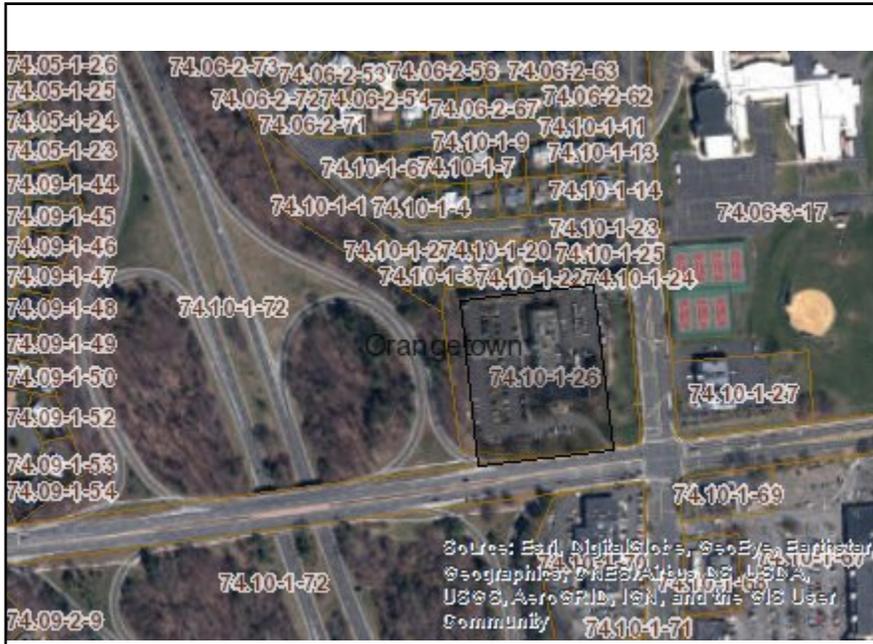

If your project or action is within or near an area with a rare animal, a permit may be required if the species is listed as endangered or threatened and the department determines the action may be harmful to the species or its habitat.

If your project or action is within or near an area with rare plants and/or significant natural communities, the environmental impacts may need to be addressed.

The presence of a unique geological feature or landform near a project, unto itself, does not trigger a requirement for a NYS DEC permit. Readers are advised, however, that there is the chance that a unique feature may also show in another data layer (ie. a wetland) and thus be subject to permit jurisdiction.

Please refer to the "Need a Permit?" tab for permit information or other authorizations regarding these natural resources.

**Disclaimer:** If you are considering a project or action in, or near, a wetland or a stream, a NYS DEC permit may be required. The Environmental Resources Mapper does not show all natural resources which are regulated by NYS DEC, and for which permits from NYS DEC are required. For example, Regulated Tidal Wetlands, and Wild, Scenic, and Recreational Rivers, are currently not included on the maps.

**Disclaimer:** The EAF Mapper is a screening tool intended to assist project sponsors and reviewing agencies in preparing an environmental assessment form (EAF). Not all questions asked in the EAF are answered by the EAF Mapper. Additional information on any EAF question can be obtained by consulting the EAF Workbooks. Although the EAF Mapper provides the most up-to-date digital data available to DEC, you may also need to contact local or other data sources in order to obtain data not provided by the Mapper. Digital data is not a substitute for agency determinations.

B.i.i [Coastal or Waterfront Area]	No
B.i.ii [Local Waterfront Revitalization Area]	No
C.2.b. [Special Planning District]	Digital mapping data are not available or are incomplete. Refer to EAF Workbook.

## Our Story

For the past 30 years, Tectonic has delivered quality professional services in a timely and cost effective manner by pooling its talented staff into project teams that think, act, and perform as one integral unit. By carefully listening and collaborating with its clients, the firm is able to identify the key issues and assure stakeholder objectives are met in the final deliverables. Through innovating and adopting technological advances, the firm is able to generate unique solutions to improve our nation's deteriorating infrastructure and build safe sustainable communities.

As the world evolves, and its challenges grow more complex, Tectonic continues to innovate and provide the practical solutions and exceptional customer service its clients have trusted since its founding.

**GENERAL NOTES**

- A. SITE CONDITIONS**
- UNLESS OTHERWISE NOTED ELSEWHERE ON PLANS OR IN THE PROJECT SPECIFICATIONS, ALL WORK SHALL BE PERFORMED BY THE GENERAL CONTRACTOR.
  - EXISTING CONDITIONS ARE BASED ON A SURVEY DATED 08/14/2020, BY SVANT LAND SURVEYING, P.C. DATED 12/04/2019, LAST REVISED 05/14/2020.
  - ALL ELEVATIONS SHOWN ARE FINISHED GRADE ELEVATIONS UNLESS OTHERWISE NOTED.
  - ALL INFORMATION SHOWN OR NOTED FOR EXISTING FACILITIES, GRADES, ROADWAYS, AND MATERIALS IS APPROPRIATE AND THE GENERAL CONTRACTOR SHALL BE RESPONSIBLE FOR CHECKING ALL INFORMATION WHICH MAY AFFECT HIS WORK.
  - TEST PITS SHALL BE CONDUCTED BY THE GENERAL CONTRACTOR AT ALL PIPE CROSSINGS SHOWN ON THE CROSSING TABLE ON SHEET C-104 TO COMPLETE THE WORK OR AS DIRECTED BY THE OWNER'S REPRESENTATIVE.
  - THE GENERAL CONTRACTOR IS RESPONSIBLE FOR THE PROVISION OF ALL MATERIALS, LABOR AND INSTALLATION OF ALL ITEMS OF CONSTRUCTION FOR THE SUCCESSFUL COMPLETION AND OPERATION OF THE PROJECT SATISFACTORY TO THE OWNER AND THEIR REPRESENTATIVE IN ACCORDANCE WITH THE CONTRACT DOCUMENTS.
  - THE GENERAL CONTRACTOR SHALL PROVIDE HIS OWN LAYOUT AND STAKEOUT OF ALL PROPOSED IMPROVEMENTS. OFFSET LINES WITH STAKES SHALL BE SET AT APPROPRIATE INTERVALS TO FACILITATE CONSTRUCTION. CUT SHEETS SHALL BE SUBMITTED FOR APPROVAL TO THE OWNER'S REPRESENTATIVE AND TO THE WORK CREATORS IN THE TIME IDENTIFIED IN SPECS PRIOR TO CONSTRUCTION.
  - VERIFY ALL BENCHMARKS PRIOR TO THE START OF CONSTRUCTION.
  - PROTECT ALL BENCH MARKS AND MONUMENTS FROM DAMAGE AND SHALL ESTABLISH OFFSET POINTS FOR HIS WORK.
  - THE GENERAL CONTRACTOR SHALL BE RESPONSIBLE FOR SITE SECURITY THROUGHOUT THE DURATION OF THE PROJECT AND SHALL PROVIDE AND MAINTAIN SAFETY AND SECURITY FENCING, MEASURES, AND PERSONNEL AS DIRECTED BY THE OWNER'S REPRESENTATIVE.
  - ATTENTION IS DIRECTED TO THE SAFETY REQUIREMENTS AS OUTLINED IN THE GENERAL CONDITIONS OF THE CONSTRUCTION SPECIFICATIONS. THE OWNER, ARCHITECT, AND ENGINEER SHALL ASSUME NO RESPONSIBILITY AND/OR LIABILITY FOR THE SAFETY OF THE WORKERS WHERE THE WORK IS BEING PERFORMED.
  - ALL CONTRACTORS SHALL COMPLY WITH ALL FEDERAL, STATE, AND LOCAL LAWS AND ALL CODES, ORDINANCES, RULES AND REGULATIONS THAT APPLY TO THE WORK OR THE ACTION OF THE WORK EMPLOYED IN THE WORK. ALL WORK, LABOR OR MATERIALS NECESSARY TO COMPLY WITH THESE LAWS, CODES, ORDINANCES, RULES AND REGULATIONS SHALL BE OBTAINED AND FURNISHED BY THE CONTRACTOR.
  - THE MUNICIPAL AND COUNTY DEPARTMENT OF PUBLIC WORKS AS WELL AS THE STATE DOT (WHERE STATE ROADS ARE INVOLVED) SHALL BE NOTIFIED 72 HOURS IN ADVANCE OF ANY ROAD OPENING OF ANY STREET.
  - THE GENERAL CONTRACTOR SHALL PROVIDE AND PAY FOR ALL NECESSARY PERMITS AND LICENSES REQUIRED TO CARRY OUT HIS WORK IN FULL ACCORDANCE WITH THE REQUIREMENTS OF ALL REGULATIONS AND AUTHORITIES HAVING JURISDICTION.
  - AREA OF SUBJECT PARCEL: 5.09 ACRES OR 221741.32 SQUARE FEET. THE SUBJECT PROPERTY DOES NOT FALL WITHIN THE 100 YEAR FLOOD ZONE AS PER THE NATIONAL FLOOD INSURANCE RATE MAP FOR THE TOWN OF ORANGETOWN, OWNER: APPLICANT: TOWN OF ORANGETOWN 28 ORANGEBURG ROAD ORANGETOWN, NY 13027 TOWN OF ORANGETOWN 28 ORANGEBURG ROAD ORANGETOWN, NY 13027
  - AT LEAST ONE WEEK PRIOR TO THE COMMENCEMENT OF ANY WORK, INCLUDING THE INSTALLATION OF EROSION CONTROL DEVICES OR THE REMOVAL OF TREES AND VEGETATION, A PRE-CONSTRUCTION MEETING MUST BE HELD WITH THE OWNER'S REPRESENTATIVES. IT IS THE RESPONSIBILITY AND OBLIGATION OF THE PROPERTY OWNER TO ARRANGE SUCH A MEETING.
- B. SOIL EROSION, SEDIMENT, AND DUST CONTROL**
- THE GENERAL CONTRACTOR SHALL TAKE ALL NECESSARY MEASURES TO MAINTAIN DUST CONTROL AS REQUIRED OR DIRECTED BY THE ENGINEER. ALL VEHICLES SHALL BE CLEAN AND ALL ROADWAYS SHALL BE MAINTAINED FREE OF CONSTRUCTION DEBRIS AND SOIL.
  - ALL SEDIMENT AND SOIL EROSION CONTROL PRACTICES ARE TO BE INSTALLED IN CONFORMANCE WITH STANDARD PRACTICES AS SET FORTH IN THE SOIL EROSION AND SEDIMENT CONTROL PLAN SHEET INCLUDING PROPER SEQUENCE AND MAINTAINED UNTIL PERMANENT PROTECTION IS ESTABLISHED.
  - THE SOIL EROSION AND SEDIMENT CONTROL PLAN SHEET INCLUDES ADDITIONAL NOTES WHICH SHALL BE ADHERED TO BY THE GENERAL CONTRACTOR.
  - THE STORM WATER POLLUTION PREVENTION PLAN (SWPPP) AS APPROVED BY THE TOWN OF ORANGETOWN AND THE INVESTIGATOR IS A PART OF THE CONTRACT DOCUMENTS AND ASSISTS THE OWNER WITH COMPLIANCE WITH CP 9-20-001.
- C. UTILITIES**
- AVAILABLE INFORMATION AS TO THE LOCATION OF EXISTING UTILITIES HAS BEEN COLLECTED FROM VARIOUS SOURCES. THE RESULTS OF SUCH INVESTIGATIONS, AS MAY BE SHOWN ON THE GENERAL CONTRACT DRAWINGS, ARE NOT GUARANTEED AS INFORMATION ONLY. THE GENERAL CONTRACTOR SHALL CONTACT THE NY STATE NEW YORK (NYS) SHOWS BELOW. IT IS THE GENERAL CONTRACTOR'S RESPONSIBILITY TO LOCATE, IDENTIFY AND PROTECT UTILITIES WITHIN THE PROJECT LIMITS. THE GENERAL CONTRACTOR SHALL DIG TEST PITS TO LOCATE UTILITIES WITHIN THE PROJECT LIMITS.
  - DIG SAFELY NEW YORK (DPSNY), PHONE # 1-800-982-7962.
  - THE GENERAL CONTRACTOR SHALL NOTIFY ALL UTILITY COMPANIES TEN (10) DAYS PRIOR TO CONSTRUCTION, OF THEIR ANTICIPATED START DATE.
  - THE GENERAL CONTRACTOR SHALL CONTACT THE UTILITY COMPANIES TO DETERMINE THEIR SCHEDULES FOR PERFORMING UTILITY RELOCATION AND INSTALLATION WORK AND HE SHALL SCHEDULE HIS WORK ACCORDINGLY SO AS NOT TO INTERFERE WITH THE WORK OF THE UTILITY COMPANIES.
  - THE GENERAL CONTRACTOR SHALL NOTIFY THE UTILITY COMPANIES AT LEAST 72 HOURS IN ADVANCE OF ANY WORK ON THEIR FACILITIES.
  - EXISTING UTILITY FACILITIES THAT MAY HAVE TO BE RELOCATED ARE TO BE MOVED BY THE RESPECTIVE UTILITY COMPANY UNLESS OTHERWISE NOTED. THE GENERAL CONTRACTOR IS RESPONSIBLE FOR SCHEDULING AND SHALL NOT CLAIM ANY DELAYS TO HIS CONSTRUCTION SCHEDULE.
  - ALL PROPOSED GAS UTILITIES SHALL BE INSTALLED BY THE CONTRACTOR UNLESS OTHERWISE NOTED AND SHALL BE LOCATED IN ACCORDANCE WITH THE REQUIREMENTS OF THE RESPECTIVE UTILITY COMPANY. THE CONTRACTOR SHALL REAR ALL COSTS ASSOCIATED WITH THESE UTILITIES FOR THE PROJECT, BOTH ON AND OFF SITE.
  - THE GENERAL CONTRACTOR SHALL BE RESPONSIBLE TO COORDINATE ALL REQUIRED UTILITY CONNECTIONS WITH THE RESPECTIVE UTILITY COMPANY.
  - ALL TRENCHES SHALL BE BACK FILLED WITHOUT DELAY. OPEN TRENCHES SHALL BE LEFT TO A MINIMUM OPEN TRENCHES SHALL BE TEMPORARILY SUPPORTED AND STER PLATED WHEN WORK IS NOT IN PROGRESS. NO EXCAVATION AREAS SHALL REMAIN OPEN OVERNIGHT. THE GENERAL CONTRACTOR IS SOLELY RESPONSIBLE FOR THE DESIGN AND INSTALLATION OF STEEL PLATES THAT ARE CAPABLE OF SAFELY SUPPORTING THE LOADS THEY WILL BE SUBJECTED TO.
  - ANY DAMAGE TO UTILITIES SHALL BE THE SOLE RESPONSIBILITY OF THE CONTRACTOR, AND ALL COST FOR REPAIRS SHALL BE BORNE BY THE CONTRACTOR.
  - THE GENERAL CONTRACTOR SHALL BE RESPONSIBLE FOR COSTS INCURRED IN TEMPORARY SUPPORT OF UTILITY PIPES NEAR EXCAVATION THAT DO NOT REQUIRE RELOCATION. IT SHALL BE THE GENERAL CONTRACTOR'S RESPONSIBILITY TO NOTIFY THE APPROPRIATE UTILITY COMPANY FOR UTILITY POLE RELOCATION.
  - ALL GAS VALVES, MARKERS, VENTS AND BOXES WITHIN THE CONSTRUCTION LIMITS SHALL BE LEFT BY THE RESPECTIVE UTILITY COMPANIES. IT SHALL BE THE RESPONSIBILITY OF THE GENERAL CONTRACTOR TO NOTIFY EACH UTILITY COMPANY AND SCHEDULE THE WORK ACCORDINGLY.
  - FIRE HYDRANTS SHALL BE RELOCATED BY THE GENERAL CONTRACTOR.
  - ALL PROPOSED WATER SERVICES SHALL BE LOCATED A MINIMUM SEPARATION DISTANCE OF 10 HORIZONTAL FEET AND 15 VERTICAL FEET FROM ALL SANITARY LINES FACILITIES. A MINIMUM 4 FEET OF COVER SHALL BE PROVIDED OVER ALL WATER.
  - ALL EXCAVATIONS MADE TO REMOVE EXISTING UNDERGROUND UTILITIES/STRUCTURES, INSTALL NEW UNDERGROUND UTILITIES/STRUCTURES WITHIN FIVE (5) FEET CENTERLINE OF THE BUILDING OR WITHIN ROADWAYS SHALL BE BACKFILLED IN ACCORDANCE WITH THE PLAN DETAILS AND SPECIFICATIONS AND UNDER THE SUPERVISION OF THE OWNER'S REPRESENTATIVE.
  - UNDERGROUND IMPROVEMENTS IF ANY AND NOT VISIBLE AT THE TIME OF THE PRELIMINARY SURVEY SHALL BE IDENTIFIED IN THE FIELD OR SHOWN HEREON. TO THE BEST OF OUR BELIEF, UNDERGROUND IMPROVEMENTS FROM AVAILABLE DOCUMENTATION HAVE BEEN SHOWN.

- D. PEDESTRIAN AND TRAFFIC FLOW**
- THE GENERAL CONTRACTOR MUST PROVIDE A MEANS OF SAFE ACCESS AND EGRESS AT ALL TIMES TO THE PUBLIC OUTSIDE OF THE BUILDING, STARTING FIVE (5) FEET FROM THE FRONT OF EACH EXIST. THIS SHALL INCLUDE RIGHTS OF WAY AS WELL AS INDIVIDUAL RESIDENCES AND/OR BUSINESSES WITHIN THE PROJECT AREA.
  - GENERAL CONTRACTOR IS REQUIRED TO ENSURE THE SAFE, ORDERLY AND EFFICIENT FLOW OF TRAFFIC AT ALL TIMES. SAID TRAFFIC FLOW IS TO BE MAINTAINED IN ACCORDANCE WITH RECOGNIZED TRAFFIC CONTROL STANDARDS AND IS ENSURED, BUT NOT LIMITED TO, THROUGH THE USE OF FLAGMAN, STOPPING, BARRICADES, FLASHING LIGHTS, CONES, BARRIERS, ETC. AS MAINTAINED BY THE CONSTRUCTION MANAGER. A WEIGH WITH THE TOWN HIGHWAY SUPERINTENDENT SHALL OCCUR PRIOR TO THE START OF CONSTRUCTION. ALL MAINTENANCE AND PROTECTION OF TRAFFIC PLANS REQUIRED TO FACILITATE CONSTRUCTION SHALL BE PROVIDED BY THE CONTRACTOR AND BE REVIEWED AND APPROVED BY THE TOWN HIGHWAY SUPERINTENDENT. THIS SHALL BE THE SOLE RESPONSIBILITY OF THE CONTRACTOR TO FURNISH AND INSTALL ALL TRAFFIC CONTROL DEVICES.
  - FLAGMAN SHALL BE EMPLOYED BY THE GENERAL CONTRACTOR FOR THE PROTECTION OF ANY EQUIPMENT ENTERING, LEAVING OR CROSSING ACTIVE TRAFFIC LANES, OR AS MAY BE REQUIRED FOR THE ROUTING OF ANY TRAFFIC AROUND OR THROUGH THE CONSTRUCTION. FLAGMAN WILL BE EMPLOYED BY THE CONTRACTOR.
  - DURING THE WINTER MONTHS, THE GENERAL CONTRACTOR SHALL BE RESPONSIBLE FOR SNOW REMOVAL AND THE COMPLETE MAINTENANCE OF EXISTING ROADWAYS UTILIZED FOR CONSTRUCTION PURPOSES BY ALL TRAFFIC. THE ROADWAYS SHALL BE KEPT FREE OF ALL OBSTRUCTIONS AND KEPT IN A SMOOTH DRIVING CONDITION AT ALL TIMES. ALL POT HOLES, WASHOUTS, CAVE-INS, ETC. DEVELOPING DURING THIS PERIOD SHALL BE PROPERLY FILLED IN WITH MATERIAL BY METHOD APPROVED BY THE OWNER'S REPRESENTATIVE.
  - BEFORE BEGINNING WORK ON ANY STAGE OF THE PROJECT, THE CONTRACTOR SHALL FURNISH AND INSTALL ALL SPECIFIED WARNING SIGNS, BARRICADES, LIGHTS, AND OTHER DEVICES AS SHOWN ON THE CONTRACT PLANS, OR DEEMED NECESSARY, IN THE OPINION OF THE OWNER'S REPRESENTATIVE, TO PROTECT THE PUBLIC DURING THAT PHASE OF HIS OPERATIONS.
  - ALL NECESSARY REGULATORY AND WARNING SIGNS SHALL BE IN ACCORDANCE WITH THE TOWN HANDBOOK (LATEST EDITION) WITH THE NYS SUPPLEMENT, LATEST EDITION, AND STANDARD HIGHWAY SIGNS (LATEST EDITION) AND SHALL BE SUPPLIED AND MAINTAINED BY THE GENERAL CONTRACTOR. WHEN SUCH SIGNS ARE REQUIRED, THE GENERAL CONTRACTOR SHALL IMMEDIATELY AND CAREFULLY REMOVE THEM FROM THE PROJECT SITE AT LOCATIONS APPROVED BY THE OWNER'S REPRESENTATIVE UNTIL THEY ARE REUSED ON THE PROJECT OR REMOVED BY THE GENERAL CONTRACTOR.
  - DURING CONSTRUCTION, ALL EXISTING ROAD AND RAMP SHALL REMAIN OPEN AND ALL TRAFFIC MAINTAINED TO ACCOMMODATE ESSENTIAL VEHICLES AT ALL TIMES.
- E. CONSTRUCTION**
- EXISTING ASPHALT PAVEMENT SHALL BE SAWCUT AND REMOVED IN SUCH A MANNER AS TO NOT TO TEAR, BURLE, DAMAGE, OR DISPLACE ADJACENT PAVEMENT. EDDGES SHALL BE CLEAN AND VERTICAL. ALL CUTS SHALL BE PARALLEL OR PERPENDICULAR TO THE DIRECTION OF TRAFFIC.
  - ALL ADJACENT CONCRETE AND BUILDING SURFACES SHALL BE PROTECTED FROM TRACK COLD AND/OR PRIME COAT IS APPLIED. TRAFFIC IS PROHIBITED UNTIL FULLY CURED.
  - WHERE UNDESIRABLE SUBGRADE IS ENCOUNTERED DURING THE COURSE OF CONSTRUCTION, THE CONTRACTOR SHALL EXCAVATE THE COMPLETE EXTERNS OF THE FAILED AREA AS DIRECTED BY THE OWNER'S REPRESENTATIVE. THE GENERAL CONTRACTOR SHALL REPLACE THE FAILED PAVEMENT WITH HMA BASE COURSE.
  - WHERE UNDESIRABLE OR WEAK AREAS OF PAVEMENT ARE ENCOUNTERED DURING THE COURSE OF CONSTRUCTION, THE GENERAL CONTRACTOR SHALL EXCAVATE THE COMPLETE EXTERNS OF THE FAILED AREA AS DIRECTED BY THE OWNER'S REPRESENTATIVE. THE GENERAL CONTRACTOR SHALL REPLACE THE FAILED PAVEMENT WITH HMA BASE COURSE.
  - ONCE THE CONTRACTOR HAS COMPLETED CONSTRUCTION, THE WORK SHALL CONTINUE ON A DAILY BASIS WITHOUT INTERRUPTION UNTIL ALL OF THE WORK HAS BEEN COMPLETED.
  - WALDOBES, STREET SIGNS, OR TRAFFIC SIGNS REMOVED FOR CONSTRUCTION PURPOSES MUST BE REPLACED BY THE GENERAL CONTRACTOR WITHIN 24 HOURS.
  - ALL NEW SURFACE CONCRETE SHALL BE PROTECTED FROM DE-ICING SALTS FOR AT LEAST 90 DAYS AFTER THE POUR DATE.
  - ALL UNPAID SIGNS, SIGN POSTS, SIGN SEWER CASTINGS AND GRATES REMOVED DURING CONSTRUCTION AND NOT REPLACED ELSEWHERE ON THIS PROJECT SHALL BE MAINTAINED UNTIL PERMANENT PROTECTION IS ESTABLISHED. THE GENERAL CONTRACTOR SHALL REMOVE THE MATERIALS FROM THE SITE AT HIS OWN ADDITIONAL COST TO THE OWNER.
  - DEPRESSED CURBS SHALL BE CONSTRUCTED AT ALL UTILITY CROSSINGS. DEPRESSED CURBS FOR HANDICAP ACCESS SHALL BE FLUSH WITH PAVEMENT. ALL HANDICAP ACCESS FACILITIES SHALL BE IN ACCORDANCE WITH CURRENT A.D.A. REGULATIONS AND NEW YORK STATE BUILDING CODE, CHAPTER 11.
  - THE GENERAL CONTRACTOR SHALL MAINTAIN SUFFICIENT COVER (TEMPORARY AND PERMANENT) OVER ALL PIPES DURING THE CONSTRUCTION OF THE PROJECT IN ACCORDANCE WITH THE MANUFACTURER'S REQUIREMENTS.
  - WHERE CONCRETE PIPE IS PROPOSED, ALL PIPE SHALL BE CLASS B WITH 0-RING JOINTS, UNLESS OTHERWISE INDICATED.
  - THE GENERAL CONTRACTOR SHALL SECURE ALL APPLICABLE TOWN OF ORANGETOWN PERMITS (FROM OPENING, WATER, SEWER, ETC) AND SCHEDULE A PRE-CONSTRUCTION MEETING WITH THE COMMISSIONER OF PUBLIC WORKS AND TOWN ENGINEER PRIOR TO THE START OF CONSTRUCTION.
- F. SITE CLEARING AND GRADING**
- SITE CLEARING SHALL INCLUDE, BUT IS NOT LIMITED TO, THE REMOVAL OF ALL DEBRIS, RUBBLE, FENCES, TREES, EXISTING UTILITIES, EXISTING STRUCTURES, FOUNDATIONS, SUBSURFACE STRUCTURES, UNDESIRABLE MATERIALS, EXISTING HARDSCAPE AND PAVEMENT, THE RELOCATION OF EXISTING UTILITIES, DRAINAGES, ETC. AND ALL OTHER WORK REQUIRED TO COMPLETE THE PROJECT FOR WHICH THERE IS NO SPECIFIC PAY ITEM OR CALLOUT.
  - ALL DEMOLITION ACTIVITIES TO BE IN ACCORDANCE WITH ALL JURISDICTIONAL AUTHORITIES INCLUDING BUT NOT LIMITED TO COUNTY RULES AND REGULATIONS, THE MUNICIPAL ORDINANCES, NYSDDC RULES AND REGULATIONS, AND NEW YORK STATE BUILDING CODE.
  - THE GENERAL CONTRACTOR SHALL BE RESPONSIBLE FOR THE DISPOSAL OF ALL UNUSABLE MATERIALS EXCAVATED OF WHATEVER NATURE AT HIS OWN EXPENSE. THE OWNER IS NOT OBLIGATED TO SUPPLY A DISPOSAL SITE. THE GENERAL CONTRACTOR MUST NOT DEPOSIT THE EXCESS MATERIALS WITHIN THE MUNICIPALITY LIMITS WITHOUT EXPRESS PERMISSION OF THE MUNICIPALITY. MATERIALS MUST BE DISPOSED OF IN ACCORDANCE WITH APPROVED NYSDDC METHODS AND VOLUMES.
  - ANY EXISTING AND NEW CONSTRUCTION DEBRIS SHALL BE REMOVED FROM THE SITE AND LAWFULLY DISPOSED. CONSTRUCTION SHALL PROVIDE DUMPING MANIFESTS UPON REQUEST.
  - EXISTING DIRTIE SUITABLE SOIL SHALL BE EXCAVATED, TRANSPORTED, SPREAD, GRADED, AND COMPACTED AS REQUIRED BY THE PROPOSED GRADES. ALL EARTHWORK OPERATIONS INVOLVING EXISTING SOILS SHALL BE COMPLETED PRIOR TO IMPORTING ANY OTHER MATERIALS. ALL IMPORTED FILL REQUIRED TO ACHIEVE THE PROPOSED GRADES SHALL BE INCLUDED IN THE PROPOSAL. IMPORTED SOIL SHALL BE FREE OF WASTE OR HAZARDOUS MATERIAL AND SHALL COMPLY WITH THE REQUIREMENTS OF THE PROJECT SPECIFICATIONS.
  - NO MATERIALS SHALL BE REMOVED FROM THE SITE FOR DISPOSAL WITHOUT THE PERMISSION OF THE OWNER.
  - ALL AREAS UNDERGOING REGRADING SHOULD BE SLOPED TO PROVIDE POSITIVE DRAINAGE AWAY FROM STRUCTURES AND ROADWAYS.
  - NO TOPSOIL IS TO BE REMOVED FROM THE PROJECT SITE. TOPSOIL SHALL BE STRIPPED SEPARATELY, STOCKPILED, AND PROTECTED.
  - THE GENERAL CONTRACTOR SHALL EXERCISE PARTICULAR CARE, ESPECIALLY AT INTERSECTIONS AND OUTLET SLOPES, IN THE PLACING OF PAVEMENT TO PROVIDE POSITIVE DRAINAGE. ANY AREAS WHERE WATER IS IMPOUNDED SHALL BE CORRECTED TO BY THE GENERAL CONTRACTOR.
  - NO MATERIAL SHALL BE PLACED OR ANY DISTURBANCE PERMITTED BEYOND THE PROJECT PROPERTY LINE OR RIGHT OF WAY WITHOUT THE WRITTEN PERMISSION OF THE PROPERTY OWNER DIRECTLY INVOLVED.
  - ALL PRIVATE AND PUBLIC PROPERTY THAT MAY BE DISTURBED OR DAMAGED BY ANY CONSTRUCTION ACTIVITY SHALL BE RELOCATED, RESTORED, REPAIRED AND/OR REPLACED BY THE CONTRACTOR AT NO COST TO EITHER THE OWNER OR THE OWNER OF THE PROPERTY. THERE WILL BE NO SEPARATE PAYMENT FOR THIS WORK OR MATERIALS.
  - ALL EARTHWORK SHALL BE PERFORMED IN ACCORDANCE WITH THE RECOMMENDATIONS OF THE GEOTECHNICAL REPORT FOR THE PROJECT.
  - PROOF ROLLING OF THE SUBBASE AND SUBGRADE SHALL BE PERFORMED IN THE PRESENCE OF BOTH THE TOWN ENGINEER AND THE OWNER'S REPRESENTATIVE AND FOUND TO BE ACCEPTABLE PRIOR TO PAVING. THE SUBGRADE SHALL BE FIRM AND UNSETTLING PRIOR TO PLACEMENT OF SUBBASE. MATERIALS, ALL TESTING AND INSPECTIONS TO ENSURE COMPLIANT CONSTRUCTION.

**GENERAL NOTES & LEGEND**

PROJECT NO.: 2219-05 SCALE: NONE  
DRAWING NO.:

C-100

THE MAXIMUM SOIL EXPOSURE LIMIT IS 14 DAYS

TECTONIC WORK ORDER NO.: 10128.01

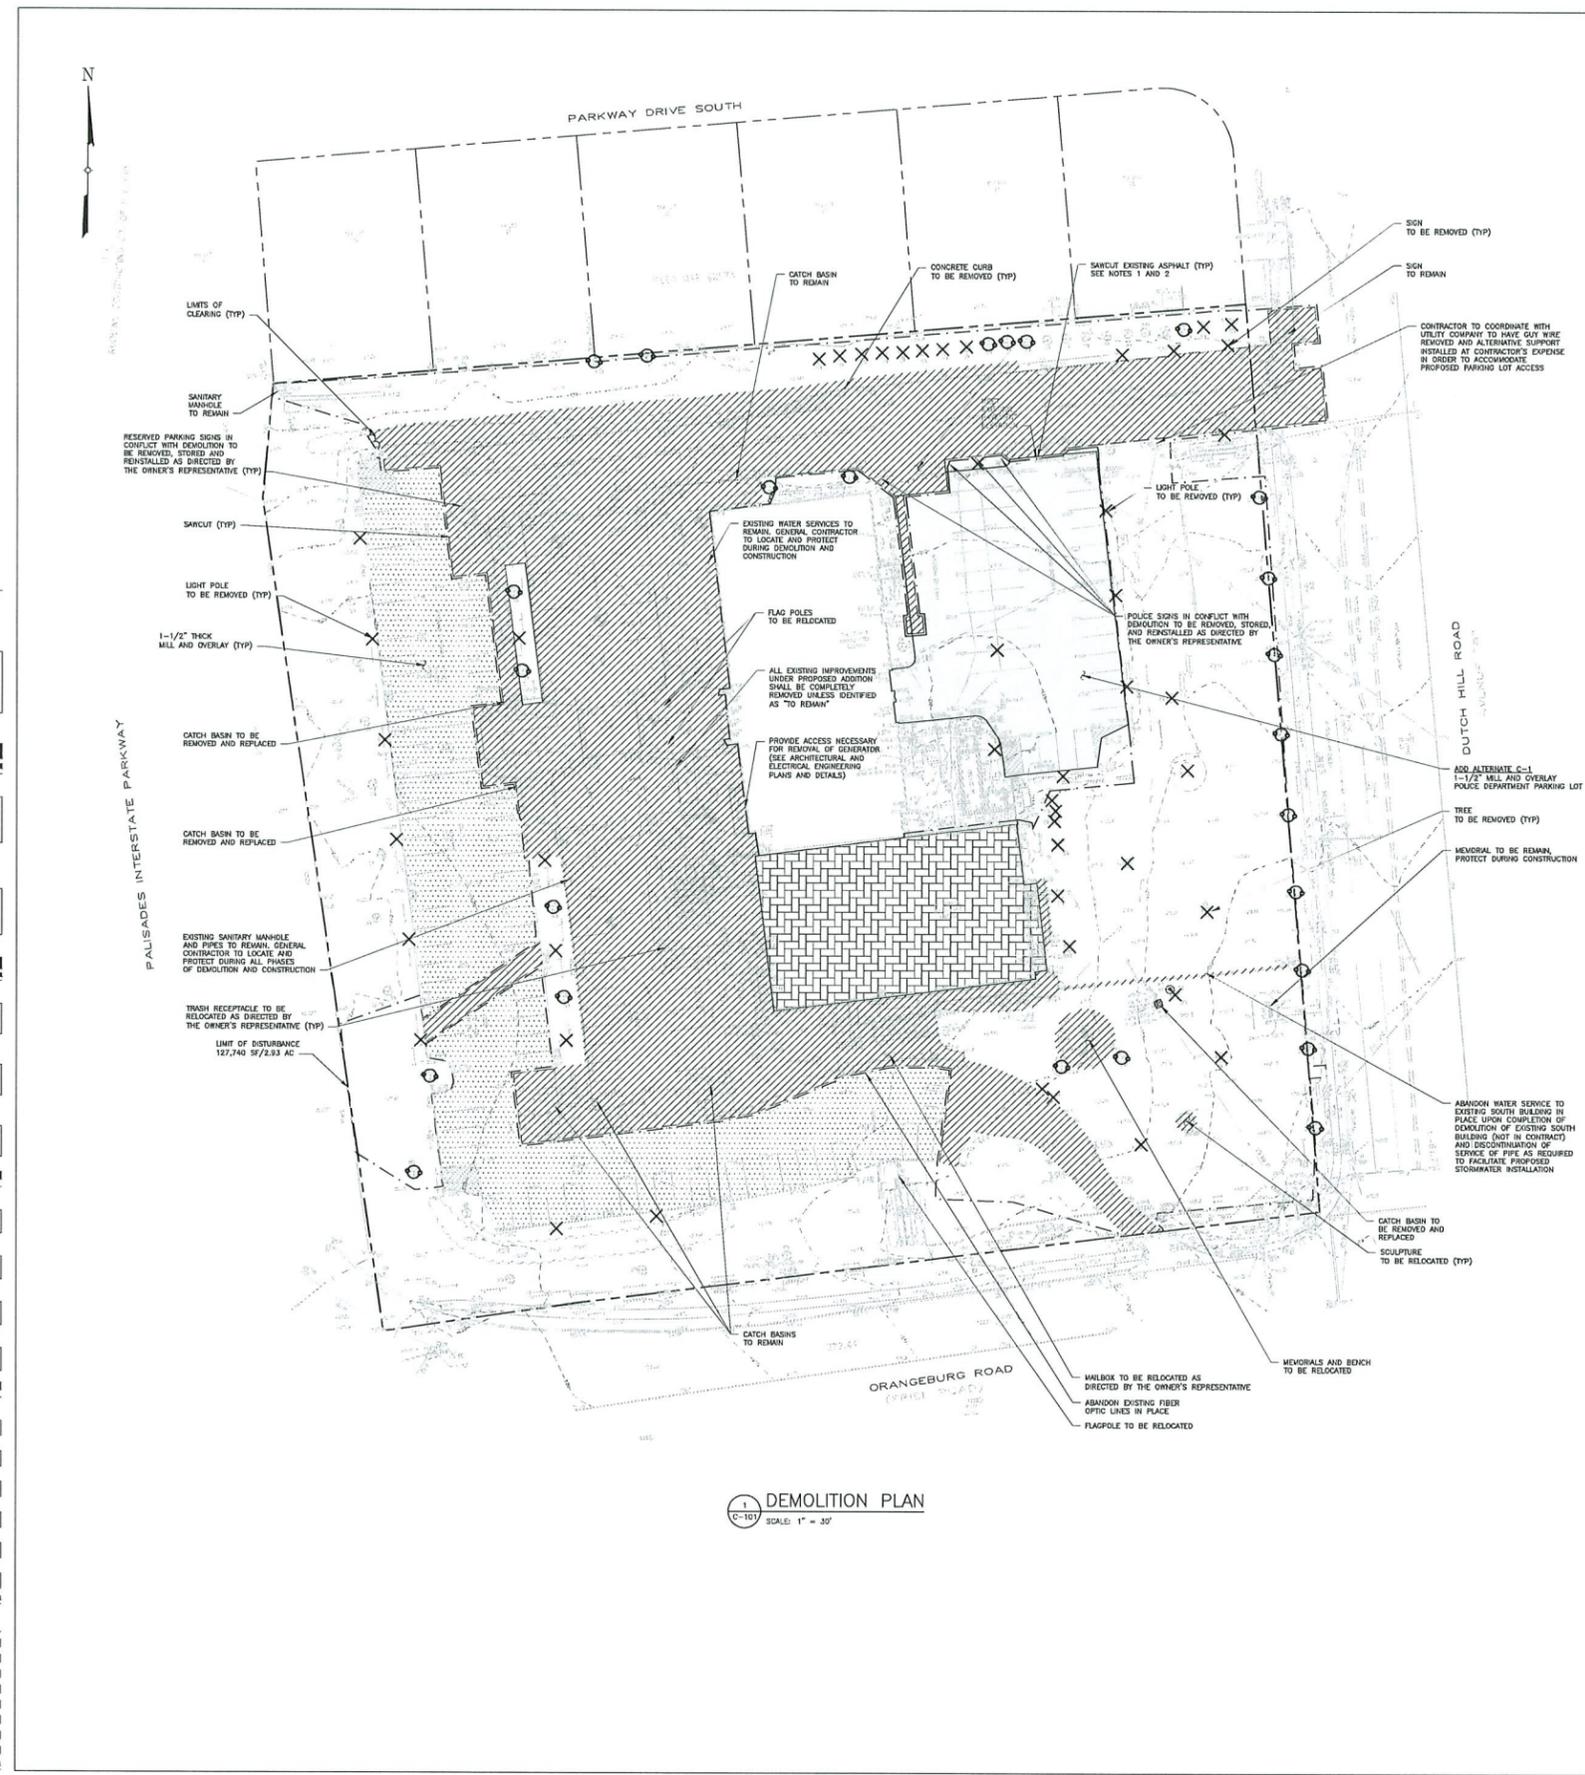

THIS DOCUMENT IS PREPARED SPECIFICALLY FOR THE CLIENT AND PROJECT DESIGNATED HEREON. REPRODUCTION, ALTERATION, REVISION, PUBLICATION OR USE WITHOUT THE CONSENT OF TECTONIC ENGINEERING CONSULTANTS, GEOLOGISTS & LAND SURVEYORS, D.P.C. IS PROHIBITED. COPYRIGHT 2021. ALL RIGHTS RESERVED.

UNAUTHORIZED ALTERATION OR ADDITIONS TO A DOCUMENT BEARING THE SEAL OF A LICENSED PROFESSIONAL ENGINEER OR LAND SURVEYOR IS A VIOLATION OF SECTION 2209 SUBSECTION 2 OF THE NEW YORK STATE EDUCATION LAW.

COPIES OF THIS DOCUMENT WITHOUT A FACSIMILE OF THE SIGNATURE AND AN ORIGINAL EMBOSSED SEAL OR ORIGINAL STAMP IN BLUE OR RED INK OF THE PROFESSIONAL ENGINEER OR LAND SURVEYOR SHALL NOT BE CONSIDERED VALID COPIES.

0 1 2 3  
ORIGINAL SIZE IN INCHES

1 DEMOLITION PLAN  
SCALE: 1" = 30'

**DEMOLITION NOTES**

1. SAW CUTTING OF ASPHALT AND SUBSEQUENT UTILITY INSTALLATIONS SHALL NOT OBSTRUCT THE POLICE DEPARTMENT'S ABILITY TO ENTER AND EXIT THE PARKING LOT. A MINIMUM OF 12 FEET OF ACCESS ON PARKING SPACES DESIGNATED FOR POLICE VEHICLES CONTINUOUSLY DURING AND THROUGHOUT CONSTRUCTION. SEE SITE PLAN FOR POLICE VEHICLE PARKING SPACES.
2. PEDESTRIAN ACCESS TO TOWN HALL BUILDING SHALL BE MAINTAINED THROUGHOUT DURATION OF CONSTRUCTION. PEDESTRIAN ACCESS THROUGH EAST SIDE OF EXISTING BUILDING THAT WILL REMAIN IS NOT PERMITTED DUE TO THIS BEING THE POLICE OFFICER'S ENTRANCE. SEQUENCING PROVIDED BELOW SHALL BE USED TO MAINTAIN PEDESTRIAN ACCESS.
  - A. INSTALL PROPOSED ADDITION AND PEDESTRIAN ACCESS. MAINTAIN EXISTING PEDESTRIAN ACCESS AT SOUTHERN ENTRANCE AND INSTALL TEMPORARY RAMP ON SOUTHERN SIDE OF EXISTING BUILDING AWAY FROM CONSTRUCTION.
  - B. DISCONTINUE ACCESS TO EXISTING SOUTH BUILDING. DEMOLISH EXISTING SOUTH BUILDING (NOT IN CONTRACT). PEDESTRIAN ACCESS SHALL BE MAINTAINED THROUGH PROPOSED BUILDING WITH ACCESS AT WESTERN ENTRANCE.
  - C. MAINTAIN SOUTH ACCESS TO EXISTING BUILDING THAT WILL REMAIN AFTER COMPLETE DEMOLITION AND REMOVAL OF DEBRIS OF EXISTING BUILDING TO BE REMOVED. PEDESTRIAN ACCESS THROUGH PROPOSED BUILDING SHALL BE ONLY ACCESS ALLOWED FOR PEDESTRIAN ACCESS UNTIL DEMOLITION OF EXISTING BUILDING TO BE REMOVED IS COMPLETE.
  - D. CONSTRUCTION FENCE SHALL BE USED TO DEMARCAT CURRENT PEDESTRIAN PATHS AT CURRENT SEQUENCE OF CONSTRUCTION. PEDESTRIAN PATHS SHALL BE KEPT CLEAR OF CONSTRUCTION DEBRIS. ENTRANCES SHALL BE DISCONTINUED AND CHANGED OUTSIDE OF TOWN OF ORANGETOWN BUSINESS HOURS OF 9AM TO 5PM. CONTRACTOR SHALL NOTIFY TOWN OF ORANGETOWN WHEN CHANGES SHALL BE OCCURRING.
  - E. EXISTING POLICE PEDESTRIAN ACCESS AT EASTERN SIDE OF EXISTING BUILDING THAT WILL REMAIN SHALL BE MAINTAINED THROUGHOUT DURATION OF CONSTRUCTION.
3. SEE SHEET C-102, SITE PLAN FOR PROPOSED LOCATION OF RELOCATED ITEMS. ITEMS SHALL BE PRESERVED UNLESS ANY DAMAGE TO THESE ITEMS SHALL BE THE SOLE RESPONSIBILITY OF THE CONTRACTOR. IF DAMAGED, THESE ITEMS SHALL BE REPLACED TO THE SATISFACTION OF THE TOWN OF ORANGETOWN AT THE SOLE COST TO THE CONTRACTOR.
4. ALL EXISTING SURFACE AND SUBSURFACE IMPROVEMENTS WITHIN THE AREAS DESIGNATED AS "TO BE REMOVED" SHALL BE REMOVED OR AMENDED IN PLACE WHERE ACCEPTABLE, UNLESS OTHERWISE STATED AS "TO REMAIN" OR "TO BE RELOCATED" UNLESS OTHERWISE STATED, ALL WORK SHALL BE PERFORMED BY THE GENERAL CONTRACTOR.
5. FOR CUTTING/TRENCHING OF ADDITIONAL UTILITY CONDUITS, SEE ELECTRICAL PLANS.
6. CONTRACTOR SHALL RESTORE ALL TRENCH WITHIN THE PARCEL LIMITS WITHIN 60 DAYS TO RESTORE TRAFFIC. MILL AND OVERLAY CURB TO CURB AND OVERLAY AT THE END TO PROVIDE A CONTINUOUS TOP SURFACE.
7. AT THE COMPLETION OF DEMOLITION OF PAVEMENT AND BUILDINGS AND PRIOR TO NEW CONSTRUCTION IN VENUE, CONTRACTOR CAN USE AREA FOR MATERIALS, BORROW, EQUIPMENT STORAGE, AND STAGING. AREAS SHALL BE COORDINATED WITH OWNER'S REPRESENTATIVE. CONSTRUCTION FENCE SHALL BE INSTALLED AT LIMITS OF STAGING TO NOTIFY VEHICLE AND PEDESTRIAN TRAFFIC. SEE C-107 FOR SEQUENCING PLAN AND PROPOSED AREAS FOR CONTRACTOR USE.

**LANDSCAPE & LIGHTING PLAN**  
SCALE: 1" = 30'

**LANDSCAPE NOTES**

- CONTRACTOR TO EXERCISE EXTREME CARE DURING THE COURSE OF DEMOLITION AND REMOVALS. ANY DAMAGE TO EXISTING FACILITIES, UTILITIES, OR TREES TO BE PROTECTED SHALL BE THE SOLE RESPONSIBILITY OF THE CONTRACTOR TO REPLACE IN KIND AND SIZE.
- CONTRACTOR SHALL BE RESPONSIBLE FOR DISPOSING OF ALL DEBRIS OFF-SITE IN A SAFE MANNER.
- ALL DISTURBED AREAS NOT RECEIVING SPECIFIC GROUNDCOVER/ ANNUALS SHALL BE SEEDED. SEED AREA WITHIN RIGHT OF WAY.
- FINE RAKE, ROLL AND WATER TO A DEPTH OF ONE INCH ALL SEEDED AREAS.
- ALL PLANT MATERIAL SHALL BE NURSERY CROWN UNLESS OTHERWISE NOTED.
- PROVIDE QUALITY, SIZE, GENUS, SPECIES AND VARIETY OF TREES AND SHRUBS INDICATED, COMPLYING WITH APPLICABLE REQUIREMENTS OF ANSI Z601 AMERICAN STANDARD FOR NURSERY STOCK.
- QUANTITIES GIVEN IN THE PLANT LIST ARE FOR REFERENCE ONLY. THE CONTRACTOR SHALL VERIFY ALL QUANTITIES SHOWN ON THE LOT AND SHALL BE RESPONSIBLE FOR FURNISHING ALL MATERIALS REQUIRED TO COMPLETE THE PLANS.
- TREES TO BE PRESERVED ON THE SITE SHALL BE PROTECTED AGAINST DAMAGE DURING CONSTRUCTION OPERATIONS BY THE USE OF WOODEN TREE GUARDS OR SHOW FENCING. THE TREE PROTECTION SHALL BE PLACED BEFORE ANY EXCAVATING OR GRADING IS BEGUN AND MAINTAINED FOR THE DURATION OF THE CONSTRUCTION WORK UNLESS OTHERWISE DIRECTED.
- THE MEADOW SEEDING AND SLOPE STABILIZATION SHALL BE ACCOMPLISHED VIA HYBRID SEEDING AND MULCHING. THE MEADOW SEEDING SHALL OCCUR BETWEEN MAY 1 AND MAY 15. THE MULCH MIX COMPONENT SHALL BE USED TO PROVIDE SHORT-TERM COVER AND STABILIZATION WHILE THE COKE MIX SPECIES BECOME ESTABLISHED. DURING THE FIRST GROWING SEASON, TWO TO THREE CUTTINGS SHALL BE COMPLETED TO KEEP TREES NO TALLER THAN THE NEWLY ESTABLISHED GRASS PLANTS.
- WHERE SHOWN, SOO TO BE USED IN ALL AREAS NOT SUBJECT TO PLANTINGS.
- EXISTING TREES THAT ARE DEAD, OR DYING, SHALL BE REMOVED AND REPLACED WITH NEW TREES AS DIRECTED BY THE OWNER'S REPRESENTATIVE.
- TEMPORARY MULCH SHALL NOT STAND TALLER THAN FIVE (5) FEET IN HEIGHT TO PREVENT VIEWING FROM NEIGHBORING PROPERTIES.

**MAINTENANCE NOTES**

- OWNER IS RESPONSIBLE FOR ANNUAL MAINTENANCE.
- ALL VEGETATION AND LANDSCAPING SHOWN SHALL BE MAINTAINED IN A HEALTHY AND VIGOROUS STATE, AND REPLACED WHEN AND AS NECESSARY TO ACCOUNT FOR DISEASE AND/OR DECAY.
- AT THE BEGINNING OF THE GROWING SEASON, INSPECT VEGETATION ON SLOPE, REMOVE ANY DEAD/DYING PLANTS AND BRANCHES.
- GENERAL CONTRACTOR SHALL WARRANT ALL PLANTS FOR ONE YEAR AFTER SUBSTANTIAL COMPLETION.
- RESEED ANY AREAS PREVIOUSLY SEEDED WITH MEADOW MIX THAT HAVE THIN VEGETATIVE COVER.

SITE DETAILS

PROJECT NO.: 2219-05 SCALE: AS NOTED

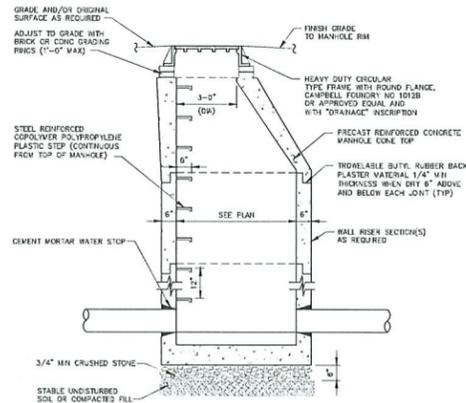

DRAWING NO.: C-201

**FENCE POST INSTALLATION AT SEGMENTAL RETAINING WALL**  
SCALE: NTS

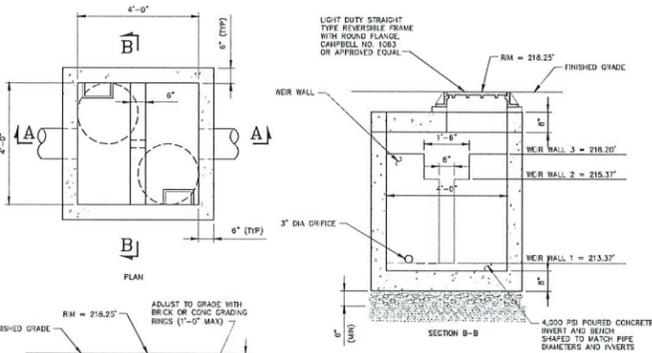

**ORNAMENTAL FENCE**  
SCALE: NTS

**DRAINAGE MANHOLE**  
SCALE: 1/2" = 1'-0"

- NOTES:**
- PROPOSED RETAINING WALL SHALL BE DESIGNED BY THE MANUFACTURER.
  - PRIOR TO CONSTRUCTION, DETAILED SHOP DRAWINGS AND DESIGNS MUST BE SUBMITTED TO THE ARCHITECT, ENGINEER, AND MUNICIPALITY FOR EACH SEGMENTAL WALL STRUCTURE. WALLS SHALL NOT BE CONSTRUCTED WITHOUT WRITTEN AUTHORIZATION TO PROCEED FROM THE OWNER. SEE THE GEOTECHNICAL REPORT PREPARED BY TECTONIC DATED MARCH 2017 FOR RECOMMENDED DESIGN CRITERIA.
  - COMPLETED WALLS SHALL BE CERTIFIED BY A NEW YORK STATE PROFESSIONAL ENGINEER TO HAVE BEEN CONSTRUCTED IN ACCORDANCE WITH THE APPROVED SHOP DRAWINGS.
  - 42" (MIN.) FENCE REQUIRED FOR WALLS GREATER THAN 30'.

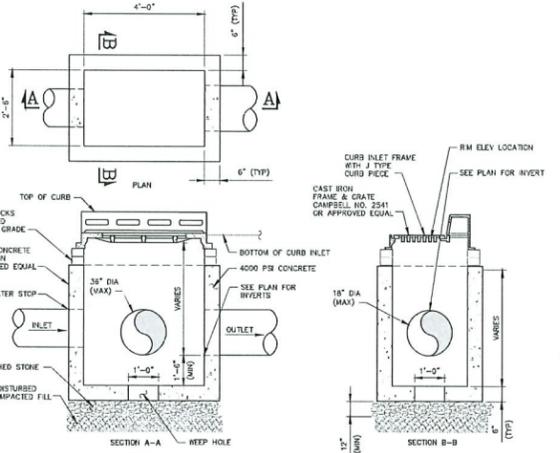

**SEGMENTAL RETAINING WALL**  
SCALE: NTS

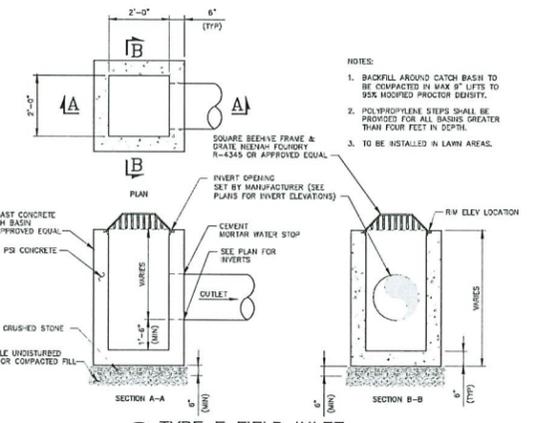

- NOTES:**
- BACKFILL AROUND CATCH BASIN TO BE COMPACTED TO 95% MODIFIED PROCTOR DENSITY (ASTM D1557) IN MAX 9" LIFTS.
  - PRECAST STEEL REINFORCED COPOLYMER POLYPROPYLENE PLASTIC STEPS SHALL BE PROVIDED FOR ALL BASINS GREATER THAN FOUR FEET IN DEPTH.
  - CATCH BASIN SHALL BE CAPABLE TO WITHSTAND HS-25 LOADING.
  - CONCRETE TO HAVE A MINIMUM COMPRESSIVE STRENGTH OF 4000 PSI AT 28 DAYS.
  - REINFORCEMENT TO BE IN CONFORMANCE WITH ASTM A615 GRADE 60 AND ASTM A185 GRADE 65.
  - CONTRACTOR TO ORDER SECTIONS FROM MANUFACTURER TO MATCH REQUIRED ELEVATIONS AND INVERTS PER PLAN.
  - PRECAST CONCRETE COMPONENTS BY FORT MILLER OR EQUAL.

**OUTLET CONTROL STRUCTURE**  
SCALE: NTS

one half inch = one foot  
one quarter inch = one foot  
one eighth inch = one foot  
one quarter inch = one foot  
one eighth inch = one foot  
one eighth inch = one foot

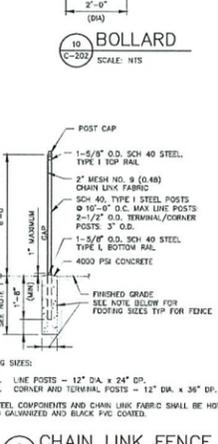

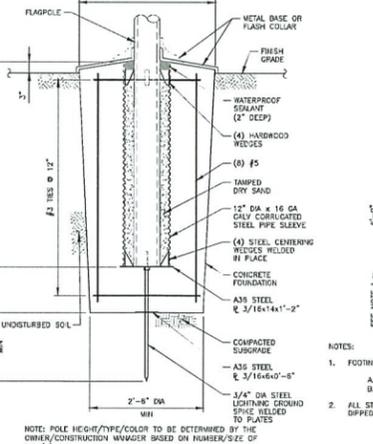

**TYPE B CATCH BASIN WITH CURB BOX**  
SCALE: 1/2" = 1'-0"

**TYPE E FIELD INLET**  
SCALE: 1/2" = 1'-0"

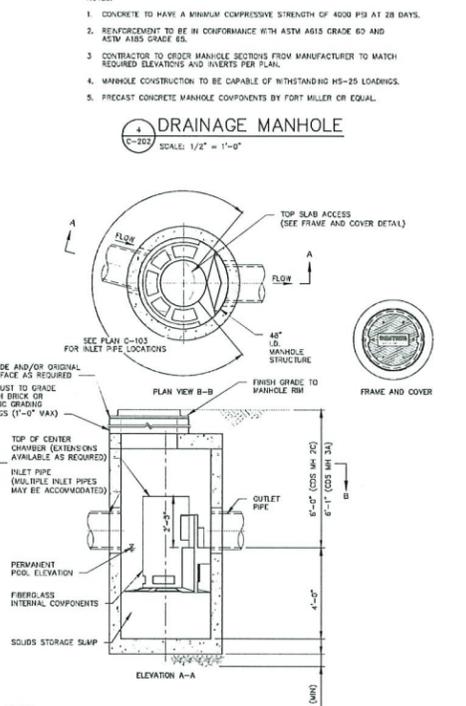

- EARTHWORK:**
- ALL EXCAVATIONS SHALL BE DEMATERIALIZED BY SHARPING, PILING, ETC. IN A MANNER WHICH WILL NOT LOOSEN FOUNDATION SUBGRADE MATERIAL. SURFACE WATER SHALL BE DIVERTED AWAY FROM EXCAVATIONS BY MEANS OF BERMS, DIVERSION DITCHES, OR OTHER SUITABLE METHODS.
  - IF ENCOUNTERED UNSUITABLE MATERIALS SUCH AS TOP SOIL, ORGANIC MATERIAL, AND SOFT SOIL SHALL BE REMOVED AND REPLACED WITH COMPACTED STRUCTURAL FILL.
- CONCRETE:**
- DESIGN AND CONSTRUCTION OF ALL CONCRETE SHALL CONFORM TO THE AMERICAN CONCRETE INSTITUTE "BUILDING CODE REQUIREMENTS FOR REINFORCED CONCRETE" AC 308.
  - ULTIMATE COMPRESSIVE STRENGTH OF CONCRETE AT 28 DAYS SHALL BE 3,000 PSI.
  - CEMENT SHALL BE PORTLAND CEMENT CONFORMING TO ASTM C150 - TYPE I OR II.
  - REINFORCING STEEL SHALL BE DEFORMED BARS CONFORMING TO ASTM A615, GRADE 60, "DEFORMED AND PLAN BUILT" STEEL BARS FOR CONCRETE REINFORCEMENT.
  - CONCRETE WORK AND MATERIALS SHALL CONFORM TO THE AMERICAN CONCRETE INSTITUTE "SPECIFICATIONS FOR STRUCTURAL CONCRETE FOR BUILDINGS" AC 308.
  - PROVIDE AIR ENTRAINMENT IN EXTERIOR EXPOSED CONCRETE TO OBTAIN TOTAL AIR CONTENT OF 54 IN ACCORDANCE WITH AC 301.
  - FOR CONCRETE CAST AGAINST AND PERMANENTLY EXPOSED TO EARTH, CONCRETE COVER FOR REINFORCING SHALL BE:  
3" FOR ALL BARS  
FOR CONCRETE EXPOSED TO EARTH OR WEATHER, MINIMUM COVER SHALL BE:  
2" FOR #8 AND LARGER BARS  
1-1/2" FOR #5 AND SMALLER BARS OR WIRE FABRIC
  - ALL REINFORCING, EMBEDDED STEEL, AND ALL OTHER EMBEDDED ITEMS AND FORMED DETAILS SHALL BE IN PLACE BEFORE START OF CONCRETE PLACEMENT.
  - REMOVE ALL LOOSE MATERIAL AND DEBRIS FROM SUBGRADE SURFACE PRIOR TO PLACING CONCRETE. CONCRETE SHALL NOT BE PLACED ON FROZEN SUBGRADE.
  - BRINGING OUT OF CONCRETE, ESPECIALLY DURING THE FIRST 24 HOURS, SHALL BE CAREFULLY GUARDED AGAINST. ALL SURFACES SHALL BE MOIST CURED.

**FLAGPOLE BASE**  
SCALE: 3/4" = 1'-0"

**CHAIN LINK FENCE**  
SCALE: 1/2" = 1'-0"

**BOLLARD**  
SCALE: NTS

**CASCADE SEPARATOR**  
SCALE: NTS

- NOTES:**
- CONTECH TO PROVIDE ALL MATERIALS UNLESS NOTED OTHERWISE.
  - CASCADE SEPARATOR WATER QUALITY STRUCTURE SHALL BE IN ACCORDANCE WITH ALL DESIGN DATA AND INFORMATION CONTAINED IN THIS DRAWING. CONTRACTOR TO CONFIRM STRUCTURE MEETS REQUIREMENTS OF PROJECT.
  - CASCADE SEPARATOR STRUCTURE SHALL MEET AASHTO HS20 LOAD RATING, ASSUMING EARTH COVER OF 2' AND GROUNDWATER ELEVATION AT OR BELOW THE OUTLET PIPE INVERT ELEVATION. CASINGS SHALL MEET AASHTO M200 AND BE CAST WITH THE CONCRETE.
  - CASCADE SEPARATOR STRUCTURE SHALL BE PRECAST CONCRETE CONFORMING TO ASTM C478 AND AASHTO LOAD FACTOR DESIGN METHOD.
  - CASCADE SEPARATOR SHALL BE VCOEL CS-4 WITH A VINYLUM SLUMP CAPACITY OF 0.70 CUBIC YARDS.
- INSTALLATION NOTES:**
- CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE CASCADE SEPARATOR MANHOLE STRUCTURE.
  - CONTRACTOR TO INSTALL JOINT SEALANT BETWEEN ALL STRUCTURE SECTIONS AND ASSEMBLE STRUCTURE.
  - CONTRACTOR TO PROVIDE, INSTALL, AND GROUT INLET AND OUTLET PIPES. MATCH PIPE INVERTS WITH ELEVATIONS SHOWN. ALL PIPE CENTERLINES TO MATCH PIPE OPENING CENTERLINES.
  - CONTRACTOR TO TAKE APPROPRIATE MEASURES TO ASSURE UNIT IS WATER TIGHT, HOLDING WATER TO FLOWLINE INVERT MINIMUM. IT IS SUGGESTED THAT ALL JOINTS BELOW PIPE INVERTS ARE GROUTED.
- THE MAXIMUM SOIL EXPOSURE LIMIT IS 14 DAYS**
- TECTONIC WORK ORDER NO.: 10128.01
- THIS DOCUMENT IS PREPARED SPECIFICALLY FOR THE CLIENT AND PROJECT DESIGNATED HEREON. REVISION, ALTERATION, REVISION, DUPLICATION, OR USE WITHOUT THE CONSENT OF TECTONIC ENGINEERING CONSULTANTS, GEOLGISTS & LAND SURVEYORS, D.P.C. IS PROHIBITED. COPYRIGHT 2021. ALL RIGHTS RESERVED.

**SITE DETAILS**

PROJECT NO.: 2219-05 SCALE: AS NOTED

DRAWING NO.: C-204

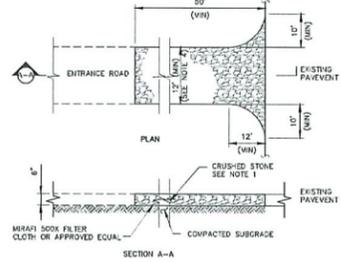

- NOTES:**
- POST MATERIAL AND SPACING:
    - STANDARD SILT FENCE - POSTS SHALL BE 2"x2" HARDWOOD OR 1" OR 1 1/2" SHAPED STEEL, NOT LESS THAN 100 POUNDS PER LINEAR FOOT AND SPACED A MAXIMUM OF 4'-0" ON CENTER. POST EMBEDMENT - 1'-4" (MIN).
    - REINFORCED SILT FENCE - POSTS SHALL BE 2"x2" HARDWOOD OR 1" OR 1 1/2" SHAPED STEEL, NOT LESS THAN 100 POUNDS PER LINEAR FOOT AND SPACED A MAXIMUM OF 10'-0" ON CENTER. POST EMBEDMENT - 1'-4" (MIN).
    - SUPER SILT FENCE - POSTS SHALL BE 2 1/2" DIAMETER STEEL, DIRECT BURRY, AND SPACED A MAXIMUM OF 10'-0" ON CENTER. POST EMBEDMENT - 3'-0" (MIN).
  - REINFORCEMENT SHALL BE FASTENED TO THE POSTS DEPENDENT ON THE POST MATERIAL AS FOLLOWS:
    - HARDWOOD - WIRE TIES OR STAPLES
    - STEEL - WIRE TIES
  - FILTER CLOTH TO BE FASTENED SECURELY TO FENCE WITH TIES SPACED EVERY 24" AT TOP AND MID-SECTION. UNREINFORCED SILT FENCE MUST BE FASTENED SECURELY TO ALL POSTS.
  - WHEN TWO SECTIONS OF FILTER CLOTH ADJOIN EACH OTHER THEY SHALL BE OVERLAPPED BY 6 INCHES AND FOLDED.
  - MAINTENANCE SHALL BE PERFORMED AS HEDED AND MATERIAL REMOVED WHEN "BULGES" FORM IN SILT FENCE.
  - SILT FENCE TO BE MAINTAINED IN PLACE DURING CONSTRUCTION AND SOIL STABILIZATION PERIOD.
  - SILT FENCE SHALL BE INSTALLED PARALLEL TO CONTOURS TO ASSURE NO CONCENTRATION OF WATER.
  - PREFABRICATED LIMITS TO MEET THE MINIMUM REQUIREMENTS TO SURE.
  - THE TYPE OF SILT FENCE SPECIFIED FOR EACH LOCATION ON THE PLAN SHALL NOT EXCEED THE MAXIMUM SLOPE LENGTH AND MAXIMUM FENCE LENGTH REQUIREMENTS SHOWN IN TABLE A.

SLOPE STEEPNESS	STANDARD (REINFORCED)	SUPER
< 5%	100/100	N/A
5-10%	150/100	200/100
10-20%	100/75	150/100
20-30%	50/50	100/75
33-50%	31/21	40/20
> 50%	20/10	30/15

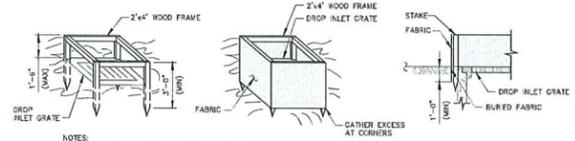

TABLE A

**1 SILT FENCE**  
SCALE: 1/4" = 1'-0"

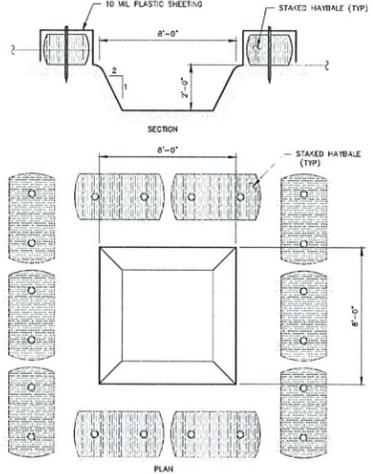

- NOTES:**
- STONE SIZE - USE MATRIX 1 TO 4" STONE, OR RECLAIMED OR RECYCLED CONCRETE EQUIVALENT.
  - LENGTH - NOT LESS THAN 50 FEET.
  - THICKNESS - NOT LESS THAN SIX INCHES.
  - WIDTH - 12 FOOT MINIMUM, BUT NOT LESS THAN THE FULL WIDTH AT POINTS WHERE INGRESS OR EGRESS OCCURS. 24 FOOT IF SINGLE ENTRANCE TO SITE.
  - FILTER CLOTH - WILL BE PLACED OVER THE ENTIRE AREA PRIOR TO PLACING OF STONE.
  - SURFACE WATER - ALL SURFACE WATER FLOWING OR DIVERTED TOWARD CONSTRUCTION ENTRANCES SHALL BE PAVED ACROSS THE ENTRANCE. IF PAVING IS IMPRACTICAL, A SCOURABLE BERM WITH 5:1 SLOPES WILL BE FURNISHED.
  - MAINTENANCE - THE ENTRANCE SHALL BE MAINTAINED IN A CONDITION WHICH SHALL PREVENT TRACKING OF FLOWING OF SEDIMENT ONTO PUBLIC RIGHTS-OF-WAY. THIS MAY REQUIRE PERIODIC TOP DRESSING WITH ADDITIONAL STONE AS COVERING DEWASH AND REPAIR AND/OR CLEANOUT OF ANY MEASURES USED TO TRAP SEDIMENT. ALL SEDIMENT SPILLED, DRIPPED, MACHED, OR TRACKED ONTO PUBLIC RIGHTS-OF-WAY MUST BE REMOVED IMMEDIATELY.
  - WASHING - WHEELS SHALL BE CLEANED TO REMOVE SEDIMENT PRIOR TO ENTRANCE ONTO PUBLIC RIGHTS-OF-WAY. WHEN WASHING IS REQUIRED, IT SHALL BE DONE ON AN AREA STABILIZED WITH STONE AND WHICH DRAINS INTO AN APPROVED SEDIMENT TRAPPING DEVICE.
  - PERIODIC INSPECTIONS AND NEEDED MAINTENANCE SHALL BE PROVIDED.

**2 STABILIZED CONSTRUCTION ACCESS**  
SCALE: 3/8" = 1'-0"

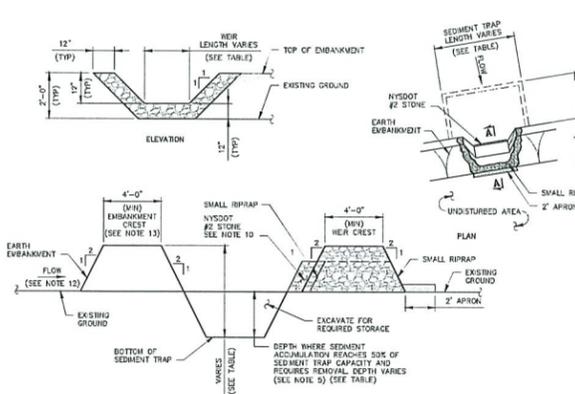

- NOTES:**
- FILTER FABRIC SHALL HAVE AN EOS OF 40-85.
  - CUT FABRIC FROM A CONTINUOUS ROLL TO ELIMINATE JOINTS. IF JOINTS ARE NEEDED THEY WILL BE OVERLAPPED TO THE NEXT STAKE.
  - STAKE MATERIALS WILL BE STANDARD 2"x4" WOOD OR EQUIVALENT. METAL WITH A MINIMUM LENGTH OF 3 FEET.
  - SPACE STAKES EVENLY AROUND INLET 3 FEET APART AND DRIVE A MINIMUM 18 INCHES DEEP. SPACES GREATER THAN 3 FEET MAY BE BROCKED WITH THE USE OF WIRE MESH BEHIND THE FILTER FABRIC FOR SUPPORT.
  - FABRIC SHALL BE EMBEDDED 1 FOOT MINIMUM BELOW GROUND AND BACKFILLED. IT SHALL BE SECURELY FASTENED TO THE STAKES AND FRAME.
  - A 2"x4" WOOD FRAME SHALL BE COMPLETED AROUND THE GREST OF THE FABRIC FOR OVER FLOW STABILITY.
  - DRAINAGE AREA LIMITED TO 1 ACRE.

**4 CATCH BASIN PROTECTION**  
SCALE: 1/4" = 1'-0"

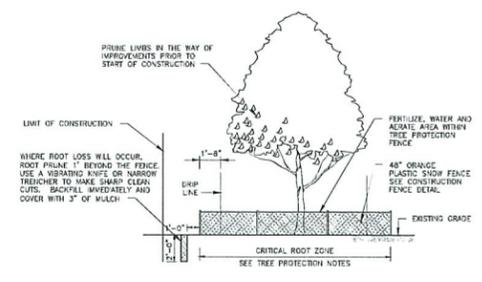

**5 TEMPORARY CONCRETE WASH**  
SCALE: 1/4" = 1'-0"

- CONSTRUCTION SPECIFICATIONS:**
- AREA UNDER EMBANKMENT SHALL BE CLEANED, GRUBBED AND STRIPPED OF ANY VEGETATION AND ROOT MAT. THE POCK AREA SHALL BE CLEANED.
  - THE FILL MATERIAL FOR THE EMBANKMENT SHALL BE FREE OF ROOTS AND OTHER WOODY VEGETATION AS WELL AS OVER-SIZED STONES, ROCKS, ORGANIC MATERIAL OR OTHER COLLECTIONABLE MATERIAL. THE EMBANKMENT SHALL BE COMPACTED BY TRAVELING WITH EQUIPMENT WHILE IT IS BEING CONSTRUCTED.
  - ALL CUT AND FILL SLOPES SHALL BE 2:1 OR FLATTER.
  - THE STONE USED IN THE OUTLET SHALL BE SMALL RIPRAP 4"-8" ALONG WITH A 1" THICKNESS OF 2" AGGREGATE PLACED ON THE UP-GRADE SIDE ON THE SMALL RIPRAP OR EMBEDDED FILTER CLOTH IN THE RIPRAP.
  - SEDIMENT SHALL BE REMOVED AND TRAP RESTORED TO ITS ORIGINAL DIMENSIONS WHEN THE SEDIMENT HAS ACCUMULATED TO 1/2 THE DESIGN DEPTH OF THE TRAP. IT SHALL BE PLACED ON SITE AND STABILIZED OR DISPOSED OF PROPERLY AS DIRECTED BY THE OWNER'S REPRESENTATIVE.
  - THE STRUCTURE SHALL BE INSPECTED AFTER EACH RAIN AND REPAIRS MADE AS NEEDED.
  - CONSTRUCTION OPERATIONS SHALL BE CARRIED OUT IN SUCH A MANNER THAT EROSION AND SEDIMENT ARE CONTROLLED.
  - THE STRUCTURE SHALL BE REMOVED AND THE AREA STABILIZED WHEN THE DRAINAGE AREA HAS BEEN PROPERLY STABILIZED.
  - MAXIMUM DRAINAGE AREA 5 ACRES.
  - A 1" LAYER OF NYSDOT #2 STONE MAY BE PLACED ON THE UPSTREAM SIDE OF THE RIPRAP IN PLACE OF THE EMBEDDED FILTER CLOTH.
  - THE MINIMUM CAPACITY FOR SEDIMENT TRAP "A" SHALL BE 7,000 CUBIC FEET AND FOR SEDIMENT TRAP "B" SHALL BE 10,000 CUBIC FEET. VOLUME OF SEDIMENT STORAGE REQUIRED SHALL BE 5.00 CUBIC FEET PER ACRE OF CONTRIBUTORY DRAINAGE. SEDIMENT TRAP "B" SHALL BE REDUCED IN SIZE WHEN ALL UPSTREAM AREA HAS BEEN STABILIZED.
  - OPENING IN EARTH EMBANKMENT SHALL BE MADE TO CAPTURE ALL UPSTREAM FLOW DISCHARGING TO SEDIMENT TRAP. CAPACITY SHALL NOT BE REDUCED TO ACCOMMODATE FLOW ENTERING SEDIMENT TRAP.
  - OBSERVED GROUNDWATER AT APPROXIMATE ELEVATIONS 205.50 FEET. SEE GEOTECHNICAL REPORT FOR FULL DISCUSSION ON SUBSURFACE CONDITIONS.

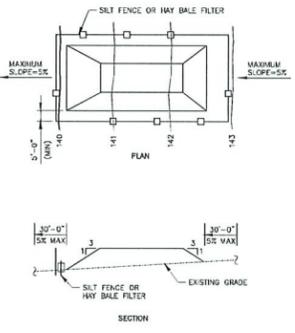

**8 STONE OUTLET SEDIMENT TRAP (ST-II)**  
SCALE: 1/4" = 1'-0"

**9 TOPSOIL, FERTILIZER, SEED & MULCH**  
SCALE: 1/4" = 1'-0"

- TREE PROTECTION NOTES:**
- THE TREE PROTECTION AND PRESERVATION GUIDELINES ADOPTED PURSUANT TO THE LAND DEVELOPMENT REGULATIONS OF THE MUNICIPALITY WILL BE IMPLEMENTED IN ORDER TO PROTECT AND PRESERVE BOTH INDIVIDUAL SPECIMEN TREES AND BUFFER AREA WITH MANY TREES. STEPS THAT WILL BE TAKEN TO REMOVE AND PROTECT EXISTING TREES TO REMAIN ARE AS FOLLOWS:
    - NO CONSTRUCTION EQUIPMENT SHALL BE PARKED UNDER THE TREE CANOPY.
    - THERE WILL BE NO STOCKPILING OF EARTH UNDERNEATH THE TREES.
    - TREES DESIGNATED TO BE PRESERVED SHALL BE MARKED CONSPICUOUSLY ON ALL SIDES AT A 5 TO 10 FOOT HEIGHT.
    - THE TREE PROTECTION ZONE FOR TREES DESIGNATED TO BE PRESERVED WILL BE ESTABLISHED BY ONE OF THE FOLLOWING METHODS:
      - ONE (1) FOOT RADIUS FROM TRUNK PER INCH DBH
      - DROP LINE OF THE TREE CANOPY. THE METHOD CHOSEN SHOULD BE BASED ON PROVIDING THE MAXIMUM PROTECTION ZONE POSSIBLE. A BARRIER OF SNOW FENCE OR EQUAL IS TO BE PLACED AND MAINTAINED ONE FOOT BEYOND THE ESTABLISHED TREE PROTECTION ZONE. IF IT IS AGREED THAT THE TREE PROTECTION ZONE OF A SELECTED TREE MUST BE ISOLATED ONE OF THE FOLLOWING METHODS MUST BE EMPLOYED TO MITIGATE THE IMPACT LIGHT TO HEAVY IMPACTS - MINIMUM OF EIGHT INCHES OF WOOD CHIPS INSTALLED IN THE AREAS TO BE PROTECTED. CHIPS SHALL BE REMOVED UPON COMPLETION OF WORK.
      - LIGHT IMPACTS ONLY - INSTALLATION OF 3/4 INCH OF PLYWOOD OR BOARDS, OR EQUAL OVER THE AREA TO BE PROTECTED.
    - WHERE EXCAVATION FOR NEW CONSTRUCTION IS REQUIRED WITHIN TREE PROTECTION ZONES, HAND CLEAR AND EXCAVATE TO MINIMIZE DAMAGE TO ROOT SYSTEMS. USE NARROW-TINE SPADING FORKS AND COMB SOIL TO EXPOSE ROOTS.
    - REDIRECT ROOTS IN BACKFILL AREAS WHERE PROSURE IF ENCOUNTERING LARGE MAIN LATERAL ROOTS, EXPOSE ROOTS BEYOND EXCAVATION LIMITS AS REQUIRED TO BEND AND REDIRECT THEM WITHOUT BRAKING. IF ENCOUNTERED IMMEDIATELY ADJACENT TO LOCATION OF NEW CONSTRUCTION AND REDIRECTION IS NOT PRACTICAL, CUT ROOTS APPROXIMATELY 3 INCHES BACK FROM NEW CONSTRUCTION AS FOLLOWS:
      - ROOT PRUNING: PRUNE TREE ROOTS EXPOSED DURING GRADE LOWERING, DO NOT CUT MAIN LATERAL ROOTS OR BARKROOTS. CUT ONLY SMALLER ROOTS. CUT ROOTS WITH SHARP PRUNING INSTRUMENTS; DO NOT BREAK OR CHOP.
      - TREE PRUNING STANDARDS: COMPLY WITH ANSI A301 (PART 1), "TREE, SHRUB, AND OTHER WOODY PLANT MAINTENANCE-STANDARD PRACTICES (PRUNING)".
      - DO NOT ALLOW EXPOSED ROOTS TO DRY OUT BEFORE PLACING PERMANENT BACKFILL. PROVIDE TEMPORARY EARTH COVER OR PACK WITH PEAT MOSS AND WRAP WITH BURLAP. WATER AND MOISTEN IN A MOIST CONDITION TEMPORARILY SUPPORT AND PROTECT ROOTS FROM DAMAGE UNTIL THEY ARE PERMANENTLY RELOCATED AND COVERED.
  - SEPARATE PAYMENT WILL NOT BE MADE FOR THIS WORK.

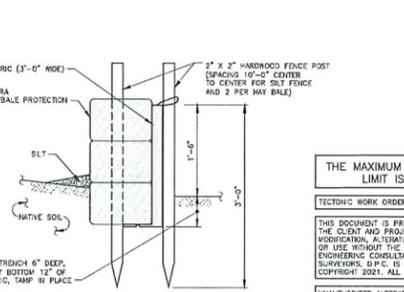

**3 TREE PROTECTION AND PRUNING**  
SCALE: 1/4" = 1'-0"

- NOTES:**
- PLACE STOCKPILES AT LOCATIONS AS SHOWN ON THE SOIL EROSION AND SEDIMENT CONTROL PLAN.
  - ALL SIDE SLOPES SHALL BE 3 TO 1 OR FLATTER.
  - STOCKPILE SURFACE SHALL BE SEALED WITH A ROLLER TO PREVENT SATURATION
  - STOCKPILE SHALL RECEIVE A VEGETATIVE COVER IN ACCORDANCE WITH MINIMUM STABILIZATION REQ.
  - SILT FENCE OR HAY BALE FILTER SHALL BE INSTALLED AS DETAILED HEREON.

**6 SOIL STOCKPILE**  
SCALE: 1/4" = 1'-0"

**7 CONSTRUCTION FENCE (PLASTIC)**  
SCALE: 1/4" = 1'-0"

**10 SILT FENCE WITH STRAW BALE DIKE**  
SCALE: 1" = 1'-0"

- NOTES:**
- TOPSOIL, SEED, MULCH, AND FERTILIZER DISTURBED SOIL AREAS THAT WILL BE LEFT EXPOSED FOR 14 DAYS OR MORE.
  - SEED 1/2 IN. RIGHT OF WAY TO BE A MIXTURE OF 30% KENTUCKY BLUE, 20% PERENNIAL RYE, 20% RED FESCUE, 20% PALMER RYE.

THE MAXIMUM SOIL EXPOSURE LIMIT IS 14 DAYS

## APPENDIX M

# Orangetown Town Hall

## Stormwater Management Maintenance Plan

---

Efficient and timely maintenance of the stormwater practices is necessary to ensure the proper function and longevity of the stormwater management system. The maintenance plan is an outline of the maintenance tasks and schedules. The maintenance is to be performed by the lease holder or their representative and contact information is presented below. Sample Maintenance Logs are attached.

### Contact Information

Contact Name: \_\_\_\_\_

Address: \_\_\_\_\_

Phone: \_\_\_\_\_

### GENERAL

- The maintenance plan must be evaluated for effectiveness at least annually and must be revised as needed.
- A record of when the inspection was performed, by whom and which structures should be kept. A sample inspection record is attached.
- See attached proprietary Maintenance Guidelines for additional information on specific practices.

### STORMWATER STRUCTURES/COLLECTION PIPING

- Includes catch basins, diversion structures, hydrodynamic separators, subsurface storage, cistern, outlet control structures, conveyance piping and cleanouts.
- Inspections should be performed at least quarterly. If the frequency appears insufficient based on the level of sediment build up or erosion, modifications should be made to the maintenance plan.
- Inspections should be performed in dry weather conditions.
- Visual inspection of grates and remove any trash or debris.
- The sump areas should be checked for debris and sedimentation. The amount of sediment and debris should be measured using a tape measure or calibrated dipstick for the structure.
- Stormwater conveyance piping may need to be cleaned out through hydro-excavating or alternative pipe cleaning method.
- Vacuuming as needed.

## Cascade Separator™ Inspection and Maintenance Guide

## Maintenance

The Cascade Separator™ system should be inspected at regular intervals and maintained when necessary to ensure optimum performance. The rate at which the system collects sediment and debris will depend upon on-site activities and site pollutant characteristics. For example, unstable soils or heavy winter sanding will cause the sediment storage sump to fill more quickly but regular sweeping of paved surfaces will slow accumulation.

## Inspection

Inspection is the key to effective maintenance and is easily performed. Pollutant transport and deposition may vary from year to year and regular inspections will help ensure that the system is cleaned out at the appropriate time. At a minimum, inspections should be performed twice per year (i.e. spring and fall). However, more frequent inspections may be necessary in climates where winter sanding operations may lead to rapid accumulations, or in equipment wash-down areas. Installations should also be inspected more frequently where excessive amounts of trash are expected.

A visual inspection should ascertain that the system components are in working order and that there are no blockages or obstructions in the inlet chamber, flumes or outlet channel. The inspection should also quantify the accumulation of hydrocarbons, trash and sediment in the system. Measuring pollutant accumulation can be done with a calibrated dipstick, tape measure or other measuring instrument. If absorbent material is used for enhanced removal of hydrocarbons, the level of discoloration of the sorbent material should also be identified during inspection. It is useful and often required as part of an operating permit to keep a record of each inspection. A simple form for doing so is provided in this Inspection and Maintenance Guide.

Access to the Cascade Separator unit is typically achieved through one manhole access cover. The opening allows for inspection and cleanout of the center chamber (cylinder) and sediment storage sump, as well as inspection of the inlet chamber and slanted skirt. For large units, multiple manhole covers allow access to the chambers and sump.

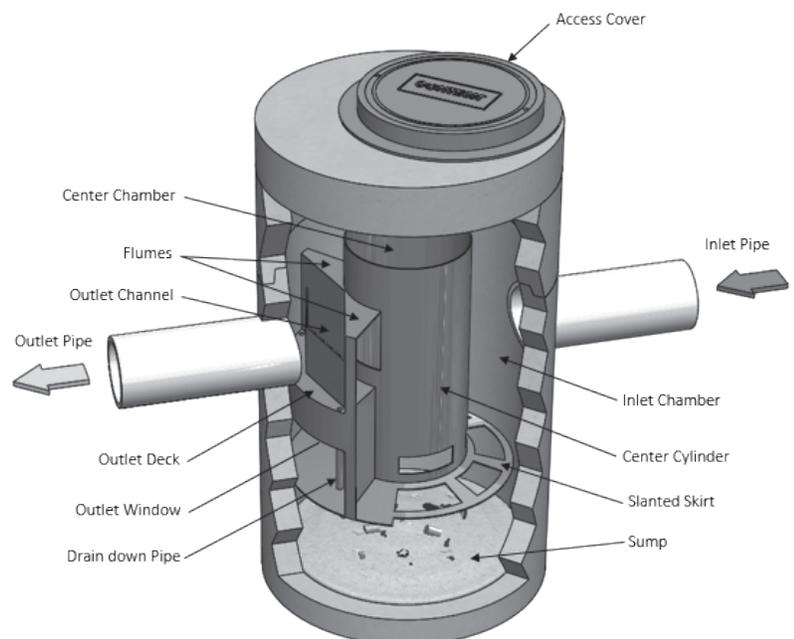

The Cascade Separator system should be cleaned before the level of sediment in the sump reaches the maximum sediment depth and/or when an appreciable level of hydrocarbons and trash has accumulated. If sorbent material is used, it must be replaced when significant discoloration has occurred. Performance may be impacted when maximum sediment storage capacity is exceeded. Contech recommends maintaining the system when sediment level reaches 50% of maximum storage volume. The level of sediment is easily determined by measuring the distance from the system outlet invert (standing water level) to the top of the sediment pile. To avoid underestimating the level of sediment in the chamber, the measuring device must be lowered to the top of the sediment pile carefully. Finer, silty particles at the top of the pile typically offer less resistance to the end of the rod than larger particles toward the bottom of the pile. Once this measurement is recorded, it should be compared to the chart in this document to determine if the height of the sediment pile off the bottom of the sump floor exceeds 50% of the maximum sediment storage.

## Cleaning

Cleaning of a Cascade Separator system should be done during dry weather conditions when no flow is entering the system. The use of a vacuum truck is generally the most effective and convenient method of removing pollutants from the system. Simply remove the manhole cover and insert the vacuum tube down through the center chamber and into the sump. The system should be completely drained down and the sump fully evacuated of sediment. The areas outside the center chamber and the slanted skirt should also be washed off if pollutant build-up exists in these areas.

In installations where the risk of petroleum spills is small, liquid contaminants may not accumulate as quickly as sediment. However, the system should be cleaned out immediately in the event of an oil or gasoline spill. Motor oil and other hydrocarbons that accumulate on a more routine basis should be removed when an appreciable layer has been captured. To remove these pollutants, it may be preferable to use absorbent pads since they are usually less expensive to dispose than the oil/water emulsion that may be created by vacuuming the oily layer. Trash and debris can be netted out to separate it from the other pollutants. Then the system should be power washed to ensure it is free of trash and debris.

Manhole covers should be securely seated following cleaning activities to prevent leakage of runoff into the system from above and to ensure proper safety precautions. Confined space entry procedures need to be followed if physical access is required. Disposal of all material removed from the Cascade Separator system must be done in accordance with local regulations. In many locations, disposal of evacuated sediments may be handled in the same manner as disposal of sediments removed from catch basins or deep sump manholes. Check your local regulations for specific requirements on disposal. If any components are damaged, replacement parts can be ordered from the manufacturer.

## Cascade Separator™ Maintenance Indicators and Sediment Storage Capacities

Model Number	Diameter		Distance from Water Surface to Top of Sediment Pile		Sediment Storage Capacity	
	ft	m	ft	m	y <sup>3</sup>	m <sup>3</sup>
CS-4	4	1.2	1.5	0.5	0.7	0.5
CS-5	5	1.3	1.5	0.5	1.1	0.8
CS-6	6	1.8	1.5	0.5	1.6	1.2
CS-8	8	2.4	1.5	0.5	2.8	2.1
CS-10	10	3.0	1.5	0.5	4.4	3.3
CS-12	12	3.6	1.5	0.5	6.3	4.8

*Note: The information in the chart is for standard units. Units may have been designed with non-standard sediment storage depth.*

A Cascade Separator unit can be easily cleaned in less than 30 minutes.

A vacuum truck excavates pollutants from the systems.

Rainwater Harvesting/Cistern

DuroMaxx<sup>®</sup> SRPE Detention & Infiltration Maintenance Guide

# DuroMaxx® Steel Reinforced Polyethylene (SRPE) Detention and Infiltration Systems

## Maintenance

Underground storm water detention and infiltration systems should be inspected at regular intervals and maintained when necessary to ensure optimum performance. The rate at which the system collects pollutants will depend more heavily on site activities than the size or configuration of the system.

## Inspection

Inspection is the key to effective maintenance and is easily performed. Contech Engineered Solutions recommends ongoing quarterly inspections of the accumulated sediment. Sediment deposition and transport may vary from year to year and quarterly inspections will help insure that systems are cleaned out at the appropriate time. Inspections should be performed more often in the winter months in climates where sanding operations may lead to rapid accumulations, or in equipment washdown areas. It is very useful to keep a record of each inspection. A sample inspection log is included for your use.

Systems should be cleaned when inspection reveals that accumulated sediment or trash is clogging the discharge orifice. Contech suggests that all systems be designed with an access/inspection manhole situated at or near the inlet and the outlet orifice. Should it be necessary to get inside the system to perform maintenance activities, all appropriate precautions regarding confined space entry and OSHA regulations should be followed.

## Cleaning

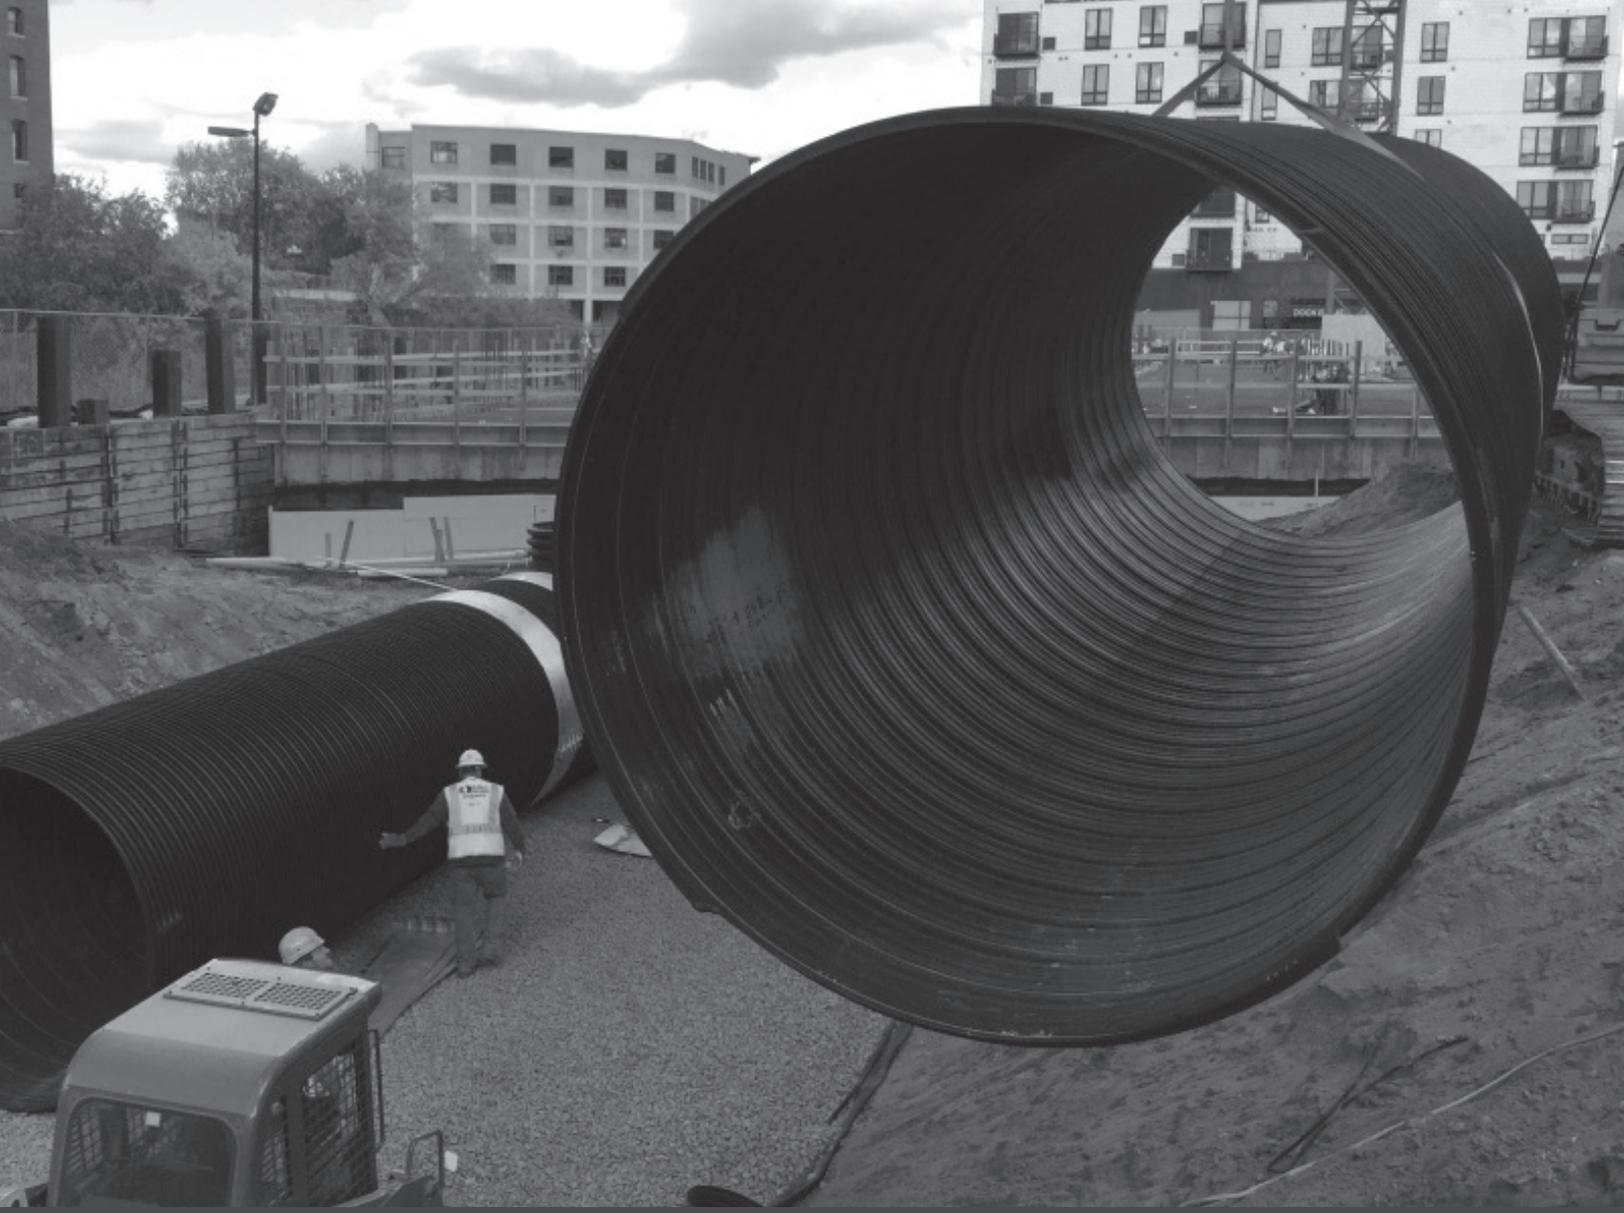

Maintaining an underground detention or retention system is easiest when there is no flow entering the system. For this reason, it is a good idea to schedule the cleanout during dry weather.

Accumulated sediment and trash can typically be evacuated through the manhole over the outlet orifice. If maintenance is not performed as recommended, sediment and trash may accumulate in front of the outlet orifice. Manhole covers should be securely seated following cleaning activities.

## Inspection & Maintenance Log Sample Template

_____ " Diameter System			Location: Anywhere, USA

# R-TANK OPERATION, INSPECTION & MAINTENANCE

## **Operation**

Your ACF R-Tank System has been designed to function in conjunction with the engineered drainage system on your site, the existing municipal infrastructure, and/or the existing soils and geography of the receiving watershed. Unless your site included certain unique and rare features, the operation of your R-Tank System will be driven by naturally occurring systems and will function autonomously. However, upholding a proper schedule of Inspection & Maintenance is critical to ensuring continued functionality and optimum performance of the system.

## **Inspection**

Both the R-Tank and all stormwater pre-treatment features incorporated into your site must be inspected regularly. Inspection frequency for your system must be determined based on the contributing drainage area, but should never exceed one year between inspections (six months during the first year of operation).

Inspections may be required more frequently for pre-treatment systems. You should refer to the manufacturer requirements for the proper inspection schedule.

With the right equipment your inspection and measurements can be accomplished from the surface without physically entering any confined spaces. If your inspection does require confined space entry, you **MUST** follow all local/regional requirements as well as OSHA standards.

R-Tank Systems may incorporate Inspection Ports, Maintenance Ports, and/or adjoining manholes. Each of these features are easily accessed by removing the lid at the surface. With the cover removed, a visual inspection can be performed to identify sediment deposits within the structure. Using a flashlight, ALL access points should be examined to complete a thorough inspection.

### **Inspection Ports**

Usually located centrally in the R-Tank System, these perforated columns are designed to give the user a base-line sediment depth across the system floor.

### **Maintenance Ports**

Usually located near the inlet and outlet connections, you'll likely find deeper deposits of heavier sediments when compared to the Inspection Ports.

### **Manholes**

Most systems will include at least two manholes - one at the inlet and another at the outlet. There may be more than one location where stormwater enters the system, which would result in additional manholes to inspect.

Bear in mind that these manholes often include a sump below the invert of the pipe connecting to the R-Tank. These sumps are designed to capture sediment before it reaches the R-Tank, and they should be kept clean to ensure they function properly. However, existence of sediment in the sump does **NOT** necessarily mean sediment has accumulated in the R-Tank.

After inspecting the bottom of the structure, use a mirror on a pole (or some other device) to check for sediment or debris in the pipe connecting to the R-Tank.

# R-TANK OPERATION INSPECTION & MAINTENANCE

If sediment or debris is observed in any of these structures, you should determine the depth of the material. This is typically accomplished with a stadia rod, but you should determine the best way to obtain the measurement.

All observations and measurements should be recorded on an Inspection Log kept on file. We've included a form you can use at the end of this guideline.

## Maintenance

The R-Tank System should be back-flushed once sediment accumulation has reached 6" or 15% of the total system height. Use the chart below as a guideline to determine the point at which maintenance is required on your system.

R-Tank Unit	Height	Max Sediment Dept
Mini	9.5"	1.5"
Single	17"	3"
Double	34"	5"
Triple	50"	6"
Quad	67"	6"
Pent	84"	6"

**Before any maintenance is performed on your system, be sure to plug the outlet pipe to prevent contamination of the adjacent systems.**

To back-flush the R-Tank, water is pumped into the system through the Maintenance Ports as rapidly as possible. Water should be pumped into ALL Maintenance Ports. The turbulent action of the water moving through the R-Tank will suspend sediments which may then be pumped out.

If your system includes an Outlet Structure, this will be the ideal location to pump contaminated water out of the system. However, removal of back-flush water may be accomplished through the Maintenance Ports, as well.

For systems with large footprints that would require extensive volumes of water to properly flush the system, you should consider performing your maintenance within 24 hours of a rain event. Stormwater entering the system will aid in the suspension of sediments and reduce the volume of water required to properly flush the system.

Once removed, sediment-laden water may be captured for disposal or pumped through a Dirtbag™ (if permitted by the locality).

## Step-By-Step Inspection & Maintenance Routine

### 1) Inspection

- a. Inspection Port
  - i. Remove Cap
  - ii. Use flashlight to detect sediment deposits
  - iii. If present, measure sediment depth with stadia rod
  - iv. Record results on Maintenance Log
  - v. Replace Cap
- b. Maintenance Port/s
  - i. Remove Cap
  - ii. Use flashlight to detect sediment deposits
  - iii. If present, measure sediment depth with stadia rod
  - iv. Record results on Maintenance Log
  - v. Replace Cap
  - vi. Repeat for ALL Maintenance Ports
- c. Adjacent Manholes
  - i. Remove Cover
  - ii. Use flashlight to detect sediment deposits
  - iii. If present, measure sediment depth with stadia rod, accounting for depth of sump (if present)
  - iv. Inspect pipes connecting to R-Tank
  - v. Record results on Maintenance Log
  - vi. Replace Cover
  - vii. Repeat for ALL Manholes that connect to the R-Tank

### 2) Maintenance

- a. Plug system outlet to prevent discharge of back-flush water
- b. Determine best location to pump out back-flush water
- c. Remove Cap from Maintenance Port
- d. Pump water as rapidly as possible (without over-topping port) into system until at least 1" of water covers system bottom
- e. Replace Cap
- f. Repeat at ALL Maintenance Ports
- g. Pump out back-flush water to complete back-flushing
- h. Vacuum all adjacent structures and any other structures or stormwater pre-treatment systems that require attention
- i. Sediment-laden water may be captured for disposal or pumped through a Dirtbag™.
- j. Replace any remaining Caps or Covers
- k. Record the back-flushing event in your Maintenance Log with any relevant specifics

---

## APPENDIX N

## SECTION 312500 - EROSION AND SEDIMENTATION CONTROL

### PART 1 - GENERAL

#### 1.1 GENERAL REQUIREMENTS

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
1. Soil Erosion and Sediment Control shall include implementation and maintenance of soil erosion and sediment control devices and construction methods, as shown on the Plans, as required under the Guidelines or as directed by the Owner's Representative, State or Municipality, which will reduce or prevent soil losses and associated damages from sedimentation during construction of this project. All costs associated with the provision of Soil Erosion and Sediment Control acceptable to the above parties shall be included in the price bid for the project. Work shall include, but not necessarily be limited to the following:
    - a. Install and maintain silt fence as required by the Contractor's staging of construction, or as directed.
    - b. Install and maintain construction entrance pad(s) at all access points.
    - c. Install and maintain inlet protection as required by the Contractor's staging of construction, or as directed.
    - d. Install and maintain diversion swales and/or berms as required by the Contractor's staging of construction, or as directed.
    - e. Install and maintain sediment traps/ponds as required by the Contractor's staging of construction, or as directed.
    - f. Plant and maintain temporary seeding to control surface runoff by site conditions.
    - g. Construct and maintain stockpile areas as required by the Contractor's staging of construction, or as directed.
    - h. Install and maintain tree protection during construction as required by the Contractor's staging of construction, or as directed.
    - i. Implement ongoing dust control.
  2. All work under this item must comply with the New York State Guidelines for Urban Erosion and Sediment Control, revised and adopted through 2016, and the latest revisions thereto. Additionally, this work is subject to the review and inspection by the owner's representative, and the Contractor shall comply with all corrective directives issued by these entities without additional payment. Any penalties levied by the Municipality, County, or State, or any direct or consequential damages arising out of a Stop Work Order issued by the Municipality, County, or State, if due to inaction by the Contractor, shall be borne solely by the Contractor, at no additional cost to the Owner.
- B. The Owner's Representative has the authority to limit the surface area of erodible earth exposed by earthwork operations and to direct the Contractor to provide immediate

temporary or permanent erosion or pollution control measures to minimize damage to property.

## 1.2 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.
- C. New York State Standards and Specifications for Erosion and Sediment Control, revised and adopted through 2016, and the latest revisions thereto.
- D. Stormwater Pollution Prevention Plan prepared for this project.

## 1.3 RELATED WORK SPECIFIED ELSEWHERE:

- A. Site Clearing: Section 311000.
- B. Earth Moving: Section 312000.

## 1.4 SUBMITTALS:

- A. Product Data:
  - 1. Silt fence: Manufacturer's catalog sheets, specifications, and installation instructions.
  - 2. Filter Fabric: Manufacturer's catalog sheets, specifications, and installation instructions.
- B. Certifications:
  - 1. Proof of current endorsed NYSDEC 4-hour training for Contractor's trained individual
  - 2. Completed Contractor's SPDES certification (see SWPPP appendix).
  - 3. Completed Subcontractor's SPDES certification(s) as applicable (see SWPPP appendix).

## **PART 2 - PRODUCTS**

### 2.1 EROSION CONTROL DEVICES

- A. Hay or Straw bales shall conform to NYS DOT Section 713-18 or 713-19 and shall be bound with wire or baling twine. The twine shall be polypropylene which has a knot strength of 170 pounds and straight break strength of 300 pounds, minimum.

- B. Silt Fence may be commercially available silt fence systems, consisting of synthetic geotextile fabrics and hardwood stakes. The height of the fence shall be a minimum of two (2) feet, and the fabric shall be wide enough to allow for a minimum embedment in the ground of two (2) feet of fabric. Sections shall be joined in a manner such that the fence shall function continuously.
- C. Rapid germination grasses such as fescue or rye.
- D. Stakes for securing bales may either be steel or wood and shall conform to the sizes shown on the Plans.
- E. Mulches: Hay, straw, wood cellulose, fiber mats, geotextiles, and other materials approved by the owner's representative.
- F. Stone: Well-graded aggregate compliant with NYSDOT Section 703.
- G. Filter Fabric shall be commercially available non-woven geotextile with the following properties:
  - 1. Grab Tensile Strength ASTM D4632: 120 lbs.
  - 2. Mullen Burst Strength ASTM D3786: 225 psi.
  - 3. Trapezoidal Tear Strength ASTM D4355: 50 lbs.
  - 4. Puncture Strength ASTM D4833: 70 lbs.
  - 5. UV Resistance after 500 hours ASTM D4355: 70% strength
  - 6. Apparent Opening Size ASTM D4751: US Sieve #70
  - 7. Permittivity ASTM D4491: 1.8 sec-1

### **PART 3 - EXECUTION**

#### **3.1 GENERAL**

- A. The contractor shall incorporate all temporary soil erosion and sediment control measures into the project at the earliest practicable time, to maintain the maximum protection against soil erosion and sedimentation possible, throughout the life of the contract.
- B. All erosion and sediment control practices shall conform to the Standards for Soil Erosion and Sediment Control in the State of New York.
- C. A schedule of construction operations shall be submitted to the Owner's Representative for approval. Said schedule shall outline construction phasing and shall indicate how and where erosion control measures will be utilized. The schedule shall include indications of locations for construction staging, soil stockpiles, etc., and any disturbances outside the limit of excavation shown on the Plans.
- D. Prior to initial clearing of the area to be excavated, erosion control measures shall be installed, such as stone construction entrance, hay bales, silt fence, and inlet protection.
- E. The smallest practicable area of land shall be disturbed at any one time during the project and, whenever feasible, natural vegetation shall be retained and protected. Stripping of

vegetation, grading and other soil disturbances shall be completed in a manner that will minimize soil erosion and sedimentation.

1. The Owner's Representative may limit the area of clearing and grubbing and earthwork operations in progress commensurate with the Contractor's demonstrated capability in protecting erodible earth surfaces with temporary or permanent erosion control measures.
  2. Under no circumstances will the area of erodible material exposed at one time exceed five (5) acres without prior written approval of the Owner's Representative and NYSDEC.
  3. The Owner's Representative may increase or decrease the area of erodible earth material exposed at one time as determined by his analysis of project, weather and other conditions.
- F. All other construction procedures shall conform to the NYS DOT Standard Specifications Section 209.
- G. Incorporate permanent control features into the work at the earliest practical time.
- H. Sweeping of hardscape shall be performed weekly (as a minimum), at the end of a work day when construction activity results in the tracking of sediment onto hardscape, or as directed by the Owner's Representative to remove accumulated sediment generated by construction operations.

### 3.2 STOCKPILE

- A. Stockpile topsoil in storage piles in areas where directed by the Owner's Representative. Construct storage piles to freely drain surface water. Cover storage piles if required to prevent windblown dust.
- B. Protect all soil and topsoil stockpiles as directed by the Owner's Representative or other authority having jurisdiction over the project.

### 3.3 TREE PROTECTION

- A. Fencing or other barrier will be installed at the drip line of the tree branches.
- B. Boards will not be nailed to trees during building operations.
- C. Feeder root should not be cut in an area inside the drip line of tree branches.
- D. Damaged trunks or exposed roots will be painted immediately with a good grade of "tree paint". Care of serious injury should be prescribed by a professional forester or licensed tree expert.
- E. Tree limb removal, where necessary, will be done flush to trunk or main branch and that area painted with a good grade of "tree paint".
- F. Water trees and other vegetation to remain within limits of contract work as required to maintain their health during course of construction.

- G. Additional requirements are provided on the details shown on the project plans.

#### 3.4 SPDES COMPLIANCE PROVISIONS

- A. The Contractor shall install, maintain and service as needed all construction run-off collection/prevention measures as indicated on the drawings and the Stormwater Pollution Prevention Plan (SWPPP) or as directed by the Owner's Representative.
- B. The Contractor must have at least one trained person responsible for implementation of the SWPPP, and have at least one trained person on site on a daily basis when soil disturbance activities are being performed. Trained contractors must have 4 hours of training in the principles and practices of erosion and sediment control endorsed by NYS DEC. Proof of training shall be submitted to the Owner's Representative prior to commencing construction.
- C. A qualified person from the Owner will perform SPDES-compliance inspections required by the Permit on a weekly basis. All recommendations and suggested modifications must be addressed by the Contractor within 1 working day of issuance of notice by the Owner's Representative. Under certain circumstances, the Owner and/or the NYSDEC has the right to direct more than one weekly inspection and visit the project construction site at any point over the course of construction.

END OF SECTION 312500

**BEGIN ATTACHMENT TO SECTION 31 25 00**

**SWPPP**

**END ATTACHMENT TO SECTION 31 25 00**

**SWPPP**

## **SECTION 31 31 00 – SOIL MANAGEMENT**

### **PART 1 - GENERAL**

#### 1.1 SECTION INCLUDES

- A. This specification describes requirements for soil management as specified herein, including segregation and storage, field organic vapor monitoring, sampling and analysis, transportation and disposal, and reuse of soils.
- B. The Contractor shall provide all labor, materials, tools, and equipment to perform all operations necessary to characterize, classify and determine the requirements for handling, disposal, and/or reuse of all materials to be excavated.

#### 1.2 GENERAL INFORMATION AND REQUIREMENTS

- A. The Contractor is responsible for assuring compliance with all applicable Federal and State regulations and policies in place at the time of construction. This includes, but is not limited to, any Federal or State modifications to sampling or analytical methods, standards, or policies specified herein.
- B. Soil contaminants may potentially include:
  - 1. Petroleum products, which may include, but are not limited to: gasoline, heating oils, diesel fuel, kerosene, lubricating oils, motor oils, greases, and other fractions of crude oil;
  - 2. Other contamination by organic constituents including volatile organic compounds;
  - 3. Metal(s) such as lead, chromium, and/or other heavy metals; and/or
  - 4. Any other constituents that require specialty disposal of the soil.

Additional information regarding contaminated soil is available in a Field Sampling Summary Report drafted in September 2020, as detailed under Specification Item 1.6: Existing Soil Conditions.

- C. Segregation and Storage
  - 1. This work shall consist of segregating contaminated soil from non-contaminated soil during excavation, and the temporary storage and management of contaminated soil (pending sampling, analysis and ultimate disposition) in accordance with an accepted Contaminated Material Handling Plan.
- D. Field Organic Vapor Monitoring

NOT USED

E. Sampling and Analysis

1. This work shall consist of collecting soil samples and arranging for samples to be analyzed at a laboratory in accordance with an accepted Field Sampling Plan. The laboratory shall be accredited for the specified parameters by the New York State Department of Health (NYSDOH) under the Environmental Laboratory Approval Program (ELAP). The results of the laboratory analysis will determine or confirm the final regulatory classification of the soil for appropriate handling, transportation, treatment and disposal/reuse methods and requirements.

F. Transportation and Disposal

1. This work shall consist of transporting and disposing of soil that is not otherwise reused on site, and completing any other related activities, in accordance with an accepted Disposal Plan. For shipping and disposal purposes, the regulatory classification of the soil (as either contaminated non-hazardous waste or RCRA regulated hazardous waste) will be based on investigations conducted prior to award or based on the results of laboratory analysis included in this Specification Section.

G. Reuse of Soils

1. This work shall consist of the reuse of soil within the contract limits as embankment, fill or other appropriate on-site use (unless gross contamination is discovered). Soil areas and reuse locations, if provided, are indicated in the contract documents or shall be determined and approved by the Engineer. The reuse of soil must be compliant with applicable sections of 6 NYCRR Part 360.12 and Part 350.13 as deemed appropriate based upon the following a) an investigation conducted prior to the contract award and/or sampling and analysis conducted during project construction and the qualification of the soil placement as a generic beneficial use determination (BUD) or b) as a site-specific BUD obtained from the New York State Department of Conservation (NYSDEC). The material must and can be considered suitable material as per the Geotechnical Investigation Report, as detailed under Specification Item 1.6: Existing Soil Conditions.

1.3 RELATED WORK SPECIFIED ELSEWHERE

- A. Earth Moving: Section 31 20 00.

1.4 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.

- C. Field Sampling Summary Report: Preliminary Soil Waste Characterization – Orangetown Town Hall Expansion, prepared by Tectonic Engineering Consultants, Geologists & Land Surveyors, D.P.C., dated September 4, 2020.
- D. Geotechnical Investigation Report – Proposed Addition to Orangetown Town Hall, prepared by Tectonic Engineering Consultants, Geologists & Land Surveyors, D.P.C., dated March 8, 2021.

## 1.5 DEFINITIONS

- A. NYSDOH: New York State Department of Health
- B. ELAP: Environmental Laboratory Approval Program
- C. RCRA: Resource Conservation and Recovery Act
- D. BUD: Beneficial Use Determination
- E. NYSDEC: New York State Department of Environmental Conservation
- F. PID: Photoionization Detector
- G. PPM: Parts Per Million
- H. FID: Flame Ionization Detector
- I. PPC: Personal Protective Clothing
- J. PPE: Personal Protective Equipment
- K. OSHA: Occupational Safety and Health Administration
- L. EPA: United States Environmental Protection Agency
- M. USDOT: United States Department of Transportation

## 1.6 EXISTING SOIL CONDITIONS

- A. A preliminary soil waste characterization field study was conducted by Tectonic Engineering Consultants, Geologists & Land Surveyors, D.P.C. (Tectonic) between August 12 – 14, 2020. Full details of this preliminary investigation are available a Field Sampling Summary Report prepared by Tectonic and drafted in September 2020. Relevant conclusions and recommendations of the preliminary waste characterization studies are as follows:
  - 1. The soils sampled and analyzed would be classified as non-hazardous regulated material by the State on New York. Material scheduled for excavation and off-site disposal should be disposed of at an appropriate, permitted facility that can accept the waste. Material considered for on-site reuse would be regulated as follows:

- a. As per the NYSDEC Pre-determined BUD Part 360.12(c)(1)(ii), “fill material generated outside of New York City with no evidence of historical impacts such as reported spill events, or visual or other indications (odors, etc.) of chemical or physical contamination,” may be re-used on Site. In the event that visual or other indications of contamination are observed during soil disturbance activities, NYSDEC Part 360.13(c) states, “fill material used as backfill for the excavation from which the fill material was taken, or as fill in areas of similar physical characteristics on the project property is exempt from regulation under this Part [360]”.
- b. If fill material exhibits historical or visual evidence of contamination (including odors), and will be used in an area with public access, the relocated fill material must be covered with a minimum of 12 inches of soil or fill material that meets the criteria for general fill as defined in this Part [360]. General fill is defined in in Table 2 of Part 360 as:

TABLE 2: Fill Material Beneficial Use

Fill Material Type	Fill Material End Use	Physical Criteria	Maximum Concentration Levels
General Fill	Any setting where the fill material meets the engineering criteria, for use, except: 1. Undeveloped land; and 2. Agricultural crop land. General Fill may also be used in the same manner as Restricted-Use Fill and Limited-Use Fill.	Only soil, sand, gravel or rock; no non-soil constituents.	Lower of Protection of Public Health-Residential Land Use and Protection of Groundwater in Table 375-6.8(b) of this Title.

1.7 SUBMITTALS

- A. Contaminated Material Handling Plan
- B. Field Sampling Plan
- C. Field Sampling Summary Report
- D. Disposal Plan

**PART 2 - MATERIALS**

2.1 GENERAL

- A. As per the Contaminated Material Handling Plan, (Item 3.2 (C) (1))

## 2.2 SEGREGATION AND STORAGE

- A. A minimum of 10-mil or two (2) layers of 6-mil polyethylene sheeting shall be used as soil stockpile(s) liner(s) and cover(s).
- B. A partial containment berm made up of hay bales, silt fences, or timbers shall be utilized around stockpiled soils to direct runoff and minimize erosion.

## 2.3 FIELD ORGANIC VAPOR MONITORING

NOT USED

## 2.4 SAMPLING AND ANALYSIS

- A. All reusable sample collection devices, such as shovels or hand trowels, shall be stainless steel. All devices shall be decontaminated before and after collection of each sample. All methods necessary to decontaminate the sampling equipment shall be used. Contractor shall be responsible for proper handling and disposal of all decontamination materials and fluids.
- B. All disposable sampling devices shall be constructed of inert materials such as polyethylene, silicon, or Teflon. All disposable sampling devices shall be used only once and properly disposed.

## 2.5 TRANSPORTATION AND DISPOSAL

- A. The Contractor must assure that the waste transporter's appropriate choice of vehicles and operating practices are fitted to prevent spillage or leakage of contaminated material during transportation.

## 2.6 REUSE OF SOILS

- A. As per the NYSDEC Pre-determined BUD Part 360.12(c)(ii), "fill material generated outside of New York City with no evidence of historical impacts such as reported spill events, or visual or other indications (odors, etc.) of chemical or physical contamination," may be re-used on Site. In the event that visual or other indications of contamination are observed during soil disturbance activities, NYSDEC Part 360.13(c) states, "fill material used as backfill for the excavation from which the fill material was taken, or as fill in areas of similar physical characteristics on the project property is exempt from regulation under this Part [360]".
- B. If fill material exhibits historical or visual evidence of contamination (including odors), and will be used in an area with public access, the relocated fill material must be covered with a minimum of 12 inches of soil or fill material that meets the criteria for general fill as defined in this Part [360]. General fill is defined in in Table 2 of Part 360 as:

TABLE 2: Fill Material Beneficial Use

Fill Material Type	Fill Material End Use	Physical Criteria	Maximum Concentration Levels
General Fill	Any setting where the fill material meets the engineering criteria, for use, except: 1. Undeveloped land; and 2. Agricultural crop land. General Fill may also be used in the same manner as Restricted-Use Fill and Limited-Use Fill.	Only soil, sand, gravel or rock; no non-soil constituents.	Lower of Protection of Public Health-Residential Land Use and Protection of Groundwater in Table 375-6.8(b) of this Title.

**PART 3 - EXECUTION**

3.1 EARTHWORK

- A. Excavating, trenching, and backfilling are specified in Specification Section 31 20 00 "Earth Moving."

3.2 GENERAL

- A. Work activities shall be performed in accordance with the contract documents and with applicable Contaminated Material Handling Plan, Field Sampling Plan and Disposal Plan. The Contractor shall initiate any measures necessary to protect the safety and health of workers and the general public based on the potential hazards associated with potentially contaminated soil.
- B. **Regulatory Compliance:** The Contractor shall conduct all tasks in accordance with all applicable Federal, State, County, and local regulations including, but not necessarily limited to:
  1. 29 CFR 1910.120 and 29 CFR 1926.65 - Hazardous Waste Operations and Emergency Response.
  2. 6 NYCRR 360 - Solid Waste Management Facilities.
  3. 6 NYCRR 364 - Waste Transporter Permits.
  4. 6 NYCRR 371 - Identification and Listing of Hazardous Wastes (Defines Resource Conservation and Recovery Act (RCRA) defined hazardous wastes.
  5. 6 NYCRR 372 - Hazardous Waste Manifest System and Related Standards for Generators, Transporters and Facilities (applicable to soils regulated as hazardous wastes only).
  6. 6 NYCRR 373 – Hazardous Waste Management Facilities.
  7. 6 NYCRR Part 375 – Environmental Remediation Program.
  8. 6 NYCRR Part 376 – Land Disposal Restrictions.
  9. 49 CFR 100 to 180 - USDOT Hazardous Materials Transport and Manifest System Requirements (applicable to soils regulated as hazardous wastes only).
  10. Local restrictions on transportation of waste/debris.
  11. 40 CFR 260 to 272 – Hazardous Waste Management (RCRA).
  12. Posted weight limitations on roads and bridges.

13. Resource Conservation and Recovery Act (RCRA).
14. NYSDEC Program Policy DER-10: Technical Guidance for Site Investigation and Remediation (DER-10).
15. NYSDEC Policy CP-51: Soil Cleanup Guidance.

C. ***Preparation of Plans / Reports:*** The Contractor shall be required to prepare the plans and reports described below. Two (2) copies of each applicable plan shall be submitted to the Engineer for acceptance at least thirty (30) calendar days prior to commencing work.

Plans and reports shall be prepared based on the type(s) of contamination and locations identified in the contract documents. If a different type of contamination is encountered during work, and additional plans must be written, the thirty (30) calendar day lead time for submittals may be modified by the Engineer as appropriate.

1. ***Contaminated Material Handling Plan (CMHP):*** The CMHP shall describe the procedures to be used to segregate contaminated soil during excavation, soil storage/stockpile procedures, and safety and health issues. The following information shall be included in the CMHP:
  - a. Name and address of the plan preparer;
  - b. Contract name, contract number and description;
  - c. Describe procedures to be used to segregate contaminated soil during excavation;
  - d. Location of intended soil stockpile, trucks, roll-off container and other storage areas;
  - e. Describe how contaminated soil will be moved to soil storage locations;
  - f. Describe how soil storage/stockpile locations will be prepared and managed;
  - g. Describe how potential air quality impacts such creation of dust particulates and vapors will be minimized to protect air quality within, adjacent to or downwind from the project;
  - h. Describe air monitoring procedures to be used during work, define action levels, and explain the response if action levels are exceeded; The protocol and procedures shall consider action levels for both work personnel and also perimeter/community action levels based on the nature of the contamination and activities conducted;
  - i. Hazardous substance evaluation - types of chemicals associated with the waste to be generated,
  - j. Hazard assessment - physical and toxic effects associated with the waste to be generated; Personal protective clothing (PPC) and personal protective equipment (PPE) to be used or available on-site;
  - k. Names of key personnel, emergency contacts and phone numbers;
  - l. List the OSHA training each worker has received. At least one worker must have completed supervisor training per 29 CFR 1910.120(E)(4);
  - m. General and site-specific safety rules, with emergency response procedures and directions to the nearest hospital (with map);
  - n. Decontamination procedures for personnel and equipment; and
  - o. Disposal of contaminated PPC and PPE;

2. **Field Sampling Plan:** A Field Sampling Plan (FSP) must be prepared and submitted to the Engineer for approval prior to mobilization for any sampling activities. The FSP shall include protocols for the collection and analysis of samples that represent all soils to be excavated and stockpiled. The Engineer will approve the FSP only if it clearly provides the information to allow for classification of all material proposed for excavation. No sampling shall be conducted until the Engineer has reviewed and formally approved the FSP in writing. At a minimum, the following information shall be included in the FSP:

- a. Name and address of the plan preparer;
- b. Name, telephone number, and ELAP certification number of the proposed NYSDOH ELAP accredited laboratory;
- c. Name, address, experience and qualifications of each individual who will collect soil samples. Each individual shall be thoroughly trained in sampling protocols, handling and chain of custody procedures, and laboratory requirements;
- d. For materials destined for offsite disposal at a permitted facility, the FSP shall include a detailed outline of the disposal facility requirements for sampling, testing and analysis including specific number and types of samples per unit volume of soil to be excavated;
- e. For all materials to be disposed, the sampling frequency shall be, at a minimum, in accordance with NYSDEC DER-10 Table 5.4(e)10, unless otherwise specified by the disposal facility:

Contaminant	VOCs	SVOCs, Inorganics & PCBs/Pesticides	
Soil Quantity (cubic yards)	Discrete Samples	Composite	Discrete Samples/Composite
0-50	1	1	3-5 discrete samples from different locations in the fill being provided will comprise a composite sample for analysis
50-100	2	1	
100-200	3	1	
200-300	4	1	
300-400	4	2	
400-500	5	2	
500-800	6	2	
800-1000	7	2	
> 1000	Add an additional 2 VOC and 1 composite for each additional 1000 Cubic yards or consult with DER		

- f. Description of QA/QC samples required by the reuse or disposal facilities;
- g. Description of additional reuse or disposal facility requirements;
- h. A scaled map of the site showing existing fixed landmarks and the proposed excavation limits. The map shall contain specific sampling locations that will conform to the applicable sampling frequency requirements;
- i. Proposed sampling, handling, preservation, and storage of equipment and procedures, including transfer procedures, and sampling equipment decontamination procedures;
- j. Analytical Methods: proposed analytical methods shall be in accordance with EPA SW-846, latest edition;
- k. Data Quality Objectives: Procedures for assessing precision, accuracy, degree of representation, comparability and completeness of samples and data, including performance audits and proposed protocols for corrective

- measures where problems are identified shall be defined and meet standards set forth in this Specification;
- l. Schedule of field inspections;
  - m. Planned preparation of daily and project summary quality control reports; and
  - n. Manufacturer, catalog data and calibration records of all analytical equipment to be used on-site.
3. **Field Sampling Summary Report:** The field sampling summary report (FSSR) shall contain all laboratory analytical results obtained from the field sampling event(s). A detailed account of any field procedures used which deviated from those established in the FSP shall be included, as well as a complete set of field notes. The Contractor shall submit hard copies of the FSSR which shall include a Summary Table listing the analytical results with highlighted exceedances of RCRA Characteristics, BUD, or applicable parameters of 6NYCRR Part 375 and all disposal facility limits, including any alternate acceptance criteria. Detailed field notes shall be maintained by the Contractor during sampling to allow identification of sample analysis results with the respective areas / volumes of soil that the data represent, and to verify quantities of materials to be beneficially reused or disposed of as regulated solid waste. The field notes shall be made available to the Engineer during the sampling program and included in the FSSR and shall consist of:
- a. Boring and/or test pit logs from each sampling location containing a continuous stratigraphic description of all material encountered. Descriptions of material shall include, but not be limited to, color, odor, staining, field screening measurement, relative grain size distribution, material composition, moisture content, and cohesive properties;
  - b. The location of each sampling point on a scaled map;
  - c. Depth intervals for each sample, whether a grab or composite, and any special notes, which are included on the laboratory chain-of-custody forms; and
  - d. Copies of all laboratory chain-of-custody forms for samples that are collected for analysis.
4. **Disposal Plan:** The following information shall be included in the Disposal Plan:
- a. Name and address of plan preparer;
  - b. Name of disposal/treatment facility, address, telephone number and contact person;
  - c. Copy of applicable permits and/or licenses held by the disposal/treatment facility;
  - d. EPA Identification Number and/or State Facility Identification Number issued to the disposal/treatment facility;
  - e. Method(s) of disposal/treatment that will be used;
  - f. Signed letter from the disposal/treatment facility stating it is authorized under law to accept the type of waste being generated, their intent to accept the waste generated by this contract, and a list of the laboratory tests required by the facility;
  - g. Name of waste transporter, address, telephone number and contact person;

- h. EPA Identification Number and/or State Transporter Identification Number issued to waste transporter; and
- i. Copies of all waste transporter permits and/or license plate numbers for vehicles that will be used for transport of waste from the site to the intended disposal/treatment facility;

### 3.3 SEGREGATION AND STORAGE

A. The Contractor shall have an accepted CMHP prior to commencing work within potentially contaminated soil areas. Soil determined to be contaminated (by PID/FID screening or observation) shall be segregated from non-contaminated soil and stored pending sampling, analysis and disposal. For the purposes of this project, contaminated versus non-contaminated soils are defined as follows:

1. **Non-Contaminated Soil:** Soil with PID/FID head space readings less than 25 ppm and exhibiting no other evidence of contamination (visual or olfactory evidence) shall be considered non-contaminated. Unless further analysis is performed for confirmation of the non-contaminated soil, this soil will be considered uncontaminated.
2. **Contaminated Soil:** Soil with PID/FID head space readings equal to or greater than 25 ppm and/or soil exhibiting other evidence of contamination (visual or olfactory evidence) shall be considered contaminated. This soil shall be segregated from non-contaminated soil and placed in stockpiles or containers. The results of laboratory analysis will be used to determine its regulatory classification. If feasible, soil with significantly higher PID/FID head space readings and soil exhibiting unusual visual or odor characteristics shall be segregated from other contaminated soil.

If feasible, soil with significantly higher PID/FID head space readings and soil exhibiting unusual visual or odor characteristics shall be segregated from other contaminated soil. The Contractor shall notify the Engineer immediately if soil is discovered that appears to contain unknown contaminants or soil that varies significantly from the type of contamination identified in the contract documents. The Engineer will determine the preliminary regulatory classification of the suspect soil and will determine how the soil is to be managed.

B. The Contractor shall not store contaminated soil for more than forty (40) calendar days, with this time limit beginning on the first day soil is placed in a stockpile, truck-bed or roll-off container. If the Engineer approves additional storage time for soil determined to be contaminated non-hazardous waste, the Contractor shall also request approval from NYSDEC for any storage greater than sixty (60) calendar days. If the Engineer approves additional storage time for soil determined to be RCRA regulated hazardous waste, the Contractor shall also obtain approval from NYSDEC for any storage greater than ninety (90) calendar days. Contaminated soil may be placed in stockpiles, trucks or roll-off containers as follows:

1. ***Stockpiles:*** The Contractor shall prepare and maintain stockpiles as follows:
  - a. ***Preparation of Stockpile Areas***
    - 1) The area shall be graded to provide positive drainage away from intended stockpile locations;
    - 2) All stones, roots, debris and other objects that may puncture polyethylene ground protection shall be removed;
    - 3) The ground surface where soil will be stockpiled shall be covered with a minimum of 10-mil or two (2) layers of 6-mil polyethylene sheeting, or an equivalent material. All seams shall be overlapped and sealed to prevent the leaching of contaminants; and
    - 4) Stockpile locations shall be accepted by the Engineer prior to use.
  - b. ***Stockpile Protection***
    - 1) At the end of each work day, contaminated soil stockpiles shall be completely covered with a minimum of 10-mil or two (2) layers of 6-mil polyethylene sheeting, or an equivalent material. All seams shall be overlapped and sealed to prevent the leaching of contaminants.
    - 2) Stockpile covers shall be weighted or secured by appropriate means to prevent tearing or removal by weather conditions.
    - 3) Stockpiles shall be labeled, signed, fenced or otherwise secured (as needed) at the end of each work day.
    - 4) A partial containment berm made up of hay bales, silt fences, or timbers shall be utilized around stockpiled soils to direct runoff and minimize erosion.
  - c. ***Maintenance***
    - 1) Stockpile covers, site grading, signing and security measures shall be properly maintained for the duration of storage.
    - 2) Damaged covers and other protections shall be repaired or replaced by the Contractor within 24-hours after notification. If this work is not satisfactorily completed within 24-hours, no further stockpiling shall be allowed until such work is completed.
2. ***Trucks or Roll-off Containers:*** The Contractor shall prepare and maintain trucks and roll-off containers as follows:
  - a. The interior of truck-beds and roll-off containers shall be lined with 10-mil or two (2) layers of 6-mil polyethylene sheeting, or an equivalent material. All seams shall be overlapped and sealed to prevent the leaching of contaminants.
  - b. At the end of each work day, trucks and roll-off containers storing soil shall be completely covered with waterproof tarpaulins. Tarpaulins shall be placed over the top of the truck bed or container (rather than over the soil inside) and shall extend over the sides to prevent water accumulation and the evaporation of contaminants.

- c. Tarpaulins shall be weighted or secured by appropriate means to prevent tearing or removal by climatic conditions.
- d. Trucks and roll-off containers shall be labeled, signed, fenced or otherwise secured (as needed) at the end of each work day.
- e. Trucks, roll-off containers and tarpaulins shall be properly maintained for the duration of soil storage.
- f. Damaged tarpaulins and protections shall be repaired or replaced by the Contractor within 24-hours after notification. If this work is not satisfactorily completed within 24-hours, no further soil storage shall be allowed until such work is completed.
- g. Trucks and roll-off containers storing contaminated soil shall be located as described in CMHP.

### 3.4 FIELD ORGANIC VAPOR MONITORING

NOT USED

### 3.5 SAMPLING AND ANALYSIS

- A. The Contractor shall have an accepted FSP prior to commencing work. Sampling shall be conducted by individuals thoroughly trained in sampling protocols, handling and chain of custody procedures, and laboratory requirements. Accepted sampling practices shall be used to obtain representative composite sample(s) and/or grab sample(s) as required for the specific analyses to be completed. Representative samples shall be collected from stored soil as soon as possible after excavation. Soil shall be taken from a depth greater than one (1) foot within the stockpile. Each composite sample shall include a minimum of three (3) to five (5) sample points. Grab samples shall be collected in a manner so as to best characterize the extent of contamination of the soil in question and best characterize the extent of contamination of the stockpile. If any soil areas are present with field indications of contamination discretely different than the other areas (i.e., significantly elevated PID/FID readings, staining, etc.), the area may require a separate sample and the Engineer shall be alerted to approve additional sample and analysis. Analyses shall be completed at a NYSDOH ELAP accredited laboratory that is certified to perform the required tests. Analyses shall be completed within ten (10) work days of sample collection. The Contractor shall provide the Engineer with a copy of all reports within two (2) work days of their receipt from the laboratory.
- B. All material shall be sampled and analyzed in accordance with the disposal facility requirements or as required by a site-specific NYSDEC or applicable Out-of-State Regulatory Agency BUD.
- C. Soil shall not be added to any stockpile, truck or roll-off container after its contents have been sampled. If soil is added after sampling, or sampled soil is otherwise tampered with, the Contractor shall re-sample the soil at no additional cost to the Town.
- D. All sampling equipment shall be certified clean or precleaned prior to the collection of each sample, by the following method:

1. Wash all sampling equipment and secondary containers with non-phosphate laboratory grade detergent and distilled water.
  2. Triple rinse with distilled water.
  3. Rinse with isopropyl alcohol, or if samples are visibly contaminated with petroleum use a solvent, such as hexane or other alternate approved by the Engineer.
  4. Triple rinse with analyte free water.
- E. All samples shall be identified with a sample label in addition to an entry on a chain-of-custody record. The label shall be identified upon receipt by the laboratory and cross-referenced to the chain-of-custody record. Any inconsistencies shall be noted on the custody record. Laboratory personnel shall notify the Contractor's sampling and analysis representative immediately if any inconsistencies exist in the paperwork associated with the samples, and the Contractor shall be responsible for collecting new samples to replace those with inconsistencies that cannot be rectified.
- F. Custody of samples shall be maintained through the shipment of samples to the selected laboratory(ies). All samples shall be packaged and shipped daily to ensure that no sample is held at the site for more than 24-hours. Samples shall be delivered directly to the laboratory.
- G. Conduct specified analyses as follows:
1. ***Petroleum Contamination Parameter Analysis:*** Samples shall be analyzed for petroleum contamination constituents (total constituent analysis) in accordance with CP – 51/Soil Cleanup Guidance, Gasoline and Fuel oil, Tables 2 and 3 using USEPA Method 8260 for volatile organics and methyl t-butyl ether (MTBE) and USEPA Method 8270 for base/neutrals.
  2. ***Hazardous Waste RCRA Toxicity Characteristic Analysis:*** Samples shall be analyzed for Hazardous Waste RCRA Toxicity Characteristics Leaching Procedure (TCLP) constituents. Analysis shall be for full TCLP constituents on the sample extract as prepared by USEPA Method 1311.
  3. ***Ignitability of Solids Analysis:*** Samples shall be analyzed for ignitability by USEPA Method 1030.
  4. ***pH of Soil and Waste:*** Samples shall be analyzed for pH measurement by USEPA Method 9045.
  5. ***Polychlorinated Biphenyls (PCB) Analysis:*** Samples shall be analyzed for PCBs by USEPA Method 8082.
  6. ***Total Petroleum Hydrocarbons (TPH) Analysis:*** Samples shall be analyzed for petroleum hydrocarbons, USEPA Method 8015, gasoline range organics (GROs) and/or diesel range organics (DROs).

### 3.6 TRANSPORTATION AND DISPOSAL

- A. The Contractor shall have an accepted Disposal Plan prior to the transportation and disposal of soils. Soils shall not be transported until all sampling and analysis, as required by the Engineer or by the Disposal facility, have been performed and laboratory reports have been provided and accepted by the Engineer and/or Town.
- B. Disposal Facility Selection Requirements
  - 1. The Contractor shall submit the name(s) of the selected offsite soil disposal facilities and their location(s) to the Engineer for approval. Note that some companies may have multiple disposal facilities, each possessing differing requirements regarding the types of materials accepted, the specific analytical testing parameters that must be performed for each material, and the frequency of sampling required for each material. It is the Contractor's responsibility to determine the specific waste acceptance criteria and testing requirements for each of its proposed facilities. If the Contractor chooses to use a facility that has not previously been approved by the Engineer or the Town, the Contractor must seek approval from the Engineer to use the facility, and all additional sampling and testing procedures associated with the facility shall be provided at no additional expense to the Town.
    - a. The Contractor shall confirm the permit status, types of materials accepted, as well as check for outstanding violations and enforcement actions at each selected disposal facility. The Engineer shall verify the information provided by the Contractor for each facility prior to approval.
    - b. The Contractor shall verify the location(s) of the selected disposal facility(ies), as well as the types of materials accepted, the specific analytical testing parameters that must be performed for each material, and the frequency of sampling required for each material, at each of the selected facilities. The analytical testing parameters and the frequency of sampling required for each material are subject to change. It shall be the Contractor's responsibility to confirm and comply with all requirements of the selected facility(ies) prior to submittal to the Engineer for review and approval.
    - c. If an approved facility is not available during construction, the Contractor shall be fully responsible for procuring alternate approved facilities at no additional expense to the Town. Any additional sampling and analysis required and labor involved in selecting new facilities after the initial reuse or disposal facilities are accepted shall be the responsibility of the Contractor.
- C. Transportation Off Site
  - 1. For the duration of transportation, roll-off containers and truck beds shall be completely covered with secured waterproof tarpaulins to prevent water infiltration, evaporation of contaminants and spillage of soil.
  - 2. The Contractor shall take immediate action to remedy any situation involving a release of soil during loading or while in transit.

3. Soil shall not be combined with material from any other source.
4. Soil shall be transported in vehicles with valid Waste Transporter permits for New York State (and other required permits/licenses from any other states as applicable). The Contractor shall provide a copy to the Engineer of the waste transporter permit documenting that the transporter is authorized to transport waste to the intended disposal/treatment facility. The Contractor shall complete any required shipping papers, labeling, placarding, and weighing/load measurements and shall provide copies of required documentation to the Engineer.
5. Soil that is determined to be a regulated hazardous waste per the criteria of 6 NYCRR Part 371 shall be shipped with a hazardous waste manifest to a treatment/disposal facility permitted to accept the waste. The Contractor shall complete all required manifests, labeling, placarding, land disposal restriction notifications, and other requirements for shipping and tracking hazardous wastes and shall provide copies of required documentation to the Engineer. The Engineer will provide the Contractor with the EPA Identification Number(s) issued to the Town as the hazardous waste generator and will sign the generator certification statements.

D. Disposal / Treatment

1. Soil shall be disposed of by the methods and procedures described in the accepted Disposal Plan. Soil characterization information, field identification and confirmation laboratory analyses will be used to determine appropriate classification and category of soil for disposal. Each category of surplus or waste soil shall be handled and disposed of based upon its characterization in accordance with applicable regulatory requirements.
2. Soil shall be transported to a disposal/treatment facility within forty (40) calendar days from the start of storage. The Contractor shall complete under this item any soil sampling and analysis required by the disposal/treatment facility that is not specifically included in the contract.

E. Documentation

1. The Contractor shall provide the Engineer with copies of all receipts from the disposal/treatment facility which indicate the actual quantity of waste received within two (2) work days of receipt from the facility. For soil determined to be RCRA regulated hazardous waste, the Contractor shall also provide the Engineer with the appropriate copies of each signed manifest within two (2) work days of receipt. Any manifest discrepancies, including the need for exception reporting, shall be reported immediately to the Engineer and shall be resolved by the Contractor.

### 3.7 REUSE OF SOILS

- A. The Contractor shall place soil as embankment, fill or other appropriate on-site use as determined and approved by the Engineer and/or Town, and in accordance with the contract documents. Only appropriate soils placed in appropriate locations as included in the contract documents shall be reused.

- B. The material must be considered suitable material as per the Geotechnical Investigation Report, as detailed under Specification Item 1.6: Existing Soil Conditions.
- C. If fill material exhibits historical or visual evidence of contamination (including odors), and will be used in an area with public access, the relocated fill material must be covered with a minimum of 12 inches of soil or fill material that meets the criteria for general fill as defined in this Part [360]. General fill is defined in in Table 2 of Part 360 as:

TABLE 2: Fill Material Beneficial Use

Fill Material Type	Fill Material End Use	Physical Criteria	Maximum Concentration Levels
General Fill	Any setting where the fill material meets the engineering criteria, for use, except: 1. Undeveloped land; and 2. Agricultural crop land. General Fill may also be used in the same manner as Restricted-Use Fill and Limited-Use Fill.	Only soil, sand, gravel or rock; no non-soil constituents.	Lower of Protection of Public Health-Residential Land Use and Protection of Groundwater in Table 375-6.8(b) of this Title.

- 1. A demarcation layer will be installed for soil covers. Material meeting the criteria for general fill as defined above will be placed over a demarcation layer (i.e., an identifiable barrier between reused soils and the soil cap). Where existing soil meets the applicable soil cleanup objectives (SCOs) and where no reused soil exists, there will not be a need to install a demarcation layer

END OF SECTION 31 31 00

## **SECTION 328000 – LANDSCAPE IRRIGATION**

### **PART 1-GENERAL**

#### **1.1 WORK INCLUDED**

- A. General Contractor shall develop and install a complete automatically controlled lawn irrigation system supplied by a rain-harvesting cistern (specified elsewhere) including, but not limited to PVC pipe, fittings, sprinkler heads, electric zone valves, isolation valves, ball valves, quick coupler valves, valve boxes, control wires, sleeves, level monitoring, controllers and all necessary equipment, testing, and materials as required to provide a complete and fully operational irrigation system in accordance with the performance standards herein. Subcontracting to a specialized irrigation subcontractor is acceptable to meet installers qualifications.
- B. Cooperation and interface with the other prime contractors.
  - 1. Electrical contractor will prepare interior space, conduit, and access for the irrigation contractor to install controls, wiring in the space allocated. Electrical connections from the controls to the building electrical system will be furnished and made by the electrical contractor.
  - 2. Furnishing and installing all associated irrigation electrical equipment and wiring outside the building five (5) feet from the point of exit. The electrical contractor shall be responsible for all penetrations and connections into the proposed building.
  - 3. Construction of all piping and specialties for irrigation services outside the building. No connections will be made into the proposed building or to a potable water source.

#### **1.2 REFERENCE SPECIFICATIONS**

- A. Manufacturer's Standard Materials Cut Sheets.
- B. Manufacturer's recommended installation standards
- C. New York State Department of Transportation Standard Specifications, as currently amended.

#### **1.3 SITE FEATURES AND UTILITIES**

The contractor shall verify all site features and utilities prior to installation of the irrigation system. The contractor shall call for mark out and notify the Owner's Agent four (4) days prior to his commencement of installation of the irrigation system. The contractor shall verify all site features and utilities to but limited to the items below.

- A. Existing Landscape Plantings
- B. All Site Utilities
- C. Plumbing

- D. Architectural
- E. Electrical
- F. Mechanical

#### 1.4 REQUIRED SYSTEM PARAMETERS

- A. Irrigation (cistern water source)
  - 1. 16,000 (min) square feet of irrigated area
  - 2. 4 zones (min)
  - 3. Delivery pressure at main control valve inlet: 50 psi (min)
  - 4. Delivery rate to furthest zone : 20 gpm (min)
  - 5. Automatic calendar controller (panel located within building)
  - 6. Remote rain sensor (panel located within building)
  - 7. Remote cistern level sensor (panel located within building)
  - 8. Rotor, spray, or drip application.
  - 9. 1 inch (min) distribution polyethylene tubing to connect each zone to a valve box adjacent to the cistern housing 4 automatic zone valves
  - 10. 1 inch (min) main pipe between cistern and distribution valve box
  - 11. Winterizing tee with threaded brass or stainless plug in cistern riser
  - 12. Main shut off ball valve
  - 13. Submersible pump with floating intake sleeve and controller, installed in most westerly cistern riser.
  - 14. Associated fittings, electrical and appurtenances
  
- B. On-Demand Water (cistern water source)
  - 1. Delivery pressure at furthest point: 40 psi (min)
  - 2. Delivery rate at furthest point: 12 gpm (min)
  - 3. 3 spigots (frost-free/freezeless yard hydrants) adjacent to west and south faces of building (approximate location shown on plans)
  - 4. 1.5 inch (min) distribution polyethylene tubing to connect each spigot to a valve box adjacent to the cistern housing 3 manual ball valves
  - 5. 1 inch (min) main pipe between cistern and distribution valve box
  - 6. Winterizing tee with threaded brass or stainless plug in cistern riser
  - 7. Main shut off ball valve
  - 8. 2-gallon (min) pressure tank
  - 9. Bottom suction cistern pump with floating intake sleeve and controller, installed in most westerly cistern riser.
  - 10. Associated fittings, electrical and appurtenances

#### 1.5 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Companies regularly engaged in manufacturing irrigation system materials and products, of types and sizes required as specified, whose products have been in satisfactory use in similar projects for not less than fifteen (15) years.
  
- B. Installer's Qualifications: Companies who have successfully designed and completed a minimum of five (5) contracts over a three (3) year period involving installation of irrigation and piping projects similar in size and scope to that required for this project. Such experiences and references shall be included in the shop drawings submitted for the project.

Codes and Standards:

1. Comply with all applicable State and Local ordinances and codes.
2. All materials and work shall meet the requirements of ASTM, AWWA, and UL.
3. Contractor shall be and experienced irrigation contractor. Include signed statement below:

I am a bona fide irrigation contractor with \_\_\_\_\_ years of installation experience and possess the equipment to complete this project within \_\_\_\_\_ days from starting the project.

\_\_\_\_\_  
Signature

\_\_\_\_\_  
Company name

1.6 SUBMITTALS

- A. Contractor shall develop a submittal package meeting the performance standards of this specification including: shop drawings, irrigation layout, zone configuration, catalog sheets for all equipment, manufacturers' data for materials to be used, and operation and maintenance information for a complete system. The Contractor shall submit legible PDF copies of the complete package with all selections clearly indicated. If providing paper copies, four (4) original binder copies of the package for review (Two (2) copies for the Owner's representative and two (2) copies to be returned to the Contractor upon execution). Fax submissions of shop drawings for review and approval shall not be accepted. Include:

1. Sprinkler Heads and spigots
2. Controllers
3. Electric Valves
4. Isolation Valves
5. Ball Valves
6. PVC Piping and SCH 40 Fittings
7. Valve Boxes
8. Control Wire
9. Wire Splices
10. Polyethylene Tubing
11. Quick Coupler Valves
12. Swing Joints
13. Level Sensors
14. Pumps

- B. Drawings of Record: At the project close a drawing of record shall be delivered to the Owner in both record mylar and digital format. Digital submissions shall be in AutoCAD, 2017 format on a compact disc in compatible format, or higher showing all the locations of the irrigation plan and any and all changes. The main elements of the drawing of record, i.e.; Main line fittings, Electric valves, gate valves, quick coupler, splice boxes and locations of ends of sleeves shall be shown on the drawing of record. All measurements shall be triangulated by means pf tape measurements, no wheel measurements will be

allowed. Contractor may use GPS. During the installation process the contractor shall keep a field copy of changes on site.

#### 1.10 INSPECTION OF SITE

- A. The contractor shall acquaint himself/herself with all site conditions. Should utilities not shown on the plans be found during excavations, the contractor shall promptly notify the owner site agent for instructions as to further action? Failure to do so will make the Contractor liable for any and all damage that arises from his neglect.
- B. The contractor shall take the necessary precautions to protect all existing site conditions, including plant materials. Should damage be incurred, the contractor shall repair or replace the damage to its original condition at his expense.

#### 1.11 PERMITS AND FEES

- A. Obtain all permits and pay required fees to any governmental agency having jurisdiction over the work including all inspection fees that may be required by local ordinances.

#### 1.12 DRAWINGS, SPECIFICATIONS AND DETAILS

- A. Scale and Dimensions:
  - 1. Consider drawings and specifications as being compatible and therefore work called for by one and not the other shall be furnished and installed as though called for by both. When discrepancies exist between scale and dimensions or between the works to be accomplished by each trade, they shall be called to the attention of the project manager immediately. The project manager decision regarding such discrepancies shall be final and binding.
  - 2. Where diagrams and details not to scale have been shown to piping connections and other accessories the contractor is cautioned that these are diagrammatic only and not to be used for obtaining lineal runs or numbers and types of fittings or materials used.
  - 3. All measurements shall be verified at the site; all pipe routing is for diagrammatic purposes and shall be staked out in the field prior to installation. And approved by the Owner's representative.

#### 1.13 PIPING ARRANGEMENTS

- A. The contractor shall make necessary adjustments in the layout of the irrigation system and the pipe routing. Should conflicts arise during installation the contractor shall obtain a change order for this adjustment to the plan. This change order shall not authorize an additional fee but shall resolve any existing site condition problems.
- B. The contractor shall not proceed with out the work order and shall provide in written assurance that such changes will not cause any extra costs due to these changes. Any work that does not receive a work order and is in conflict with existing site conditions shall be removed and reinstalled by the contractor at no expense to the owner or owner's agent.

#### 1.14 WORKMANSHIP

- A. The Contractor shall follow the manufacturer's recommendations for installing all pipe, fittings, valves, electric valves, sprinklers, controllers and all other appurtenances. The Contractor shall also follow all standards and installation practices which have been established by all related associations and local, state, and federal codes. The Contractor shall always perform his work in a professional and orderly manner. The Contractor at all times shall have a Project Superintendent on the site who is completely familiar with all installed materials and will be responsible for the installation of all materials.

#### 1.15 ACCURACY

- A. Lay out work as accurately as possible to the drawings. The drawings, though carefully drawn, are generally diagrammatic to the extent that swing joints, offsets, and all fittings are not shown.

#### 1.16 COVERAGE

- A. The Contractor shall be responsible for full and complete coverage of all irrigated areas and shall make any necessary minor adjustments at no additional cost to the Owner. If not specified on the plans, the Contractor shall be responsible for proper nozzle choice and arc adjustment to assure:
  - 1. Matched precipitation of all heads within each area and zone.
  - 2. Proper flow rates not to exceed 5.0 feet/second in any piping.

#### 1.17 REVISIONS

- A. Any major revisions to the irrigation system must be submitted and answered in written form, along with any negotiated change in contract price.

#### 1.18 COORDINATION

- A. All work shall be coordinated with other trades on the site; any conflicts shall be resolved by the project manager in order to proceed with the work as rapidly and efficiently as possible.

#### 1.19 GUARANTEE

- A. All work shall be guaranteed for one (1) year from date of acceptance of the completed installation against all defects in materials, equipment and workmanship. Guarantee shall cover the repair of damage to any part of the installation site resulting from leaks or other defects in materials, equipment and workmanship to the satisfaction of the owner. Repairs if required under the guarantee period shall be done at no costs to the owner. All manufacturers' extended warranties shall be transferred to owner with the caveat that any labor after the one year general contractor guarantee shall be billable by the contractor should the owner decide to use the contractor's service to install any manufacturer's equipment through extended warranty.
- B. Guarantee shall include system shut down for 1st winterization, spring start up, and 2nd winterization. The development of an approved water application schedule by the

contractor and approved by the Owner's representative. Winter damage due to improper winterizations will be the responsibility of the contractor and repairs to the irrigation system through both included winterizations shall be performed at no cost to the Owner.

#### 1.20 RELATED WORK SPECIFIED ELSEWHERE

Earth Moving	Section 312000
Erosion and Sediment Control	Section 312500
Turf and Grasses	Section 329200

### **PART 2 - PRODUCTS**

#### 2.1 ACCEPTABLE MANUFACTURERS

Subject to compliance with requirements, provide materials by the following irrigation manufacturers, or approved equal. Mixing manufacturers for single system elements is not acceptable, but multiple manufacturers for disparate elements may be submitted if operationally compatible.

THE TORO COMPANY  
5825 Jasmine Street  
Riverside, CA 92504  
[www.toro.com](http://www.toro.com)

BUCKNER IRRIGATION  
4381 N. Brawley Ave  
Fresno, CA 93722

## 2.2 MATERIALS

- A. Provide all irrigation materials and factory-fabricated products of size, types, pressure ratings and capacities as indicated. If there are any discrepancies in materials or interpretation or their use the contractor shall be responsible to obtain proper clarification before any materials are installed
- B. All materials throughout the irrigation system shall be new and undamaged and in perfect working condition.

## 2.3 PIPING AND FITTINGS

- A. All rigid piping 2 ½ inch and smaller shall be solvent weld SDR 21 class 200 PVC pipe, extruded from 100 percent virgin polyvinyl chloride conforming to ASTM D 2241 and shall be continuously and permanently marked with the manufacturers name, material, size and schedule or type. Pipe shall conform to all specifications form ASTM, Department of Commerce, NSF/TL (NSF) or the latest revisions.
  - 1. All fittings on 2 inch and smaller shall be SCH 40 PVC conforming to ASTM D-2466. No saddle or clamp type fittings shall be used
- B. All pipes under vehicular traffic shall be sleeved by SCH 40 PVC conforming to ASTM D-1785. Sleeve sizes shall be large enough to accommodate the bell housing of the ring tight pipe or the solvent weld belled end pipe. As a minimum, **the sleeve pipe ID shall be 1 ¼ times the irrigation pipe OD at the bell housing.**
- C. All flexible piping 2 ½ inch and smaller shall be polyethylene tubing conforming to ASTM F 771 or current, and shall be continuously and permanently marked with the manufacturers name, material, size and schedule or type. Pressure rating for 1 inch tubing shall be 100 psi. Pressure rating for 1.5 inch tubing shall be 160 psi. Tubing shall be rated for direct burial.

### 2.3 VALVES

- A. Ball valves shall be forged brass, 600W.O.G./150WSP two piece, full port, conforming to WWV 35, type II style with T-style handles
- B. Electric control valves for each zone of irrigated area shall be sized to match the connecting pipe with pressure regulation.
- C. All electric and line size isolation valves shall be in standard composite valve boxes with extensions and lids as required.
- D. Quick coupler valves shall be 1 inch brass with swing joint with top flange to prevent QCV from being unscrewed from swing joint. Swing joint shall accommodate brass nipple to connect the QCV all QCV shall be in 10 inch round composite valve boxes with a 6 inch PVC sleeve.

### 2.4 VOLT ELECTRICAL WIRE

- A. All 24-volt control wires from controller to the electric valves shall be #14/1 red wire for direct burial. All 24-volt common wire from the controller to the electric valves shall be #12/1 white wire for direct burial. Splices and connections to the electric valves shall be with 3M DBY and DBR connectors. There will be no tee splices allowed. The common wire will be one continuous run; more than one common run may be used and spliced at the controller. Spare wires shall be run from the controller a minimum of six (6) from each controller location to the last electric valve on the run. Spare wire shall be #14/1 blue wire for direct burial. No wire splices will be allowed in wire runs of less than 1000'.
- B. When control wires must go into the building the proper splice boxes must be used and the same size corresponding wire size shall be used at the splice box location. All wire shall conform to ASTM B3 or B-8 for soft drawn bare copper wire with polyethylene insulation.

### 2.5 SPRINKLER HEADS, SWING JOINTS, AND SPIGOTS

- A. Turf sprinklers shall be sized to produce the coverage required. The sprinklers shall have a swing joints. The lay on all swing joints shall not be less than 35 degrees nor greater than 55 degrees from the horizontal lateral zone pipe.
  - 1. The electric valve pressure setting shall be set at 40 PSI for all zones no sprinkler head shall be spaced greater than 35'-0". The contractor is required to provide 100% coverage in all areas.
- B. Spigots shall be free-standing freezeless/frost-free cast yard hydrants, 1 inch nominal diameter riser, buried 5 feet, with 1 CF pea stone drainage pocket around the 1/8 inch (min) drain hole. Provide manual lever operating handle. Outlet shall daylight 24 inches above finished grade. Woodford models Y1 or U100, or approved equal.

### 2.7 CONTROLLERS

- A. The controller shall be capable of twenty four (24) stations. The controller shall operate as a stand-alone controller. The controller shall have 16 total start times; the controller shall have 4 independent programs offer concurrent operation capability, with a 7 day calendar, odd/even or day interval options for one to 30 days. The Controller shall have excluded day option, when used with the odd/even day option, allows for no watering on specific days. The station run times shall be from one (1) minute to ten (10) hours with percent of adjust by program from ten (10) to two hundred fifty (200) percent.
- B. Zone valves shall be paired at the controller all paired zones shall be of similar sprinkler type or drip zones and of similar flows in zones. No zones shall be paired with greater than five (5) percent differences in zone flow. The contractor shall submit a controller zone pairing schedule to the Owner's representative for approval prior to starting of system. No more than two (2) zones will be on any controller station.
- C. Pump controller shall be compatible with furnished equipment.

## 2.8 VALVE BOXES

- A. All electric zone valves, isolation valves, drain valves, quick coupler valves, splices; air vent valves and flush valves shall be in composite valve boxes or approved equal. All electric zone valves shall be placed in standard valve boxes with the extensions required to provide the proper drainage and cover of the zone valve. The valve boxes and extensions shall extend to the bottom of the zone pipe feeding the zone and installed in accordance with the these and the manufacturer's specifications.
  - 1. All isolation valves, drain valves, splices and quick coupler valves shall be placed in ten inch (10") circular valve boxes, with a piece of six inch (6") PVC pipe reach wells.
  - 2. All valve box-lifting tools and unlocking tools shall be supplied to the owner after installation. The contractor shall provide three (3) sets of these tools.

## 2.9 PUMPS

- A. General
  - 1. 304 stainless steel construction
  - 2. Pumps shall be suspended by non-powered 1/8 inch diameter synthetic cables or stainless steel chains secured to the pump and riser by mechanical connections. Riser connection point shall be within 1 foot of finished grade.
  - 3. Pump discharge lines shall be flexible PEX tubing rated at least twice the pump operating discharge pressure and connected to the main discharge pipe.
  - 4. Include compatible synthetic floating intake sleeves
    - i. Float shall be bright orange or yellow, spherical
    - ii. Adjust to suspend intake 6 to 12 inches below cistern water surface
- B. Irrigation
  - 1. Submersible
  - 2. 1 HP (min)
  - 3. 2 wire, 60hz
  - 4. 115V, GFCI-protected circuit
  - 5. Strom 4SF25P series, or approved equal

- C. On-Demand Water
  - 1. Bottom suction with integral automatic pressure switch
  - 2. ¾ HP (min)
  - 3. 2 wire, 60 Hz
  - 4. 115V, GFCI-protected circuit
  - 5. Strom BSP007PF series, or approved equal
  - 6. Pressure tank:
    - i. 2 gallon, welded steel, painted
    - ii. 100 percent butyl rubber diaphragm with polypropylene liner
    - iii. 125 psi maximum pressure rating
    - iv. Install within cistern riser, above maximum water level

#### 2.10 RAIN & LEVEL SENSORS

- A. All controllers shall have separate rain and cistern level sensors that will shut the irrigation cycle off during periods of low storage, rain or rainfall accumulated amounts. The sensors shall interrupt the controller's common wire and be able to have a bypass switch for testing and to override the sensors. Rain Sensor location shall be located by Owner's representative. Cistern sensor shall be located in the most westerly riser. Wireless sensors are acceptable if the base station is wired to the building power and equipped with a sensor battery warning indicator on station.

#### 2.11 GROUNDING

- A. All controllers shall be grounded in accordance with the manufacturer's recommendations and shall be 10 Ohms or less.

### **PART 3 - INSTALLATION**

#### 3.1 STAKE OUT

- A. The Contractor shall stake out all proposed lines prior to trenching operations. The location of said lines shall conform in general with the locations shown on the approved submittals. The location of the stakes will be checked by the Owner's representative and approved prior to trenching.
- B. Of particular importance is the location of sprinkler heads where prevailing winds, surface slope and special ground conditions must be taken into consideration. The final location of all sprinklers must be approved by the Owner's representative.

#### 3.2 EXCAVATION

- A. Trench for pipe shall be wide enough to allow for proper tamping around the pipe in accordance with the manufacturer's recommendations. Trenches shall also be made wide enough to allow a minimum of 2 inches between parallel pipelines. Trenches for pipelines shall be made of sufficient depths to provide minimum cover from finish grade as follows:

1. 24" minimum cover over main lines.
2. 16" minimum cover over control wires from controller to valves (or as required by code).
3. 16" minimum cover over lateral lines to heads.

B. Maintain all warning signs, shoring, barricades, flares and red lanterns as required by OSHA, and any local ordinances. The bottom of the trench shall be clean and smooth, with all rock, loose soil, and organic matter removed. The Contractor shall insure that there are no conditions in the trench that could damage the pipe or the wires. Any deviations from the above must be approved by the Owner. Vibratory plowing of wire and solvent weld pipe will be acceptable subject to Owner approval of plowing equipment and procedures. Restore all surfaces, existing underground installations, etc., damaged or cut as a result of the excavations to their original condition and in a manner approved by the Owner.

### 3.3 ROCK REMOVAL

A. See Section 312000

### 3.4 DELETERIOUS MATERIAL

A. See Section 312000

### 3.5 PIPE LINE ASSEMBLY

A. Plastic pipe and fittings shall be solvent welded using solvents and methods as recommended by manufacturer of the pipe, except where screwed connections are required. Pipe and fittings shall be thoroughly cleaned of dirt, dust and moisture before applying solvent with a non-synthetic bristle brush. Pipe may be assembled and welded on the surface. Snake pipe from side to side of trench bottom to allow for expansion and contraction. Make all connections between plastic pipe and metal valves or steel pipe with threaded fittings using SCH 80 PVC.

### 3.6 THRUSTING

A. Install thrust blocks or anchoring for all isolation valves larger than 3", and all piping including changes in direction and reducers, in strict accordance with pipe manufacturer's recommendations. Construct thrust blocks of Sakrete or concrete of the following mix, having a compressive strength of 2000 PSI: 1 part concrete; 2.5 parts sand; 4 parts washed gravel. All thrust blocks must bear against undisturbed soil. In no case will fieldstone or wood of any form be acceptable for thrusting.

### 3.7 SPRINKLER HEADS

A. Install sprinklers as per manufacturer's recommended specifications. Install all sprinkler heads on specified swing joints.

### 3.8 CLOSING PIPE AND FLUSHING LINES

- A. Cap or plug all openings as lines have been installed to prevent the entrance of materials that would obstruct the pipe. Leave in place until removal is necessary for completion of installation. Thoroughly flush out all water lines before installing heads. Test in accordance with paragraph on Hydrostatic Tests. Upon completion of the testing, the Contractor shall complete assembly and adjust sprinkler heads for proper distribution.

### 3.9 HYDROSTATIC TESTS

- A. Request the presence of the Owner's Representative in writing at least 48 hours in advance of testing. Testing to be accomplished at the expense of the Contractor and in the presence of the Owner. Center load piping with small amount of backfill to prevent arching or slipping under pressure. Apply a continuous and static water pressure of 80 PSI when welded plastic joints have cured at least 24 hours and with the risers capped as follows:
  - 1. Main lines and sub mains to be tested for 3 hours.
  - 2. Lateral lines to be tested for 2 hours. (If laterals and individual sub-mains downstream of control valves have less than 45 PSI working pressure or less than 5 GPM flow, hydrostatic tests are waived for these laterals.)
- B. Repair leaks resulting from tests.

### 3.10 AUTOMATIC CONTROLLERS

- A. Connect sprinkler valve wires to controller in a logical sequence to correspond with specification. Controller wires shall not be connected until system is ready to be activated.

### 3.11 ELECTRIC ZONE VALVES

- A. All electric zone valves shall be installed as proposed on the approved submittal. The Contractor shall take extra caution to avoid over tightening the nipples on the inlet side or the discharge side of the electric valve. No pipe dope shall be used: only Teflon tape.
- B. The Contractor shall lower the electric zone valve assembly completely with valve boxes and extension to cover the PVC lateral pipe with the valve box. All brick supports shall be complete around the valve box and brick shall be placed on undisturbed soil.
- C. Prior to installation of zone valves all main line piping shall be flushed and free from contaminants.

### 3.12 WIRE AND WIRE SPLICING

- A. Do not yank, stretch, or pull wires during installation. Provide a minimum of one foot of slack, in an expansion loop, in each 100 feet of wire. Lay wire on a firm even bed in the trench, which shall support the entire length. At splice locations, provide sufficient slack to allow the splice to be raised a minimum of 24 inches above grade for inspection. Do not lay wire above, or on top of the pipe, except when wire and pipe are being plowed simultaneously. When power wire runs do not follow the pipe, lay them in a straight line which shall be carefully located on the as-built plan. Minimum 2.5" pipe shall be used as wire conduit for all sleeves.

- B. Splice all wires to requirements of local minimum regulations or to the following recommendations, whichever is more restrictive: Make all splices by baring a minimum of three-quarters of an inch of copper conductor, twisting the leads together, and soldering them with a non-acid core solder. Wire nuts are acceptable in lieu of soldering. Make the splice completely waterproof by using connector kits in strict accordance with the manufacturer's recommendations.

### 3.13 AUTOMATIC CONTROL WIRING

- A. Install control wires, sprinkler mains and laterals in common trenches wherever possible. Install control wires at least 12 inches below finish grade and lay to the side and below main line. Provide looped slack at valves and snake wires in trench to allow for contraction of wires. Tie wires in bundles at ten foot intervals. Control wire splices will be allowed only in runs more than 1000 feet. Any splices must be installed in an existing valve box or separate valve box installed flush with finished grade. On runs longer than 2500 feet contractor shall use 12/1 field and 10/1 common.
- B. All wire passing under existing or future paving, construction, etc., shall be encased in plastic or galvanized steel conduit extending at least 16 inches beyond edges of paving or construction.

### 3.14 VALVE BOXES

- A. All valve boxes shall be set at finished grade and supported by brick foundations on undisturbed soil. All valve box sizes shall include all special tools necessary for removal and unlocking of lids. Contractor shall clean out all sedimented materials from valve boxes and provide 1 CF pea gravel sumps. The Contractor shall maintain the valve boxes during the construction process to protect them from damage and excessive sedimentation.

### 3.16 BACKFILL AND COMPACTING

- A. After system is operating and required tests and inspections have been made, backfill excavations and trenches with clean soil, free of rubbish and deleterious material.
- B. See Section 312000

### 3.17 CLEAN-UP

- A. Remove from the site all debris resulting from work of this section.

END OF SECTION 328000

## **SECTION 329200 - TURF AND GRASSES**

### **PART 1 - GENERAL**

#### **1.1 GENERAL REQUIREMENTS**

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the Drawings and specified herein, including, but not limited to, the following:
  - 1. The preparation of the topsoil to receive stabilization.
  - 2. The seeding, establishment, watering and maintenance of lawns until the Owner accepts the project.
  - 3. The placement of fertilizers.
  - 4. The placement and maintenance of mulches.

#### **1.2 RELATED WORK SPECIFIED ELSEWHERE**

- A. Site Clearing: Section 311000.
- B. Earth Moving: Section 312000.
- C. Erosion and Sedimentation Controls: Section 312500.

#### **1.3 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.

#### **1.4 SUBMITTALS**

- A. The Contractor shall submit a schedule of his proposed methods and operations of Site Preparation.
- B. The Contractor shall provide material certifications and/or shop drawings for the materials stated herein.

#### **1.5 QUALITY ASSURANCE**

- A. The Contractor shall perform all his operations in accordance with the rules, regulations and ordinances of those governing bodies having jurisdiction.

## 1.6 JOB CONDITIONS

- A. General: The Contractor shall place all required topsoil, replace sod or provide seeding and mulching in accordance with the lines and grades shown on the Drawings and as specified herein. The Contractor shall provide all topsoil required from the approved stockpile accumulated from the Site stripping operations or from offsite sources where a deficiency exists in the stockpiled amount, within the Contract Sum for the Project. No additional cost to the Owner will be incurred for topsoil which must be provided from offsite sources.
- B. Time of Planting: The Contractor shall notify the Owner's Representative when sections of the Work have progressed sufficiently, to commence Work on lawns, including placing of topsoil to finished grade. Thereafter, planting operations shall be performed under favorable weather conditions during the next season or seasons which are normal for such work.
- C. Unless otherwise approved the seeding schedule shall be as follows:

### Seeding of Permanent Lawns

March 15 (if soil is frost-free and not excessively moist) to May 15.  
August 15 to October 15.

If the lawn areas are not ready for seeding between the time periods designated above, the areas shall be seeded immediately upon completion of topsoil operations, with ryegrass (annual or perennial) at a rate of thirty (30) lbs. per acre for a temporary lawn. Lawn work will not be permitted when the soil is frozen or excessively moist. If temporary lawn work has to be provided, the permanent lawn shall be installed during the next seeding season as specified.

- D. All areas within the limit of disturbance not required to be developed otherwise shall be planted with grass under the Contract Sum.

## 1.7 WARRANTY

- A. Maintenance shall begin immediately following each operation of installation for each portion of lawn and shall continue for the length of this Contract.
- B. Inspection of the Work to determine completion of Contract Work will be performed by the Owner's Representative at the conclusion of the maintenance period upon written notice requesting such inspection, submitted by the Contractor at least ten (10) days prior to the anticipated date. The condition of lawns will be noted and a determination made by the Owner's Representative whether maintenance shall continue in any part.
- C. Acceptance - After inspection, the Contractor will be notified in writing by the Owner's Representative of acceptance of all Work under this Section.
- D. Acceptance in Part - The Work may be accepted in part by the Owner's Representative upon written application by the Contractor, provided the Work offered for acceptance is completed in accordance with this Section.

- E. Any areas which fail to show a "catch" for any reason whatsoever, shall be reseeded at the Contractor's expense until a "catch" is obtained. Damage resulting from erosion, rills, gulleys, construction activity, washouts or other causes shall be repaired by filling with topsoil, tamping and reseeded by Contractor at his own expense, until final acceptance of the Work.

**PART 2 - PRODUCTS**

2.1 MATERIALS

A. TOPSOIL

- 1. The Contractor shall furnish, at his expense, any additional quantities of topsoil to properly install all work as specified herein and as shown on the Drawings.
- 2. Topsoil shall consist of natural loam topsoil, free from subsoil. Topsoil shall be of uniform quality, free from hard clods, stiff clay, hard pan, sods, partially disintegrated stone, or any other undesirable material.
- 3. Topsoil shall contain at least 6% and not more than 25% organic matter as determined by loss of ignition on a moisture-free sample dried in accordance with the current method of the Association of Official Agricultural Chemists. The acidity range shall be pH 5.5 to pH 7.5, inclusive. Largest object size shall be three (3) inches. Amend as necessary to achieve these standards using amendments specified herein. The mechanical gradation analysis of the soil shall be as follows:

Sieve Size	Percent Passing by Weight
2 inch	100
1 inch	85 to 100
¼ inch	65 to 90
No. 200	20 to 50

B. COMMERCIAL FERTILIZER

- 1. Shall be a complete fertilizer formula (5-10-10, or equivalent) and shall conform to the applicable State Fertilizer laws. It shall be uniform in composition, dry and free flowing, and shall be delivered to the Site in the original, unopened containers, each bearing the manufacturer's guaranteed analysis. Any fertilizer which becomes caked or otherwise damaged, making it unsuitable for use, will not be accepted.

C. WATER

- 1. The Contractor shall make, at his expense, whatever arrangements necessary to ensure an adequate supply of water to meet the needs of this Contract. He shall also furnish all necessary hose, equipment, attachments and accessories for the adequate

irrigation of lawns and planted areas as may be required to complete the Work as Specified.

D. SCREEN

1. Shall be one-half (1/2) inch mesh galvanized hardware cloth.

E. LAWN MATERIAL

1. Grass seed for mowed lawn areas shall be mixed and guaranteed by the Dealer as follows:
  - a. 65 lbs Kentucky Bluegrass per acre
  - b. 65 lbs. Perennial Ryegrass per acre
2. Grass seed for occasional mowing areas shall be mixed and guaranteed by the Dealer as follows:
  - a. 8 lbs Empire Birdsfoot, Trefoil or Dutch White Clover per acre
  - b. 20 lbs Tall Fescue per acre
  - c. 2 lbs Redtop or 5 lbs Perennial Ryegrass per acre
3. Grass seed for stabilization of steep slopes (including and exceeding 3:1) shall be mixed and guaranteed by Pennington Seed (800.285.SEED), or approved equal:
  - a. "Slopemaster"
  - b. 200 lbs. per acre
  - c. Mixture:
    - 1) 75% Turf Type Tall Fescue
    - 2) 11% Annual Ryegrass
    - 3) 9% Unhulled Serecia Lespedeza
    - 4) 5% Durana White Clover (low, spreading habit)
4. Total weed content shall not exceed 1.5% of the total seed mixture.
5. If the plans indicate a seed mixture other than as specified above, use the plan values.

F. EROSION CONTROL MATERIALS

1. Blankets: Biodegradable wood excelsior, straw, or coconut-fiber mat enclosed in a photodegradable plastic mesh. Include manufacturer's recommended steel wire staples, 6-inches long. North American Green (800.772.2040) or approved equal. See plan for type.
2. Fiber Mesh: Biodegradable twisted jute or spun-coir mesh, 0.92 lb per sq. yd. minimum, with 50 to 65 percent open area. Include manufacturer's recommended steel wire staples, 6-inches long.

G. SOIL AMENDMENTS

1. Lime: ASTM C 602, Class T, agricultural limestone containing a minimum 80 percent calcium carbonate equivalent, with a minimum 99 percent passing a No. 8 sieve and a minimum 75 percent passing a No. 60 sieve.
  - a. Provide lime in the form of dolomitic limestone.

2. Aluminum Sulfate: Commercial grade, unadulterated.
3. Sand: Clean, washed, natural or manufactured sand, free of toxic materials.
4. Perlite: Horticultural perlite, soil amendment grade.
5. Peat Humus: Finely divided or granular texture, with a pH range of 6 to 7.5, composed of partially decomposed moss peat (other than sphagnum), peat humus, or reed-sedge peat.
6. Select paragraph above or below or delete when not required. Sphagnum moss is too acid for many trees, shrubs, and plants.
7. Peat Humus: For acid-tolerant trees and shrubs, provide moss peat, with a pH range of 3.2 to 4.5, coarse fibrous texture, medium-divided sphagnum moss peat or reed-sedge peat.
8. Sawdust or Ground-Bark Humus: Decomposed, nitrogen-treated, of uniform texture, free of chips, stones, sticks, soil, or toxic materials.
  - a. When site treated, mix with at least 0.15 lb of ammonium nitrate or 0.25 lb of ammonium sulfate per cu. ft. of loose sawdust or ground bark.
9. Manure: Well-rotted, unleached stable or cattle manure containing not more than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, and material harmful to plant growth.
10. Herbicides: EPA registered and approved, of type recommended by manufacturer.
11. Water: Potable.

#### H. STRAW MULCH

1. Provide clean, seed-free salt hay or threshed straw of wheat, rye, oats, or barley.

#### I. TURFGRASS SOD

1. Turfgrass sod: Number 1 Quality/Premium, including limitations on thatch, weeds, diseases, nematodes, and insects, complying with TPI's "Specification for Turfgrass Sod Materials" in its "Guideline Specifications to Turfgrass Sodding." Furnish viable sod of uniform density, color, and texture, strongly rooted, and capable of vigorous growth and development when planted.
2. Turfgrass Species: Sod of grass species as follows, with not less than 95 percent germination, not less than 85 percent pure seed, and not less than 0.5 percent weed seed
  - a. Athletic Field proportioned by weight as follows:
    - 1) 80 percent turf type Tall Fescue
    - 2) 10 percent perennial Ryegrass
    - 3) 10 percent Kentucky Bluegrass

### PART 3 - EXECUTION

#### 3.1 LAWN PLANTING PREPARATION

- A. The contractor shall be responsible to restore all site disturbance generated as a direct result of this project with topsoil, fertilizing, seeding, and straw mulching in accordance with the requirements of this specification.
- B. Limit subgrade preparation to areas that will be planted in the immediate future.

- C. Loosen subgrade to a minimum depth of 4 inches. Remove stones larger than 1-1/2 inches in any dimension and sticks, roots, rubbish, and other extraneous materials.
- D. Spread planting soil mixture to depth required to meet thickness, grades, and elevations shown, after light rolling and natural settlement. Do not spread if planting soil or subgrade is frozen.
  - 1. Place approximately 1/2 the thickness of planting soil mixture required. Work into top of loosened subgrade to create a transition layer and then place remainder of planting soil mixture.
  - 2. Allow for sod thickness in areas to be sodded.
- E. Preparation of Unchanged Grades: Where lawns are to be planted in areas unaltered or undisturbed by excavating, grading, or surface soil stripping operations, prepare soil as follows:
  - 1. Remove and dispose of existing grass, vegetation, and turf. Do not turn over into soil being prepared for lawns.
  - 2. Till surface soil to a depth of at least 6 inches. Apply required soil amendments and initial fertilizers and mix thoroughly into top 4 inches of soil. Trim high areas and fill in depressions. Till soil to a homogenous mixture of fine texture.
  - 3. Clean surface soil of roots, plants, sods, stones, clay lumps, and other extraneous materials harmful to plant growth.
  - 4. Remove waste material, including grass, vegetation, and turf, and legally dispose of it off the Owner's property.
- F. Grade lawn and grass areas to a smooth, even surface with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades. Limit fine grading to areas that can be planted in the immediate future. Remove trash, debris, stones larger than 1-1/2 inches in any dimension, and other objects that may interfere with planting or maintenance operations.
- G. Moisten prepared lawn areas before planting when soil is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.
- H. Restore prepared areas if eroded or otherwise disturbed after fine grading and before planting.

### 3.2 INSTALLATION

#### A. TOPSOIL

- 1. Upon completion of grading operations for each respective area of Work, the Contractor shall place topsoil to a minimum depth of four (4) inches on all embankments and seed areas, first scarifying the subgrade for a depth of two (2) inches for the bonding of the topsoil with the subsoil. Where embankments are too steep for hand raking or tamping, topsoil may be compacted by mechanical means. Topsoil shall not be spread in a frozen or muddy condition. Topsoil from stockpile shall be raked to remove objectionable and oversized material as directed by the Owner's Representative.

B. LIME

1. Ground limestone shall be applied sufficiently to the lawn areas being prepared for seeding to attain a acidity pH of 6.0 to 7.0. Incorporate limestone into top three (3) inches of the soil at least three (3) days prior to seeding.

C. COMMERCIAL FERTILIZER

1. Commercial fertilizer shall be applied at the rate of 600-lbs per acre of lawn area.

D. EROSION CONTROL MATTING

1. Prepare location to receive matting as specified in subpart 3.1 above.
2. Install matting at locations indicated on the plans, as directed by the Owner's Representative, or at locations of surface erosion in accordance with manufacturer's recommendations.
3. Secure matting to ground in a manner and pattern that is in accordance with the manufacturer's recommendations and appropriate for the installation location.

E. SODDING

1. Lay sod within 24 hours of harvesting. Do not lay sod if dormant or if ground is frozen or muddy.
2. Lay sod to form a solid mass with tightly fitted joints. Butt ends and sides of sod; do not stretch or overlap. Stagger sod strips or pads to offset joints in adjacent courses. Avoid damage to subgrade or sod during installation. Tamp and roll lightly to ensure contact with subgrade, eliminate air pockets, and form a smooth surface. Work sifted soil or fine sand into minor cracks between pieces of sod; remove excess to avoid smothering sod and adjacent grass.
  - a. Lay sod across angle of slopes exceeding 1:3
3. Saturate sod with fine water spray within two hours of planting. During first week, water daily or more frequently as necessary to maintain moist soil to a minimum depth of 1-1/2 inches below sod.

3.3 HYDROSEEDING NEW LAWNS

A. Hydroseeding: Mix specified seed, fertilizer, and fiber mulch in water, using equipment specifically designed for hydroseed application. Continue mixing until uniformly blended into homogenous slurry suitable for hydraulic application.

1. Mix slurry with nonasphaltic tackifier.

B. Apply slurry uniformly to all areas to be seeded in a 1-step process. Apply mulch at the minimum rate of 1500 lb per acre (16.5 kg per 100 sq. m) dry weight but not less than the rate required to obtain specified seed-sowing rate.

C. Apply slurry uniformly to all areas to be seeded in a 2-step process. Apply first slurry application at the minimum rate of 500 lb per acre (5.5 kg per 100 sq. m) dry weight but not less than the rate required to obtain specified seed-sowing rate. Apply slurry cover coat of fiber mulch at a rate of 1000 lb per acre (11 kg per 100 sq. m).

### 3.4 RECONDITIONING LAWNS

- A. Recondition existing lawn areas damaged by Contractor's operations, including storage of materials or equipment and movement of vehicles. Also recondition lawn areas where settlement or washouts occur or where minor regrading is required.
  - 1. Recondition other existing lawn areas.
- B. Remove sod and vegetation from diseased or unsatisfactory lawn areas; do not bury into soil. Remove topsoil containing foreign materials resulting from Contractor's operations, including oil drippings, fuel spills, stone, gravel, and other construction materials, and replace with new topsoil.
- C. Where substantial lawn remains, mow, dethatch, core aerate, and rake. Remove weeds before seeding. Where weeds are extensive, apply selective herbicides as required. Do not use pre-emergence herbicides.
- D. Remove waste and foreign materials, including weeds, soil cores, grass, vegetation, and turf, and legally dispose of it off the Owner's property.
- E. Till stripped, bare, and compacted areas thoroughly to a depth of 6 inches.
- F. Apply required soil amendments and initial fertilizers and mix thoroughly into top 4 inches of soil. Provide new planting soil as required to fill low spots and meet new finish grades.
- G. Apply seed and protect with straw mulch as required for new lawns.
- H. Apply sod as required for new lawns.
- I. Water newly planted areas and keep moist until new grass is established.

### 3.5 MAINTENANCE

- A. The Contractor shall provide necessary watering, fertilizer, etc. as required to establish perennial vegetation cover with a minimum density of 80% over the entire pervious surface of the disturbed area, or until sufficient vegetation is established to prevent erosion, whichever is greater.
- B. The Contractor shall provide necessary watering, fertilizer, etc., required to establish and maintain seeded areas until same are accepted by the Owner.
- C. Begin maintenance of lawns immediately after each area is planted and continue until acceptable lawn is established, but for not less than the following periods:
  - 1. 60 days after date of Substantial Completion.
    - a. When full maintenance period has not elapsed before end of planting season, or if lawn is not fully established at that time, continue maintenance during next planting season.

- D. Maintain and establish lawns by watering, fertilizing, weeding, mowing, trimming, replanting, and other operations. Roll, regrade, and replant bare or eroded areas and mulch to produce a uniformly smooth lawn.
- E. Watering: Provide and maintain temporary piping, hoses, and lawn-watering equipment to convey water from sources and to keep lawns uniformly moist to a depth of 4 inches.
  - 1. Water lawn at the minimum rate of 1 inch per week.
- F. Mow lawns as soon as there is enough top growth to cut with mower set at specified height for principal species planted. Repeat mowing as required to maintain specified height without cutting more than 40 percent of the grass height. Remove no more than 40 percent of grass-leaf growth in initial or subsequent mowings. Do not delay mowing until grass blades bend over and become matted. Do not mow when grass is wet.
- G. Postfertilization: Apply fertilizer to lawn after first mowing and when grass is dry.
  - 1. Use fertilizer that will provide actual nitrogen of at least 1 lb per 1000 sq. ft. of lawn area.
- H. Repair of eroded areas:
  - 1. Restore soil and reseed
  - 2. If problem persists, install erosion control materials as directed by the Owner's Representative.
  - 3. All repair work shall be performed at no additional cost to the Owner.

### 3.6 CLEANUP AND PROTECTION

- A. During landscaping, keep pavements clean and work area in an orderly condition.
- B. Protect landscaping from damage due to landscape operations, operations by other contractors and trades, and trespassers. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged landscape work as directed.

### 3.7 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A. Disposal: Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of it off the Owner's property.

END OF SECTION 329200

## **SECTION 329300 - PLANTS**

### **PART 1 - GENERAL**

#### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 – General Requirements, apply to this Section.
- B. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
  - 1. Trees.
  - 2. Fertilizers and mulches.
  - 3. Stakes and guys.
- C. RELATED WORK SPECIFIED ELSEWHERE:
  - 1. Site Clearing Section 311000
  - 2. Earth Moving Section 312000
  - 3. Turf and Grasses Section 329200

#### 1.2 SUBMITTALS

- A. General: Submit each item in this Article according to the Conditions of the Contract and Division 1 – General Requirements.
- B. Product certificates signed by manufacturers certifying that their products comply with specified requirements. Label data substantiating that plants, trees, shrubs, and planting materials comply with specified requirements.
- C. Material test reports from qualified independent testing agency indicating and interpreting test results relative to compliance of the following materials with analysis of existing surface soil.
- D. Submit three (3) copies of planting schedule showing scheduled dates for planting in each area of site.
- E. Submit typewritten instructions recommending procedures to be established by the Owner for maintenance of lawn and grass work for one full year. Submit prior to expiration date of required maintenance period(s).
- F. All bags need to be saved for lime, fertilizer, seed, and liquid mulch binder (if used as mulch anchoring method). Such proofs may need to be submitted to the Owner's Representative for verification of materials and quantities used for all seedings.

#### 1.3 QUALITY ASSURANCE

- A. Installer Qualifications: Engage an experienced Installer who has completed landscaping work similar in material, design, and extent to that indicated for this Project and with a record of successful landscape establishment.
  - 1. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on the Project site during times that landscaping is in progress.
- B. Testing Agency Qualifications: To qualify for acceptance, an independent testing agency must demonstrate to Municipal Engineer's satisfaction, based on evaluation of agency-submitted criteria conforming to ASTM E 699, that it has the experience and capability to satisfactorily conduct the testing indicated without delaying the Work.
- C. Provide quality, size, genus, species, and variety of trees and shrubs indicated, complying with applicable requirements of ANSI Z60.1 "American Standard for Nursery Stock."

#### 1.4 DELIVERY, STORAGE, AND HANDLING

- A. Packaged Materials: Deliver packaged materials in containers showing weight, analysis, and name of manufacturer. Protect materials from deterioration during delivery and while stored at site.
- B. Trees and Shrubs: Deliver freshly dug trees and shrubs. Do not prune before delivery, except as approved by Construction Manager. Protect bark, branches, and root systems from sun scald, drying, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy natural shape. Provide protective covering during delivery. Do not drop trees and shrubs during delivery.
- C. Handle balled and burlapped stock by the root ball.
- D. Deliver trees, shrubs, ground covers, and plants after preparations for planting have been completed and install immediately. If planting is delayed more than 6 hours after delivery, set planting materials in shade, protect from weather and mechanical damage, and keep roots moist.
  - 1. Heel-in bare-root stock. Soak roots in water for 2 hours if dried out.
  - 2. Set balled stock on ground and cover ball with soil, peat moss, sawdust, or other acceptable material.
  - 3. Do not remove container-grown stock from containers before time of planting.
  - 4. Water root systems of trees and shrubs stored on site with a fine-mist spray. Water as often as necessary to maintain root systems in a moist condition.

#### 1.5 PROJECT CONDITIONS

- A. Utilities: Determine location of above grade and underground utilities and perform work in a manner that will avoid damage. Hand excavate, as required. Maintain grade stakes until removal is mutually agreed upon by parties concerned.
- B. Excavation: When conditions detrimental to plant growth are encountered, such as rubble fill, adverse drainage conditions, or obstructions, notify Construction Manager before planting.

#### 1.6 COORDINATION AND SCHEDULING

- A. Coordinate installation of planting materials during normal planting seasons for each type of plant material required.

#### 1.7 WARRANTY

- A. General Warranty: The special warranty specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.
- B. Special Warranty: Warrantee the following living planting materials for a period of one year after date of Substantial Completion, against defects including death and unsatisfactory growth, except for defects resulting from lack of adequate maintenance, neglect, or abuse by Owner, abnormal weather conditions unusual for warranty period, or incidents that are beyond Contractor's control.
  - 1. Trees.
- C. Remove and replace dead planting materials immediately unless required to plant in the succeeding planting season.
- D. Replace planting materials that are more than 25 percent dead or in an unhealthy condition at end of warranty period.
- E. A limit of one replacement of each plant material will be required, except for losses or replacements due to failure to comply with requirements.

#### 1.8 TREE AND SHRUB MAINTENANCE

- A. Maintain trees and shrubs by pruning, cultivating, watering, weeding, fertilizing, restoring planting saucers, tightening and repairing stakes and guy supports, and resetting to proper grades or vertical position, as required to establish healthy, viable plantings. Spray as required to keep trees and shrubs free of insects and disease. Restore or replace damaged tree wrappings. Maintain trees and shrubs for the following period:
  - 1. Maintenance Period: 12 months following Substantial Completion.

### **PART 2 - PRODUCTS**

#### 2.1 TREE AND SHRUB MATERIAL

- A. General: Furnish nursery-grown trees and shrubs conforming to ANSI Z60.1, with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully-branched, healthy, vigorous stock free of disease, insects, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.
- B. Grade: Provide trees and shrubs of sizes and grades conforming to ANSI Z60.1 for type of trees and shrubs required. Trees and shrubs of a larger size may be used if acceptable to Construction Manager, with a proportionate increase in size of roots or balls.
- C. Label at least 1 tree and 1 shrub of each variety and caliper with a securely attached, waterproof tag bearing legible designation of botanical and common name.

## 2.2 FERTILIZER

- A. Bonemeal: Commercial, raw, finely ground; minimum of 4 percent nitrogen and 20 percent phosphoric acid.
- B. Superphosphate: Commercial, phosphate mixture, soluble; minimum of 20 percent available phosphoric acid.
- C. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea-form, phosphorous, and potassium in the following composition:
  - 1. Composition: 1 lb per 1000 sq. ft. (0.5 kg per 100 sq. m) of actual nitrogen, 4 percent phosphorous, and 2 percent potassium, by weight.
  - 2. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing agency.
- D. Slow-Release Fertilizer: Granular fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:
  - 1. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing agency.

## 2.3 MULCHES

- A. Organic Mulch: Organic mulch, free from deleterious materials and suitable as a top dressing of lawns, consisting of one of the following:
  - 1. Type: Unrotted pine straw, salt hay, or threshed straw.
- B. Peat Mulch: Provide peat moss in natural, shredded, or granulated form, of fine texture, with a pH range of 4 to 6 and a water-absorbing capacity of 1100 to 2000 percent.

- C. Asphalt Emulsion Tackifier: Asphalt emulsion, ASTM D 977, Grade SS-1, nontoxic shall not be permitted for use on this project.
- D. Nonasphaltic Tackifier: Colloidal tackifier recommended by fiber-mulch manufacturer for slurry application, nontoxic and free of plant growth- or germination-inhibitors.
- E. Shredded Wood Landscaping Mulch: shredded, uncolored, natural cedar bark from a source located within the United States suitable for placement under trees, shrub planting beds, and other locations indicated on the plans.

#### 2.4 WEED-CONTROL BARRIERS

- A. Sheet Polyethylene: Black, 0.006-inch (0.15-mm) minimum thickness.
- B. Nonwoven Fabric: Polypropylene or polyester fabric, 3 oz. per sq. yd. (100 g per sq. m) minimum.
- C. Composite Fabric: Woven, needle-punched polypropylene substrate bonded to a nonwoven polypropylene fabric, 4.8 oz. per sq. yd. (160 g per sq. m).

#### 2.5 STAKES AND GUYS

- A. Upright and Guy Stakes: Rough-sawn, sound, new hardwood, redwood, or pressure-preservative-treated softwood, free of knots, holes, cross grain, and other defects, 2 by 2 inches (50 by 50 mm) by length indicated, pointed at one end.
- B. Guy and Tie Wire: ASTM A 641 (ASTM A 641M), Class 1, galvanized-steel wire, 2-strand, twisted, 0.106 inch (2.7 mm) in diameter.
- C. Guy Cable: 5-strand, 3/16-inch (4.8-mm) diameter, galvanized-steel cable, with zinc-coated turn buckles, 3-inch- (75-mm-) long minimum, with two 3/8-inch- (10-mm-) galvanized eyebolts.
- D. Hose Chafing Guard: Reinforced rubber or plastic hose at least 1/2 inch (13 mm) in diameter, black, cut to lengths required to protect tree trunks from damage.
- E. Flags: Standard surveyor's plastic flagging tape, white, 6 inches (150 mm) long.

#### 2.6 MISCELLANEOUS MATERIALS

- A. Antidesiccant: Water-insoluble emulsion, permeable moisture retarder, film forming, for trees and shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's instructions.
- B. Anti-Erosion Mulch: Provide clean, seed-free salt hay or threshed straw of wheat, rye, oats, or barley.

## **PART 3 - EXECUTION**

### 3.1 EXAMINATION

- A. Examine areas to receive landscaping for compliance with requirements and for conditions affecting performance of work of this Section. Do not proceed with installation until unsatisfactory conditions have been corrected.

### 3.2 PREPARATION

- A. Lay out individual tree locations and areas for multiple plantings. Stake locations, outline areas, and secure Owner's acceptance before the start of planting work. Make minor adjustments as may be required.
- B. Finish grading for areas to be seeded shall be done with previously stockpiled (if any) and supplementary topsoil. Do not complete topsoil work until the installation of all underground utilities, sewers, storm drainage systems, etc. have been completed.
- C. Apply fertilizers by mechanical rotary or drop type distributor and thoroughly and evenly incorporate with soil to a depth of 3" by discing or other approved method. Fertilize areas inaccessible to power equipment with hand tools and incorporate into soil.

### 3.3 PLANTING SOIL PREPARATION

- A. Before mixing, clean topsoil of roots, plants, sods, stones, clay lumps, and other extraneous materials harmful to plant growth.
- B. Mix soil amendments and fertilizers with topsoil at rates indicated. Delay mixing fertilizer if planting does not follow placing of planting soil within a few days.
  - 1. A "Planting Soil Amendments Schedule" is included at the end of this Section.
- C. For tree pit or trench backfill, mix planting soil before backfilling and stockpile at site.
- D. For planting beds and lawns, mix planting soil either prior to planting or apply on surface of topsoil and mix thoroughly before planting.
  - 1. Mix lime with dry soil prior to mixing fertilizer. Prevent lime from contacting roots of acid-tolerant plants.
  - 2. Apply phosphoric acid fertilizer, other than that constituting a portion of complete fertilizers, directly to subgrade before applying planting soil and tilling.

### 3.4 EXCAVATION FOR TREES AND SHRUBS

- A. Pits and Trenches: Excavate with vertical sides and with bottom of excavation slightly raised at center to assist drainage. Loosen hard subsoil in bottom of excavation.
  - 1. Bare-Root Trees and Shrubs: Excavate at least 12 inches (300 mm) wider than root spread and deep enough to allow setting of roots on a layer of planting soil and with collar set at same grade as in nursery, but 1 inch (25 mm) below finish grade, unless otherwise indicated.
    - a. Setting Layer: Allow 3 inches (75 mm) of planting soil.
  - 2. Balled and Burlapped Trees and Shrubs: Excavate approximately 1-1/2 times as wide as ball diameter and equal to ball depth, plus the following setting layer depth:
    - a. Setting Layer: Allow 3 inches (75 mm) of planting soil.
  - 3. Container-Grown Trees and Shrubs: Excavate to container width and depth, plus the following setting-layer depth:
    - a. Setting Layer: Allow 3 inches (75 mm) of planting soil.
- B. Dispose of subsoil removed from landscape excavations. Do not mix with planting soil or use as backfill.
- C. Obstructions: Notify Construction Manager if unexpected rock or obstructions detrimental to trees or shrubs are encountered in excavations.
  - 1. Hardpan Layer: Drill 6-inch- (150-mm-) diameter holes into free-draining strata or to a depth of 10 feet (3 m), whichever is less, and backfill with free-draining material.
- D. Drainage: Notify Construction Manager if subsoil conditions evidence unexpected water seepage or retention in tree or shrub pits.
- E. Fill excavations with water and allow to percolate out, before placing setting layer and positioning trees and shrubs.

### 3.5 PLANTING TREES AND SHRUBS

- A. Set balled and burlapped stock plumb and in center of pit or trench with top of ball raised above adjacent finish grades as indicated.
  - 1. Place stock on setting layer of compacted planting soil.
  - 2. Remove burlap and wire baskets from tops of balls and partially from sides, but do not remove from under balls. Remove pallets, if any, before setting. Do not use planting stock if ball is cracked or broken before or during planting operation.
  - 3. Place backfill around ball in layers, tamping to settle backfill and eliminate voids and air pockets. When pit is approximately 1/2 backfilled, water

thoroughly before placing remainder of backfill. Repeat watering until no more is absorbed. Water again after placing and tamping final layer of backfill.

- B. Set container-grown stock plumb and in center of pit or trench with top of ball raised above adjacent finish grades as indicated.
  - 1. Carefully remove containers so as not to damage root balls.
  - 2. Place stock on setting layer of compacted planting soil.
  - 3. Place backfill around ball in layers, tamping to settle backfill and eliminate voids and air pockets. When pit is approximately 1/2 backfilled, water thoroughly before placing remainder of backfill. Repeat watering until no more is absorbed. Water again after placing and tamping final layer of backfill.
- C. Dish and tamp top of backfill to form a 3-inch- (75-mm-) high mound around the rim of the pit. Do not cover top of root ball with backfill. Place mulch 4" thick.

### 3.6 TREE AND SHRUB PRUNING

- A. Prune, thin, and shape trees and shrubs as directed by Construction Manager.
- B. Prune, thin, and shape trees and shrubs according to standard horticultural practice. Prune trees to retain required height and spread. Unless otherwise directed by Construction Manager, do not cut tree leaders; remove only injured or dead branches from flowering trees. Prune shrubs to retain natural character. Shrub sizes indicated are size after pruning.

### 3.7 TREE AND SHRUB GUYING AND STAKING

- A. Upright Staking and Tying: Stake trees of 2- through 5-inch (50- through 125-mm) caliper. Stake trees of less than 2-inch (50-mm) caliper only as required to prevent wind tip-out. Use a minimum of 2 stakes of length required to penetrate at least 18 inches (450 mm) below bottom of backfilled excavation and to extend at least 72 inches (1800 mm) above grade. Set vertical stakes and space to avoid penetrating balls or root masses. Support trees with 2 strands of tie wire encased in hose sections at contact points with tree trunk. Allow enough slack to avoid rigid restraint of tree.
- B. Guying and Staking: Guy and stake trees exceeding 14 feet (4.2 m) and more than 3-inch (75-mm) caliper unless otherwise indicated. Securely attach no fewer than 3 guys to stakes 30 inches (760 mm) long, driven to grade. Attach flags to each guy wire, 30 inches (760 mm) above finish grade.

### 3.8 MULCHING

- A. Mulch backfilled surfaces of pits, trenches, planted areas, and other areas indicated.

- B. Weed-Control Barriers: Install the following weed-control barriers according to manufacturer's recommendations, before mulching. Completely cover area to be mulched, lapping edges a minimum of 6 inches (150 mm).
  - 1. Material and Seam Treatment: Sheet polyethylene with seams taped.
  - 2. Material and Seam Treatment: Nonwoven fabric with seams pinned.
  - 3. Material and Seam Treatment: Composite fabric with seams pinned.
- C. Organic Mulch: Apply the following average thickness of organic mulch and finish level with adjacent finish grades. Do not place mulch against trunks or stems.
  - 1. Thickness: 4 inches.

### 3.9 INSTALLATION OF MISCELLANEOUS MATERIALS

- A. Apply antidesiccant using power spray to provide an adequate film over trunks, branches, stems, twigs, and foliage.
  - 1. When deciduous trees or shrubs are moved in full-leaf, spray with antidesiccant at nursery before moving and again 2 weeks after planting.

### 3.10 CLEANUP AND PROTECTION

- A. During landscaping, keep pavements clean and work area in an orderly condition.
- B. Protect landscaping from damage due to landscape operations, operations by other contractors and trades, and trespassers. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged landscape work as directed.

### 3.11 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A. Disposal: Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of it off the Owner's property.

### 3.12 PLANTING SOIL AMENDMENTS SCHEDULE

- A. Tree Pits or Trenches: Provide soil amendments in not less than the recommended quantities as determined by the independent testing laboratory. The cost of all testing, fertilizer and amendments are the responsibility of the contractor, and shall be included as part of the price bid for each item.
- B. Ground Cover and Planting Beds:
  - 1. Provide soil amendments in not less than the recommended quantities as determined by the independent testing laboratory. The cost of all testing, fertilizer and amendments are the responsibility of the contractor, and shall be included as part of the price bid for each item.

END OF SECTION 32 93 00

## **SECTION 334000 - STORM DRAINAGE UTILITIES**

### **PART 1 - GENERAL**

#### 1.1 GENERAL REQUIREMENTS

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
  - 1. Installation of all exterior storm drainage elements outside of the building five (5) feet from the point of exit.
  - 2. The general contractor shall be responsible for coordinating all horizontal and vertical locations of connections into the building line with the plumbing contractor.
  - 3. The general contractor shall be responsible for closing and sealing all existing storm sewer connections that are no longer required by the proposed configuration.
  - 4. Facilitating the Owner's visual inspection of the storm sewer piping installed under this project.
- B. Cooperation and interface with the other prime contractors.
  - 1. The plumbing contractor shall be responsible for all penetrations and connections into the proposed building.

#### 1.2 RELATED WORK SPECIFIED ELSEWHERE

- A. Earth Moving: Section 312000.
- B. Flexible Paving Section 321200.

#### 1.3 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.

#### 1.4 DEFINITIONS

- A. HDPE: High Density Polyethylene plastic.
- B. PVC: Polyvinyl chloride plastic.
- C. DIP: Ductile Iron Pipe

## 1.5 PERFORMANCE REQUIREMENTS

- A. Gravity-Flow, Nonpressure-Piping Pressure Ratings: At least equal to system test pressure.

## 1.6 SUBMITTALS

- A. Shop Drawings: Include plans, elevations, details, and attachments for the following:
1. Precast concrete manholes, inlets and other structures, including frames, covers, and grates.
  2. Perimeter drain, grates, catch basins, layout, and manufacturer installation instructions.
  3. Cast-in-place concrete manholes, inlets and other structures, including frames, covers, and grates.
  4. Signed by a Licensed New York Professional Engineer specializing in structural design.
  5. Product specifications for pipes, clean-outs, connections and gaskets.
- B. Coordination Drawings: Show manholes and other structures, pipe sizes, locations, and elevations. Include details of underground structures and connections. Show other piping in same trench and clearances from sewerage system piping. Indicate interface and spatial relationship between piping and proximate structures.
- C. Design Mix Reports and Calculations: For each class of cast-in-place concrete.
- D. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.
- E. Record Drawings in accordance with Division 01 Section "Contract Close-Out".
1. These drawings shall show the following information:
    - a. As-built location of storm sewer line in plan
    - b. Invert elevation
    - c. Rim elevation
    - d. Pipe diameter, material, length and percent slope
    - e. Locations of lateral cleanouts (by triangulation)
    - f. Above-ground Detention pond structures and earthworks (if indicated on plans)
    - g. Under-ground Detention pond structures and earthworks (if indicated on plans)
    - h. Utility crossing locations
  2. These drawing shall comply with the following standards:
    - a. Clearly marked and easily readable
    - b. A scale identical to the construction plans
    - c. Horizontal datum: North American Datum (NAD) 1983
    - d. Vertical datum: North American Vertical Datum (NAVD) 1988
    - e. Signed and sealed by a Licensed New York Professional Land Surveyor

3. As-builts shall be delivered to the Owner in both record mylar and digital format. Digital submissions shall be in AutoCAD, 2017 format on a compact disc in compatible format.

#### 1.7 DELIVERY, STORAGE, AND HANDLING

- A. Do not store plastic structures, pipe, and fittings in direct sunlight.
- B. If piping and structures are to be stored on site prior to placement in accordance with the construction documents, the following shall be required:
  1. All pipes shall be stored on grade. Stacking is not permitted.
  2. Sufficient barricades shall be provided around piping and structures to prevent unauthorized access to the storage area.
- C. Protect pipe, pipe fittings, and seals from dirt and damage.
- D. Handle precast concrete manholes, inlets and other structures according to manufacturer's written rigging instructions.

#### 1.8 PROJECT CONDITIONS

- A. Site Information: Perform site survey, research public utility records, and verify existing utility locations.
- B. Locate existing structures and piping to be closed and abandoned.
- C. Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:
  1. Notify Owner not less than two days in advance of proposed utility interruptions.
  2. Do not proceed with utility interruptions without Owner's written permission.

### **PART 2 - PRODUCTS**

#### 2.1 MANUFACTURERS

- A. Proposed material manufacturers shall be supplied and approved at the time of shop drawing submission.

#### 2.2 PIPING MATERIALS

- A. Refer to Part C "Piping Applications" Article for applications of pipe and fitting materials.

## 2.3 PIPES AND FITTINGS

- A. Drainage Pipe and Fittings, NPS 8 and Smaller:
  - 1. ASTM D1785 Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe, Schedule 40
  - 2. Solvent-cemented joints.
- B. Sewer Pipe and Fittings, NPS 8 and Smaller:
  - 1. ASTM D 3034, SDR 35
  - 2. Solvent-cemented or gasketed joints.
    - a. Gaskets: ASTM F 477, elastomeric seals.
- C. Reinforced-Concrete Sewer Pipe and Fittings: ASTM C 76, Class III, Wall B, for gasketed joints.
  - 1. Gaskets: ASTM C 443, rubber.
- D. HDPE storm sewer pipe shall comply with the requirements for test methods, dimensions and markings found in AASHTO Designations M252, and M294. Pipe and fittings shall be made from virgin PE compounds which conform to the applicable current edition of the AASHTO Material Specifications for cell classification as defined and described in ASTM D3350.
  - 1. Storm sewer piping greater than eight (8) inch in diameter shall be smooth interior/corrugated exterior pipe fitted with watertight joints meeting or exceeding ASTM 3212 lab test and ASTM 1417 watertight field test. N-12 IB WT® Product as manufactured by Advanced Drainage Systems, Inc. (ADS), Columbus, OH, (614) 457-3051 or approved equal.
  - 2. Underdrain piping less than or equal to eight (8) inch in diameter shall be perforated single-wall pipe fitted with soil-tight joints meeting ASTM standards F405 and F606 as manufactured by Advanced Drainage Systems, Inc. (ADS), Columbus, OH, (614) 457-3051 or approved equal.
- E. Ductile Iron pipe (DIP), Class 52, cement lined, and shall have push on joints. (ANSI/AWWA 151/A21.51)
- F. Underground Stormwater Vault ACF Model UD-Double-Mini, or approved equal.
- G. Hydrodynamic Separator: Contech CS-4 Unit, or approved equal.
- H. Yard Drains: As specified on plans, or approved equal.

## 2.4 SPECIAL PIPE COUPLINGS AND FITTINGS

- A. Sleeve-type and bushing-type pipe couplings ('Fernco') shall not be permitted.

- B. Pipe Couplings shall be DIP, PVC, HDPE or other approved rigid connectors for joining existing and dissimilar piping materials as manufactured by Dresser (814) 362-9200, Genco (800) 345-6454, Harco (502) 366-4596 or other approved equal.

## 2.5 MANHOLES

- A. Normal-Traffic Precast or cast-in-place Concrete Manholes: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for rubber gasketed joints.
  - 1. Diameter: 48 inches minimum, unless otherwise indicated.
  - 2. Ballast: Increase thickness of precast concrete sections or add concrete to base section, as required to prevent flotation.
  - 3. Base Section: 8-inch minimum thickness for floor slab and 5-inch minimum thickness for walls and base riser section, and having separate base slab or base section with integral floor.
  - 4. Precast Riser Sections: 5-inch minimum thickness, and lengths to provide depth indicated.
  - 5. Cast-in-place Riser Sections: 8-inch minimum block thickness up to a depth of 8 feet below finished grade; 12-inch minimum block thickness below 8 feet deep.
  - 6. Top Section: Eccentric-cone type, unless concentric-cone or flat-slab-top type is indicated. Top of cone of size that matches grade rings.
  - 7. Gaskets: ASTM C 443, rubber.
  - 8. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match 30-inch- diameter frame and cover.
  - 9. Steps: Polypropylene, individual steps or ladder. Include width that allows worker to place both feet on one step and is designed to prevent lateral slippage off step. Cast or anchor into base, riser, and top section sidewalls with steps at 12-inch
  - 10. Pipe Connectors: ASTM C 923, resilient, of size required, for each pipe connecting to base section.
  - 11. Cast-in-place finish: mortar parge a minimum uniform thickness of 1/4".
- B. Cast-in-Place Concrete Manhole (Doghouse): Construct of reinforced-concrete bottom, walls, and top; designed according to ASTM C 890 for A-16, heavy-traffic, structural loading; of depth, shape, dimensions, and appurtenances indicated.
  - 1. Ballast: Increase thickness of concrete, as required to prevent flotation.
  - 2. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match 30-inch diameter frame and cover.
  - 3. Cast-in-place Riser Sections: 8-inch minimum block thickness up to a depth of 8 feet below finished grade; 12-inch minimum block thickness below 8 feet deep.
  - 4. Steps: Polypropylene, individual steps or ladder. Include width that allows worker to place both feet on one step and is designed to prevent lateral slippage off step. Cast or anchor into sidewalls with steps at 12-inch intervals.
  - 5. Cast-in-place finish: mortar parge a minimum uniform thickness of 1/4".
- C. Manhole Frames and Covers: ASTM A 536, Grade 60 ID by 4- to 10-inch riser with 4-inch minimum width flange, and 30-inch- diameter cover. Include indented top design with lettering per Owner requirements cast into cover

## 2.6 CATCH BASINS

- A. Normal-Traffic, Precast or Cast-in-place Concrete Catch Basins: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for rubber gasketed joints.
1. Base Section: 10-inch minimum thickness for floor slab and 6-inch minimum thickness for walls and base riser section, and having separate base slab or base section with integral floor.
  2. Riser Sections: 6-inch minimum thickness, 48-inch diameter, and lengths to provide depth indicated.
  3. Cast-in-place Riser Sections: 8-inch minimum block thickness up to a depth of 8 feet below finished grade; 12-inch minimum block thickness below 8 feet deep.
  4. Top Section: Eccentric-cone type, unless concentric-cone or flat-slab-top type is indicated. Top of cone of size that matches grade rings.
  5. Gaskets: ASTM C 443, rubber.
  6. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match 24-inch diameter frame and grate.
  7. Steps: Polypropylene, individual steps or ladder. Include width that allows worker to place both feet on one step and is designed to prevent lateral slippage off step. Cast steps or anchor ladder into base, riser, and top section sidewalls at 12-inch intervals. Pipe Connectors: ASTM C 923M, resilient, of size required, for each pipe connecting to base section.
  8. Cast-in-place finish: mortar parge a minimum uniform thickness of ¼".
  9. Channels and Benches: Concrete.
- B. Cast-in-Place Concrete Structure (Doghouse): Construct of reinforced-concrete bottom, walls, and top; designed according to ASTM C 890 for A-16, heavy-traffic, structural loading; of depth, shape, dimensions, and appurtenances indicated.
1. Ballast: Increase thickness of concrete, as required to prevent flotation.
  2. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match inlet dimensions of frame and cover.
  3. Cast-in-place Riser Sections: 8-inch minimum block thickness up to a depth of 8 feet below finished grade; 12-inch minimum block thickness below 8 feet deep.
  4. Steps: Polypropylene, individual steps or ladder. Include width that allows worker to place both feet on one step and is designed to prevent lateral slippage off step. Cast or anchor into sidewalls with steps at 12-inch intervals.
  5. Cast-in-place finish: mortar parge a minimum uniform thickness of ¼".

## 2.7 STORMWATER INLETS

- A. Curb Inlets: Made with vertical curb opening, of materials and dimensions according to local standards.
- B. Gutter Inlets: Made with horizontal gutter opening, of materials and dimensions according to local standards. Include heavy-duty frames and grates.
- C. Combination Inlets: Made with vertical curb and horizontal gutter openings, of materials and dimensions according to local standards. Include heavy-duty frames and grates.

- D. Frames and Grates: Heavy-duty cast iron frames and grates according to local standards with bicycle-safe grate patterns.
- E. Yard Inlets: As specified on plans or approved equal.

## 2.8 FILTER FABRIC

- A. Filter fabric shall be AASHTO M288 class 2 non-woven, TC Mirafi 140N or approved equal.
- B. Filter fabric in high-scour applications (e.g. riprap aprons) shall be AASHTO M288 class 1 woven, TC Mirafi FW500 or approved equal.
- C. See Plans for specified locations/USGS.

## 2.9 CONCRETE

- A. General: Cast-in-place concrete according to ACI 318, ACI 350R, and the following:
  - 1. Cement: ASTM C 150, Type II.
  - 2. Fine Aggregate: ASTM C 33, sand.
  - 3. Coarse Aggregate: ASTM C 33, crushed gravel.
  - 4. Water: Potable.
- B. Portland Cement Design Mix: 4000 psi minimum, with 0.45 maximum water-cementitious ratio.
  - 1. Reinforcement Fabric: ASTM A 185, steel, welded wire fabric, plain.
  - 2. Reinforcement Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), deformed steel.
- C. Structure Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 4000 psi minimum, with 0.45 maximum water-cementitious ratio. Include channels and benches in manholes.
  - 1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope. Invert slope shall be one (1) percent through manhole.
  - 2. Benches: Concrete, sloped to drain into channel. Slope shall be four (4) percent.
- D. Include channels in catch basins.
  - 1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope. Invert Slope: shall be one (1) percent through catch basin.
- E. Ballast and Pipe Supports: Portland cement design mix, 3000 psi minimum, with 0.58 maximum water-cementitious ratio.

1. Reinforcement Fabric: ASTM A 185, steel, welded wire fabric, plain.
2. Reinforcement Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), deformed steel.

## 2.10 PROTECTIVE COATINGS

- A. Description: One- or two-coat, coal-tar epoxy; 15-mil minimum thickness, unless otherwise indicated; factory or field applied to the following surfaces:
1. Concrete Manholes: On exterior and interior surfaces.
  2. Catch Basins: On exterior and interior surfaces.
  3. Stormwater Inlets: On exterior and interior surfaces.

## 2.11 CLEANOUTS

- A. PVC Cleanouts: PVC body with PVC threaded plug. Include PVC sewer pipe fitting and riser to cleanout of same material as sewer piping.

## 2.12 UNDERGROUND STORMWATER VAULT

- A. Injection molded plastic tank plates assembled to form a 95% void modular structure of predesigned height and envelope shown on plans.
- B. Units shall meet the following Physical Characteristics:
- a. Void Area: 95%
  - b. Comprehensive Strength: 134.2 psi
  - c. HS-20 Minimum Cover: 12" (Stone Backfill)
- C. Supplier: ACF Environmental 2831 Cardwell Road Richmond, VA 23234 (T): 800-448-3636; (F): 804-743-7779 [www.acfenvironmental.com](http://www.acfenvironmental.com), or approved equal.
- D. Bedding Materials: Stone (angular and smaller than 1.5" in diameter) or soil (GW, GP, SW, or SP as classified by the Unified Soil Classification System) shall be used below the system (3" minimum). Material must be free from lumps, debris, and any sharp objects that could cut the geotextile. Material shall be within 3 percent of the optimum moisture content as determined by ASTM D698 at the time of installation. For infiltration applications bedding material shall be free draining.
- E. Side and Top Backfill: Free draining material shall be used adjacent to (24" minimum) and above (for the first 12") the system. Material must be free from lumps, debris and any sharp objects that could cut the geotextile. Material shall be within 3 percent of the optimum moisture content as determined by ASTM D698 at the time of installation.
- F. For UD modules in traffic loaded (HS-20) applications with less than 14" of top cover, backfill materials shall be free draining stone (angular and smaller than 1.5" in diameter). The use of soil backfill on the sides and top of the UD module is not permitted unless the modules are installed outside of traffic areas or with cover depths of 14" or more. Top

backfill material (from top of module to bottom of pavement base or 12" maximum) must be consistent with side backfill.

- G. System shall provide 3,524 cf of storage at a depth of 3.35 feet.

2.13 STORMWATER TREATMENT DEVICE (SWTD): HYDRODYNAMIC SEPARATOR

- A. This item shall govern the furnishing and installation of the SWTD, complete and operable as shown and as specified herein, in accordance with the requirements of the plans and contract documents.
- B. The manufacturer of the SWTD shall be one that is regularly engaged in the engineering design and production of systems deployed for the treatment of storm water runoff for at least five (5) years and which have a history of successful production, acceptable to the Engineer. In accordance with the Drawings, the SWTD(s) shall be a hydrodynamic separation device manufactured by:

Contech Engineered Solutions LLC  
9025 Centre Pointe Drive  
West Chester, OH, 45069  
Tel: 1 800 338 1122

- C. The manufacturer shall guarantee the SWTD components against all manufacturer originated defects in materials or workmanship for a period of twelve (12) months from the date the components are delivered to the owner for installation. The manufacturer shall upon its determination repair, correct or replace any manufacturer originated defects advised in writing to the manufacturer within the referenced warranty period at the cost to the manufacturer. The use of SWTD components shall be limited to the application for which it was specifically designed.
- D. The SWTD manufacturer shall submit to the Engineer of Record a "Manufacturer's Performance Certification" certifying that the SWTD is capable of achieving the specified removal efficiencies listed in these specifications. The certification shall be supported by independent third-party research.
- E. No product substitutions shall be accepted unless submitted 10 days prior to project bid date, or as directed by the Engineer of Record. Submissions for substitutions require review and approval by the Engineer of Record, for hydraulic performance, impact to project designs, equivalent treatment performance, and any required project plan and report (hydrology/hydraulic, water quality, stormwater pollution) modifications that would be required by the approving jurisdictions/agencies. Contractor to coordinate with the Engineer of Record any applicable modifications to the project estimates of cost, bonding amount determinations, plan check fees for changes to approved documents, and/or any other regulatory requirements resulting from the product substitution.
- F. Performance
1. The SWTD shall be sized to either achieve an 80 percent average annual reduction in the total suspended solid load or treat a flow rate designated by the jurisdiction in which the project is located. Both methods should be sized using the OK-110 particle distribution having particles ranging from 53 microns to 212 microns with a d50 of around 110 microns.

2. The SWTD shall be designed with a sump chamber for the storage of captured sediments and other negatively buoyant pollutants in between maintenance cycles. The minimum storage capacity provided by the sump chamber shall be in accordance with the following requirements: Minimum Sump Storage Capacity of 0.70 cubic yards and Minimum Oil Storage Capacity of 141.0 gallons. The boundaries of the sump chamber shall be limited to that which do not degrade the SWTD's treatment efficiency as captured pollutants accumulate. In order to not restrict the Owner's ability to maintain the SWTD, the minimum dimension providing access from the ground surface to the sump chamber shall be 16 inches in diameter.
3. The SWTD shall be designed to capture and retain Total Petroleum Hydrocarbons generated by wet-weather flow and dry-weather gross spills and have a capacity as discussed in Section 2 of the Performance Specifications for the unit.
4. The SWTD shall convey the flow from the peak storm event of the drainage network, in accordance with required hydraulic upstream conditions as defined by the Engineer. If a substitute SWTD is proposed, supporting documentation shall be submitted that demonstrates equal or better upstream hydraulic conditions compared to that specified herein. This documentation shall be signed and sealed by a Professional Engineer registered in the State of New York. All costs associated with preparing and certifying this documentation shall be born solely by the Contractor.

#### 2.14 STORMWATER TREATMENT DEVICE: CISTERN

- A. This item shall govern the furnishing and installation of a cistern for rainwater harvesting and other underground water storage for nominal diameters 30" (750mm) through 120" (3000mm).
- B. A stormwater treatment device upstream of the cistern is recommended as the appropriate means of pretreating for the purpose of extending the maintenance interval on the cistern system and reducing the life cycle cost. Both engineered solutions shall be provided by a single supplier/manufacturer.
- C. Site layout drawings, product specifications, materials, hydraulic storage data and supported calculations of proposed alternatives shall be submitted to the Engineer of Record (EOR) for review at a minimum of 10 working days prior to bid closing.
- D. The cistern system proposal shall be sized in accordance with the design provided and approved by the Engineer of Record (EOR). Any Contractor deviating from the design shown on the plans, to include: material, footprint, etc., shall provide to the Engineer of Record (EOR) a summary report on stage-storage curves, design calculations, system modeling and engineering drawings.
- E. Shop drawings shall be annotated to indicate all materials to be furnished and installed under this section, and all applicable standards for materials, required tests of materials and design assumptions for structural analysis.
- F. Virgin high density polyethylene stress-rated resins are used to manufacture the cistern and complimentary fabricated fittings. Resins shall conform to the minimum requirements of cell classification 345464C as defined and described in the latest version of ASTM D3350
- G. Performance

1. All tanks must be leak tested and results documented using a positive pressure air test prior to shipment from the manufacturing location. Testing documentation shall include test air pressure and hold time. A copy of the leak test report must be provided to the Engineer of Record as requested.
2. Bulkheads shall be constructed of material in conformance with Section 2.14 F and designed for H-20/HS-25 final live loading conditions.
3. All cistern inlets shall be equipped with an inlet calming device that they may introduce water to the tank with little to no turbulence.
4. The cistern shall provide a minimum of one 36 inch diameter access riser.
5. Cistern tank spacing, and stone base thickness cannot be altered with consultation from the manufacturer.
6. The cistern shall be designed for a minimum HS-20/HS-25 final live loading conditions. The cistern shall meet HS-20/HS-25 loading requirements with a minimum cover of 1.5 ft. and a maximum cover of 8' measured from the top of tank to the bottom of flexible pavement. The cistern shall have a unit weight of 65.6 lbs./ft. and a minimum wall thickness of 0.220 in.

#### 2.15 SWTD – PERFORMANCE

- A. The SWTD shall be sized to either achieve an 80 percent average annual reduction in the total suspended solid load or treat a flow rate designated by the jurisdiction in which the project is located. Both methods should be sized using the OK-110 particle distribution having particles ranging from 53 microns to 212 microns with a d50 of around 110 microns.
- B. The SWTD shall be designed with a sump chamber for the storage of captured sediments and other negatively buoyant pollutants in between maintenance cycles. The minimum storage capacity provided by the sump chamber shall be in accordance with the volume listed in Table 1. The boundaries of the sump chamber shall be limited to that which do not degrade the SWTD's treatment efficiency as captured pollutants accumulate. In order to not restrict the Owner's ability to maintain the SWTD, the minimum dimension providing access from the ground surface to the sump chamber shall be 16 inches in diameter.
- C. The SWTD shall be designed to capture and retain Total Petroleum Hydrocarbons generated by wet-weather flow and dry-weather gross spills and have a capacity listed in Table 1 of the required unit.
- D. The SWTD shall convey the flow from the peak storm event of the drainage network, in accordance with required hydraulic upstream conditions as defined by the Engineer. If a substitute SWTD is proposed, supporting documentation shall be submitted that demonstrates equal or better upstream hydraulic conditions compared to that specified herein. This documentation shall be signed and sealed by a Professional Engineer registered in the State of the work. All costs associated with preparing and certifying this documentation shall be born solely by the Contractor.

### PART 3 - EXECUTION

### 3.1 EARTHWORK

- A. Excavating, trenching, and backfilling are specified in Division 31 Section "Earth Moving."

### 3.2 IDENTIFICATION

- A. Materials and their installation are specified in Division 31 Section "Earth Moving." Arrange for installing green warning tapes directly over piping and at outside edges of underground structures.
  - 1. Use detectable warning tape over ferrous piping.
  - 2. Use detectable warning tape over nonferrous piping and over edges of underground structures.
  - 3. Install detectable warning tape 6-inches to 12-inches below finished grade.

### 3.3 PIPING APPLICATIONS

- A. General: Include watertight or soil-tight joints as specified.
- B. Refer to Part B of this Section for detailed specifications for pipe and fitting products. Use pipe, fittings, and joining methods according to applications indicated.

### 3.4 SPECIAL PIPE COUPLING AND FITTING APPLICATIONS

- A. Special Pipe Couplings: Use where required to join piping and no other appropriate method is specified. Do not use instead of specified joining methods. Use the following pipe couplings for nonpressure applications:
  - 1. Rigid connection fittings
- B. Encase all dissimilar connections or connections to existing piping materials located under proposed structures (buildings, roadways, etc.) with concrete.

### 3.5 INSTALLATION, GENERAL

- A. Unloading and Handling
  - 1. Follow all Occupational Safety and Health Administration (OSHA) safety requirements.
  - 2. When the truckload of pipe is initially received, it should be inspected for damage and quantities should be verified with shipping papers. Any damage or discrepancies should be noted on the delivery receipt and the supplier notified. The Owner shall not be responsible for acceptance and installation of defective materials.
- B. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of underground storm drainage piping. Location and arrangement of

pipng layout take design considerations into account. Install piping as indicated, to extent practical.

- C. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab or drag in line, and pull past each joint as it is completed.
- D. Use manholes for changes in direction, unless fittings are indicated. Use fittings for branch connections, unless direct tap into existing sewer is indicated.
- E. Install gravity-flow piping and connect to building's storm drains, of sizes and in locations indicated. Terminate piping as indicated.
  - 1. Install piping pitched down in direction of flow, at minimum slope of 0.25 percent, unless otherwise indicated.
- F. Tunneling: Install pipe under streets or other obstructions that cannot be disturbed by tunneling, jacking, or a combination of both.

### 3.6 INSTALLATION REQUIREMENTS, HDPE OR PVC

#### A. Unloading and Handling

- 1. HDPE pipe is designed to withstand normal field handling and can be easily unloaded by hand or with equipment. To avoid damage, the pipe should not be dropped. When using equipment to unload or move the pipe, a fork extension can be used. When unloading by hand, gloves should be worn.
- 2. Do not use chains or wire rope to lift the pipe. Use nylon slings and do not pick up 20-foot lengths from only one place on pipe.

#### B. Trenching

- 1. Excessive groundwater necessitates dewatering. Plastic pipe will float in standing water, requiring immediate haunching and initial backfill to hold line and grade. If the contactor encounters this condition. Dewatering shall be employed.
- 2. An unstable trench bottom must be stabilized with gravel or stone bedding materials.
- 3. Excavation from 0 to 12 inches below the pipe should be filled with acceptable bedding material and compacted to a minimum 95 percent Proctor density in accordance with ASTM D 1557. Fill area of over-excavation beyond 12 inches with processed stone or gravel.
- 4. Before installing pipe, bring bedding material to grade along the entire length of the pipe.
- 5. When excavating in Class IV materials (silt, silty clays, and clays), provide a uniform, improved trench bottom in accordance with the plan details.

#### C. Field cutting

1. Use a handsaw or power pipe cutoff saw.
2. For ribbed pipe, cut in the valley of a corrugation. Do not cut into the sidewall of an annular corrugation. For pipe with external spiral corrugations, place a split coupling around it and use the coupling edge as a cutting guide.
3. It is not necessary to bevel the cut pipe edge prior to installing an o-ring gasket joint system.
4. Skew or bevel cuts shall not be permitted.

D. Laying plastic pipe

1. Curvilinear installation shall not be permitted.
2. Plastic pipe can be easily carried to the trench and in sizes below 24 inches, installed by hand without the use of special equipment. Do not drop the pipe into the trench.

E. Embedment for bedding, haunching and initial backfill

1. Embedment materials are those used for bedding, haunching and initial backfill. ASTM D-2321 classifies soil materials as:
  - a. Class I: Angular crushed stone or rock, dense or open-graded, with little or no fines (1/4 inch to 1-1/2 inches in size).
  - b. Class II: Clean, coarse-grained materials, such as gravel, coarse sands, and gravel/sand mixtures (1-1/2 inches in size).
  - c. Class III: Coarse-grained material with fines including silty or clayey gravels or sands. Gravel or sand must comprise more than 50 percent of Class III: materials (1-1/2 inches maximum size.)
  - d. Class IV: Fine-grained materials, such as fine sand and soils, containing 50 percent or more clay or silt. Soils classified as Class IVa (ML or CL) have medium to low plasticity and are not recommended in the embedment zone. Soils classified as Class IVb (MH or CH) have high plasticity and are not recommended for embedment materials.
  - e. Class V: These materials include organic silts and clays, peat, and other organic materials. They are not recommended for embedment materials.
2. Do not place lumps of frozen soil or ice in the embedment zone.

F. Bedding

1. The contractor shall place bedding material providing uniform support to hold the pipe on line and grade in accordance with the plan details. Bedding materials under pipe shall be Class I, II or III.

G. Haunching

1. Proper haunching provides a major portion of the pipe's strength and stability. Poor workmanship will lead to excessive pipe deflection and grade and alignment problems. Haunching materials shall be Class I, II or III and must be compacted to minimum 90 percent standard Proctor.
2. Haunching Requirements

- a. Work enough material under the haunch of the pipe to provide proper compaction and side support.
- b. Where trench walls are unstable, prevent loss of side support by controlling sloughing, etc.
- c. Do not allow the pipe move when placing material under the haunch of the pipe.
- d. Take care not to damage the smaller size pipe with shovels or tamping equipment.
- e. Haunching shall be in 6-inch lifts.
- f. Controlled low strength material (CLSM) slurry is suitable for embedment. Trench width may be narrower if allowed by the Owner. Prevent floating with stakes or other methods.

#### H. Initial Backfill

1. Initial backfill materials extend from the spring line to 6 inches to 12 inches above the pipe to provide the remainder of the pipe support and protect the pipe from stones or cobbles in the final backfill. Class I, II, III materials shall be used. However:
  - a. Class I materials shall be used in wet trenches if Class I bedding and haunching materials are used.
  - b. Class II materials shall be compacted in 6-inch lifts to 95 percent modified Proctor density in accordance with ASTM D 1557.
  - c. Class III materials shall be compacted in 6-inch lifts to 95 percent modified Proctor density in accordance with ASTM D 1557.

#### I. Construction Loads

1. During construction, avoid heavy equipment wheel loads over the pipe or place additional cover at vehicle crossings. If a hydro-hammer or hoe-pak is to be used to compact the trench at least 48 inches of cover must be provided.
2. When connections to structures, laterals, deep laterals, risers, or drop manholes are required, the installation must be designed to ensure that the pipe and fittings are not damaged by loads generated due to soil settlement, dragdown, and/or poor installation practices.
3. When removing sheeting or other trench protection, do not disturb the embedment material. If sheeting or trench protection must be used below the top of the pipe, bracing shall be cut at the top of pipe elevation and left in place.
4. If any damage occurs due to construction loading of the pipes, contractor shall bear entire expense for repair and/or replacement.

### 3.7 PIPE JOINT CONSTRUCTION AND INSTALLATION

- A. General: Join and install pipe and fittings according to installations indicated.
- B. PVC Sewer Pipe and Fittings: As follows:
  1. Join pipe and gasketed fittings with gaskets according to ASTM D 2321.

2. Install according to ASTM D 2321.
- C. Concrete Pipe and Fittings: Install according to ACPA's "Concrete Pipe Installation Manual." Use the following seals:
  1. Round Pipe and Fittings: ASTM C 443, rubber gaskets.
- D. HDPE Pipe and Fittings: Install split couplings as follows:
  1. Split Couplings: This joint system is used where a soil-tight system is required.
  2. The sides of these split couplings are "hinged" so they easily open up to accept each end of adjacent pipe sections. There are matching holes at the split in the top of the coupling that are secured for a tight fit with nylon ties.
- E. System Piping Joints: Make joints using system manufacturer's couplings, unless otherwise indicated.
- F. Join piping made of different materials or dimensions with couplings made for this application. Use couplings that are compatible with and that fit both systems' materials and dimensions.
- G. All labor, materials, and equipment required to join and provide fittings for all pipe joints shall be included in the price bid for the proposal.

### 3.8 MANHOLE INSTALLATION

- A. General: Install manholes, complete with appurtenances and accessories indicated in accordance with manufacturer's guidelines and recommendations.
- B. Form continuous concrete channels and benches between inlets and outlet.
- C. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops 2 inches above finished surface elsewhere, unless otherwise indicated.
- D. Install precast concrete manhole sections with gaskets according to ASTM C 891.
- E. Construct cast-in-place manholes as indicated.

### 3.9 STORMWATER CATCH BASIN/INLET INSTALLATION

- A. Construct catch basins/inlets to sizes and shapes indicated.
- B. Set frames and grates to elevations indicated.

### 3.10 UNDERDRAIN

- A. General: Install filter fabric, stone, piping and backfill as indicated.

### 3.11 CONCRETE PLACEMENT

- A. Place cast-in-place concrete according to ACI 318 and ACI 350R.

### 3.12 PIPE BENEATH BUILDING SLABS AND FOUNDATIONS

- A. All pipe shall be Ductile Iron, Class 52.
- B. Reinforced pipe material shall extend from structure to structure. Material changes shall not be permitted mid-run.
- C. Pipe shall be cement-lined where used to sleeve PVC/HDPE principal conduit material.
  - 1. Principal conduit shall be aligned along the central axis of the sleeve pipe, braced into position utilizing cement or HDPE shims, and the annular space filled with pea gravel (1/2" maximum particle size).
- D. Pipe backfill shall be 3/4" quarry process clean stone placed in 1 foot lifts and compacted in place in accordance with Division 31 section "Earth Moving". Stone backfill shall extend from the pipe springline to finished grade.

### 3.13 CONNECTION TO EXISTING STRUCTURES

- A. Where connection into an existing storm sewer structure is required, the Contractor shall be responsible for maintaining the integrity of the existing structure. No separate payment shall be made for repair work required to correct damage to the structure because of the connection work.
- B. All cuts into the existing structure walls shall be made with an approved power saw.
- C. All joints and excess wall surface removed to facilitate pipe installation shall be sealed water-tight with masonry block and grout.
- D. All backfill shall be in accordance with Section 31 20 00 Earth Moving.

### 3.14 CLEANOUT INSTALLATION

- A. Install cleanouts and riser extension from sewer pipe to cleanout at grade. Use HDPE/PVC pipe fittings in sewer pipes at branches for cleanouts and HDPE/PVC pipe for riser extensions to cleanouts. Install piping so cleanouts open in direction of flow in sewer pipe.
- B. Set cleanout frames and covers in earth in cast-in-place concrete block, 18 by 18 by 12 inches deep. Set with tops 1/4 inch below surrounding earth grade.
- C. In roadway traffic areas, enclosed top of cleanout stack in a cast iron casting set in concrete to prevent crushing of the stack.

- D. All labor, materials, and equipment required to join and provide fittings for all cleanout assemblies shall be included in the price bid for the proposal.

3.15 UNDERGROUND STORMWATER VAULT

- A. Install in accordance with manufacturer specifications and requirements.

3.16 STORM WATER TREATMENT DEVICE

- A. Install in accordance with manufacturer specifications and requirements.

3.17 REHABILITATE EXISTING STRUCTURES

- A. This work shall consist of removing and cleaning the existing castings, replacement of any damaged block and/or brick, replacement of any loose or missing mortar, parging of the inlet interior, resetting of any loose ladder rings, resetting of the existing castings to the final grade and any work necessary as directed by the Owner.

3.18 CLOSING ABANDONED STORM DRAINAGE SYSTEMS

- A. Abandoned Piping: Close open ends of abandoned underground piping indicated to remain in place. Include closures strong enough to withstand hydrostatic and earth pressures that may result after ends of abandoned piping have been closed. Use either procedure below as appropriate:
  - 1. Close open ends of piping with at least 8-inch thick, brick masonry bulkheads.
  - 2. Close open ends of piping with threaded metal caps, plastic plugs, or other acceptable methods suitable for size and type of material being closed. Do not use wood plugs.
  - 3. Fill with flowable fill where indicated on the plans.
- B. Abandoned Structures: Excavate around structure as required and remove structure and close open ends of remaining piping.

3.19 ADJUSTMENTS TO GRATE RIM ELVATIONS

- A. Raise or lower the existing frames, covers and gratings of manholes, and drainage structures to the grades shown on the plans or directed by the Owner.
- B. Parge exterior surface with mortar when brick or masonry units are added or when the exterior surface is disturbed.
- C. Replace frames, covers or gratings damaged during the Work of the Contract

3.20 FIELD QUALITY CONTROL

- A. Clear interior of piping and structures of dirt and superfluous material as work progresses. Maintain swab or drag in piping, and pull past each joint as it is completed.
  - 1. In large, accessible piping, brushes and brooms may be used for cleaning.
  - 2. Place plug in end of incomplete piping at end of day and when work stops.
  - 3. Flush piping between manholes and other structures to remove collected debris, if required by authorities having jurisdiction.
  
- B. Inspect interior of piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches of backfill is in place, and again at completion of Project.
  - 1. Submit separate reports for each system inspection.
  - 2. Defects requiring correction include the following:
    - a. Alignment: Less than full diameter of inside of pipe is visible between structures.
    - b. Deflection: Flexible piping with deflection that prevents passage of ball or cylinder of size not less than 92.5 percent of piping diameter.
    - c. Crushed, broken, cracked, or otherwise damaged piping.
    - d. Infiltration: Water leakage into piping.
    - e. Exfiltration: Water leakage from or around piping.
  - 3. Replace defective piping using new materials, and repeat inspections until defects are within allowances specified.
  - 4. Reinspect and repeat procedure until results are satisfactory.
  
- C. Upon completion of storm sewer installation, the contractor shall schedule a final acceptance inspection with the Owner's Representative. The contractor shall furnish at his expense, labor and equipment to inspect all pipe runs (i.e. lights, mirrors, pry-bars, laborers, etc.)
  - 1. Do not enclose, cover, or put into service before inspection and approval.
  - 2. Test completed piping systems according to authorities having jurisdiction.
  - 3. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours' advance notice.
  - 4. Submit separate reports for each test.
  
- D. Leaks constitute defects that must be repaired.
  
- E. Replace leaking piping using new materials.

END OF SECTION 334000

SECTION (\_\_\_\_)  
STORM WATER TREATMENT DEVICE

1.0 GENERAL

- 1.1 This item shall govern the furnishing and installation of the Cascade Separator® by Contech Engineered Solutions LLC, complete and operable as shown and as specified herein, in accordance with the requirements of the plans and contract documents.
- 1.2 The Contractor shall furnish all labor, equipment and materials necessary to install the storm water treatment device(s) (SWTD) and appurtenances specified in the Drawings and these specifications.
- 1.3 The manufacturer of the SWTD shall be one that is regularly engaged in the engineering design and production of systems deployed for the treatment of storm water runoff for at least five (5) years and which have a history of successful production, acceptable to the Engineer. In accordance with the Drawings, the SWTD(s) shall be a Cascade Separator™ device manufactured by:

Contech Engineered Solutions LLC  
9025 Centre Pointe Drive  
West Chester, OH, 45069  
Tel: 1 800 338 1122

1.4 Related Sections

- 1.4.1 Section 02240: Dewatering
- 1.4.2 Section 02260: Excavation Support and Protection
- 1.4.3 Section 02315: Excavation and Fill
- 1.4.4 Section 02340: Soil Stabilization

- 1.5 All components shall be subject to inspection by the engineer at the place of manufacture and/or installation. All components are subject to being rejected or identified for repair if the quality of materials and manufacturing do not comply with the requirements of this specification. Components which have been identified as defective may be subject for repair where final acceptance of the component is contingent on the discretion of the Engineer.
- 1.6 The manufacturer shall guarantee the SWTD components against all manufacturer originated defects in materials or workmanship for a period of twelve (12) months from the date the components are delivered to the owner for installation. The manufacturer shall upon its determination repair, correct or replace any manufacturer originated defects advised in writing to the manufacturer within the referenced warranty period. The use of SWTD components shall be limited to the application for which it was specifically designed.
- 1.7 The SWTD manufacturer shall submit to the Engineer of Record a “Manufacturer’s Performance Certification” certifying that each SWTD is capable of achieving the specified removal efficiencies listed in these specifications. The certification shall be supported by independent third-party research

1.8 No product substitutions shall be accepted unless submitted 10 days prior to project bid date, or as directed by the Engineer of Record. Submissions for substitutions require review and approval by the Engineer of Record, for hydraulic performance, impact to project designs, equivalent treatment performance, and any required project plan and report (hydrology/hydraulic, water quality, stormwater pollution) modifications that would be required by the approving jurisdictions/agencies. Contractor to coordinate with the Engineer of Record any applicable modifications to the project estimates of cost, bonding amount determinations, plan check fees for changes to approved documents, and/or any other regulatory requirements resulting from the product substitution.

## 2.0 MATERIALS

2.1 Housing unit of stormwater treatment device shall be constructed of pre-cast or cast-in-place concrete, no exceptions. Precast concrete components shall conform to applicable sections of ASTM C 478, ASTM C 857 and ASTM C 858 and the following:

- 2.1.1 Concrete shall achieve a minimum 28-day compressive strength of 4,000 pounds per square-inch (psi);
- 2.1.2 Unless otherwise noted, the precast concrete sections shall be designed to withstand lateral earth and AASHTO H-20 traffic loads;
- 2.1.3 Cement shall be Type III Portland Cement conforming to ASTM C 150;
- 2.1.4 Aggregates shall conform to ASTM C 33;
- 2.1.5 Reinforcing steel shall be deformed billet-steel bars, welded steel wire or deformed welded steel wire conforming to ASTM A 615, A 185, or A 497.
- 2.1.6 Joints shall be sealed with preformed joint sealing compound conforming to ASTM C 990.
- 2.1.7 Shipping of components shall not be initiated until a minimum compressive strength of 4,000 psi is attained or five (5) calendar days after fabrication has expired, whichever occurs first.

2.2 Internal Components and appurtenances shall conform to the following:

- 2.2.1 Hardware shall be manufactured of Type 316 stainless steel conforming to ASTM A 320;
- 2.2.2 Support brackets shall be manufactured of 5052 aluminum
- 2.2.3 Fiberglass components shall conform to applicable sections of ASTM D-4097
- 2.2.4 Access system(s) conform to the following:
- 2.2.5 Manhole castings shall be designed to withstand AASHTO H-20 loadings and manufactured of cast-iron conforming to ASTM A 48 Class 30.

## 3.0 PERFORMANCE

3.1 The SWTD shall be sized to either achieve an 80 percent average annual reduction in the total suspended solid load or treat a flow rate designated by the jurisdiction in which the project is located. Both methods should be sized using the OK-110 particle distribution having particles ranging from 53 microns to 212 microns with a d50 of around 110 microns.

3.2 The SWTD shall be designed with a sump chamber for the storage of captured sediments and other negatively buoyant pollutants in between maintenance cycles. The minimum storage capacity provided by the sump chamber shall be in accordance with the volume listed in Table

1. The boundaries of the sump chamber shall be limited to that which do not degrade the SWTD's treatment efficiency as captured pollutants accumulate. In order to not restrict the Owner's ability to maintain the SWTD, the minimum dimension providing access from the ground surface to the sump chamber shall be 16 inches in diameter.
- 3.3 The SWTD shall be designed to capture and retain Total Petroleum Hydrocarbons generated by wet-weather flow and dry-weather gross spills and have a capacity listed in Table 1 of the required unit.
  - 3.4 The SWTD shall convey the flow from the peak storm event of the drainage network, in accordance with required hydraulic upstream conditions as defined by the Engineer. If a substitute SWTD is proposed, supporting documentation shall be submitted that demonstrates equal or better upstream hydraulic conditions compared to that specified herein. This documentation shall be signed and sealed by a Professional Engineer registered in the State of the work. All costs associated with preparing and certifying this documentation shall be born solely by the Contractor.

#### 4.0 EXECUTION

- 4.1 The contractor shall exercise care in the storage and handling of the SWTD components prior to and during installation. Any repair or replacement costs associated with events occurring after delivery is accepted and unloading has commenced shall be borne by the contractor.
- 4.2 The SWTD shall be installed in accordance with the manufacturer's recommendations and related sections of the contract documents. The manufacturer shall provide the contractor installation instructions and offer on-site guidance during the important stages of the installation as identified by the manufacturer at no additional expense. A minimum of 72 hours notice shall be provided to the manufacturer prior to their performance of the services included under this subsection.
- 4.3 The contractor shall fill all voids associated with lifting provisions provided by the manufacturer. These voids shall be filled with non-shrinking grout providing a finished surface consistent with adjacent surfaces. The contractor shall trim all protruding lifting provisions flush with the adjacent concrete surface in a manner, which leaves no sharp points or edges.
- 4.4 The contractor shall removal all loose material and pooling water from the SWTD prior to the transfer of operational responsibility to the Owner.

**TABLE 1: Storm Water Treatment Device Storage Capacities**

Cascade Model	Minimum Sump Storage Capacity (yd <sup>3</sup> )	Minimum Oil Storage Capacity (gal)
CS-4	0.70	141.0
CS-5	1.09	269.3
CS-6	1.57	475.9
CS-8	2.79	1128.0
CS-10	4.36	2203.2
CS-12	6.28	3807.1

**END OF SECTION**

## Section 33 46 23 MODULAR STORMWATER STORAGE UNITS

### PART 1 – GENERAL

#### 1.01 RELATED DOCUMENTS

- A. Drawings, technical specification and general provisions of the Contract as modified herein apply to this section.

#### 1.02 DESCRIPTION OF WORK INCLUDED

- A. Provide excavation and base preparation per geotechnical engineer's recommendations and/or as shown on the design drawings, to provide adequate support for project design loads and safety from excavation sidewall collapse. Excavations shall be in accordance with the owner's and OSHA requirements.
- B. Provide and install R-Tank<sup>LD</sup>, R-Tank<sup>HD</sup>, R-Tank<sup>SD</sup>, or R-Tank<sup>UD</sup> system (hereafter called R-Tank) and all related products including fill materials, geotextiles, geogrids, inlet and outlet pipe with connections per the manufacturer's installation guidelines provided in this section.
- C. Provide and construct the cover of the R-Tank system including; stone backfill, structural fill cover, and pavement section as specified.
- D. Protect R-Tank system from construction traffic after installation until completion of all construction activity in the installation area.

#### 1.03 QUALITY CONTROL

- A. All materials shall be manufactured in ISO certified facilities.
- B. Installation Contractor shall demonstrate the following experience:
  - 1. A minimum of three R-Tank or equivalent projects completed within 2 years; and,
  - 2. A minimum of 25,000 cubic feet of storage volume completed within 2 years.
  - 3. Contractor experience requirement may be waived if the manufacturer's representative provides on-site training and review during construction.
- C. Installation Personnel: Performed only by skilled workers with satisfactory record of performance on bulk earthworks, pipe, chamber, or pond/landfill construction projects of comparable size and quality.
- D. Contractor must have manufacturer's representative available for site review if requested by Owner.

#### 1.04 SUBMITTALS

- A. Submit proposed R-Tank layout drawings. Drawings shall include typical section details as well as the required base elevation of stone and tanks, minimum cover requirements and tank configuration.
- B. Submit manufacturer's product data, including compressive strength and unit weight.
- C. Submit manufacturer's installation instructions.
- D. Submit R-Tank sample for review. Reviewed and accepted samples will be returned to the Contractor.
- E. Submit material certificates for geotextile, geogrid, base course and backfill materials.
- F. Submit required experience and personnel requirements as specified in Section 1.03.
- G. Any proposed equal alternative product substitution to this specification must be submitted for review and approved prior to bid opening. Review package should include third party reviewed performance data that meets or exceeds criteria in Table 2.01 B.

#### 1.05 DELIVERY, STORAGE, AND HANDLING

- A. Protect R-Tank and other materials from damage during delivery, and store UV sensitive materials under tarp to protect from sunlight when time from delivery to installation exceeds two weeks. Storage of materials should be on smooth surfaces, free from dirt, mud and debris.
- B. Handling is to be performed with equipment appropriate to the materials and site conditions, and may include hand, handcart, forklifts, extension lifts, etc.
- C. Cold weather:
  - 1. Care must be taken when handling plastics when air temperature is 40 degrees or below as plastic becomes brittle.
  - 2. Do not use frozen materials or materials mixed or coated with ice or frost.
  - 3. Do not build on frozen ground or wet, saturated or muddy subgrade.

#### 1.06 PREINSTALLATION CONFERENCE.

- A. Prior to the start of the installation, a preinstallation conference shall occur with the representatives from the design team, the general contractor, the excavation contractor, the R-Tank installation contractor, and the manufacturer's representative.

1.07 PROJECT CONDITIONS

- A. Coordinate installation for the R-Tank system with other on-site activities to eliminate all non-installation related construction traffic over the completed R-Tank system. No loads heavier than the design loads shall be allowed over the system, and in no case shall loads higher than a standard AASHTO HS20 (or HS25, depending on design criteria) load be allowed on the system at any time.
- B. Protect adjacent work from damage during R-Tank system installation.
- C. All pre-treatment systems to remove debris and heavy sediments must be in place and functional prior to operation of the R-Tank system. Additional pretreatment measures may be needed if unit is operational during construction due to increased sediment loads.
- D. Contractor is responsible for any damage to the system during construction.

**PART 2 – PRODUCTS**

2.01 R-TANK UNITS

- A. R -Tank - Injection molded plastic tank plates assembled to form a 95% void modular structure of predesigned height (custom for each project).
- B. R-Tank units shall meet the following Physical & Chemical Characteristics:

PROPERTY	DESCRIPTION	R-Tank <sup>LD</sup> VALUE	R-Tank <sup>HD</sup> VALUE	R-Tank <sup>SD</sup> VALUE	R-Tank <sup>UD</sup> VALUE
Void Area	Volume available for water storage	95%	95%	95%	95%
Surface Void Area	Percentage of exterior available for infiltration	90%	90%	90%	90%
Vertical Compressive Strength	ASTM D 2412 / ASTM F 2418	30.0 psi	33.4 psi	42.9 psi	134.2 psi
Lateral Compressive Strength	ASTM D 2412 / ASTM F 2418	20.0 psi	22.4 psi	28.9 psi	N/A
HS-20 Minimum Cover	Cover required to support HS-20 loads	N/A	20"	18"	12" (Stone Backfill)
HS-25 Minimum Cover	Cover required to support HS-25 loads	N/A	24"	19"	15" (Stone Backfill)
Maximum Cover	Maximum allowable cover depth	3 feet	< 7 feet	< 10 feet	5 feet
Unit Weight	Weight of plastic per cubic foot of tank	3.29 lbs / cf	3.62 lbs/cf	3.96 lbs / cf	4.33 lbs / cf
Rib Thickness	Thickness of load-bearing members	0.18 inches	0.18 inches	0.18 inches	N/A
Service Temperature	Safe temperature range for use	-14 – 167° F			

- C. Supplier: ACF Environmental 2831 Cardwell Road Richmond, VA 23234  
(T): 800-448-3636; (F): 804-743-7779 [www.acfenvironmental.com](http://www.acfenvironmental.com)

2.02 GEOSYNTHETICS

- A. Geotextile. A geotextile envelope is required to prevent backfill material from entering the R-Tank modules.
- Standard Application:** The standard geotextile shall be an 8 oz per square yard nonwoven geotextile (ACF N080 or equivalent).
  - Infiltration Applications:** When water must infiltrate/exfiltrate through the geotextile as a function of the system design, a woven monofilament (ACF M200 or equivalent) shall be used.

- B. Geogrid. For installations subject to traffic loads and/or when required by project plans, install geogrid (ACF BX12 or equivalent) to reinforce backfill above the R-Tank system. Geogrid is not always required for R-Tank<sup>UD</sup> installations, and is often not required for non-traffic load applications.

## 2.03 BACKFILL & COVER MATERIALS

- A. **Bedding Materials:** Stone (angular and smaller than 1.5" in diameter) or soil (GW, GP, SW, or SP as classified by the Unified Soil Classification System) shall be used below the R-Tank system (3" minimum). Material must be free from lumps, debris, and any sharp objects that could cut the geotextile. Material shall be within 3 percent of the optimum moisture content as determined by ASTM D698 at the time of installation. For infiltration applications bedding material shall be free draining.
- B. **Side and Top Backfill:** Material must be free from lumps, debris and any sharp objects that could cut the geotextile. Material shall be within 3 percent of the optimum moisture content as determined by ASTM D698 at the time of installation.
  - 1. Traffic Applications - Free draining material shall be used adjacent to (24" minimum) and above (for the first 12") the R-Tank system.
    - a. For HD, and SD modules, backfill materials shall be free draining stone (angular and smaller than 1.5" in diameter) or soil (GW, GP, SW, or SP as classified by the Unified Soil Classification System).
    - b. For UD modules with less than 14" of top cover, backfill materials shall be free draining stone (angular and smaller than 1.5" in diameter). The use of soil backfill on the sides and top of the UD module is not permitted unless the modules are installed outside of traffic areas or with cover depths of 14" or more. Top backfill material (from top of module to bottom of pavement base or 12" maximum) must be consistent with side backfill.
  - 2. Non-Traffic / Green Space Applications - For all R-Tank modules installed in green spaces and not subjected to vehicular loads, backfill materials may either follow the guidelines for Traffic Applications above, or the top backfill layer (12" minimum) may consist of AASHTO #57 stone blended with 30-40% (by volume) topsoil to aid in establishing vegetation.
- C. **Additional Cover Materials:** Structural Fill shall consist of granular materials meeting the gradational requirements of SM, SP, SW, GM, GP or GW as classified by the Unified Soil Classification System. Structural fill shall have a maximum of 25 percent passing the No. 200 sieve, shall have a maximum clay content of 10 percent and a maximum Plasticity Index of 4. Material shall be within 3 percent of the optimum moisture content as determined by ASTM D698 at the time of installation.

## 2.04 OTHER MATERIALS

- A. Utility Marker: Install metallic tape at corners of R-Tank system to mark the area for future utility detection.

## PART 3 – EXECUTION

### 3.01 ASSEMBLY OF R-TANK UNITS

- A. Assembly of modules shall be performed in accordance with the R-Tank Installation Manual, Section 2.

### 3.02 LAYOUT AND EXCAVATION

- A. Installer shall stake out, excavate, and prepare the subgrade area to the required plan grades and dimensions, ensuring that the excavation is at least 2 feet greater than R-Tank dimensions in each direction allowing for installation of geotextile filter fabric, R-Tank modules, and free draining backfill materials.
- B. All excavations must be prepared with OSHA approved excavated sides and sufficient working space.
- C. Protect partially completed installation against damage from other construction traffic by establishing a perimeter with high visibility construction tape, fencing, barricades, or other means until construction is complete.
- D. Base of the excavation shall be uniform, level, and free of lumps or debris and soft or yielding subgrade areas. A minimum 2,000 pounds per square foot bearing capacity is required.
  - 1. **Standard Applications:** Compact subgrade to a minimum of 95% of Standard Proctor (ASTM D698) density or as required by the Owner's engineer.
  - 2. **Infiltration Applications:** Subgrade shall be prepared in accordance with the contract documents. Compaction of subgrade should not be performed in infiltration applications.
- E. **Unsuitable Soils or Conditions:** All questions about the base of the excavation shall be directed to the owner's

engineer, who will approve the subgrade conditions prior to placement of stone. The owner's engineer shall determine the required bearing capacity of the R-Tank subgrade; however in no case shall a bearing capacity of less than 2,000 pounds per square foot be provided.

1. If unsuitable soils are encountered at the subgrade, or if the subgrade is pumping or appears excessively soft, repair the area in accordance with contract documents and/or as directed by the owner's engineer.
2. If indications of the water table are observed during excavation, the engineer shall be contacted to provide recommendations.
3. Do not start installation of the R-Tank system until unsatisfactory subgrade conditions are corrected and the subgrade conditions are accepted by the owner's engineer.

### 3.03 PREPARATION OF BASE

- A. Place a thin layer (3" unless otherwise specified) of bedding material (Section 2.03 A), over the subgrade to establish a level working platform for the R-Tank modules. Level to within  $\frac{1}{2}$ " (+/-  $\frac{1}{4}$ ") or as shown on the plans. Native subgrade soils or other materials may be used if determined to meet the requirements of 2.03 A and are accepted by the owner's engineer.
  1. **Standard Applications:** Static roll or otherwise compact bedding materials until they are firm and unyielding.
  2. **Infiltration Applications:** Bedding materials shall be prepared in accordance with the contract documents.
- B. Outline the footprint of the R-Tank system on the excavation floor using spray paint or chalk line to ensure a 2' perimeter is available around the R-Tank system for proper installation and compaction of backfill.

### 3.04 INSTALLATION OF THE R-TANKS

- A. Where a geotextile wrap is specified on the stone base, cut strips to length and install in excavation, removing wrinkles so material lays flat. Overlap geotextile a minimum 12" or as recommended by manufacturer. Use tape, special adhesives, sandbags or other ballast to secure overlaps. As geotextiles can be damaged by extreme heat, smoking is not permissible on/near the geotextile, and tools using a flame to tack the overlaps, such as propane torches, are prohibited.
- B. Where an impervious liner (for containment) is specified, install the liner per manufacturer's recommendations and the contract documents. The R-Tank units shall be separated from impervious liner by a non-woven geotextile fabric installed accordance with Section 3.04A.
- C. Install R-Tank modules by placing side by side, in accordance with the design drawings. No lateral connections are required. It is advisable to use a string line to form square corners and straight edges along the perimeter of the R-Tank system. The modules are to be oriented as per the design drawing with required depth as shown on plans.
  1. For LD, HD, and SD installations, the large side plate of the tank should be placed on the perimeter of the system. This will typically require that the two ends of the tank area will have a row of tanks placed perpendicular to all other tanks. If this is not shown in the construction drawings, it is a simple field adjustment that will have minimal effect on the overall system footprint. Refer to R-Tank Installation Guide for more details
  2. For UD installations, there is no perpendicular end row required.
- D. Wrap the R-Tank top and sides in specified geotextile. Cut strips of geotextile so that it will cover the sides and top, encapsulating the entire system to prevent backfill entry into the system. Overlap geotextile 12" or as recommended by manufacturer. Take great care to avoid damage to geotextile (and, if specified, impervious liner) during placement.
- E. Identify locations of inlet, outlet and any other penetrations of the geotextile (and optional liner). These connections should be installed flush (buted up to the R-Tank) and the geotextile fabric shall be cut to enable hydraulic continuity between the connections and the R-Tank units. These connections shall be secured using pipe boots with stainless steel pipe clamps. Support pipe in trenches during backfill operations to prevent pipe from settling and damaging the geotextile, impervious liner (if specified) or pipe. Connecting pipes at 90 degree angles facilitates construction, unless otherwise specified. Ensure end of pipe is installed snug against R-Tank system.
- F. Install Inspection and Maintenance Ports in locations noted on plans. At a minimum one maintenance port shall be installed within 10' of each inlet & outlet connection, and with a maximum spacing of one maintenance port for every 2,500 square feet. Install all ports as noted in the R-Tank Installation Guide.
- G. If required, install ventilation pipes and vents as specified on drawings to provide ventilation for proper hydraulic

performance. The number of pipes and vents will depend on the size of the system. Vents are often installed using a 90 degree elbow with PVC pipe into a landscaped area with 'U' bend or venting bollard to inhibit the ingress of debris. A ground level concrete or steel cover can be used.

### 3.05 BACKFILLING OF THE R-TANK UNITS

- A. Backfill and fill with recommended materials as follows:
1. Place freely draining backfill materials (Section 2.03 B) around the perimeter in lifts with a maximum thickness of 12". Each lift shall be placed around the entire perimeter such that each lift is no more than 24" higher than the side backfill along any other location on the perimeter of the R-Tank system. No fill shall be placed over top of tanks until the side backfill has been completed.
  2. Each lift shall be compacted at the specified moisture content to a minimum of 95% of the Standard Proctor Density until no further densification is observed (for self-compacting stone materials). The side lifts must be compacted with walk behind compaction equipment. Even when "self-compacting" backfill materials are selected, a walk behind vibratory compactor must be used.
  3. Take care to ensure that the compaction process does not allow the machinery to come into contact with the modules due to the potential for damage to the geotextile and R-Tank units.
  4. No compaction equipment is permissible to operate directly on the R-Tank modules.
  5. Top Backfill: Only low pressure track vehicles shall be operated over the R-Tank system during construction. Dump Trucks and Pans shall not be operated within the R-Tank system footprint at any time. Heavy equipment should unload in an area adjacent to the R-Tank system and the material should be moved over the system using tracked equipment with an operating weight of less than 10 tons.
    - a. Typical Applications: Install a 12" (or as shown on plans) lift of freely draining material (Section 2.03 B) over the R-Tank Units, maintaining 12" between equipment tracks and R-Tank System. Lightly compacted using a walk-behind trench roller. Alternately, a roller (maximum gross vehicle weight of 6 tons) may be used. Roller must remain in static mode until a minimum of 24" of cover has been placed over the modules. Sheep foot rollers should not be used.
    - b. Shallow Applications (< 18" total cover): Install top backfill in accordance with plans.
  6. If required, install a geogrid as shown on plans. Geogrid shall extend a minimum of 3 feet beyond the limits of the excavation wall.
  7. Following placement and compaction of the initial cover, subsequent lifts of structural fill (Section 2.03 C) shall be placed at the specified moisture content and compacted to a minimum of 95% of the Standard Proctor Density and shall cover the entire footprint of the R-Tank system. During placement of fill above the system, unless otherwise specified, a uniform elevation of fill shall be maintained to within 12" across the footprint of the R-Tank system. Do not exceed maximum cover depths listed in Table 2.01 B.
  8. Place additional layers of geotextile and/or geogrid at elevations as specified in the design details. Each layer of geosynthetic reinforcement placed above the R-Tank system shall extend a minimum of 3 feet beyond the limits of the excavation wall.
- B. Ensure that all unrelated construction traffic is kept away from the limits of excavation until the project is complete and final surface materials are in place. No non-installation related loading should be allowed over the R-Tank system until the final design section has been constructed (including pavement).
- C. Place surfacing materials, such as groundcovers (no large trees), or paving materials over the structure with care to avoid displacement of cover fill and damage to surrounding areas.
- D. Backfill depth over R-Tank system must be within the limitations shown in the table in Section 2.01 B. If the total backfill depth does not comply with this table, contact engineer or manufacturer's representative for assistance.

### 3.06 MAINTENANCE REQUIREMENTS

- A. A routine maintenance effort is required to ensure proper performance of the R-Tank system. The Maintenance program should be focused on pretreatment systems. Ensuring these structures are clean and functioning properly will reduce the risk of contamination of the R-Tank system and stormwater released from the site. Pretreatment systems shall be inspected yearly, or as directed by the regulatory agency and by the manufacturer (for proprietary systems). Maintain as needed using acceptable practices or following manufacturer's guidelines (for proprietary systems).
- B. All inlet pipes and Inspection and/or Maintenance Ports in the R-Tank system will need to be inspected for accumulation of sediments at least quarterly through the first year of operation and at least yearly thereafter.

- C. If sediment has accumulated to the level noted in the R-Tank Maintenance Guide or beyond a level acceptable to the Owner's engineer, the R-Tank system should be flushed.
- D. All inspection and maintenance activities should be performed in accordance with the R-Tank Operation, Inspection & Maintenance Manual.

**END OF SECTION**

SECTION ( )

Steel Reinforced Polyethylene (SRPE) Tank  
Standard Specification

1.0 GENERAL

- 1.1 This item shall govern the furnishing and installation of Steel Reinforced Polyethylene (SRPE) Tanks for rainwater harvesting and other underground water storage for nominal diameters 30" (750mm) through 120" (3000mm).
- 1.2 Contractor shall furnish all labor, materials, equipment and incidentals necessary to install the SRPE system, appurtenances and incidentals in accordance with the Drawings and as specified herein.
- 1.3 A stormwater treatment device upstream of the SRPE system is recommended as the appropriate means of pretreating for the purpose of extending the maintenance interval on the SRPE system and reducing the life cycle cost. Both engineered solutions shall be provided by a single supplier/manufacturer.
- 1.4 Applicable provisions of any Division shall govern work in this section.
- 1.5 Related Standards
  - 1.5.1 ASTM F2562 "Standard Specification for Steel Reinforced Thermoplastic Ribbed Pipe and Fittings for Non-Pressure Drainage and Sewerage"
  - 1.5.2 AASHTO Designation MP-20 Section
  - 1.5.3 ASTM D3350 "Standard Specification for Polyethylene Plastics Pipe and Fittings Materials"
  - 1.5.4 ASTM D2321 "Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications"
- 1.6 Site layout drawings, product specifications, materials, hydraulic storage data and supported calculations of proposed alternatives shall be submitted to the Engineer of Record (EOR) for review at a minimum of 10 working days prior to bid closing.
- 1.7 The SRPE system proposal shall be sized in accordance to the design provided and approved by the Engineer of Record (EOR). Any Contractor deviating from the design shown on the plans, to include: material, footprint, etc., shall provide to the Engineer of Record (EOR) a summary report on stage-storage curves, design calculations, HydroCAD modeling and engineering drawings.
- 1.8 Shop drawings shall be annotated to indicate all materials to be furnished and installed under this section, and all applicable standards for materials, required tests of materials and design assumptions for structural analysis:
- 1.9 Before installation of the SRPE system, Contractor shall obtain the written approval of the Engineer of Record (EOR) for the stormwater system and the installation drawings.

## 2.0 MATERIALS

- 2.1 SRPE shall be manufactured in accordance with the applicable requirements of ASTM F2562 “Standard Specification for Steel Reinforced Thermoplastic Ribbed Pipe and Fittings for Non-Pressure Drainage and Sewerage”.
- 2.2 Virgin high density polyethylene stress-rated resins are used to manufacture SRPE Tank and complimentary fabricated fittings. Resins shall conform to the minimum requirements of cell classification 345464C as defined and described in the latest version of ASTM D3350 “Standard Specification for Polyethylene Plastics Pipe and Fittings Materials”.
- 2.3 The manufacturer of the SRPE system shall be one that has regularly been engaged in the engineering design and production of these systems for at least eight (8) years and which has a history of successful production, acceptable to the Engineer of Record (EOR). In accordance with the Drawings, the SRPE system shall be supplied by:

Contech Engineered Solutions  
9025 Centre Pointe Drive  
West Chester, OH, 45069  
Tel: 1 800 338 1122

- 2.4 Sampling, testing, and inspection of PE resin, metal sheets and coils used for manufacturing the SRPE system shall be in accordance with to the above applicable referenced specifications. All fabrication of the product shall occur within the United States.

## 3.0 PERFORMANCE

- 3.1 All tanks must be leak tested and results documented using a positive pressure air test prior to shipment from the manufacturing location. Testing documentation shall include test air pressure, and hold time. A copy of the leak test report must be provided to the Engineer of Record as requested.
- 3.2 Bulkheads shall be constructed of material in conformance with Section 2.2 and designed for H-20/HS-25 final live loading conditions.
- 3.3 All SRPE system inlets shall be equipped with an inlet calming device that they may introduce water to the tank with little to no turbulence.
- 3.4 The SRPE system shall provide a minimum of one 36 inch diameter access riser.
- 3.5 SRPE tank spacing and stone base thickness cannot be altered with consultation from Contech Engineered Solutions, LLC.

- 3.6 The SRPE system shall be designed for a minimum HS-20/HS-25 final live loading conditions. The SRPE system shall meet HS-20/HS-25 loading requirements with a minimum cover measured from the top of tank to the bottom of flexible pavement as shown in Table 1.

**Table 1: Dimensions and Cover limitations**

Nominal Tank diam.	Outside Diameter	Unit Weight*	Minimum Wall Thickness (t <sub>1</sub> )		Minimum Cover**		Maximum Cover**	
			in.	[mm]	ft.	[m]	ft.	[m]
30	30.9 [785]	15.5	.082	[2.08]	1	[.305]	8	[15.2]
36	37.1 [942]	20.8	.082	[2.08]	1	[.305]	8	[15.2]
42	43.2 [1097]	26.5	.082	[2.08]	1	[.305]	8	[15.2]
48	49.5 [1257]	29.1	.130	[3.30]	1	[.305]	8	[15.2]
54	55.5 [1410]	34.7	.130	[3.30]	1	[.305]	8	[15.2]
60	61.4 [1560]	41.6	.130	[3.30]	1	[.305]	8	[15.2]
66	67.8 [1722]	56.9	.220	[5.58]	1.5	[.457]	8	[15.2]
72	74.1[1882]	65.6	.220	[5.58]	1.5	[.457]	8	[15.2]
84	85.9 [2182]	76.3	.220	[5.58]	2	[.610]	8	[15.2]
96	97.8 [2484]	87.0	.220	[5.58]	2	[.610]	8	[15.2]
108	111.3 [2827]	99.7	.220	[5.58]	2.5	[.762]	8	[15.2]
120	121.9 [3097]	109.0	.220	[5.58]	3	[.914]	8	[15.2]

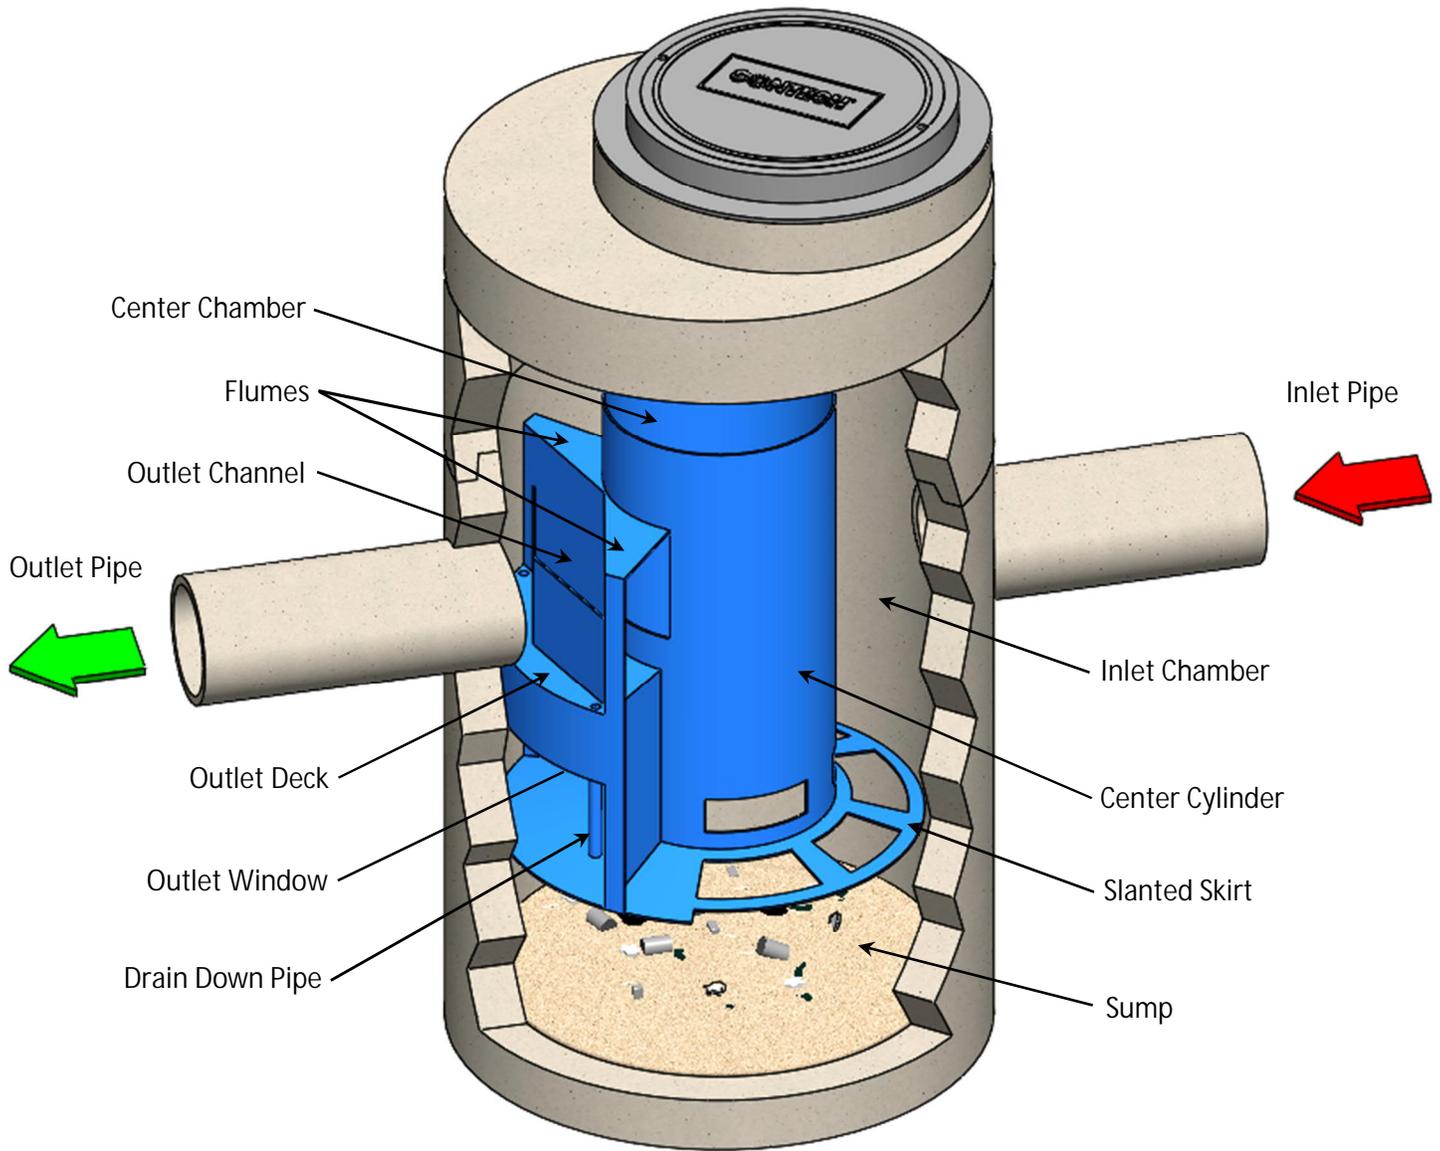

\* Approximate weights. Actual weight will vary with length.  
 \*\*measured from top of tank to bottom of flexible pavement or top of rigid pavement

#### 4.0 EXECUTION

- 4.1 The SRPE system installation shall be in accordance with ASTM D2321 “Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications” along with Table 1 and product-specific recommendations contained in Contech SRPE Tank Installation Guide, available from local Contech representative or from [www.conteches.com](http://www.conteches.com).
- 4.2 The contractor shall follow Occupational Safety and Health Association (OSHA) guidelines for safe practices in executing the installation process in accordance with the manufacturer/supplier installation recommendations.
- 4.3 Supplier will conduct an on-site preconstruction meeting with the contractor prior to the scheduled delivery date of the SRPE system.

END SECTION

## Installation Guide for Contractors

## Overview

These instructions provide installation guidelines for the Cascade Separator stormwater treatment system. Before starting installation, be sure you have all the components, tools, and supplies necessary to complete the work.

## Safety Notice

### Confined Space Entry

Secure all equipment and training to meet applicable local and OSHA regulations regarding confined space entry.

### Personal Safety Equipment

- Fall protection equipment
- Gloves
- Hard hat
- Eye protection
- Ear protection
- Respiratory protection

## Cascade Separator Parts List

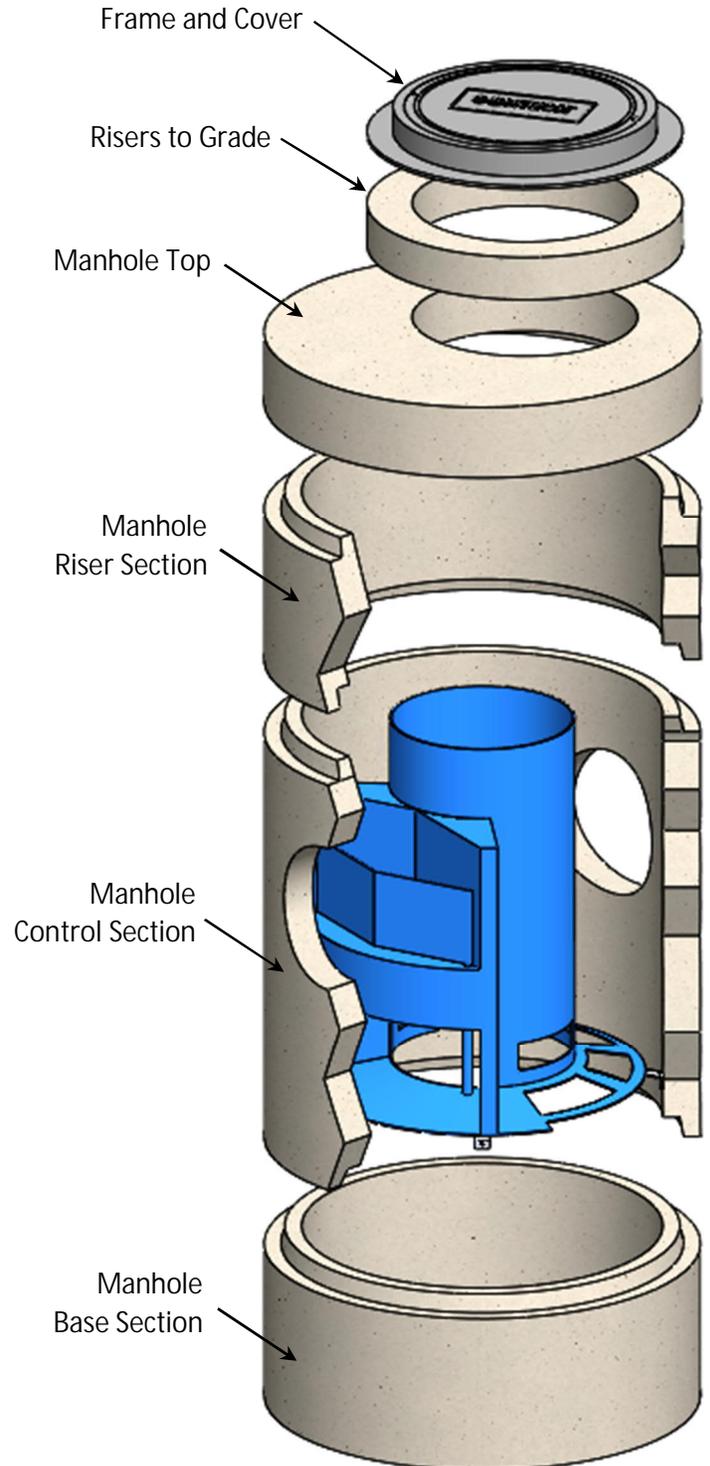

### Standard Equipment (What to expect)

Typically, the Cascade Separator will arrive on site with the fiberglass internal components pre-installed within the Manhole Control Section. Large Cascade Separator systems may require the internal components to be installed on site after some manhole sections are placed in the excavated hole. In these cases, Contech will provide additional instructions for the installation of the internal components and possible on site assistance from a trained Contech representative.

- Manhole Base Section
  - May be part of, or attached to, the Manhole Control Section.
- Manhole Control Section
  - Contains the pre-installed internal components and the inlet/outlet core holes.
  - May be made up of multiple section mechanically attached together.
- Manhole Riser Section(s) (if needed, per plans)
- Manhole Top (per plans)
- Risers to Grade (per plans)
- Frame(s) and Cover(s) (per plans)
- Butyl Mastic (sealant for joints)

## Unloading and Handling

Any unloading/handling suggestions or guidance is beyond our scope of work but can be obtained from the precaster. Contact your Contech representative if contact information for the precaster is needed.

## Contractor Supplied Material

Grout — Non-shrink grout to connect the inlet pipe(s) and outlet pipe to the manhole.

## Base Preparation

Compact undisturbed sub-grade materials to 95% of maximum density at +/-2% of optimum moisture content prior to placement of crushed rock. Crushed rock base material shall be six-inch minimum layer of ¾-inch minus rock. Unsuitable material below sub-grade shall be replaced per site engineer's recommendation.

## Crane Selection

The contractor is responsible for selecting the appropriate equipment to unload and set the Cascade Separator manhole. Contech will provide the contractor with the weights of the precast manhole sections. A representative from the crane company should visit the jobsite and review pertinent information (shop drawings, weights, etc) prior to the selection of the crane.

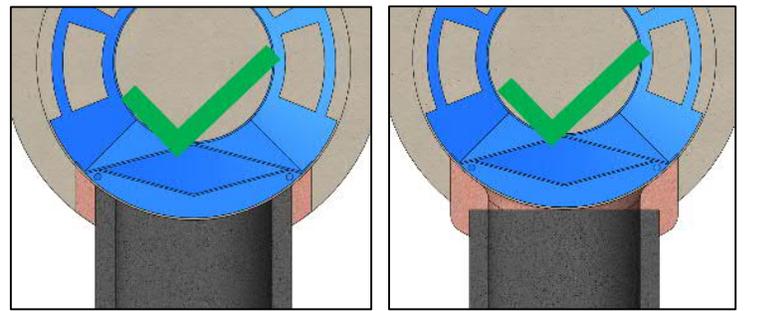

## Setting the Cascade Separator

Ensure the inlet(s) and outlet are oriented per the plans. Manhole floor shall slope ¼ inch maximum across the "width" and "length". Manhole cover top shall be even with surrounding finish grade surface per the plans unless otherwise directed by the site engineer.

## Pipe Connections

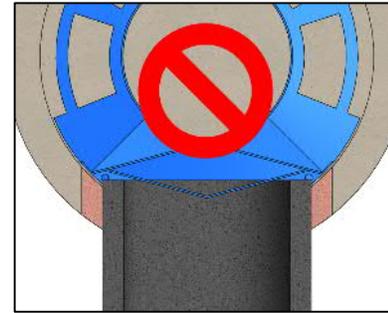

Pipe(s) shall be stubbed in and connected to precast manhole according to Engineer's requirements and specifications. Contractor to grout all inlet pipe(s) and the outlet pipe centered in the inlet and outlet core holes and flush with interior wall of manhole.

Large diameter pipes may need to have the ends cut to match the manhole inside diameter or they may be stubbed in flush to inside wall and a grout connection collar formed. Pipes should never extend in past the inside wall and fiberglass should never be cut to install a pipe connection.

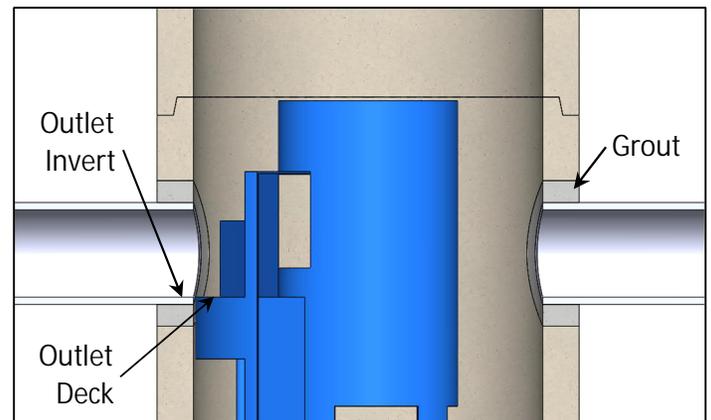

PIPE CUT FLUSH WITH INSIDE WALL

PIPE STUBBED-CONNECTION COLLAR

PIPE SHOULD NEVER EXTEND PAST INSIDE WALL

The inside bottom (invert) of the outlet pipe should be flush with the top of the outlet deck. The outlet pipe invert should never be above the outlet deck, or the system drain down feature will not function correctly.

## Ballast

When required, ballast shall be placed to the dimensions specified by the Engineer as noted on the plans.

## Risers, Covers and Closing the System

The Cascade Separator is delivered with the necessary risers and covers to bring the unit to grade. It is the contractor's responsibility to assemble the manhole per the plans and as directed by the site engineer.

- Place a layer of 1/4 x 1 1/2 butyl mastic manhole sealant between all manhole sections and top.
- Manhole access opening(s) should be oriented according to the contract drawing provided by Contech.

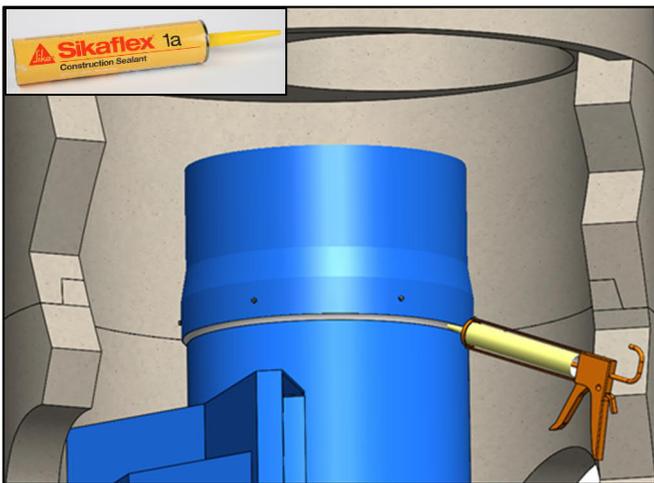

## Backfill

Backfill material and placement method should be performed in accordance with the construction plans and as directed by the site engineer.

## Optional Equipment if Required

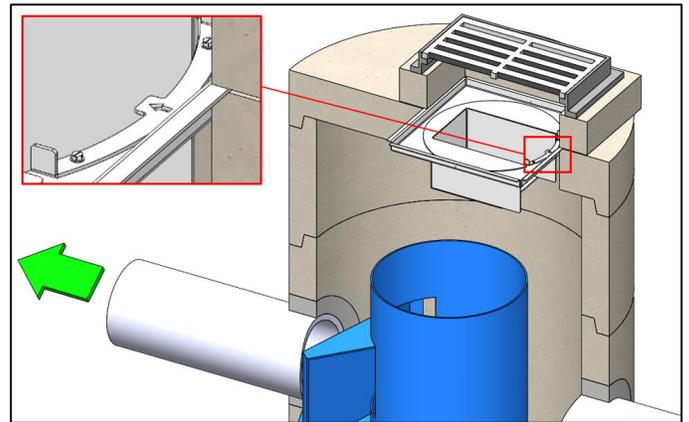

### Cylinder Extension Installation

On some projects the Cascade Separator center cylinder may need to be extended. In these situations, a fiberglass cylinder extension is installed by the contractor over the existing center cylinder. This must be done before the manhole top is set. The bell end of the extension will slip over the top of the existing cylinder and rest on the inside ledge. Using #12 self-drilling stainless steel screws spaced approximately 12" apart secure the extension in place. Do not over-tighten the screws or they may strip out of the fiberglass and weaken the connection. Apply SIKAFLEX 1A polyurethane sealant to seal the gap between the cylinder and the cylinder extension.

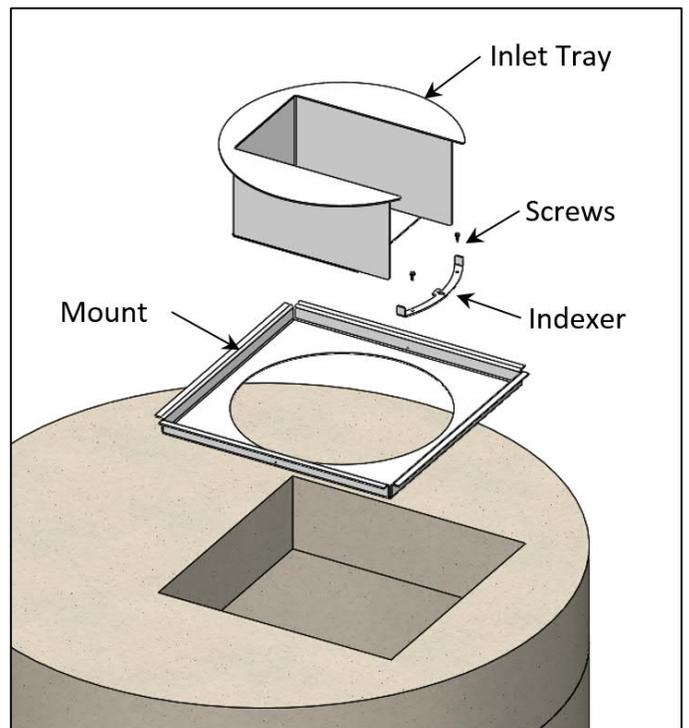

### Grate Inlet Installation

The Cascade Separator can be configured with an optional grate inlet in place of the inlet pipe or in addition to the inlet pipe. This configuration requires the installation of an inlet tray assembly to ensure incoming water goes directly into the inlet chamber.

\*\*\*IMPORTANT- Arrow on the indexer must point in direction of outlet pipe.\*\*\*

Align indexer along the edge of hole in mount so that arrow is pointing in direction of outlet pipe. Attach indexer to mount with (2) self-drilling screws, pre-drill 1/8" pilot holes if desired. Set the inlet tray in mount, the indexer will force the inlet tray into proper alignment.

Install any risers to grade and then the inlet frame and grate supplied by Contech.

## SRPE TANK INSTALLATION GUIDE

## Preface

This installation guide is for your crews. Distribute it to help them unload, handle and install steel reinforced polyethylene (SRPE) tank safely. SRPE tanks can be installed per the requirements of ASTM D2321, "Standard Recommended Practice for Underground Installation of Flexible Thermoplastic Sewer Pipe."

Don't assume that experienced workers know all the answers. Review these instructions with your supervisors and crews. It can mean a safer and better job for you and your customer.

SRPE tanks are made from DuroMaxx® pipe and as such many pipe installation procedures are referenced in this manual.

If you have any questions about these instructions, call your Contech Dealer or your Contech Sales Engineer, or carefully review the installation guide and ASTM D2321.

 This safety alert symbol indicates important safety messages. When you see this symbol, it will alert you to hazards or unsafe practices that CAN result in severe personal injury (including death) or property damage. Be sure you understand the message that follows.

## Safety Instructions

 Failure to follow these instructions can result in serious injury or death and/or damage to pipe.

1. Only trained and authorized equipment operators are to be permitted to unload the trailer.
2. Wear approved safety hat, shoes, gloves and eye protection.
3. Park the truck and trailer on level ground before you start unloading.
4. Keep all unauthorized persons clear of the area when the driver releases the binders from the trailer and during unloading.
5. Do not release strapping around the wood frame until the pallets or bundles have been placed on level ground and will not be moved again as a unit.
6. On nested loads, cut the internal strapping prior to unloading.
7. Know the capabilities and rated load capacities of your lifting equipment. Never exceed them.
8. Do not stand or ride on the load of pipe while it is being unloaded.
9. If unloading at multiple points, secure pallets between drop off points. Always unload the top pallets first. (See illustration at right)
10. Never attach chains or cable to the pipe. They could damage the pipe.
11. Do not push pallets off the trailer or permit pipe to drop to the ground.
12. Do not stack DuroMaxx pipe over two pallets high. Stacks of three or more pallets can damage bottom pipes and can become unstable.
13. Only use authorized unloading poles to lift pipe. Unauthorized unloading pole can lead to unsafe practices and damaged pipe.

## WARNING

14. Falling or rolling pipe can cause severe personal injury or death. Notwithstanding the instructions contained in this booklet, it is the responsibility of the consignee or consignee's agent to devise safe unloading and handling procedures.

## WARNING

14. Do not lift from the steel strapping.
15. Do not stand beneath or near the pipe while it is being unloaded.
16. Always follow all project, local, state and OSHA rules and safety requirements including but not limited to confined space, trenching, shoring and excavation procedures.

## Handling Weights

These are estimated average weights and are not for specification use.

TABLE 1. DIMENSIONS & HANDLING WEIGHTS							
Nom. Volume (gal)	Nom. Diameter (in)	Length (ft)	Pick Weight (lb)	Total Volume (gal)	Total Volume (cf)	Actual Volume (gal)	Actual Volume (cf)
2000	60	16	1250	2280	305	2122	284
3000		24	1750	3420	457	3183	425
4500		32	2000	4560	610	4243	567
6500		48	2750	6840	914	6365	851

20000		36	5500	20486	2739	19231	2571
22500		40	6000	22762	3043	21368	2856

## Unloading and Handling

Read and follow all safety instructions before unloading pipe.

1. Before unloading, observe the pipe for damage while it is still on the truck. Note any pipe damage on the bill-of-lading and have the truck driver initial the notes. Also, report any shipping damage to your local Contech representative.
2. **Do not** overtighten strapping as it may cause dimpling. If dimpling occurs, unstrap pipe to allow for rebound to occur at the dimpling of the pipe.
3. Use a forklift with full-length forks or fork extensions (typically 8 feet), front-end loader or backhoe with fork adapters at full length to engage entire pallet width. Make sure back of forklift is free of protrusions or spikes that could damage the pipe.
4. Use Nylon lifting slings of sufficient strength, length and specifically intended to safely handle entire pallet or individual pipe, whichever is being lifted.
5. Use two (2) sling points for lifting sizes greater than 30" diameter. Sling spacing equal to 1/3rd of the pipe length is generally sufficient.
6. For tank lengths longer than 32 ft, the use of a spreader bar is recommended. The spreader bar should be 1/3rd the length of the tank and appropriately sized for the weight being lifted.
7. **Do not** use steel cables, chains and/or hooks to unload or handle pipe.
8. **Do not** stand or ride on the pipe load during unloading or handling.
9. **Do not** scoop the pipe or strike with forks.
10. **Do not** drag or drop the pipe.

## Trench Dimensions

Trenching practices shall be in accordance with OSHA.

1. The trench needs to be wide enough for a person to work safely.
2. Where trench walls are unstable, the contractor may elect to use tight sheeting, bracing, or a trench box for stabilization during pipe laying. If the conditions are severe, sheeting may be left in place.
3. Refer to ASTM D2321, Paragraph 6.4.2, for proper placement and movement of trench boxes. Improper use of trench boxes can affect pipe performance.

## Groundwater

1. Excessive groundwater may necessitate dewatering. Dewatering techniques must meet all OSHA and local requirements and codes.
2. In areas of saturated trench conditions or in dewatered trenches, refer to "Foundation and Bedding," and ASTM D2321 for proper selection of bedding and backfill materials.
3. Flotation of the pipe and erosion or wash-out of previously placed soil support must be prevented to ensure that the structure maintains its load carrying capacity.
4. Contact the Engineer of Record, hereinafter referred to as "engineer," for proper cover to prevent flotation.

**TABLE 2. MINIMUM COVER NEEDED TO PREVENT FLOTATION**

Pipe Dia. (in)	Cover Required
30	1'-4"
36	1'-7"
42	1'-10"
48	2'-2"
54	2'-5"
60	2'-8"
72	3'-2"
84	3'-9"
96	4'-3"
108	5'
120	5'-5"

## Foundation and Bedding

1. An unstable trench bottom must be stabilized at the engineer's direction. In such cases, install special foundation and bedding materials in 6 inch layers and compact.
2. Excavation below the final loosely placed bedding material shall be compacted using standard bedding practices or compacted at a minimum of 90% Standard Proctor Density.

3. The final bedding material provides uniform support to hold the pipe on line and grade. A relatively loose 4" to 6" thick bedding layer is usually adequate. Before installing the pipe, bring bedding material to grade along the entire length of the pipe. Bedding materials can be Class I, II or III per ASTM D2321.
4. When excavating in Class IV materials (silts, silty clays and clays), provide a uniform, undisturbed foundation.
5. Class IA materials if used for bedding, must be used as haunching material to the spring line in a dry trench. To minimize the potential for migration, Class IA materials should be used to the top of the pipe in wet trenches or in trenches that will fall below the water table.

## Haunching

1. Proper haunching provides a major portion of the pipe's load-carrying capability. Poor workmanship will lead to excessive pipe deflection and grade and alignment problems. Haunching materials can be Class I, II, or III per ASTM D2321.
2. Work enough material under the haunch of the pipe by hand to provide proper compaction and side support. Material shall meet the minimum compaction requirements of ASTM D2321.
3. When trench walls are unstable, sloughing must be prevented so that haunching material can be placed and compacted adequately. The proper use of a trench box or over-excavation can assist in these cases.
4. Don't let the pipe move when placing material under the haunch of the pipe.
5. Take care not to damage the pipe with shovels, or other construction/tamping equipment.
6. Haunch material extends from the bedding/foundation material to the springline elevation.

## Backfill and Compaction

1. Initial backfill materials extend from the springline to above the pipe (see page 9 -Standard Backfill Detail) to provide the remainder of the pipe support and protect the pipe from stones or cobbles in the final backfill. Backfill materials that generally follow the requirements of ASTM D2321, such as Class I, II, or III (or approved equal) may be used.
2. Native materials meeting the acceptable materials on page 7 can be used as backfill, but should be approved by the Engineer.
3. Materials must be free from large stones, frozen lumps or other debris.
4. Typical trench/backfill details can be found on pages 8 and 9; and acceptable backfill materials and compaction requirements on page 7 in this document.
5. Select fill should be placed and compacted to the minimum thickness referenced in the applicable installation detail before transitioning to native or non-select fill material over the pipe or to pavement.
6. Fill above the select fill should be fully compacted.
7. As backfill is placed around the pipe, care should be taken to avoid damage to the pipe.
8. Backfill height differential from one side of pipe to the other shall not exceed 12". Only "hand compaction" equipment is allowed over and around the pipe until minimum construction heights are achieved.

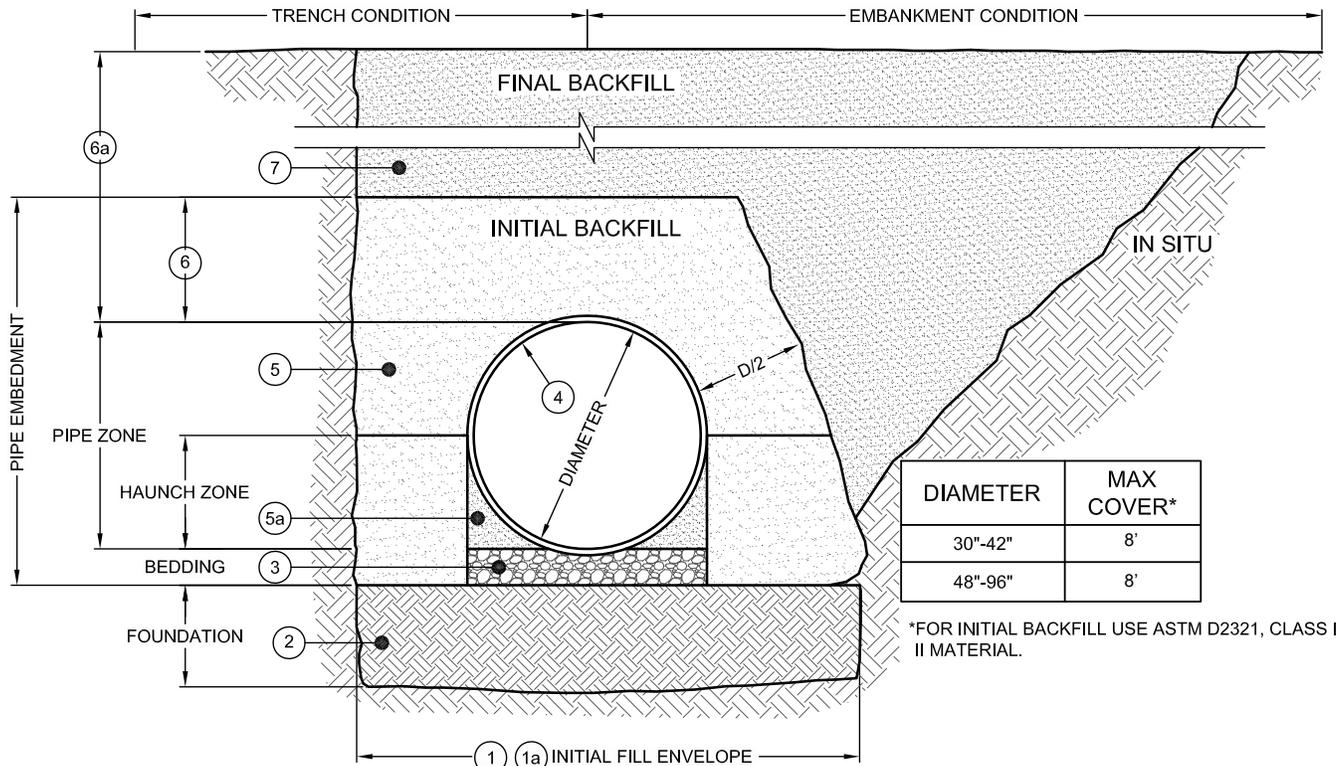

**TABLE 3. ACCEPTABLE BACKFILL MATERIALS AND COMPACTION REQUIREMENTS**

DESCRIPTION	SOIL CLASSIFICATIONS				MINIMUM STANDARD PROCTOR DENSITY %
	ASTM D2321	ASTM D2487	AASHTO M43	AASHTO M145	
Graded or crushed, crushed stone, gravel	Class I	-	5 56	A-1-a	85%
Well-graded sand, gravels and gravel/sand mixtures; poorly graded sand, gravels and gravel/sand mixtures; little or no fines	Class II	GW GP SW SP	57 6	A-1-b A-3	85%
Silty or clayey gravels, gravel/sand/silt or gravel and clay mixtures; silty or clayey sands, sand/clay or sand/silt mixtures	Class III	GM GC SM SC	Gravel and sand (<10% fines)	A-2-4 A-2-5	90%

Use of cementitious or flowable backfills is compatible with DuroMaxx. Proper precautions should be taken to preclude flotation of the pipe. Contact your Contech representative for further guidance.

# Backfill Detail for 36" to 96" diameter

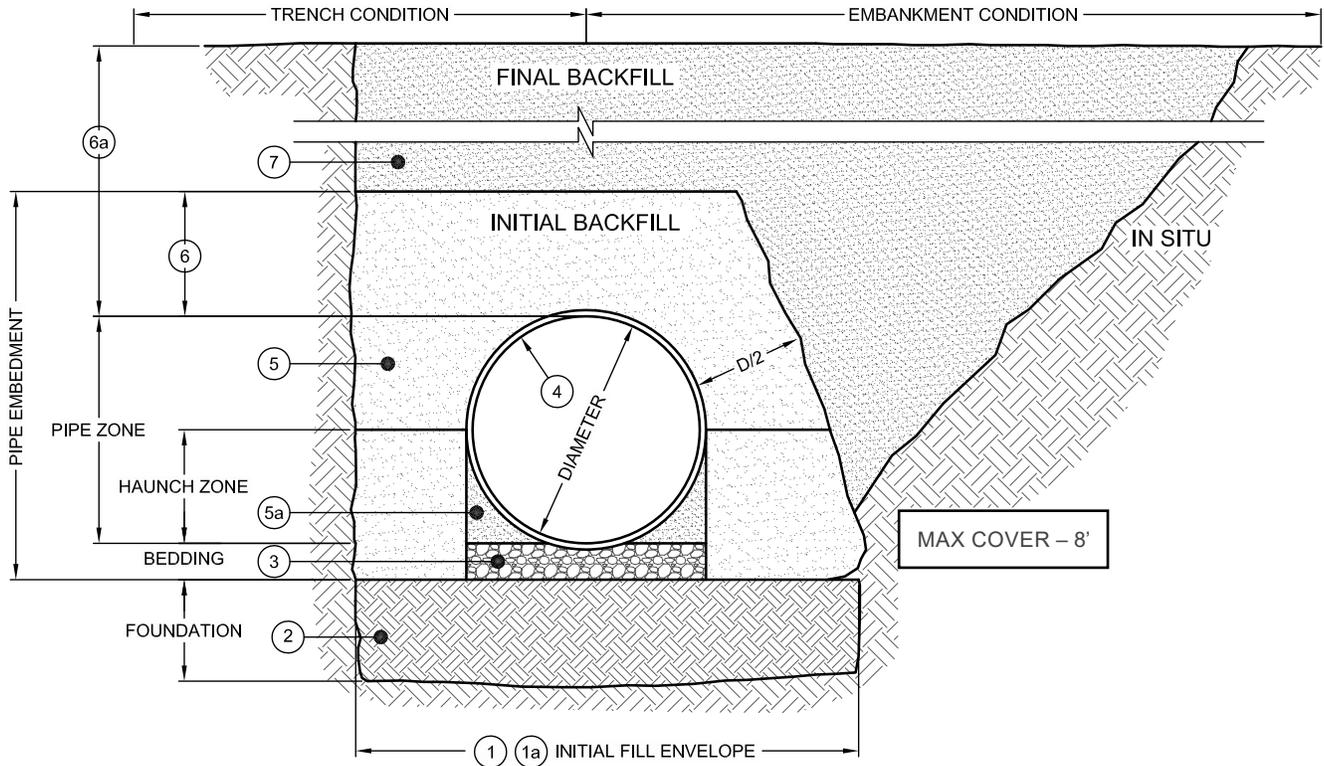

- ① MINIMUM TRENCH WIDTH MUST ALLOW ROOM FOR PROPER COMPACTION OF HAUNCH MATERIALS UNDER PIPE. MIN. WIDTH = (1.25 x DIAMETER) + 12" (FOLLOW ASTM D2321)
- ①a MINIMUM EMBANKMENT WIDTH IS 3 PIPE DIAMETERS BUT NO LESS THAN 2' OUTSIDE OF SPRINGLINE.
- ② FOUNDATION SHALL BE WELL CONSOLIDATED & STABLE.
- ③ BEDDING MATERIAL SHALL BE A RELATIVELY LOOSE MATERIAL THAT IS ROUGHLY SHAPED TO FIT THE BOTTOM OF THE PIPE, 4" TO 6" IN DEPTH.
- ④ DUROMAXX STEEL REINFORCED (SRPE) PIPE.
- ⑤ INITIAL BACKFILL FOR PIPE EMBEDMENT MATERIAL TO MEET ASTM D2321 CLASS I, II, III OR APPROVED EQUAL, COMPACTED TO 90% STANDARD PROCTOR (NATIVE MATERIAL CAN BE UTILIZED THAT MEETS ASTM D2321 OR APPROVED EQUAL).
  - ALL LIFTS PLACED IN CONTROLLED MANNER. TO PREVENT UNEVEN LOADING, IT IS RECOMMENDED THAT LIFTS NOT EXCEED 8" UNCOMPACTED LIFT HEIGHTS.
- ⑤a HAUNCH ZONE MATERIAL SHALL BE HAND SHOVELED OR SHOVEL SLICED INTO PLACE TO ALLOW FOR PROPER COMPACTION.
- ⑥ INITIAL BACKFILL ABOVE PIPE MAY INCLUDE ROAD BASE MATERIAL AND RIGID PAVEMENT (IF APPLICABLE), MINIMUM COVER STILL APPLIES, OTHERWISE:
  - 6" MINIMUM FOR PIPE DIAMETERS 30" - 60"
  - 12" MINIMUM FOR PIPE DIAMETERS 66" - 96"
- ⑥a HEIGHT OF COMPACTED COVER PER DIAMETER FOR CONVENTIONAL HIGHWAY LOADS (DISTANCE MEASURED FROM TOP OF PIPE TO BOTTOM OF FLEXIBLE PAVEMENT OR TOP OF RIGID PAVEMENT):
  - 12" MINIMUM FOR PIPE DIAMETERS 30" - 60"
  - 18" MINIMUM FOR PIPE DIAMETERS 66" - 72"
  - 24" MINIMUM FOR PIPE DIAMETERS 84" - 96"
- ⑦ FINAL BACKFILL MATERIAL SELECTION AND COMPACTION REQUIREMENTS PER THE PROJECT PLANS, SPECIFICATIONS. ENGINEER OF RECORD.

NOTES:

- GEOTEXTILE SHALL BE USED AS REQUIRED TO PREVENT SOIL MIGRATION.
- FOR MULTIPLE BARREL INSTALLATION THE RECOMMENDED STANDARD SPACING BETWEEN PARALLEL PIPE RUNS SHALL BE = PIPE DIA./2 OR 3' FOR PIPE DIAMETERS 72" AND LARGER. CONTACT YOUR CONTECH REPRESENTATIVE FOR NONSTANDARD SPACING.
- BACKFILL REQUIREMENTS SHALL FOLLOW ASTM D2321. IN THE EVENT OF DISCREPANCIES, ASTM D2321 SHALL SUPERCEDE THIS DETAIL.

1 **BACKFILL DETAIL**  
2 SCALE: N.T.S.

# Backfill Detail for 108" and 120" diameter

- ① MINIMUM TRENCH WIDTH MUST ALLOW ROOM FOR PROPER COMPACTION OF HAUNCH MATERIALS UNDER PIPE. MIN. WIDTH =  $(1.25 \times \text{DIAMETER}) + 12"$  (FOLLOW ASTM D2321)
- ①a MINIMUM EMBANKMENT WIDTH IS 3 PIPE DIAMETERS.
- ② FOUNDATION SHALL BE WELL CONSOLIDATED & STABLE.
- ③ BEDDING MATERIAL SHALL BE A RELATIVELY LOOSE MATERIAL THAT IS ROUGHLY SHAPED TO FIT THE BOTTOM OF THE PIPE, 4" TO 6" IN DEPTH.
- ④ DUROMAXX STEEL REINFORCED (SRPE) PIPE.
- ⑤ INITIAL BACKFILL FOR PIPE EMBEDMENT MATERIAL TO MEET ASTM D2321 CLASS I OR APPROVED EQUAL, COMPACTED TO 90% STANDARD PROCTOR (NATIVE MATERIAL CAN BE UTILIZED THAT MEETS ASTM D2321 OR APPROVED EQUAL).
  - ALL LIFTS PLACED IN CONTROLLED MANNER. TO PREVENT UNEVEN LOADING, IT IS RECOMMENDED THAT LIFTS NOT EXCEED 8" UNCOMPACTED LIFT HEIGHTS.
- ⑤a HAUNCH ZONE MATERIAL SHALL BE HAND SHOVELED OR SHOVEL SLICED INTO PLACE TO ALLOW FOR PROPER COMPACTION.
- ⑥ INITIAL BACKFILL ABOVE PIPE MAY INCLUDE ROAD BASE MATERIAL AND RIGID PAVEMENT, MINIMUM COVER STILL APPLIES, OTHERWISE: 18" MINIMUM FOR PIPE DIAMETERS 108" - 120"
- ⑥a HEIGHT OF COMPACTED COVER PER DIAMETER FOR CONVENTIONAL HIGHWAY LOADS (DISTANCE MEASURED FROM TOP OF PIPE TO BOTTOM OF FLEXIBLE PAVEMENT OR TOP OF RIGID PAVEMENT):
  - 30" MINIMUM FOR PIPE DIAMETERS 108"
  - 36" MINIMUM FOR PIPE DIAMETERS 120"
- ⑦ FINAL BACKFILL MATERIAL SELECTION AND COMPACTION REQUIREMENTS PER THE PROJECT PLANS, SPECIFICATIONS. ENGINEER OF RECORD.

**NOTES:**

- GEOTEXTILE SHALL BE USED AS REQUIRED TO PREVENT SOIL MIGRATION.
- FOR MULTIPLE BARREL INSTALLATION THE RECOMMENDED STANDARD SPACING BETWEEN PARALLEL PIPE RUNS SHALL BE = PIPE DIA./2 OR 3' FOR PIPE DIAMETERS 72" AND LARGER. CONTACT YOUR CONTECH REPRESENTATIVE FOR NONSTANDARD SPACING.
- BACKFILL REQUIREMENTS SHALL FOLLOW ASTM D2321. IN THE EVENT OF DISCREPANCIES, ASTM D2321 SHALL SUPERCEDE THIS DETAIL.

1 **BACKFILL DETAIL**  
2 **SCALE: N.T.S.**

## Flowable Fill

These materials are suitable for use with DuroMaxx at the direction of the Engineer. The contractor must take precautions to preclude the dislocation or flotation of the pipe during placement of the flowable fill. Should these materials be utilized by the contractor, Contech will assist with recommendations for restraint to ensure line and grade can be maintained.

## Embankment Conditions

1. DuroMaxx is a superior product that is normally installed in a trench condition. Embankment installations are an acceptable installation application.
2. In general, the backfill type and placement of the backfill immediately around the pipe can be the same as that shown on page 8.
3. The width of the select fill zone around the pipe and the type of material placed outside the zone – adjacent to the select fill zone – are critical and dependent upon the pipe diameter and ultimate amount of fill and loads to be placed over the pipe.
4. In the event of an embankment installation, a backfill design should be prepared for the specific site conditions by the Engineer.
5. Larger diameters may not be allowed or may require additional care in backfilling. Only small walk-behind compaction equipment should be used directly around the pipe.

## Cover Limits

Once the backfilling process is completed, the contractor should take care to maintain the minimum allowable cover height over the pipe and should notify all other contractors and subcontractors to avoid removal of fill cover or rutting.

Pipe Dia. (in)	Min. Cover (ft)	Max. Cover (ft)
30-42	1	8
48-60	1	8
66-72	1.5	8
84-96	2	8
108	2.5	8
120	3	8

## NOTES

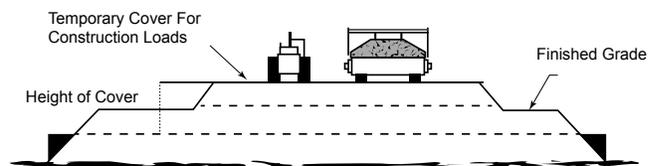

1. Allowable minimum cover is measured from the top of the pipe to the bottom of a flexible pavement or the top of the pipe to the top of a rigid pavement. Minimum cover in unpaved areas will be greater than for paved areas shown in Table 2 and must be maintained. Contact your local Contech Sales Engineer for more information.
2. All heights of cover are based on trench conditions. If embankment conditions exist, additional care in the placement of fill outside the pipe backfill zone is required. Your Contech representative can provide further guidance for a project in embankment conditions.

## Construction Loads

For temporary construction vehicle loads, an extra amount of compacted cover may be required over the top of the pipe. The height of cover shall meet the minimum requirements shown in Table 5 below. The use of heavy construction equipment necessitates greater protection for the pipe than finished grade cover minimums for normal highway traffic.

Minimum cover may vary depending on local conditions. The contractor must provide the additional cover required to avoid damage to the pipe. Minimum cover is measure from the opt of the pipe to the top of the maintained construction roadway surface.

Minimum Height of Cover Requirements for Construction Loads. The Minimum Cover should be a COMPACTED Height of Cover Requirement.				
Diameter/Span (in)	Axle Load (Kips)			
	>32≤50	50≤75	75≤100	110≤150
30-42	2.0 ft	2.5 ft	3.0 ft	3.0 ft
48-72	3.0 ft	3.0 ft	3.5 ft	4.0 ft
84-96	3.0 ft	3.5 ft	4.0 ft	4.5 ft
102-120	3.5 ft	4.0 ft	4.5 ft	5.0 ft

## Temperature Effects

1. DuroMaxx is a superior product and the pipe's stiffness is not affected by solar absorption or elevated ambient temperatures.
2. If large swings in temperature occur from the location the pipe is stored and the bottom of the trench, then the pipe may require conditioning to avoid contraction of the pipe's length.
3. Operating temperatures are not recommended beyond 120° F (49° C).

## Repairs

1. The recommended cutting tool for DuroMaxx pipe is a chop saw and abrasive saw blade. Refer to the Operating Instructions from the saw manufacturer for additional information.
2. Blade thickness should be no less than 1/8" thick and is recommended to be made of 2 ply material that is used to cut ductile iron pipe.
3. Use the leading edge of the blade to cut into the ribs of the pipe.
4. Bury the blade as much as possible into the pipe as you proceed.
5. The alternative cutting tool for DuroMaxx is a handheld reciprocating saw. This process will take about 2 minutes to cut the steel ribs. There are 9 ribs for 24" around the pipe circumference.
6. For large diameters, square cuts can be achieved from the inside. Repairs
4. Should damage to the pipe occur at any point during installation, the Engineer should be contacted immediately.
5. For larger damaged sections, cut out damaged areas and cut a length of replacement pipe to fit.
6. Similar to other flexible pipe products, DuroMaxx can be coupled using various industry standard methods and materials (e.g. concrete collars, Fernco® Inc., Mar Mac® or equal).
7. For smaller abrasions or exposed steel, an approved rubberized undercoating spray can be used to cover the steel.

## Taps

1. DuroMaxx pipe can be supplied with standard prefabricated taps fittings or components per job plans once pre-fabrication drawings are reviewed by Contech Engineering and approved by the Engineer.
2. DuroMaxx can be field tapped using Inserta-Tees® for drainage projects. Please contact your Contech Representative for more information. Recommendations

**Always use safety glasses when cutting DuroMaxx pipe and use protective gloves in case sharp edges are exposed.**

## Recommended Draining Procedure

The tank can be drained for inspection and maintenance through the manhole access. Tank draining can be accomplished by operating the rainwater harvesting pump to evacuate the water from the tank. A vac truck can be used to evacuate any remaining water. If it is not feasible to operate the rainwater harvesting pump, a vac truck in conjunction with a portable submersible pump placed in the tank can be used.

## Tank Corrosion and Chemical Leaching Potential

SRPE tanks are not suitable for potable water storage applications.

Please refer to the "DuroMaxx Technical Bulletin TB1- Durability Considerations for DuroMaxx Sewer Pipe" for tank corrosion and chemical leaching potential.

## Acceptable pH Range for RWH Applications

Please refer to the "DuroMaxx Technical Bulletin TB1- Durability Considerations for DuroMaxx Sewer Pipe" for pH range considerations.

# INSTALLATION GUIDE

# R-TANK® INSTALLATION

## PRE-CONSTRUCTION CHECKLIST

### TOOLS YOU'LL NEED

- Laser or transit
- Measuring tape (long enough to mark R-Tank® footprint)
- Hard rakes
- Marking paint
- Razor knife
- Screw driver / nut driver set (for pipe boots)
- Metal snips to cut steel band clamps
- String line
- Reciprocating saw (to cut in inspection & maintenance ports)
- Drill with 1" drill bit to create vent holes in ports

### Additional tools if R-TANK® modules are not preassembled

- Dead blow mallets
- Work tables (3/4" plywood placed on R-Tank® modules works well)

### MATERIALS YOU'LL NEED

- R-Tank® modules
- Geotextile
- Geogrid (only for load bearing applications)
- Liner (if required by plans)
- Base & backfill material (per spec section 2.03)
- Pipe boot kits  
(If not using kits, you'll need duct tape and a stainless steel band clamp for each inlet and outlet pipe, and for each inspection or maintenance port.)
- Maintenance port kits  
(If not using kits, you will need non corrosive rigid anti-scour pad [15" x 15" to fit below maintenance ports.], fabric pipe boot, duct tape, stainless steel band clamp 12" schedule 40 PVC pipe and H2O rated ring and cover.)
- Metallic tape

### EQUIPMENT YOU'LL NEED

- Forklift and other equipment/tools necessary to unload box truck
- Pallet jack (to unload material from box truck)
- Walk-behind trench roller (plate compactor may work for smaller projects)
- Low ground pressure (LGP) tracked skid steer or dozer (<7.0 psi gross operating pressure)
- LGP dozer - 10 ton max gross vehicle weight and 7.0 psi max operating pressure
- Roller - 6 ton max gross vehicle weight

**Note: This list does not include equipment or tools needed to excavate or level the floor of the excavation.**

**ACF offers an on-site assembly service.  
Call to request a quote, 800-448-3636.**

## STEP 1 - EXCAVATION

The excavation limits and location of R-Tank® System should be staked out using the drawings. If limits are not shown, add 2' on each side of the R-Tank® system.

- A.** Excavate the designated surveyed area according to plans following all relevant local, state and OSHA guidelines. Typical excavations should include:
  - Two foot perimeter around R-Tank® to allow for proper compaction of backfill
  - Enough depth to accommodate a minimum 3" base (if required) below the R-Tank®
- B.** Level the bottom of the excavation (see Fig. 1) as shown on plans. Most excavations have a flat bottom while some will slope toward the outlet pipe.
- C.** Prepare subgrade according to plans. Base of excavation must be uniform, level and free of debris and soft or yielding subgrade areas. Compact to at least 95% standard proctor density (or as required by Engineer) unless infiltration of stormwater into subgrade is desired. A minimum bearing capacity of 2,000 psf (per spec section 3.02D) must be achieved prior to beginning R-Tank module installation. If the subgrade is pumping or appears excessively soft, the design engineer should be consulted.

Fig. 1 Excavate according to plans, following all governmental regulations.

**TIP:** Assembling the R-Tank® units (Step 2) during excavation may save time during the installation, but requires additional material handling and space. If time allows consider assembling modules in the completed excavation to reduce labor / material handling costs.

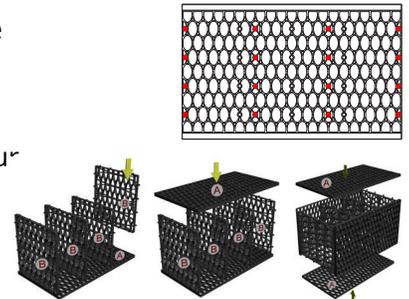

## STEP 2 - ASSEMBLE R-TANK® UNITS

If R-Tank units arrive on your project in flat panels, they will need to be assembled. Complete directions are provided for each module type below, and a video is available on YouTube by searching for "R-Tank assembly" or by using this link: <https://www.youtube.com/watch?v=0MTzTVkTq5Q>. The modules should take 2-3 minutes per segment to build, with workers completing the assembly and material handlers assisting. This is a conservative estimate used to approximate total man hours needed for assembly.

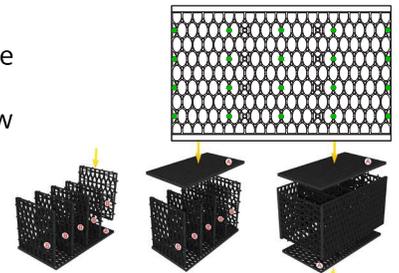

- \*Begin** by connecting four (4) small plates to one large plate, using the connection locations shown in red dots. Next, attach a second large plate opposite the first. Finally, add two large plates to the sides, and the single module is complete. To build a double module (or taller), follow the directions above, using the top of the single module as your first large plate to connect additional small plates.

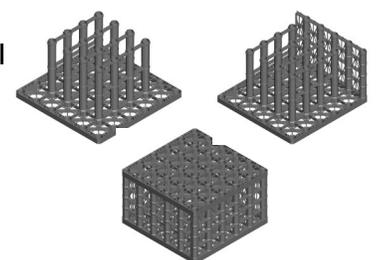

**\*Warning:** R-Tank® LD modules are only for applications not subjected to traffic loads.

- Begin** by connecting five (5) small plates to one large plate, using the connection locations shown in green dots. Next, attach a second large plate opposite the first. Finally, add two plates to the sides, and the single module is complete. To build a double module (or taller), follow the directions above, using the top of the single module as your first large plate to connect additional small plates.

- UD** modules have three (3) different plates: a top/bottom plate, a side plate, and an internal plate. Sides have five columns, while the internal plates only have 4. **Begin** by connecting four (4) internal plates to the bottom plate. Next, add four side plates, and finish the single module by snapping on the top. To build a double module (or taller), follow the directions above, using the top of the single module as your first bottom plate to connect additional plates.

# R-TANK® INSTALLATION

## STEP 3 - PREPARE BASE

- A. If present, remove standing water in the excavation as it will prevent proper base preparation.
- B. Establish a level working platform. A thin layer (minimum 3") of material is recommended. Check plans to see if geotextile is specified below the base material. Base materials must meet spec section 2.03A.
  - In regions with sandy soils meeting the requirements noted and where the subgrade elevation is above the groundwater table, imported base materials may not be needed. (For more information see specification section 2.03A.)
- C. Grade and level base as shown on plans with no more than 1/2" variance (+/- 1/4"). Base must be smooth and free of debris and large rocks.

Fig. 2 Base must be smooth to ensure units fit together without gaps

**TIP:** Creating a smooth, level platform will allow for faster installation of R-Tank® modules, as they will fit together evenly, eliminating detail work that can delay your progress.

## STEP 4 - PLACE GEOTEXTILE

- A. Check the plans to see if geotextile is required to be placed between the base and the R-Tank® units. It is required on most projects, but not all. If it is not required, skip to Step 5.
- B. Cut strips of geotextile to the proper length, and place them over the base, covering the floor of the excavation. The geotextile should extend at least 2' beyond the edge of the R-Tank® footprint. Adjacent panels of material should be overlapped by 12" or more, as shown on the plans.
- C. Use pins, staples, sandbags or other ballast to hold the geotextile in place, preventing it from blowing or sliding out of position.
- D. Patch any holes made in the Geotextile by placing a small patch of fabric over the damaged area. The patch must be large enough to cover the damaged area with at least 12" of overlap on undamaged material.
- E. If a liner and/or additional geotextile is required per plans, install these now as shown on the project plans.

Fig. 3 Pull wrinkles out of geotextiles so material lays flat

**TIP:** Some contractors choose to cut the geotextile strips long enough to wrap up the sides and over the top of the R-Tank® in a single piece (see Fig. 3). If space allows and the folded flaps will not interfere with the installation, you may want to consider this option. If a liner is required on your project, this method should be used to protect the liner.

Fig.4 Reduced overlaps don't create significant savings and can create delays

**TIP:** Many contractors find that it is both easier and less expensive to have specialty contractors install the liner (typically used when building a cistern). If you are installing a liner yourself, handle it VERY CAREFULLY to avoid damage.

**\*\*WARNING: GEOTEXTILES CAN BE DAMAGED BY EXTREME HEAT. SMOKING IS NOT PERMISSIBLE ON/NEAR THE SYSTEM, AND TOOLS USING A FLAME TO TACK GEOTEXTILE OVERLAPS, SUCH AS PROPANE TORCHES, ARE PROHIBITED. \*\***

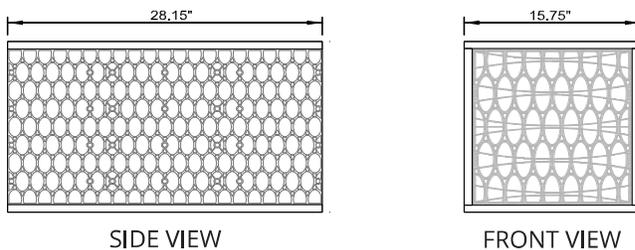

## STEP 5 - INSTALL R-TANK® MODULES

- A.** Determine the starting location. It is often helpful to use an inlet or outlet pipe to guide you. Using a string line, establish two adjacent edges of the R-Tank® footprint. Ensure that your corner is square. Mark these two edges with marking paint and remove the string line (see Fig. 5).
- B.** Begin placing R-Tanks® in the corner of the marked area.
- Do NOT place units on their sides, as this will void the warranty. Check plans to ensure the correct orientation of the R-Tanks® (see Fig. 8).
  - Check the plans to ensure the R-Tanks® are running in the correct direction (North/South vs. East/West) to match the footprint shown on plans (see Fig. 8).
  - R-Tank® units should fit together evenly. Occasional minor gaps between units ( $< \frac{1}{2}$ " ) or variations in the height of the units ( $< \frac{1}{2}$ " ) are acceptable (see Fig. 6), but reasonable efforts should be made to minimize these variations. If gaps or height variations persist through 3 or more adjacent units, remove the modules and pull back the textile to repair base.
  - No lateral connections between adjacent R-Tank® units are required

**For LD, HD and SD modules:** the large side plate of the tanks should be placed on the perimeter of the system. This will require that two ends of the tank area will have a row of tanks placed perpendicular to all other tanks (see Fig. 7).

- Option 1: End column should cover 75% of the final module.
- Option 2: End column may extend beyond the final row.

### LD/ HD/ SD

### UD

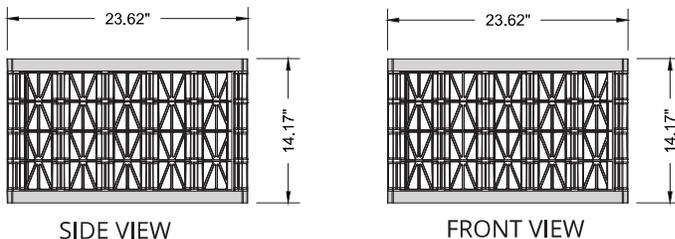

Fig. 5 Use a string line and marking paint to square the system footprint

Fig. 6 Minor variations (less than width of top plate) in tank height are acceptable

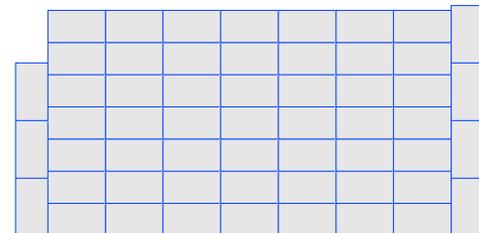

Fig. 7 Plan view showing the end rows turned perpendicular. The corners may not match up perfectly, so two acceptable alternatives are shown. Most plans do not show this configuration. Field adjustments are easily made.

Fig. 8 (To the left) Make sure the tanks are oriented properly in the excavation

**IMPORTANT:** Anyone walking directly on top of the units should be instructed to keep their weight over the vertical supports of the tank to prevent damaging the units.

# R-TANK® INSTALLATION

## STEP 6 - INSTALL INSPECTION / MAINTENANCE PORTS

- A. Check plans for size and type of pipe (usually 10-12" schedule 40 PVC pipe), and cut pipe to length, leaving enough excess to trim the top when final grade is reached. All ports should be made from pipe long enough to extend from the bottom of the R-Tank® to finished grade.
- B. Drill several 1" diameter holes (air vents) into the pipe right below where the future top of the R-Tank® system and pipe meet when installed. Air vents can also be created with a chop saw or grinder by cutting several 3-5" vertical slots into the pipe at the same location.
- C. Using a reciprocating saw, cut several 8" triangular notches into the bottom of the pipe as shown on plans (see Fig. 9).
- D. Identify the location of all ports and remove the R-Tank® from each location.
- E. All modules will need to be disassembled in order to cut, remove, and/or relocate internal plates. This process will vary based on the module your project is using, as noted on the next page.
- F. Reassemble the R-Tank® when cutting is completed.
- G. Insert the non-corrosive anti-scour pad in the bottom of the R-Tank® (should fit directly below the Maintenance Port), and replace the R-Tank® into the proper location.
- H. If using Prefabricated Pipe Boot Kits, install the boot onto the pipe now, leaving the band clamps loose so that final adjustments may be made in Step 7. Install the pipe into the R-Tank® unit (see Fig. 12) and make sure it is plumb.
- G. Temporarily seal the opening on top of the pipe with a cap or temporary lid to prevent debris from entering the system during construction.

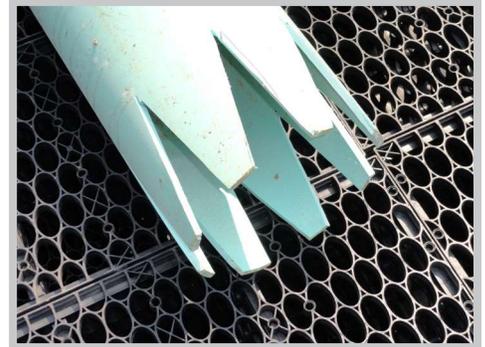

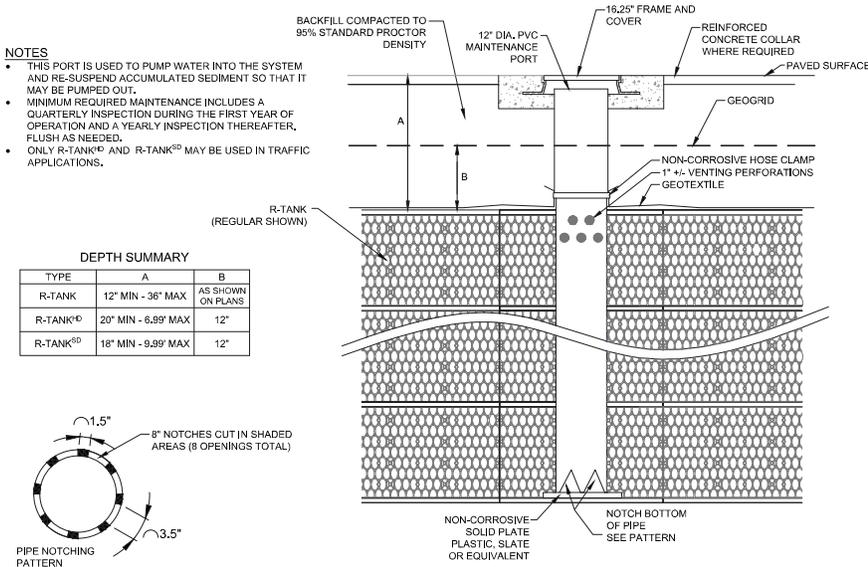

Fig. 9 Cut 8" notches into the bottom of maintenance port

Fig. 10 Installed maintenance port

**TIP:** If the location of Maintenance Ports is not shown on your plans, contact the engineer. Ports should be added within 10' of all inlet and outlet pipes (a single Maintenance Port can cover multiple pipe connections), and include additional Maintenance Ports as needed to prevent the distance between ports from exceeding 50'.

**IMPORTANT:** Do not over-cut the R-Tank® plates. Minimize the gaps between the pipe and the R-Tank® plates. This is particularly important with the top plate.

## STEP 6E DETAILS - INSTALL INSPECTION / MAINTENANCE PORTS

### LD Modules

To accommodate the maintenance port, remove the two internal plates and reconnect them at the connection points a few inches closer to the edges of the module. This will provide enough room for a 12" pipe. Using your reciprocating saw, cut a circular hole the same size as the pipe in the center of the horizontal R-Tank plates, between the relocated internal plates. All horizontally oriented plates will need to be cut EXCEPT FOR THE BOTTOM PLATE. See Table 1 for the number of horizontal plates that will need to be cut.

### HD / SD Modules

To accommodate the maintenance port, remove the center interior small plate (see Fig. 11). Using your reciprocating saw, cut a circular hole the same size as the pipe in the center of the horizontal R-Tank plates, between the internal plates. All horizontally oriented plates will need to be cut EXCEPT FOR THE BOTTOM PLATE. See Table 1 for the number of horizontal plates that will need to be cut for your specific module.

### UD Modules

Use a 10" PVC Pipe to create the maintenance port. A 12" pipe will not fit correctly. To accommodate the 10" pipe, remove the two center internal plates. Cut one of the plates in half vertically, so that you are left with two pieces, each with two full columns. Reinsert these pieces into the module on the edges, perpendicular to the full-size internal plates (see Fig. 12). Discard the other internal plate that was removed.

Using your reciprocating saw, cut a circular hole the same size as the 10" pipe in the center of the horizontal R-Tank plates, between the internal columns. All horizontal plates will need to be cut EXCEPT FOR THE BOTTOM PLATE. See Table 1 below for the number of horizontal plates that will need to be cut for your specific module.

Fig. 11 For HD and SD modules, make space for the pipe by removing the center plate

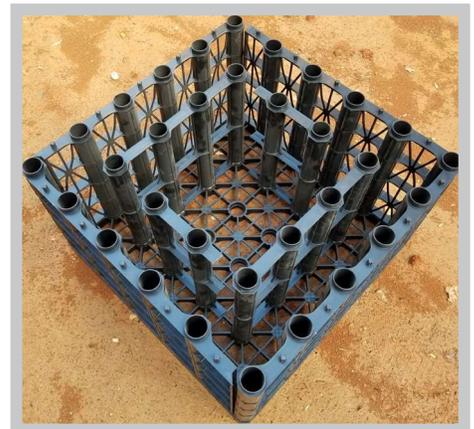

Fig. 12 For UD modules, two internal plates are removed, and two half-pieces are reinserted perpendicular to the other internal pieces.

Unit	Cut
Single	1 Large Plate
Double	2 Large Plates
Triple	3 Large Plates
Quad	4 Large Plates
Pent	5 Large Plates

Table 1

# R-TANK® INSTALLATION

## STEP 7 - SEAL R-TANK® WITH GEOTEXTILE

- A.** Clean off any debris that may be lying on top of the exposed geotextile around the perimeter of the R-Tank®
- B.** Cut strips of geotextile to fit over the top and down both sides of the R-Tank® with at least 2' of excess material on each side of the system. This 2' flap should overlay the geotextile placed below the R-Tank® units, creating a clean 24" overlap to seal the system. Adjacent strips of geotextile should overlap at least 12" or as shown on plans.
- C.** Use duct tape, sand bags or other ballast to temporarily secure overlaps
- D.** Where the geotextile intersects an Inspection or Maintenance Port, cut an "X" into the geotextile and pull it over the pipe. The flaps of the "X" should point AWAY from the R-Tank® (see Fig. 14). Use a fabric boot and a stainless steel band clamp to seal the flaps to the pipe.
- E.** Fold geotextile for outside corners similar to sheets on a bed, and lay excess material flat against R-Tank® (see Fig. 15). Leave corners loose to avoid creating weak spots in the material. Temporarily secure excess fabric with duct tape.
- F.** Where the inlet and outlet pipes connect to the R-Tank®, cut an "X" into the geotextile so that the pipe makes DIRECT contact with the R-Tank®. Pull the flaps of the "X" over the pipe so that the flaps of the "X" point AWAY from the R-Tank®. Use a stainless steel band clamp to seal the flaps to the pipe.
- G.** If using prefabricated pipe boot kits, install them onto the inlet and outlet pipes (see Fig. 16). Adjust boots so that the fabric lays snug against the R-Tank®. Tighten the band clamps with a screw/nut driver. Use duct tape to secure the boot flap to the outside of the geotextile envelope.
- H.** Walk bottom edge of geotextile along the sides of R-Tank to eliminate gaps between the fabric and the bottom corner of the R-Tank®.

Fig. 13 Encapsulate R-Tanks® with geotextile

Fig. 14 Cut an "X" into textile to accommodate pipe penetration and seal with a boot

Fig. 15 Finished envelope should lay flat against R-Tank®

Fig. 16 Install boots onto pipes prior to connecting them to the R-Tank, leaving the clamps loose for final adjustment later

**IMPORTANT:** Take special care with inside corners on the footprint of the system. Cut geotextile as needed to ensure that it lays flat against the R-Tank®. Use additional pieces of geotextile to seal the corner and any cuts that are made (12" overlap).

**WARNING:** Inlet and outlet pipes must make DIRECT contact with the R-Tank® (per Step 7F), allowing water to flow directly into or out of the R-Tank® without filtering through the geotextile.

Failing to correctly connect pipes will cause the system to malfunction.

**\*\*WARNING: GEOTEXTILES CAN BE DAMAGED BY EXTREME HEAT. SMOKING IS NOT PERMISSIBLE ON/NEAR THE SYSTEM, AND TOOLS USING A FLAME TO TACK GEOTEXTILE OVERLAPS, SUCH AS PROPANE TORCHES, ARE PROHIBITED. \*\***

## STEP 8 - BACKFILL SIDES

- A. Place backfill material (see specification section 2.03 B) around perimeter of the R-Tank®, distributing the material evenly to prevent shoving of the R-Tank® units. All backfill material must meet requirements listed in the specs
- B. Use a trench roller or plate compactor to compact backfill in 12" lifts (see Fig. 17)
- C. Continue placing and compacting backfill in 12" lifts until the material reaches the top of the R-Tank® units

Fig. 17 Vibratory compaction of side backfill is ALWAYS REQUIRED, regardless of what backfill material is used.

Fig. 18 Use an LGP dozer to push backfill over R-Tank® units.

**IMPORTANT:** Vibratory compaction of the side backfill (see Fig. 18) is a critical step that both compacts the backfill and eliminates minor gaps between individual R-Tank® units. While some backfill materials will yield a 95% proctor density without compaction, vibratory compaction of the material must be completed to ensure the stability of the system. **Skipping this step will void the manufacturer's warranty.**

## STEP 9 - BACKFILL TOP

- A. Dump backfill material adjacent to the R-Tank® and, using your LGP Skid Steer or Dozer (see table below), push the material over the R-Tank® system.
  - Backfill must meet requirements listed in specification section 2.03 B
  - If your machine is not listed in the table, and you cannot find its ground pressure, you'll need to find your vehicle's Operating Weight and measure the area where the tracks contact the ground. Take these dimensions and multiply them (Length x Width), then multiply by 2 (since the machine has two tracks), then divide the Operating Weight by the total square inches of contact area to determine the contact pressure of the machine. If the contact pressure is less than 7.0 psi and the operating weight is less than 20,000 lbs, the machine will work with 12" of cover.
- B. Lightly compact top backfill to 95% standard proctor density (or as shown on plans) using your walk-behind trench roller. Alternately, a roller (maximum gross vehicle weight of 6 tons) may be used. Roller must remain in static mode until a minimum of 24" of cover has been placed over the modules (per spec, section 3.05 A5). Sheep foot rollers should not be used.

### Largest Track Dozers that can be used with 12" of cover over R-Tank®

Machine Weight	Operating Dimensions	Track Pressure	Ground
Case 850K LGP	20,700 lbs	28" x 92.6" = 2593 si	4.0 psi
Caterpillar D5K LGP	21,347 lbs	26" x 91" = 2366 si	4.52 psi
John Deere 550J LGP	18,252 lbs	24" x 86" = 2064 si	4.2 psi
Komatsu D39PX-21	19,620 lbs	25" x 93" = 2325 si	4.27 psi
New Holland D95 LGP	20,700 lbs	28" x 93" = 2604 si	4.0 psi

This list is not intended to be all inclusive, but representative.

**TIP:** When pushing backfill over R-Tank® units, work in the direction of the geotextile overlap to avoid shoving material between the fabric layers.

**WARNING:** Dump trucks should not drive over or dump material on top of the R-Tank®.

**WARNING:** Some materials will compact significantly while others may shove excessively as you work. Never allow your lift thickness to compact to less than 12" without adding more material.

**WARNING:** A minimum of 12" of material must be maintained between the Dozer tracks and top of the R-Tank®. For best results, push at least 14" (or more) of backfill over the units, so that as the material compacts beneath the dozer, a 12" minimum lift is maintained. It is recommended that the dozer drive straight on and back straight off of the system during backfill placement. Turning movements are likely to shove the backfill material, reducing the thickness of the lift and potentially damaging the R-Tank® modules.

# R-TANK® INSTALLATION

## STEP 10 - PLACE GEOGRID

- A.** Check plans to see if required. Geogrid is required for most load-bearing applications (see Fig. 19), such as systems placed beneath parking lots and roads. It is not required for some UD installations and above systems used in open space where traffic is prohibited, such as sport fields or natural areas.
- B.** Geogrid must be placed 12" above the R-Tank®, or as shown on plans. Overlap adjacent panels by 18" minimum or as specified. Roll out Geogrid over the top of the system, with the edges of the grid extending 5' from R-Tank® footprint or 3' beyond the edge of excavation - or more as show on plans (refer to CAD detail HS20 loads).
- C.** If metallic tape has been specified (used to locate the system), install it now.

Fig. 19 Overlap geogrid 18" or as required by plans.

Fig. 20 Pushing backfill parallel to the Geogrid prevents the grid from shoving.

## STEP 11 - PLACE ADDITIONAL COVER AS NEEDED

If additional cover or pavement base is required by the plans, begin placing and compacting material as discussed in Step 9. Push cover material parallel to the geogrid for best results (see Fig. 20). All cover material must meet requirements of specification section 2.03C.

**TIP:** To achieve proper compaction requirements, it may be beneficial to begin placing material in 6" lifts.

**WARNING:** Maximum cover for R-Tank<sup>LD</sup>® systems (4-plate) is 3'. Use R-Tank<sup>HD</sup>® units for cover depths less than 7', R-Tank<sup>SD</sup>® units for cover depths up to 10', and R-Tank<sup>XD</sup>® units for cover depths up to 16'. If you suspect the incorrect module is being used on your project, please contact ACF Environmental at 800-448-3636.

## STEP 12 - SECURE THE INSTALLATION

Construction loads are often the heaviest loads that ever drive over the R-Tank® System, and there are many construction vehicles that exceed the HS20 standard that most detention systems are designed to meet. To prevent damage from these vehicles, the installation should be secured to prevent unauthorized traffic from driving over the system once it has been installed.

- A.** Projects nearing completion (within three months) should use warning tape or temporary fencing to secure the installation (see Fig. 21).
- B.** For larger projects with ongoing construction activities, consider a more durable method for preventing unauthorized traffic from accessing the system (see Fig. 22).

Regardless of what method is selected to secure the installation, it must remain in place until construction activity has concluded and no further access of vehicles exceeding the HS20 standard is necessary.

Fig. 21 Secure the installation with temporary fencing

Fig. 22 Secured R-Tank® installation using Jersey barriers

## STEP 13 - INSTALL PRE-TREATMENT DEVICES

Install any pre-treatment devices prior to activating the R-Tank® System to prevent debris from entering the system (see Fig. 23).

Fig. 23 Trash Guard Plus prevents contamination of your system

**TIP:** For more information about pretreatment devices, or R-Tank installations, contact ACF Environmental's Inside Sales team at 800-448-3636

RE: W.O. 10128.01-REV.1  
GEOTECHNICAL INVESTIGATION  
PROPOSED ADDITION TO ORANGETOWN TOWN HALL  
ORANGEBURG, NEW YORK

Dear Mr. Gabalski;

Tectonic Engineering Consultants, Geologists & Land Surveyors, D.P.C. is pleased to submit this geotechnical investigation and engineering evaluation was performed for the proposed addition to the Orangetown Town Hall building complex located at 26 Orangeburg Road, in Orangeburg, New York. The purpose of the investigation was to characterize the subsurface conditions in the area of the proposed addition, and to develop geotechnical design and construction criteria for the proposed building addition.

We appreciate this opportunity to assist you with this project. If you have any questions, please do not hesitate to contact the undersigned.

Sincerely,

TECTONIC ENGINEERING CONSULTANTS, GEOLOGISTS & LAND SURVEYORS, DPC

Mark A. Stier, P.E., PG 076154

FIGURE 1 BORING LOCATION PLAN

APPENDIX I BORING LOGS

APPENDIX II LABORATORY TEST RESULTS

## 1.0 INTRODUCTION

A geotechnical investigation and engineering evaluation was performed for the proposed addition to the Orangetown Town Hall building complex located at 26 Orangeburg Road, in Orangeburg, New York. The purpose of the investigation was to characterize the subsurface conditions in the area of the proposed addition, and to develop geotechnical design and construction criteria for the proposed building addition.

The following sections summarize the performed scope of services; provides general descriptions of the existing site conditions and proposed construction; and describe the performed investigation. These are followed by a discussion of the findings and our geotechnical recommendations for the design and construction of the building addition.

## 2.0 SCOPE OF SERVICES

The following services were performed for Lothrop Associates LLP, herein referred to as Client:

- Drilling, sampling, and logging of nine (9) test borings. Two (2) borings were added as a result of encountering shallow refusal on obstructions.
- Field inspection services by a geotechnical engineer to confirm conformance of the investigation to appropriate standards, collect samples for laboratory testing, and prepare logs of the encountered subsurface conditions.
- Laboratory testing of representative soil samples to assist in the evaluation of the engineering properties of the encountered soils and to check field classifications of soils.
- Performance of geotechnical engineering evaluation of the encountered subsurface conditions as they relate to the proposed building addition.
- Preparation of this report presenting the results of the subsurface investigations, laboratory testing, analyses, and our geotechnical recommendations for the design and construction of the proposed building addition.

## 3.0 SITE AND PROJECT DESCRIPTIONS

The project site, which is the existing Orangetown Town Hall and police department building complex, is located at 26 Orangeburg Road in Orangeburg, New York. This property is located at the northwest corner of Orangeburg Road and Dutch Hill Road, immediately east of the northbound entrance and exit ramps of the Palisades Parkway. The property has two main connected buildings, and asphalt paved driveways/parking areas located on the west and northeast sides of the buildings. The southeastern corner and far eastern end

of the site, as well as areas immediately adjacent to the buildings and within islands of the west parking lot, are landscaped, containing lawn areas, trees and shrubs. The western end of the site is wooded. The southern of the two buildings is a single-story structure that measures roughly 75 by 150 feet, with the long dimension paralleling Orangeburg Road. The northern building is a two-story structure with a basement that has a plan area of about 80 by 170 feet, with the long dimension paralleling Dutch Hill Road. Surface grades across the site are flat to gently sloping, with grades overall sloping down towards the southeast. Based on **review of the drawing entitled “Grading and Drainage Plan, Orangetown Town Hall Additions and Alterations”** revision dated March 3, 2021, by Tectonic, the existing two-story building has a finish floor elevation of +219.56 feet, and the basement has a floor elevation of approximately +211.23 feet. Grades around the site range from a high of about +222 feet within the wooded area at the west, to a low elevation of about +208 feet at the southeast.

We understand that the proposed project is to consist of the demolition of the existing single-story building and the construction of an addition on the west side of the three-story building, along with the construction of a parking lot within the landscaped area along the east end of the site. Based on the previously referenced grading and drainage plan, existing grades within the area of the proposed addition, which spans from the sidewalk and landscaped areas immediately fronting the building to the paved driveway and parking to the west, generally range from about +217 feet to +219 feet. Based on review of the undated architectural drawings, prepared by Lothrop Associates LLP, we understand that the addition will be a three-story structure having a length of about 220 feet and a width of about 78 feet, with the long dimension adjoining the existing building. The building will not have a basement. The approximate finish floor elevation of the proposed building is reportedly +219.56 feet. Structural loading estimates were not provided at the time of this report.

#### 4.0 SUBSURFACE INVESTIGATION

The subsurface investigation consisted of the performance of nine test borings, with two being added after encountering shallow refusal on apparent cobbles or boulders. The borings were designated as B-1 through B-7, with the added borings, which were located several feet from the original boring, being given a letter suffix. These are borings B-1a and B-5a. The locations of the borings are shown on the attached Boring Location Plan, Figure 1.

The test borings were performed between the dates of August 12 and 14, 2020, by Craig Test Boring Company Inc. using a CME 55LC ATV mounted drill rig equipped with an automatic hammer. The borings were advanced to depths ranging from 4 to 32 feet using a tricone drill bit and mud-rotary drilling techniques. Four-inch nominal driven steel casing was installed to depths ranging from 6 to 20 feet to further stabilize the boring sidewalls. Standard Penetration Testing was typically conducted continuously to a depth of 12 feet and at 5-foot maximum intervals thereafter.

The test borings were performed under the full-time observation of a geotechnical engineer. The engineer observed that the investigation was performed in accordance with the appropriate standards and prepared logs of the encountered subsurface conditions. Logs of the test borings are attached in Appendix I.

#### 5.0 LABORATORY TESTING

Laboratory testing was conducted on selected samples to evaluate field identification of soil samples and assist in identifying the **soil's engineering properties**. The **laboratory testing** consisted of the performance of six gradation analyses performed in accordance with ASTM D6913. The results of the laboratory testing are provided in Appendix II and discussed in Section 6.

#### 6.0 SUBSURFACE CONDITIONS

The encountered subsurface conditions generally consist, in turn, of a thin layer of fill; apparent glacial till soils; and highly decomposed bedrock. It is noted that the soils characterized as glacial till could also be residual soils, those resulting from the complete decomposition of the underlying bedrock. Sedimentary rock of the Brunswick formation can be locally seen in outcrop in the general area.

The fill, which was encountered to depths up to approximately 2 feet at most of the boring locations, commonly consists of brown or gray-brown silty sand with minor amounts of gravel. The fill is overlain by a variable 3 to 6-inch thick layer of asphalt pavement at borings performed within the driveway and parking lots, and a several inch thick layer of topsoil within landscaped areas.

The native soils most commonly consist of silty, red-brown, coarse to fine sand with varying amounts of gravel. The presence of larger materials, such as cobbles and possibly boulders, is indicated by the encountering of casing refusal at borings B-1 and B-5. Occasionally, the native soils consist of silty medium

to fine sand with varying amounts of gravel, or silt with lesser amounts of sand and gravel. SPT N-values within the native soils generally indicate that they are in a medium dense state to depths varying from about 6 to 10 feet, and a dense to very dense state at greater depths, with split-spoon sampler refusal commonly being encountered at depths ranging from about 16.5 to 20 feet. Split-spoon sampler refusal is defined as over 50 blows of the 140-pound hammer with less than 6 inches of sampler penetration, and it is an indicator of transition into highly weathered sandstone bedrock. All of the deeper borings were terminated within these very dense materials.

Due to the introduction of water during mud-rotary drilling and the relatively low permeability of the site soils, groundwater levels could not be reliably measured while and immediately upon completion of drilling. Boring B-6 was left open during the duration of the investigation after having pumped the drilling fluids to a depth of 18.8 feet. Water rose in the hole to an elevation of 11.5 feet over the next day, indicating that this is the likely groundwater depth at the end of the investigation. This corresponds to a groundwater elevation of about +205.5 feet. It is also noted that in general, split-spoon soil samples were generally moist in the 10 to 12-foot sample, and wet in the 12 to 15 feet sample. This generally further suggests that groundwater at the other boring locations was at a similar depth over the duration of the investigation.

It should be noted that groundwater levels will vary with season, weather and other factors. Consequently, groundwater should be anticipated to be encountered at other depths at other times.

#### 7.0 SEISMIC SITE COEFFICIENTS AND LIQUEFACTION POTENTIAL

Based on the results of the test borings, the site falls under Seismic Site Class C. The corresponding maximum spectral response accelerations at short periods ( $S_{MS}$ ) is equal to 0.388g and at a 1-second period ( $S_{M1}$ ) is equal to 0.092g.

Due to the dense nature of the site soils below the water table, the site soils is not subject to liquefaction during the design earthquake event.

## 8.0 DISCUSSION & CONCLUSIONS

The following bulleted items discuss the geotechnical considerations regarding the design and construction of the proposed addition to the town hall building. The discussion is based on the findings of the investigation described in Section 6, and our understanding of the proposed site development described in Section 3.

- The subgrade soils at the anticipated minimum foundation bearing depths are anticipated to range from medium dense to dense glacial till soils suitable for the support of spread footings and continuous wall foundations. Some fill may also be encountered at the proposed foundation subgrades. The existing fill should be removed to suitable native soil materials.
- Since the proposed building does not have a basement, proposed foundations are anticipated to bear approximately 8 feet above the foundations of the existing building. In order to avoid loading the existing foundations, the proposed foundations will need to be gradually stepped up from the basement bearing elevation at a 1H:1V slope, or the basement wall bounding the transition will need to be designed to resist surcharge loads resulting from shallow bearing foundations.
- As groundwater was measured at an elevation of approximately +205.5 feet, and the new building is proposed to be at an elevation +219.5 feet, groundwater is not anticipated to impact both building design and construction.
- The glacial till and highly decomposed sedimentary bedrock should be assumed to contain oversized materials. Apparent cobbles resulted in casing refusal at shallow depths at borings B-1 and B-5.
- Because of their high fines contents, the glacial till soils and underlying highly decomposed bedrock are not suitable for use as structural fill. Also, these materials should be considered moderately to highly frost susceptible. Design measures to minimize the frost heave of pavements and slabs should be implemented. This includes extending free draining base fills to greater depths to provide partial frost protection and minimizing access of surface water beneath these structures.
- The on-site soils are not subject to liquefaction during the design earthquake event.

## 9.0 RECOMMENDATIONS

The following sections provide recommendations for the design of the proposed building foundations. The recommendations are based on the results of the subsurface investigation presented in this report and our experience working in similar site conditions.

## 9.1 Foundations

The proposed building addition can be supported on continuous wall footings and spread footings bearing on undisturbed medium dense to dense native soils, or compacted structural fill placed over these materials. We recommend that all foundations be designed for a net allowable bearing pressure of 2 tons per square foot. Based on the anticipated building loads, this bearing pressure is anticipated to result in reasonably sized foundations. Subgrade preparation recommendations are provided in Section 10.

Continuous wall footings be designed with a minimum width of 2 feet and spread footings should have a minimal width of 3 feet. Exterior footings should bear at least 3.5 feet below the adjacent outside grade for frost protection. Interior foundations should bear at least 1.5 feet below the finished floor slab elevation within heated sections of the building. Stepped foundations should be stepped such that the rise over run does not exceed 1H:1V. Using the above design criteria, total settlement is estimated to be less than 1.0 inch and differential settlements are estimated to be less than 0.5 inches. The differential settlement is estimated over a distance of about 30 feet along continuous footings, or between adjacent column footings.

## 9.2 Building and Temporary Retaining Walls

Building and retaining walls should be backfilled with non-expansive, free draining soil. Imported structural fill, as defined in Section 10, should be used within these zones. Foundation and temporary retaining walls can be designed in accordance with the following criteria:

<u>Soil Parameter</u>	<u>Select Fill Backfill &amp; Medium Dense Native Soil<sup>4</sup></u>	<u>Dense to Very Dense Native Soil/Decomposed Bedrock<sup>4</sup></u>
Angle of internal Friction	34°	38°
Active earth pressure Coefficient ( $K_a$ ) <sup>(1)</sup>	0.28	0.24
At rest earth pressure Coefficient ( $K_o$ ) <sup>(2)</sup> (restrained wall)	0.44	0.38
Passive earth pressure Coefficient ( $K_p$ ) <sup>(3)</sup>	3.54	4.2
Total unit weight of soil (pounds per cubic foot)	125	130

- 1) Use for free standing walls where movement of up to 0.0025 X height of wall is both possible and tolerable. Otherwise, use at-rest coefficient.
- 2) Use for walls restrained against outward lateral movement.
- 3) Passive resistance should be within the zone of frost penetration (3.5 feet).
- 4) Medium dense soils can be taken as those having SPT N-values between 10 and 30 blows per foot (bpf), while dense to very dense soils can be taken as those having SPT N-values greater than 30 bpf.

Concrete foundations cast directly against the native on-site soils or fill can be assumed to have a coefficient of sliding resistance of 0.34.

Additional loading due to temporary and permanent surcharges, such as earthquake, automobiles and construction traffic, and building foundations falling in close proximity to the basement walls should be added to the lateral loading exerted by the backfill. Loads due to supported structures should be applied in appropriate combinations with the lateral loads.

Damproofing should be provided for all foundation walls where the outside grade is higher than the slab elevation. All retaining walls and any foundation walls where the slab resides at a lower elevation than the outside grade should include foundation drainage consisting of a minimum 12-inch wide drainage layer of crushed stone or clean gravel placed against the full-height of the wall with a collector pipe at the footing bottom draining by gravity to a suitable outlet. The gradation specification for the drainage material is provided in Section 10 as **“free draining crushed stone.”** The stone or gravel should be completely separated from the soil backfill by a permeable geotextile having an apparent opening size (AOS) of U.S. Sieve Nos. 70 to 100, **such as TenCate's Mirafi 140N.** Grading of the surface of the backfill and the surrounding topography and pavements should provide positive drainage away from the walls. Roof drains should be positively drained to areas away from the building.

### 9.3 Slabs-on-Grade

Slab-on-grade floors should be supported on a minimum 6-inch thick layer of free draining ½ to ¾ inch crushed stone placed over a proof-rolled and approved subgrade consisting of native soil, or a structural fill subgrade. Remedial removals of unsuitable materials such as topsoil, or loose upper

soils will likely be required within the footprint of the proposed building. Subgrade preparation and structural fill material and placement recommendations are provided in Section 10 of this report.

A vapor barrier consisting of a polyethylene membrane at least 20 mils thick, such as Stego® Wrap Vapor Barrier, should be placed beneath all moisture-sensitive floor slabs. A coefficient of friction of 0.3 should be used between the slab and the vapor barrier. If concrete is cast directly against compacted structural fill, a coefficient of friction of 0.45 can be used.

For design of slab-on-grade floors with a 6 inch crushed stone base, a modulus of subgrade reaction of 150 pounds per cubic inch (pci) is recommended when bearing on fill, native soils, or compacted structural fill. The modulus of subgrade reaction is suitable for estimating distributions of bearing pressure beneath the slab and for estimating bending moments and shears within the slab. It is not intended for the purpose of calculating total or differential settlements.

## 10.0 CONSTRUCTION RECOMMENDATIONS

The following sections provide our general site and building construction recommendations.

### 10.1 General Site Preparation

Topsoil, stumps, roots greater than 1/2-inch in diameter, pavement, sidewalks, catch basins, drain pipes and other structures should be removed. Topsoil removed from the stripping operation may be stockpiled and **processed (if necessary) to meet the site civil engineer's and/or landscape architect's** specifications for topsoil to be placed around the site. All debris and unsuitable materials removed from the site should be disposed of at a legal disposal facility. Existing utilities within the project limits, if any, should be re-routed or protected from damage by construction equipment. Site clearing should extend a minimum 10 feet **beyond the proposed building's footprint.**

### 10.2 Subgrade Preparations

The subgrades should consist of undisturbed, firm, and stable fill or glacial till, or imported structural fill placed over an undisturbed native subgrade.

Foundation subgrades should be prepared by removing all soil loosened by machine excavation. Fill, floor and pavement subgrades may be prepared by recompacting loosened materials. The foundation subgrades, slab-on-grade subgrades, pavement subgrades, and any areas to receive fill should be proofrolled under the observation of the geotechnical engineer. Proofrolling in confined areas should be performed with a double-drum vibratory roller having a minimum static weight of 1.5 tons. Proofrolling in open areas should be performed with a static roller having a minimum weight of 10 tons, or by a fully-loaded 10-wheeled dump truck. Soils not meeting the recommended requirements for suitable bearing materials, all existing fill, or areas found to be soft and yielding during proofrolling, should be removed. The area of removal should be within the zone of influence of the foundations, which is defined as zone contained within imaginary planes sloping downward and outward from the bottom edges of the foundation at a slope of 1 horizontal to 1 vertical. When unsuitable material is encountered beneath slabs or pavement, the area of removal should span the entire soft, yielding area beneath the slab or pavement. Over-excavated areas should be re-established with compacted fill.

### 10.3 Protection of Subgrades and Temporary Dewatering

The glacial till soils at the site will become readily disturbed when exposed to moisture. Subgrades should be protected from the effects of frost, construction traffic, groundwater, and surface water. The necessary protection should be provided immediately subsequent to excavation and be maintained until placing fill or concrete. Temporary surface drainage measures are recommended to divert runoff away from the proposed construction limits.

If maintaining subgrade stabilization during periods of wet weather is a concern, crushed stone may be placed on footing subgrades after excavation, proofrolling and subgrade approved by the geotechnical engineer. The crushed stone should be clean 3/4-inch gravel and not exceed 6 inches in thickness. The crushed stone should be compacted after placement to create a level bearing **surface and to “seal” the subgrade.**

It is not expected that significant dewatering will be required at this site, but if necessary, it should be performed in a manner that will prevent loosening or migration of the subgrade soils and performed to maintain the water level at least 1-foot below the deepest excavation. Given the dense nature and high

finer content of the on-site soils, it is anticipated that sump pits and pumps may be suitable for dewatering. The operation of sumps directly in the footing excavations should not be allowed. Sump pits should be placed at least 1-foot outside of foundation excavations for every foot below the foundation subgrade elevation that they are excavated. The dewatering system should be designed by a New York State Licensed Professional Engineer, and it should be designed to ensure that dewatering does not result in any loss of soil.

#### 10.4 General Excavation

All excavations should conform to the latest OSHA requirement regarding worker safety. The soils will vary from having OSHA designation Class B and C soils.

The results of our subsurface investigation indicate that the required on-site excavations should be feasible with normal heavy-duty earthmoving equipment in good working order. However, larger boulders may be encountered that require excavator mounted hydraulic hammer to fracture. Also, and as noted, weathered bedrock requiring excavator mounted hydraulic hammers to fracture may also be encountered in deeper excavations.

#### 10.5 Fill and Backfill Materials

Structural fill shall consist of sand, gravel, crushed stone, crushed gravel, or a mixture of these, it shall contain no organic matter, and it shall conform to the following gradation:

<u>Sieve Size</u>	<u>Percent Finer by Weight</u>
3 inch	100
¼ inch	30-70
No. 40	5-40
No. 200	0-10

Based on the results of our subsurface investigation and laboratory testing, the majority of the on-site soils are not suitable for use as structural fill as all but isolated layers have excessive fines (soil passing the No. 200 sieve).

All fill and backfill should be compacted to at least 95 percent of the maximum dry density, within 2 percent of the optimum moisture content, as determined by ASTM D1557. The lift thickness for the fill soils will vary depending on the type of compaction equipment used. Fills should generally be placed in uniform horizontal lifts not exceeding 12 inches in loose thickness. In confined areas, the loose lift thickness should be 6 inches or less and each lift should be compacted with sufficient passes of hand operated vibratory or impact compaction equipment. A geotechnical engineer with appropriate field and laboratory support should inspect all footing subgrades, approve materials for use as fill, and test backfill materials for compliance with the recommended compaction.

Free draining crushed stone placed below slabs and as drainage materials behind foundation and retaining walls, and within curtain drains and underdrains should meet the specification for Underdrain Filter Type I materials, as specified in the NYSDOT Standard Specifications (Item 733.2001), as follows:

<u>Sieve Size</u>	<u>Percent Finer by Weight</u>
1 inch	100
½ inch	30-100
¼ inch	0 – 30
No. 10	0 – 10
No. 20	0 – 5

In some cases, it may be preferable to place flowable fill as backfill within utility trenches or as a substitute for compacted fill to restore the grade when undercutting unsuitable materials from beneath buildings or other structures. In that case, the flowable fill should have a minimum 28-day unconfined compressive strength of 150 psi and should meet the requirements for Controlled Low Strength Material (CLSM), as specified in Section 733-01 – “**Flowable Fill**” of the NYSDOT Standard Specifications.

#### 11.0 CONSTRUCTION MONITORING

A geotechnical engineer familiar with the existing subsurface conditions and having the appropriate laboratory and field-testing support should be engaged by the owner to observe that all earthwork is performed in accordance with the specifications, the Code, and the design criteria provided in this report.

The following work should be performed under the observation of the geotechnical engineer:

- Placement and compaction of fill
- Foundation subgrade preparation
- Proofrolling of floor, pavement and foundation subgrades
- Temporary dewatering activities

All materials proposed for use as soil fill should be tested and approved prior to delivery or use on-site. All fill materials should be tested as they are being placed to verify that the required compaction is being achieved.

## 12.0 LIMITATIONS

Our professional services have been performed using the degree of care and skill ordinarily exercised under similar circumstances by reputable geotechnical engineers and geologists practicing in this or similar situations. The interpretation of the field data is based on good judgment and experience. However, no matter how qualified the geotechnical engineer or detailed the investigation, subsurface conditions cannot always be predicted between the points of actual sampling and testing. No other warranty, expressed or implied, is made as to professional advice included in this report.

The recommendations and data contained in this report are intended for design purposes only. The use of this report as a construction document is neither intended nor authorized by Tectonic Engineering Consultants, Geologists & Land Surveyors, D.P.C. (Tectonic). Contractors and others involved in the construction of this project are advised to make an independent assessment of the subsurface conditions for establishing quantities, schedules, and construction techniques.

This report has been prepared for the exclusive use of the Lothrop Associates LLP and their designees for the specific application to the proposed construction described in this report. In the event that any changes in nature, design or location of proposed structures are planned, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed and conclusions modified or verified in writing by Tectonic. It is recommended that Tectonic be retained to review the plans and specifications prior to bidding and to provide construction monitoring and inspection services to ensure proper implementation of the recommendations contained herein, which would otherwise limit our professional liability.

### GRAIN SIZE DISTRIBUTION

Project No: 10128.01

Date: 8/31/20

Project: Orangeburg Town Hall Addition

Location: Orangeburg, NY

GRAIN SIZE DISTRIBUTION 10128.01.GPJ\_TECTONIC ENG.GDT 8/31/20

## Our Story

For the past 30 years, Tectonic has delivered quality professional services in a timely and cost effective manner by pooling its talented staff into project teams that think, act, and perform as one integral unit. By carefully listening and collaborating with its clients, the firm is able to identify the key issues and assure stakeholder objectives are met in the final deliverables. Through innovating and adopting technological advances, the firm is able to generate unique solutions to improve our nation's deteriorating infrastructure and build safe sustainable communities.

As the world evolves, and its challenges grow more complex, Tectonic continues to innovate and provide the practical solutions and exceptional customer service its clients have trusted since its founding.

## SECTION 31 31 00 – SOIL MANAGEMENT

### PART 1 - GENERAL

#### 1.1 SECTION INCLUDES

- A. This specification describes requirements for soil management as specified herein, including segregation and storage, field organic vapor monitoring, sampling and analysis, transportation and disposal, and reuse of soils.
- B. The Contractor shall provide all labor, materials, tools, and equipment to perform all operations necessary to characterize, classify and determine the requirements for handling, disposal, and/or reuse of all materials to be excavated.

#### 1.2 GENERAL INFORMATION AND REQUIREMENTS

- A. The Contractor is responsible for assuring compliance with all applicable Federal and State regulations and policies in place at the time of construction. This includes, but is not limited to, any Federal or State modifications to sampling or analytical methods, standards, or policies specified herein.
- B. Soil contaminants may potentially include:
  - 1. Petroleum products, which may include, but are not limited to: gasoline, heating oils, diesel fuel, kerosene, lubricating oils, motor oils, greases, and other fractions of crude oil;
  - 2. Other contamination by organic constituents including volatile organic compounds;
  - 3. Metal(s) such as lead, chromium, and/or other heavy metals; and/or
  - 4. Any other constituents that require specialty disposal of the soil.

Additional information regarding contaminated soil is available in a Field Sampling Summary Report drafted in September 2020, as detailed under Specification Item 1.6: Existing Soil Conditions.

- C. Segregation and Storage
  - 1. This work shall consist of segregating contaminated soil from non-contaminated soil during excavation, and the temporary storage and management of contaminated soil (pending sampling, analysis and ultimate disposition) in accordance with an accepted Contaminated Material Handling Plan.
- D. Field Organic Vapor Monitoring

NOT USED

E. Sampling and Analysis

1. This work shall consist of collecting soil samples and arranging for samples to be analyzed at a laboratory in accordance with an accepted Field Sampling Plan. The laboratory shall be accredited for the specified parameters by the New York State Department of Health (NYSDOH) under the Environmental Laboratory Approval Program (ELAP). The results of the laboratory analysis will determine or confirm the final regulatory classification of the soil for appropriate handling, transportation, treatment and disposal/reuse methods and requirements.

F. Transportation and Disposal

1. This work shall consist of transporting and disposing of soil that is not otherwise reused on site, and completing any other related activities, in accordance with an accepted Disposal Plan. For shipping and disposal purposes, the regulatory classification of the soil (as either contaminated non-hazardous waste or RCRA regulated hazardous waste) will be based on investigations conducted prior to award or based on the results of laboratory analysis included in this Specification Section.

G. Reuse of Soils

1. This work shall consist of the reuse of soil within the contract limits as embankment, fill or other appropriate on-site use (unless gross contamination is discovered). Soil areas and reuse locations, if provided, are indicated in the contract documents or shall be determined and approved by the Engineer. The reuse of soil must be compliant with applicable sections of 6 NYCRR Part 360.12 and Part 350.13 as deemed appropriate based upon the following a) an investigation conducted prior to the contract award and/or sampling and analysis conducted during project construction and the qualification of the soil placement as a generic beneficial use determination (BUD) or b) as a site-specific BUD obtained from the New York State Department of Conservation (NYSDEC). The material must and can be considered suitable material as per the Geotechnical Investigation Report, as detailed under Specification Item 1.6: Existing Soil Conditions.

1.3 RELATED WORK SPECIFIED ELSEWHERE

- A. Earth Moving: Section 31 20 00.

1.4 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.

- C. Field Sampling Summary Report: Preliminary Soil Waste Characterization – Orangetown Town Hall Expansion, prepared by Tectonic Engineering Consultants, Geologists & Land Surveyors, D.P.C., dated September 4, 2020.
- D. Geotechnical Investigation Report – Proposed Addition to Orangetown Town Hall, prepared by Tectonic Engineering Consultants, Geologists & Land Surveyors, D.P.C., dated March 8, 2021.

## 1.5 DEFINITIONS

- A. NYSDOH: New York State Department of Health
- B. ELAP: Environmental Laboratory Approval Program
- C. RCRA: Resource Conservation and Recovery Act
- D. BUD: Beneficial Use Determination
- E. NYSDEC: New York State Department of Environmental Conservation
- F. PID: Photoionization Detector
- G. PPM: Parts Per Million
- H. FID: Flame Ionization Detector
- I. PPC: Personal Protective Clothing
- J. PPE: Personal Protective Equipment
- K. OSHA: Occupational Safety and Health Administration
- L. EPA: United States Environmental Protection Agency
- M. USDOT: United States Department of Transportation

## 1.6 EXISTING SOIL CONDITIONS

- A. A preliminary soil waste characterization field study was conducted by Tectonic Engineering Consultants, Geologists & Land Surveyors, D.P.C. (Tectonic) between August 12 – 14, 2020. Full details of this preliminary investigation are available a Field Sampling Summary Report prepared by Tectonic and drafted in September 2020. Relevant conclusions and recommendations of the preliminary waste characterization studies are as follows:
  - 1. The soils sampled and analyzed would be classified as non-hazardous regulated material by the State on New York. Material scheduled for excavation and off-site disposal should be disposed of at an appropriate, permitted facility that can accept the waste. Material considered for on-site reuse would be regulated as follows:

- a. As per the NYSDEC Pre-determined BUD Part 360.12(c)(1)(ii), “fill material generated outside of New York City with no evidence of historical impacts such as reported spill events, or visual or other indications (odors, etc.) of chemical or physical contamination,” may be re-used on Site. In the event that visual or other indications of contamination are observed during soil disturbance activities, NYSDEC Part 360.13(c) states, “fill material used as backfill for the excavation from which the fill material was taken, or as fill in areas of similar physical characteristics on the project property is exempt from regulation under this Part [360]”.
- b. If fill material exhibits historical or visual evidence of contamination (including odors), and will be used in an area with public access, the relocated fill material must be covered with a minimum of 12 inches of soil or fill material that meets the criteria for general fill as defined in this Part [360]. General fill is defined in in Table 2 of Part 360 as:

TABLE 2: Fill Material Beneficial Use

Fill Material Type	Fill Material End Use	Physical Criteria	Maximum Concentration Levels
General Fill	Any setting where the fill material meets the engineering criteria, for use, except: 1. Undeveloped land; and 2. Agricultural crop land. General Fill may also be used in the same manner as Restricted-Use Fill and Limited-Use Fill.	Only soil, sand, gravel or rock; no non-soil constituents.	Lower of Protection of Public Health-Residential Land Use and Protection of Groundwater in Table 375-6.8(b) of this Title.

1.7 SUBMITTALS

- A. Contaminated Material Handling Plan
- B. Field Sampling Plan
- C. Field Sampling Summary Report
- D. Disposal Plan

**PART 2 - MATERIALS**

2.1 GENERAL

- A. As per the Contaminated Material Handling Plan, (Item 3.2 (C) (1))

## 2.2 SEGREGATION AND STORAGE

- A. A minimum of 10-mil or two (2) layers of 6-mil polyethylene sheeting shall be used as soil stockpile(s) liner(s) and cover(s).
- B. A partial containment berm made up of hay bales, silt fences, or timbers shall be utilized around stockpiled soils to direct runoff and minimize erosion.

## 2.3 FIELD ORGANIC VAPOR MONITORING

NOT USED

## 2.4 SAMPLING AND ANALYSIS

- A. All reusable sample collection devices, such as shovels or hand trowels, shall be stainless steel. All devices shall be decontaminated before and after collection of each sample. All methods necessary to decontaminate the sampling equipment shall be used. Contractor shall be responsible for proper handling and disposal of all decontamination materials and fluids.
- B. All disposable sampling devices shall be constructed of inert materials such as polyethylene, silicon, or Teflon. All disposable sampling devices shall be used only once and properly disposed.

## 2.5 TRANSPORTATION AND DISPOSAL

- A. The Contractor must assure that the waste transporter's appropriate choice of vehicles and operating practices are fitted to prevent spillage or leakage of contaminated material during transportation.

## 2.6 REUSE OF SOILS

- A. As per the NYSDEC Pre-determined BUD Part 360.12(c)(ii), "fill material generated outside of New York City with no evidence of historical impacts such as reported spill events, or visual or other indications (odors, etc.) of chemical or physical contamination," may be re-used on Site. In the event that visual or other indications of contamination are observed during soil disturbance activities, NYSDEC Part 360.13(c) states, "fill material used as backfill for the excavation from which the fill material was taken, or as fill in areas of similar physical characteristics on the project property is exempt from regulation under this Part [360]".
- B. If fill material exhibits historical or visual evidence of contamination (including odors), and will be used in an area with public access, the relocated fill material must be covered with a minimum of 12 inches of soil or fill material that meets the criteria for general fill as defined in this Part [360]. General fill is defined in in Table 2 of Part 360 as:

TABLE 2: Fill Material Beneficial Use

Fill Material Type	Fill Material End Use	Physical Criteria	Maximum Concentration Levels
General Fill	Any setting where the fill material meets the engineering criteria, for use, except: 1. Undeveloped land; and 2. Agricultural crop land. General Fill may also be used in the same manner as Restricted-Use Fill and Limited-Use Fill.	Only soil, sand, gravel or rock; no non-soil constituents.	Lower of Protection of Public Health-Residential Land Use and Protection of Groundwater in Table 375-6.8(b) of this Title.

**PART 3 - EXECUTION**

3.1 EARTHWORK

- A. Excavating, trenching, and backfilling are specified in Specification Section 31 20 00 "Earth Moving."

3.2 GENERAL

- A. Work activities shall be performed in accordance with the contract documents and with applicable Contaminated Material Handling Plan, Field Sampling Plan and Disposal Plan. The Contractor shall initiate any measures necessary to protect the safety and health of workers and the general public based on the potential hazards associated with potentially contaminated soil.
- B. **Regulatory Compliance:** The Contractor shall conduct all tasks in accordance with all applicable Federal, State, County, and local regulations including, but not necessarily limited to:
  1. 29 CFR 1910.120 and 29 CFR 1926.65 - Hazardous Waste Operations and Emergency Response.
  2. 6 NYCRR 360 - Solid Waste Management Facilities.
  3. 6 NYCRR 364 - Waste Transporter Permits.
  4. 6 NYCRR 371 - Identification and Listing of Hazardous Wastes (Defines Resource Conservation and Recovery Act (RCRA) defined hazardous wastes.
  5. 6 NYCRR 372 - Hazardous Waste Manifest System and Related Standards for Generators, Transporters and Facilities (applicable to soils regulated as hazardous wastes only).
  6. 6 NYCRR 373 – Hazardous Waste Management Facilities.
  7. 6 NYCRR Part 375 – Environmental Remediation Program.
  8. 6 NYCRR Part 376 – Land Disposal Restrictions.
  9. 49 CFR 100 to 180 - USDOT Hazardous Materials Transport and Manifest System Requirements (applicable to soils regulated as hazardous wastes only).
  10. Local restrictions on transportation of waste/debris.
  11. 40 CFR 260 to 272 – Hazardous Waste Management (RCRA).
  12. Posted weight limitations on roads and bridges.

13. Resource Conservation and Recovery Act (RCRA).
14. NYSDEC Program Policy DER-10: Technical Guidance for Site Investigation and Remediation (DER-10).
15. NYSDEC Policy CP-51: Soil Cleanup Guidance.

C. ***Preparation of Plans / Reports:*** The Contractor shall be required to prepare the plans and reports described below. Two (2) copies of each applicable plan shall be submitted to the Engineer for acceptance at least thirty (30) calendar days prior to commencing work.

Plans and reports shall be prepared based on the type(s) of contamination and locations identified in the contract documents. If a different type of contamination is encountered during work, and additional plans must be written, the thirty (30) calendar day lead time for submittals may be modified by the Engineer as appropriate.

1. ***Contaminated Material Handling Plan (CMHP):*** The CMHP shall describe the procedures to be used to segregate contaminated soil during excavation, soil storage/stockpile procedures, and safety and health issues. The following information shall be included in the CMHP:
  - a. Name and address of the plan preparer;
  - b. Contract name, contract number and description;
  - c. Describe procedures to be used to segregate contaminated soil during excavation;
  - d. Location of intended soil stockpile, trucks, roll-off container and other storage areas;
  - e. Describe how contaminated soil will be moved to soil storage locations;
  - f. Describe how soil storage/stockpile locations will be prepared and managed;
  - g. Describe how potential air quality impacts such creation of dust particulates and vapors will be minimized to protect air quality within, adjacent to or downwind from the project;
  - h. Describe air monitoring procedures to be used during work, define action levels, and explain the response if action levels are exceeded; The protocol and procedures shall consider action levels for both work personnel and also perimeter/community action levels based on the nature of the contamination and activities conducted;
  - i. Hazardous substance evaluation - types of chemicals associated with the waste to be generated,
  - j. Hazard assessment - physical and toxic effects associated with the waste to be generated; Personal protective clothing (PPC) and personal protective equipment (PPE) to be used or available on-site;
  - k. Names of key personnel, emergency contacts and phone numbers;
  - l. List the OSHA training each worker has received. At least one worker must have completed supervisor training per 29 CFR 1910.120(E)(4);
  - m. General and site-specific safety rules, with emergency response procedures and directions to the nearest hospital (with map);
  - n. Decontamination procedures for personnel and equipment; and
  - o. Disposal of contaminated PPC and PPE;

2. **Field Sampling Plan:** A Field Sampling Plan (FSP) must be prepared and submitted to the Engineer for approval prior to mobilization for any sampling activities. The FSP shall include protocols for the collection and analysis of samples that represent all soils to be excavated and stockpiled. The Engineer will approve the FSP only if it clearly provides the information to allow for classification of all material proposed for excavation. No sampling shall be conducted until the Engineer has reviewed and formally approved the FSP in writing. At a minimum, the following information shall be included in the FSP:

- a. Name and address of the plan preparer;
- b. Name, telephone number, and ELAP certification number of the proposed NYSDOH ELAP accredited laboratory;
- c. Name, address, experience and qualifications of each individual who will collect soil samples. Each individual shall be thoroughly trained in sampling protocols, handling and chain of custody procedures, and laboratory requirements;
- d. For materials destined for offsite disposal at a permitted facility, the FSP shall include a detailed outline of the disposal facility requirements for sampling, testing and analysis including specific number and types of samples per unit volume of soil to be excavated;
- e. For all materials to be disposed, the sampling frequency shall be, at a minimum, in accordance with NYSDEC DER-10 Table 5.4(e)10, unless otherwise specified by the disposal facility:

Contaminant	VOCs	SVOCs, Inorganics & PCBs/Pesticides	
Soil Quantity (cubic yards)	Discrete Samples	Composite	Discrete Samples/Composite
0-50	1	1	3-5 discrete samples from different locations in the fill being provided will comprise a composite sample for analysis
50-100	2	1	
100-200	3	1	
200-300	4	1	
300-400	4	2	
400-500	5	2	
500-800	6	2	
800-1000	7	2	
> 1000	Add an additional 2 VOC and 1 composite for each additional 1000 Cubic yards or consult with DER		

- f. Description of QA/QC samples required by the reuse or disposal facilities;
- g. Description of additional reuse or disposal facility requirements;
- h. A scaled map of the site showing existing fixed landmarks and the proposed excavation limits. The map shall contain specific sampling locations that will conform to the applicable sampling frequency requirements;
- i. Proposed sampling, handling, preservation, and storage of equipment and procedures, including transfer procedures, and sampling equipment decontamination procedures;
- j. Analytical Methods: proposed analytical methods shall be in accordance with EPA SW-846, latest edition;
- k. Data Quality Objectives: Procedures for assessing precision, accuracy, degree of representation, comparability and completeness of samples and data, including performance audits and proposed protocols for corrective

- measures where problems are identified shall be defined and meet standards set forth in this Specification;
- l. Schedule of field inspections;
  - m. Planned preparation of daily and project summary quality control reports; and
  - n. Manufacturer, catalog data and calibration records of all analytical equipment to be used on-site.
3. **Field Sampling Summary Report:** The field sampling summary report (FSSR) shall contain all laboratory analytical results obtained from the field sampling event(s). A detailed account of any field procedures used which deviated from those established in the FSP shall be included, as well as a complete set of field notes. The Contractor shall submit hard copies of the FSSR which shall include a Summary Table listing the analytical results with highlighted exceedances of RCRA Characteristics, BUD, or applicable parameters of 6NYCRR Part 375 and all disposal facility limits, including any alternate acceptance criteria. Detailed field notes shall be maintained by the Contractor during sampling to allow identification of sample analysis results with the respective areas / volumes of soil that the data represent, and to verify quantities of materials to be beneficially reused or disposed of as regulated solid waste. The field notes shall be made available to the Engineer during the sampling program and included in the FSSR and shall consist of:
- a. Boring and/or test pit logs from each sampling location containing a continuous stratigraphic description of all material encountered. Descriptions of material shall include, but not be limited to, color, odor, staining, field screening measurement, relative grain size distribution, material composition, moisture content, and cohesive properties;
  - b. The location of each sampling point on a scaled map;
  - c. Depth intervals for each sample, whether a grab or composite, and any special notes, which are included on the laboratory chain-of-custody forms; and
  - d. Copies of all laboratory chain-of-custody forms for samples that are collected for analysis.
4. **Disposal Plan:** The following information shall be included in the Disposal Plan:
- a. Name and address of plan preparer;
  - b. Name of disposal/treatment facility, address, telephone number and contact person;
  - c. Copy of applicable permits and/or licenses held by the disposal/treatment facility;
  - d. EPA Identification Number and/or State Facility Identification Number issued to the disposal/treatment facility;
  - e. Method(s) of disposal/treatment that will be used;
  - f. Signed letter from the disposal/treatment facility stating it is authorized under law to accept the type of waste being generated, their intent to accept the waste generated by this contract, and a list of the laboratory tests required by the facility;
  - g. Name of waste transporter, address, telephone number and contact person;

- h. EPA Identification Number and/or State Transporter Identification Number issued to waste transporter; and
- i. Copies of all waste transporter permits and/or license plate numbers for vehicles that will be used for transport of waste from the site to the intended disposal/treatment facility;

### 3.3 SEGREGATION AND STORAGE

A. The Contractor shall have an accepted CMHP prior to commencing work within potentially contaminated soil areas. Soil determined to be contaminated (by PID/FID screening or observation) shall be segregated from non-contaminated soil and stored pending sampling, analysis and disposal. For the purposes of this project, contaminated versus non-contaminated soils are defined as follows:

1. **Non-Contaminated Soil:** Soil with PID/FID head space readings less than 25 ppm and exhibiting no other evidence of contamination (visual or olfactory evidence) shall be considered non-contaminated. Unless further analysis is performed for confirmation of the non-contaminated soil, this soil will be considered uncontaminated.
2. **Contaminated Soil:** Soil with PID/FID head space readings equal to or greater than 25 ppm and/or soil exhibiting other evidence of contamination (visual or olfactory evidence) shall be considered contaminated. This soil shall be segregated from non-contaminated soil and placed in stockpiles or containers. The results of laboratory analysis will be used to determine its regulatory classification. If feasible, soil with significantly higher PID/FID head space readings and soil exhibiting unusual visual or odor characteristics shall be segregated from other contaminated soil.

If feasible, soil with significantly higher PID/FID head space readings and soil exhibiting unusual visual or odor characteristics shall be segregated from other contaminated soil. The Contractor shall notify the Engineer immediately if soil is discovered that appears to contain unknown contaminants or soil that varies significantly from the type of contamination identified in the contract documents. The Engineer will determine the preliminary regulatory classification of the suspect soil and will determine how the soil is to be managed.

B. The Contractor shall not store contaminated soil for more than forty (40) calendar days, with this time limit beginning on the first day soil is placed in a stockpile, truck-bed or roll-off container. If the Engineer approves additional storage time for soil determined to be contaminated non-hazardous waste, the Contractor shall also request approval from NYSDEC for any storage greater than sixty (60) calendar days. If the Engineer approves additional storage time for soil determined to be RCRA regulated hazardous waste, the Contractor shall also obtain approval from NYSDEC for any storage greater than ninety (90) calendar days. Contaminated soil may be placed in stockpiles, trucks or roll-off containers as follows:

1. ***Stockpiles:*** The Contractor shall prepare and maintain stockpiles as follows:
  - a. ***Preparation of Stockpile Areas***
    - 1) The area shall be graded to provide positive drainage away from intended stockpile locations;
    - 2) All stones, roots, debris and other objects that may puncture polyethylene ground protection shall be removed;
    - 3) The ground surface where soil will be stockpiled shall be covered with a minimum of 10-mil or two (2) layers of 6-mil polyethylene sheeting, or an equivalent material. All seams shall be overlapped and sealed to prevent the leaching of contaminants; and
    - 4) Stockpile locations shall be accepted by the Engineer prior to use.
  - b. ***Stockpile Protection***
    - 1) At the end of each work day, contaminated soil stockpiles shall be completely covered with a minimum of 10-mil or two (2) layers of 6-mil polyethylene sheeting, or an equivalent material. All seams shall be overlapped and sealed to prevent the leaching of contaminants.
    - 2) Stockpile covers shall be weighted or secured by appropriate means to prevent tearing or removal by weather conditions.
    - 3) Stockpiles shall be labeled, signed, fenced or otherwise secured (as needed) at the end of each work day.
    - 4) A partial containment berm made up of hay bales, silt fences, or timbers shall be utilized around stockpiled soils to direct runoff and minimize erosion.
  - c. ***Maintenance***
    - 1) Stockpile covers, site grading, signing and security measures shall be properly maintained for the duration of storage.
    - 2) Damaged covers and other protections shall be repaired or replaced by the Contractor within 24-hours after notification. If this work is not satisfactorily completed within 24-hours, no further stockpiling shall be allowed until such work is completed.
2. ***Trucks or Roll-off Containers:*** The Contractor shall prepare and maintain trucks and roll-off containers as follows:
  - a. The interior of truck-beds and roll-off containers shall be lined with 10-mil or two (2) layers of 6-mil polyethylene sheeting, or an equivalent material. All seams shall be overlapped and sealed to prevent the leaching of contaminants.
  - b. At the end of each work day, trucks and roll-off containers storing soil shall be completely covered with waterproof tarpaulins. Tarpaulins shall be placed over the top of the truck bed or container (rather than over the soil inside) and shall extend over the sides to prevent water accumulation and the evaporation of contaminants.

- c. Tarpaulins shall be weighted or secured by appropriate means to prevent tearing or removal by climatic conditions.
- d. Trucks and roll-off containers shall be labeled, signed, fenced or otherwise secured (as needed) at the end of each work day.
- e. Trucks, roll-off containers and tarpaulins shall be properly maintained for the duration of soil storage.
- f. Damaged tarpaulins and protections shall be repaired or replaced by the Contractor within 24-hours after notification. If this work is not satisfactorily completed within 24-hours, no further soil storage shall be allowed until such work is completed.
- g. Trucks and roll-off containers storing contaminated soil shall be located as described in CMHP.

### 3.4 FIELD ORGANIC VAPOR MONITORING

NOT USED

### 3.5 SAMPLING AND ANALYSIS

- A. The Contractor shall have an accepted FSP prior to commencing work. Sampling shall be conducted by individuals thoroughly trained in sampling protocols, handling and chain of custody procedures, and laboratory requirements. Accepted sampling practices shall be used to obtain representative composite sample(s) and/or grab sample(s) as required for the specific analyses to be completed. Representative samples shall be collected from stored soil as soon as possible after excavation. Soil shall be taken from a depth greater than one (1) foot within the stockpile. Each composite sample shall include a minimum of three (3) to five (5) sample points. Grab samples shall be collected in a manner so as to best characterize the extent of contamination of the soil in question and best characterize the extent of contamination of the stockpile. If any soil areas are present with field indications of contamination discretely different than the other areas (i.e., significantly elevated PID/FID readings, staining, etc.), the area may require a separate sample and the Engineer shall be alerted to approve additional sample and analysis. Analyses shall be completed at a NYSDOH ELAP accredited laboratory that is certified to perform the required tests. Analyses shall be completed within ten (10) work days of sample collection. The Contractor shall provide the Engineer with a copy of all reports within two (2) work days of their receipt from the laboratory.
- B. All material shall be sampled and analyzed in accordance with the disposal facility requirements or as required by a site-specific NYSDEC or applicable Out-of-State Regulatory Agency BUD.
- C. Soil shall not be added to any stockpile, truck or roll-off container after its contents have been sampled. If soil is added after sampling, or sampled soil is otherwise tampered with, the Contractor shall re-sample the soil at no additional cost to the Town.
- D. All sampling equipment shall be certified clean or precleaned prior to the collection of each sample, by the following method:

1. Wash all sampling equipment and secondary containers with non-phosphate laboratory grade detergent and distilled water.
  2. Triple rinse with distilled water.
  3. Rinse with isopropyl alcohol, or if samples are visibly contaminated with petroleum use a solvent, such as hexane or other alternate approved by the Engineer.
  4. Triple rinse with analyte free water.
- E. All samples shall be identified with a sample label in addition to an entry on a chain-of-custody record. The label shall be identified upon receipt by the laboratory and cross-referenced to the chain-of-custody record. Any inconsistencies shall be noted on the custody record. Laboratory personnel shall notify the Contractor's sampling and analysis representative immediately if any inconsistencies exist in the paperwork associated with the samples, and the Contractor shall be responsible for collecting new samples to replace those with inconsistencies that cannot be rectified.
- F. Custody of samples shall be maintained through the shipment of samples to the selected laboratory(ies). All samples shall be packaged and shipped daily to ensure that no sample is held at the site for more than 24-hours. Samples shall be delivered directly to the laboratory.
- G. Conduct specified analyses as follows:
1. ***Petroleum Contamination Parameter Analysis:*** Samples shall be analyzed for petroleum contamination constituents (total constituent analysis) in accordance with CP – 51/Soil Cleanup Guidance, Gasoline and Fuel oil, Tables 2 and 3 using USEPA Method 8260 for volatile organics and methyl t-butyl ether (MTBE) and USEPA Method 8270 for base/neutrals.
  2. ***Hazardous Waste RCRA Toxicity Characteristic Analysis:*** Samples shall be analyzed for Hazardous Waste RCRA Toxicity Characteristics Leaching Procedure (TCLP) constituents. Analysis shall be for full TCLP constituents on the sample extract as prepared by USEPA Method 1311.
  3. ***Ignitability of Solids Analysis:*** Samples shall be analyzed for ignitability by USEPA Method 1030.
  4. ***pH of Soil and Waste:*** Samples shall be analyzed for pH measurement by USEPA Method 9045.
  5. ***Polychlorinated Biphenyls (PCB) Analysis:*** Samples shall be analyzed for PCBs by USEPA Method 8082.
  6. ***Total Petroleum Hydrocarbons (TPH) Analysis:*** Samples shall be analyzed for petroleum hydrocarbons, USEPA Method 8015, gasoline range organics (GROs) and/or diesel range organics (DROs).

### 3.6 TRANSPORTATION AND DISPOSAL

- A. The Contractor shall have an accepted Disposal Plan prior to the transportation and disposal of soils. Soils shall not be transported until all sampling and analysis, as required by the Engineer or by the Disposal facility, have been performed and laboratory reports have been provided and accepted by the Engineer and/or Town.
- B. Disposal Facility Selection Requirements
  - 1. The Contractor shall submit the name(s) of the selected offsite soil disposal facilities and their location(s) to the Engineer for approval. Note that some companies may have multiple disposal facilities, each possessing differing requirements regarding the types of materials accepted, the specific analytical testing parameters that must be performed for each material, and the frequency of sampling required for each material. It is the Contractor's responsibility to determine the specific waste acceptance criteria and testing requirements for each of its proposed facilities. If the Contractor chooses to use a facility that has not previously been approved by the Engineer or the Town, the Contractor must seek approval from the Engineer to use the facility, and all additional sampling and testing procedures associated with the facility shall be provided at no additional expense to the Town.
    - a. The Contractor shall confirm the permit status, types of materials accepted, as well as check for outstanding violations and enforcement actions at each selected disposal facility. The Engineer shall verify the information provided by the Contractor for each facility prior to approval.
    - b. The Contractor shall verify the location(s) of the selected disposal facility(ies), as well as the types of materials accepted, the specific analytical testing parameters that must be performed for each material, and the frequency of sampling required for each material, at each of the selected facilities. The analytical testing parameters and the frequency of sampling required for each material are subject to change. It shall be the Contractor's responsibility to confirm and comply with all requirements of the selected facility(ies) prior to submittal to the Engineer for review and approval.
    - c. If an approved facility is not available during construction, the Contractor shall be fully responsible for procuring alternate approved facilities at no additional expense to the Town. Any additional sampling and analysis required and labor involved in selecting new facilities after the initial reuse or disposal facilities are accepted shall be the responsibility of the Contractor.
- C. Transportation Off Site
  - 1. For the duration of transportation, roll-off containers and truck beds shall be completely covered with secured waterproof tarpaulins to prevent water infiltration, evaporation of contaminants and spillage of soil.
  - 2. The Contractor shall take immediate action to remedy any situation involving a release of soil during loading or while in transit.

3. Soil shall not be combined with material from any other source.
4. Soil shall be transported in vehicles with valid Waste Transporter permits for New York State (and other required permits/licenses from any other states as applicable). The Contractor shall provide a copy to the Engineer of the waste transporter permit documenting that the transporter is authorized to transport waste to the intended disposal/treatment facility. The Contractor shall complete any required shipping papers, labeling, placarding, and weighing/load measurements and shall provide copies of required documentation to the Engineer.
5. Soil that is determined to be a regulated hazardous waste per the criteria of 6 NYCRR Part 371 shall be shipped with a hazardous waste manifest to a treatment/disposal facility permitted to accept the waste. The Contractor shall complete all required manifests, labeling, placarding, land disposal restriction notifications, and other requirements for shipping and tracking hazardous wastes and shall provide copies of required documentation to the Engineer. The Engineer will provide the Contractor with the EPA Identification Number(s) issued to the Town as the hazardous waste generator and will sign the generator certification statements.

D. Disposal / Treatment

1. Soil shall be disposed of by the methods and procedures described in the accepted Disposal Plan. Soil characterization information, field identification and confirmation laboratory analyses will be used to determine appropriate classification and category of soil for disposal. Each category of surplus or waste soil shall be handled and disposed of based upon its characterization in accordance with applicable regulatory requirements.
2. Soil shall be transported to a disposal/treatment facility within forty (40) calendar days from the start of storage. The Contractor shall complete under this item any soil sampling and analysis required by the disposal/treatment facility that is not specifically included in the contract.

E. Documentation

1. The Contractor shall provide the Engineer with copies of all receipts from the disposal/treatment facility which indicate the actual quantity of waste received within two (2) work days of receipt from the facility. For soil determined to be RCRA regulated hazardous waste, the Contractor shall also provide the Engineer with the appropriate copies of each signed manifest within two (2) work days of receipt. Any manifest discrepancies, including the need for exception reporting, shall be reported immediately to the Engineer and shall be resolved by the Contractor.

### 3.7 REUSE OF SOILS

- A. The Contractor shall place soil as embankment, fill or other appropriate on-site use as determined and approved by the Engineer and/or Town, and in accordance with the contract documents. Only appropriate soils placed in appropriate locations as included in the contract documents shall be reused.

- B. The material must be considered suitable material as per the Geotechnical Investigation Report, as detailed under Specification Item 1.6: Existing Soil Conditions.
- C. If fill material exhibits historical or visual evidence of contamination (including odors), and will be used in an area with public access, the relocated fill material must be covered with a minimum of 12 inches of soil or fill material that meets the criteria for general fill as defined in this Part [360]. General fill is defined in in Table 2 of Part 360 as:

TABLE 2: Fill Material Beneficial Use

Fill Material Type	Fill Material End Use	Physical Criteria	Maximum Concentration Levels
General Fill	Any setting where the fill material meets the engineering criteria, for use, except: 1. Undeveloped land; and 2. Agricultural crop land. General Fill may also be used in the same manner as Restricted-Use Fill and Limited-Use Fill.	Only soil, sand, gravel or rock; no non-soil constituents.	Lower of Protection of Public Health-Residential Land Use and Protection of Groundwater in Table 375-6.8(b) of this Title.

- 1. A demarcation layer will be installed for soil covers. Material meeting the criteria for general fill as defined above will be placed over a demarcation layer (i.e., an identifiable barrier between reused soils and the soil cap). Where existing soil meets the applicable soil cleanup objectives (SCOs) and where no reused soil exists, there will not be a need to install a demarcation layer

END OF SECTION 31 31 00

## **SECTION 321200 - FLEXIBLE PAVING**

### **PART 1 - GENERAL**

#### **1.1 GENERAL REQUIREMENTS**

A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:

1. Fine grading of pavement sub-grade
2. Milling of existing asphalt pavement.
3. Sawing of existing asphalt pavement.
4. Installation of full-depth hot mix asphalt pavement.
5. Installation of hot mix asphalt patching.
6. Installation of hot mix asphalt overlays.
7. Pavement reconstruction.
8. Trench repair with hot mix asphalt.
9. Temporary pavement.
10. Installation of bituminous surface treatment.

B. RELATED WORK SPECIFIED ELSEWHERE

- |                       |                 |
|-----------------------|-----------------|
| 1. Earth Moving:      | Section 312000. |
| 2. Curbs and Gutters: | Section 321600  |

#### **1.2 SUBMITTALS**

A. Product Data: Manufacturer's name, specifications, and installation instructions, for each item specified.

B. Quality Control Submittals:

1. Plant name and location of hot mix asphalt supplier.

#### **1.3 PROJECT CONDITIONS**

A. Environmental Requirements:

1. Discontinue paving when surface temperatures fall below requirements listed in NYS DOT Table 402-2.
2. Do not place asphalt concrete on wet surfaces, or when weather conditions otherwise prevent the proper handling or finishing of bituminous mixtures as determined by the Owner's Representative.

#### **1.4 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.

## 1.5 QUALITY ASSURANCE

- A. Installer Qualifications: Engage an experienced installer who has completed hot-mix asphalt paving similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- B. Manufacturer Qualifications: Engage a firm experienced in manufacturing hot-mix asphalt similar to that indicated for this Project and with a record of successful in-service performance. Firm shall be a registered and approved paving mix manufacturer with authorities having jurisdiction or with the DOT of the state in which Project is located.

## PART 2 - PRODUCTS

### 2.1 MATERIALS

- A. Hot Mix Asphalt Paving: Conform to NYS DOT Section 400 Bituminous Pavements.
  - 1. Top Course: NYS DOT, Type F2, Item 402.128204, or as indicated on the plans.
  - 2. Binder Course: NYS DOT Type F9, Item 402.198904, or as indicated on the plans.
  - 3. Diluted Tack Coat: NYS DOT 407.0102
  - 4. Joint Sealant: ASTM D6690 Type II Joint and Crack Sealants, Hot Applied, for Concrete and Asphalt Pavements.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Verify that subgrade is dry and in suitable condition to support paving and imposed loads.
- B. Proof-roll subbase to satisfaction of the Owner's Representative using heavy, pneumatic-tired rollers to locate areas that are unstable or that require further compaction.
- C. Remediate unsatisfactory conditions. Do not begin paving installation until these conditions have been corrected to the satisfaction of the Owner's Representative.

### 3.2 COLD MILLING

- A. Clean existing paving surface of loose and deleterious material immediately before cold milling. Remove existing asphalt pavement, including hot-mix asphalt and, as necessary,

unbound-aggregate base course, by cold milling to grades and cross sections indicated. Repair or replace curbs, manholes, and other construction damaged during cold milling.

### 3.3 PATCHING, REPAIRS, AND INTERFACE WITH PREVIOUSLY PLACED PAVEMENTS

- A. Patching: Saw cut perimeter of patch and excavate existing pavement section to sound base. Recompact new subgrade. Excavate rectangular or trapezoidal patches, extending 12 inches into adjacent sound pavement, unless otherwise indicated. Cut excavation faces vertically.
  - 1. Tack coat faces of excavation and allow to cure before paving.
  - 2. Fill excavation with dense-graded, hot-mix asphalt base mix and, while still hot, compact flush with adjacent surface.
  - 3. Partially fill excavation with dense-graded, hot-mix asphalt base mix and compact while still hot. Cover asphalt base course with compacted, hot-mix surface layer finished flush with adjacent surfaces.
- B. Crack and Joint Filling: Remove existing filler material from cracks or joints to a depth of 1/4 inch. Refill with asphalt joint-filling material to restore watertight condition. Remove excess filler that has accumulated near cracks or joints.
- C. Tack Coat: Apply uniformly to existing surfaces of previously constructed asphalt or portland cement concrete paving and to surfaces abutting or projecting into new, hot-mix asphalt pavement. Apply at a uniform rate of 0.05 to 0.15 gal./sq. yd. of surface.
  - 1. Allow tack coat to cure undisturbed before paving.
  - 2. Avoid smearing or staining adjoining surfaces, appurtenances, and surroundings. Remove spillages and clean affected surfaces.

### 3.4 HOT MIX ASPHALT PAVING

- A. Construct hot mix asphalt pavement in accordance with NYSDOT, Section 402.

### 3.5 TEMPORARY PAVEMENT

- A. The Contractor will provide temporary pavement at areas indicated on the plans or as directed by the Owner's Representative to ensure safe, stable site access during the various stages of project construction.
- B. Temporary pavement will comply with the requirements and standards of this specification. However, temporary pavement shall exclude the provision of a surface-wearing course.
- C. All costs associated with the provision of temporary pavement shall be included in the price bid for the project.

### 3.6 INSTALLATION TOLERANCES

- A. Thickness: Compact each course to produce the thickness indicated within the following tolerances:
  - 1. Binder Course: Plus or minus 1/2 inch (13 mm).
  - 2. Surface Course: Plus 1/4 inch (6 mm), no minus.
  
- B. Surface Smoothness: Compact each course to produce a surface smoothness within the following tolerances as determined by using a 10-foot (3-m) straightedge applied transversely or longitudinally to paved areas:
  - 1. Binder Course: 1/4 inch (6 mm).
  - 2. Surface Course: 1/8 inch (3 mm).
  - 3. Crowned Surfaces: Test with crowned template centered and at right angle to crown. Maximum allowable variance from template is 1/8 inch (3 mm).

### 3.7 FIELD QUALITY CONTROL

- A. Testing Agency: Contractor will engage a qualified independent testing agency at his expense to perform field inspections and tests and to prepare test reports. Testing agency will conduct and interpret tests and state in each report whether tested Work complies with or deviates from specified requirements. All reporting demonstration compliance with the standards described herein shall be provided to the Owner's Representative at the Contractor's expense.
  
- B. Additional testing, at Contractor's expense, will be performed to determine compliance of corrected Work with specified requirements.
  
- C. Thickness: In-place compacted thickness of hot-mix asphalt courses will be determined according to ASTM D 3549.
  
- D. Surface Smoothness: Finished surface of each hot-mix asphalt course will be tested for compliance with smoothness tolerances.
  
- E. In-Place Density: Field density of in-place compacted pavement shall be determined by nuclear method according to ASTM D 2950.
  
- F. Remove and replace or install additional hot-mix asphalt where test results or measurements indicate that it does not comply with specified requirements.

END OF SECTION 321200

## **SECTION 321300 - RIGID PAVING**

### **PART 1 - GENERAL**

#### 1.01 GENERAL REQUIREMENTS

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
  - 1. Installation of concrete walkways.
  - 2. Installation of concrete pads.
  - 3. Installation of concrete footings for incidental site construction.
  - 4. Placement of miscellaneous concrete during the course of construction.

#### 1.02 RELATED WORK SPECIFIED ELSEWHERE

- A. Earth Moving: Section 312000.
- B. Curbs and Gutters: Section 321600

#### 1.03 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.
- C. Except as shown or specified otherwise, the Work of this Section shall conform to the requirements of Specifications for Structural Concrete for Buildings ACI 301-05 of the American Concrete Institute.

#### 1.04 DEFINITIONS (Amendments to ACI 301, Chapter 1):

- A. Exposed Construction: Exposed to view.
- B. Architectural Concrete: Concrete which is exposed to view as an interior or exterior surface in the completed structure.

#### 1.05 SUBMITTALS

- A. Submittals Package: Submit product data for design mix(es) and materials for concrete specified below at the same time as a package.

- B. Shop Drawings: Placing drawings for bar reinforcement.
- C. Product Data:
  - 1. Concrete design mix(es) with name and location of batching plant.
  - 2. Portland Cement: Brand and manufacturer's name.
  - 3. Fly Ash: Name and location of source, and NYS DOT test numbers.
  - 4. Air-entraining Admixture: Brand and manufacturer's name.
  - 5. Water-reducing Admixture: Brand and manufacturer's name.
  - 6. Aggregates: Name and location of source, and NYS DOT test numbers.
  - 7. Lightweight Coarse Aggregate: Brand and manufacturer's name
  - 8. Chemical Curing and Anti-Spalling Compound: Brand and manufacturer's name, and application instructions.
  - 9. Bonding Agent (Adhesive): Brand and manufacturer's name, and preparation and application instructions.
  - 10. Expansion Joint Filler: Brand and manufacturer's name.
  - 11. Emery Aggregate: Brand and manufacturer's name, and application instructions.
- D. Quality Control Submittals:
  - 1. Certificates: Affidavit required under Quality Assurance Article.

#### 1.06 QUALITY ASSURANCE

- A. Concrete batching plant shall be currently approved as a concrete supplier by the New York State Department of Transportation.
- B. Fly ash supplier shall be currently approved as a fly ash supplier by the New York State Department of Transportation.
- C. Certifications: Affidavit by the bar reinforcement manufacturer certifying that bar material meets the contract requirements.
- D. Source Quality Control: the Owner's Representative reserves the right to inspect and approve the following items, at his own discretion, either with his own forces or with a designated inspection agency:
  - 1. Batching and mixing facilities and equipment.
  - 2. Sources of materials.

#### 1.07 FIELD CONDITIONS

- A. Weather limitations: The provisions of NYSDOT Section 502-3.02 shall apply.

#### 1.08 STORAGE

- A. Store materials to insure the preservation of their quality and fitness for the Work. Materials, even though accepted prior to storage, are subject to inspection and shall meet the requirements of the Contract before their use in the Work.

## **PART 2 - PRODUCTS**

### 2.01 MATERIALS (Amendments to ACI 301, Chapter 2):

- A. Water-reducing Admixture: ASTM C 494, Type A, and on the New York State Department of Transportation's current "Approved List".
- B. Fly Ash: ASTM C 618, including Table 1A (except for footnote A), Class F except that loss on ignition shall not exceed 4.0 percent.
- C. Chemical Curing and Anti-Spalling Compound: ASTM C-309, Type 1D, Class B, with a minimum 18 percent total solids content. No thinning of material allowed.
  - 1. SureCure Emulsion, Kaufman Products, Inc. 3811 Curtis Avenue, Baltimore, MD 21226, (800) 637-6372.
  - 2. Cure & Seal by Symons Corp., 200 East Touhy Ave., PO Box 5018, Des Plaines, IL 60017-5018, (847) 298-3200.
  - 3. "Kure N Seal W" by Sonneborn Building Products, Chemrex, Inc., 889 Valley Park Dr., Shakopee, MN 55379, (800) 433-9517.
  - 4. Day-Chem Cure & Seal 26 percent (J-22) by Dayton Superior Corp., 721 Richard St., Miamisburg, OH 45342, (800) 745-3700.
  - 5. Acrylseal HS by Master Builders, Inc., 23700 Chagrin Blvd., Cleveland, OH 44122, (800) 628-9990
- D. Type 1 Expansion Joint Filler: Preformed, resilient, non-extruding cork units; ASTM D 1752, Type II.
- E. Chamfer Strips: Wood, metal, PVC or rubber; one inch chamfer.
- F. Epoxy Bonding Agent (Adhesive): 100 percent solids epoxy-resin-base bonding compound, complying with ASTM C 881, Types I, II, IV and V, Grade 2 (horizontal areas) or Grade 3 (overhead/vertical areas), and Class B (40-60 degrees Fahrenheit) or Class C (60 degree Fahrenheit and above).
  - 1. SurePoxy HM Series by Kaufman Products, Inc., 3811 Curtis Avenue, Baltimore, MD 21226, (800) 637-6372.
  - 2. Sikadur Hi-Mod 32 by Sika Corporation, 201 Polito Avenue, Lyndhurst, NJ 07071, (800) 933-7452.
  - 3. Epogrip by Sonneborn-Chemrex, 889 Valley Park Drive, Shakopee, MN 55379, (800) 433-9517.

### 2.02 SUBBASE

- A. Subbase material: Crushed stone in accordance with NYSDOT 304.12 Subbase Course, Type 2

### 2.03 PROPORTIONING (Amendments to ACI 301, Chapter 3):

- A. Compressive Strength: Minimum 4000 psi, unless shown or specified otherwise.

1. Minimum 4000 psi for subsurface concrete, footings, poured inverts, stairs, and sidewalks.
  - B. Weight: Normal:
  - C. Durability: Concrete shall be air-entrained. Design air content shall be 6 percent by volume, with an allowable tolerance of plus or minus 1.5 percent for total air content. Entrained air shall be provided by use of an approved air-entraining admixture. Air-entrained cement shall not be used.
  - D. Slump:
    1. 3000 psi Normal Weight Concrete: Between 2 inches and 4 inches.
    2. 4000 psi Normal Weight Concrete: Between 2 inches and 3 inches.
    3. Lightweight Concrete: Between 1 inch and 4 inches.
  - E. Admixtures: Do not use admixtures in concrete unless specified or approved in writing by the owner's representative.
  - F. Selection of Proportions: Concrete proportions shall be established on the basis of previous field experience or laboratory trial batches, unless otherwise approved in writing by the Owner's Representative. Proportion mix with a minimum cement content of 564 pounds per cubic yard for 3000 psi concrete and 611 pounds per cubic yard for 4000 psi concrete.
    1. Optional Material: Fly ash may be substituted for (Portland) cement in normal weight concrete up to a maximum of 15 percent by weight of the required minimum (Portland) cement. If fly ash is incorporated in a concrete design mix, make necessary adjustments to the design mix to compensate for the use of fly ash as a partial replacement for (Portland) cement.
      - a. Adjustments shall include the required increase in air-entraining admixture to provide the specified air content.
      - b. Lower early strength of the concrete shall be considered in deciding when to remove formwork.
- 2.04 REINFORCEMENT (Amendments to ACI 301, Chapter 5):
- A. Bar Reinforcement: ASTM A 615, Grade 60, deformed steel bars.
  - B. Fabric Reinforcement: ASTM A 185, welded wire fabric, fabricated into flat sheets unless otherwise indicated.
  - C. Bar Supports: Galvanized steel or AISI Type 430 stainless steel, and without plastic tips.
  - D. Tie Wire: Black annealed wire, 16-1/2 gage or heavier.
- 2.05 JOINTS AND EMBEDDED ITEMS (Amendments to ACI 301, Chapter 6):
- A. Obtain bond at construction joints by the use of bonding agent (adhesive) or the use of cement grout.
- 2.06 PRODUCTION (Amendments to ACI 301, Chapter 7):

- A. Provide ready-mixed concrete, either central-mixed or truck-mixed.

## 2.07 FORMS

- A. Form Materials: Plywood, metal, metal-framed plywood, or other approved panel-type materials to provide full-depth, continuous, straight, smooth exposed surfaces. Use flexible or curved forms for curves of a radius 100 feet or less.
- B. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent treatments of concrete surfaces.

## PART 3 - EXECUTION

### 3.01 EXAMINATION AND PREPARATION

- A. Do not use items of aluminum for mixing, chuting, conveying, forming or finishing concrete, except magnesium alloy tools may be used for finishing.
- B. Keep excavations free of water. Do not deposit concrete in water.
- C. Hardened concrete, reinforcement, forms, and earth which will be in contact with fresh concrete shall be free from frost at the time of concrete placement.
- D. Prior to placement of concrete, remove all hardened concrete spillage and foreign materials from the space to be occupied by the concrete.

### 3.02 FORMWORK (Amendments to ACI 301, Chapter 4):

- A. Chamfer all exposed external corners of concrete.

### 3.03 PLACING REINFORCEMENT (Amendments to ACI 301, Chapter 5):

- A. At the time concrete is placed, reinforcement shall be free of mud, oil, loose rust, loose mill scale, and other materials or coatings that may adversely affect or reduce the bond.

### 3.04 PLACING CONCRETE (Amendments to ACI 301, Chapter 8):

- A. Operation of truck mixers and agitators and discharge limitations shall conform to the requirements of ASTM C 94.
- B. Do not allow concrete to free fall more than 4 feet.
- C. Protect concrete from exposure to salts for sixty (60) days.

3.05 FINISHING FORMED SURFACES (Amendments to ACI 301, Chapter 10):

- A. Finish Schedule: Except where indicated otherwise on the Drawings, provide the finishes below:
- B. Rough Form Finish for concrete surfaces not exposed to view.
- C. Smooth Form Finish for concrete surfaces exposed to view.

3.06 FINISHING SLABS (Amendments to ACI 301, Chapter 11):

- A. Slabs On Grade: Provide key type joints unless otherwise shown. Tool exposed joints.
- B. Finish Schedule: Except where indicated otherwise on the Drawings, provide the finishes below:
  - 1. Floated Finish for:
    - a. Treads and platforms of exterior steps and stairs.
    - b. Slabs and fill over which waterproofing, roofing, vapor barrier, or insulation is required.
  - 2. Broom or Belt Finish for:
    - a. Exterior slabs. Texture, as approved by the Owner's Representative.
- C. Finishing, General: Provide monolithic finishes on concrete floors and slabs without the addition of mortar or other filler material. Finish surfaces in true planes, true to line, with particular care taken during screeding to maintain an excess of concrete in front of the screed so as to prevent low spots. Screed and darby concrete to true planes while plastic and before free water rises to the surface. Do not perform finishing operations during the time free water (bleeding) is on the surface.

3.07 JOINTS

- A. General: Construct construction, isolation, and contraction joints and tool edgings true to line with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline, unless otherwise indicated. When joining existing pavement, place transverse joints to align with previously placed joints, unless otherwise indicated.
- B. Construction Joints: Set construction joints at side and end terminations of pavement and at locations where pavement operations are stopped for more than one-half hour, unless pavement terminates at isolation joints.
  - 1. Continue reinforcement across construction joints, unless otherwise indicated. Do not continue reinforcement through sides of pavement strips, unless otherwise indicated.
- C. Use a bonding agent at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
- D. Isolation Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, walks, other fixed objects, and where indicated.

1. Locate expansion joints at intervals of 20 feet, unless otherwise indicated.
2. Extend joint fillers full width and depth of joint.
3. Terminate joint filler less than 1/2 inch or more than 1 inch below finished surface if joint sealant is indicated.
4. Place top of joint filler flush with finished concrete surface if joint sealant is not indicated.
5. Furnish joint fillers in one-piece lengths. Where more than one length is required, lace or clip joint-filler sections together.
6. Protect top edge of joint filler during concrete placement with metal, plastic, or other temporary preformed cap. Remove protective cap after concrete has been placed on both sides of joint.

E. Contraction Joints: Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-half of the concrete thickness, as follows:

1. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint with groover tool to the following radius. Repeat grooving of contraction joints after applying surface finishes. Eliminate groover marks on concrete surfaces. Radius shall be 1/4 inch.
2. Sawn Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch-wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before developing random contraction cracks.

F. Edging: Tool edges of pavement, gutters, curbs, and joints in concrete after initial floating with an edging tool to the following radius. Repeat tooling of edges after applying surface finishes. Eliminate tool marks on concrete surfaces. Radius shall be 1/4 inch.

### 3.08 CURING AND PROTECTION (Amendments to ACI 301, Chapter 12):

A. Maintain concrete surfaces in a moist condition for at least 7 days after placing, except where otherwise indicated. Do not use curing compound.

1. For surfaces of exterior slabs (on grade), apply chemical curing and anti-spalling compound in accordance with the recommendations of the manufacturer.

### 3.09 FIELD QUALITY CONTROL (Amendments to ACI 301, Chapter 16):

A. Make available to the Owner's Representative whatever test samples are required to make tests. Furnish shipping boxes for compression test cylinders. Provide field cure box as required.

### 3.10 TOLLERANCES

A. Comply with tolerances of ACI 117 and as follows:

1. Elevation: 1/4 inch.
2. Thickness: Plus 3/8 inch, minus 1/4 inch
3. Surface: Gap below 10 foot long, unlevelled straightedge not to exceed 1/4 inch.

4. Joint Spacing: 3 inches.
5. Contraction Joint Depth: Plus ¼ inch, no minus.
6. Joint Width: Plus 1/8 inch, no minus.

### 3.11 REPAIRS AND PROTECTION

- A. Remove and replace concrete that is broken, damaged, or defective, or does not meet requirements in this Section. Reasons for rejection of concrete include the following:
  1. Staining or discoloration of pavement.
  2. Expansion joints are not perpendicular to roadway.
  3. Joints and surfaces are improperly finished.
  4. Expansion joints protrude from pavement.
  5. Cracks, chips, or other damage occur in construction of maintenance period.
  6. Improper vibration of concrete.
  7. Vandalism during initial setup of concrete.
  8. Pavement is out of alignment by more than 0.2 feet.
  9. Pavement is off grade by more than 0.1 feet.
  10. Settlement of pavement.
  11. Inspection of formwork not asked for by Contractor prior to pouring of pavement.
- B. Drill test cores where directed by the Owner's Representative when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory pavement areas with portland cement concrete bonded to pavement with epoxy adhesive.
- C. Protect concrete from damage. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials as they occur.
- D. Maintain concrete pavement free of stains, discoloration, dirt, and other foreign material. Sweep concrete pavement not more than two days before date scheduled for Substantial Completion inspections.

END OF SECTION 321300

## **SECTION 321600 - CURBS AND GUTTERS**

### **PART 1 - GENERAL**

#### **1.1 GENERAL REQUIREMENTS**

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
  - 1. Installation of concrete vertical/mountable curbing.
  - 2. Installation of stone, precast, block, or granite vertical/mountable curbing with concrete foundations.
  - 3. Installation of concrete gutters.

#### **1.2 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.
- C. Except as shown or specified otherwise, the Work of this Section shall conform to the requirements of Specifications for Structural Concrete for Buildings ACI 301-05 of the American Concrete Institute.

#### **1.3 DEFINITIONS (Amendments to ACI 301, Chapter 1):**

- A. Exposed Construction: Exposed to view.
- B. Architectural Concrete: Concrete which is exposed to view as an interior or exterior surface in the completed structure.

#### **1.4 SUBMITTALS**

- A. Submittals Package: Submit product data for design mix(es) and materials for concrete specified below at the same time as a package.
- B. Shop Drawings: Placing drawings for bar reinforcement.
- C. Product Data:
  - 1. Concrete design mix(es) with name and location of batching plant.
  - 2. Portland Cement: Brand and manufacturer's name.
  - 3. Fly Ash: Name and location of source, and NYS DOT test numbers.
  - 4. Air-entraining Admixture: Brand and manufacturer's name.

5. Water-reducing Admixture: Brand and manufacturer's name.
6. Aggregates: Name and location of source, and NYS DOT test numbers.
7. Lightweight Coarse Aggregate: Brand and manufacturer's name
8. Chemical Curing and Anti-Spalling Compound: Brand and manufacturer's name, and application instructions.
9. Bonding Agent (Adhesive): Brand and manufacturer's name, and preparation and application instructions.
10. Expansion Joint Filler: Brand and manufacturer's name.
11. Emery Aggregate: Brand and manufacturer's name, and application instructions.

D. Quality Control Submittals:

1. Certificates: Affidavit required under Quality Assurance Article.

1.5 QUALITY ASSURANCE

- A. Concrete batching plant shall be currently approved as a concrete supplier by the New York State Department of Transportation.
- B. Fly ash supplier shall be currently approved as a fly ash supplier by the New York State Department of Transportation.
- C. Certifications: Affidavit by the bar reinforcement manufacturer certifying that bar material meets the contract requirements.
- D. Source Quality Control: the Owner's Representative reserves the right to inspect and approve the following items, at his own discretion, either with his own forces or with a designated inspection agency:
  1. Batching and mixing facilities and equipment.
  2. Sources of materials.

1.6 FIELD CONDITIONS

- A. Weather limitations: The provisions of NYSDOT Section 502-3.02 shall apply.

1.7 STORAGE

- A. Store materials to insure the preservation of their quality and fitness for the Work. Materials, even though accepted prior to storage, are subject to inspection and shall meet the requirements of the Contract before their use in the Work.

1.8 RELATED WORK SPECIFIED ELSEWHERE

- A. Earth Moving: Section 312000.

**PART 2 - PRODUCTS**

2.1 MATERIALS (Amendments to ACI 301, Chapter 2):

- A. Water-reducing Admixture: ASTM C 494, Type A, and on the New York State Department of Transportation's current "Approved List".
- B. Fly Ash: ASTM C 618, including Table 1A (except for footnote A), Class F except that loss on ignition shall not exceed 4.0 percent.
- C. Chemical Curing and Anti-Spalling Compound: ASTM C-309, Type 1D, Class B, with a minimum 18 percent total solids content. No thinning of material allowed.
  - 1. SureCure Emulsion, Kaufman Products, Inc. 3811 Curtis Avenue, Baltimore, MD 21226, (800) 637-6372.
  - 2. Cure & Seal by Symons Corp., 200 East Touhy Ave., PO Box 5018, Des Plaines, IL 60017-5018, (847) 298-3200.
  - 3. "Kure N Seal W" by Sonneborn Building Products, Chemrex, Inc., 889 Valley Park Dr., Shakopee, MN 55379, (800) 433-9517.
  - 4. Day-Chem Cure & Seal 26 percent (J-22) by Dayton Superior Corp., 721 Richard St., Miamisburg, OH 45342, (800) 745-3700.
  - 5. Acrylseal HS by Master Builders, Inc., 23700 Chagrin Blvd., Cleveland, OH 44122, (800) 628-9990.
- D. Type 1 Expansion Joint Filler: Preformed, resilient, non-extruding cork units; ASTM D 1752, Type II.
- E. Chamfer Strips: Wood, metal, PVC or rubber; one inch chamfer.
- F. Epoxy Bonding Agent (Adhesive): 100 percent solids epoxy-resin-base bonding compound, complying with ASTM C 881, Types I, II, IV and V, Grade 2 (horizontal areas) or Grade 3 (overhead/vertical areas), and Class B (40-60 degrees Fahrenheit) or Class C (60 degree Fahrenheit and above).
  - 1. SurePoxy HM Series by Kaufman Products, Inc., 3811 Curtis Avenue, Baltimore, MD 21226, (800) 637-6372.
  - 2. Sikadur Hi-Mod 32 by Sika Corporation, 201 Polito Avenue, Lyndhurst, NJ 07071, (800) 933-7452.
  - 3. Epogrip by Sonneborn-Chemrex, 889 Valley Park Drive, Shakopee, MN 55379, (800) 433-9517.
- G. Stone Curb: The requirements of NYSDOT Section 714-01 shall apply with the exception of all references to "bluestone", which are disallowed. Belgian block shall also comply with the requirements of ASTM C 615.

2.2 PROPORTIONING (Amendments to ACI 301, Chapter 3):

- A. Compressive Strength: Minimum 4000 psi, unless shown or specified otherwise.
  - 1. Minimum 4000 psi
- B. Weight: Normal:

- C. Durability: Concrete shall be air-entrained. Design air content shall be 6 percent by volume, with an allowable tolerance of plus or minus 1.5 percent for total air content. Entrained air shall be provided by use of an approved air-entraining admixture. Air-entrained cement shall not be used.
- D. Slump:
  - 1. 4000 psi Normal Weight Concrete: Between 2 inches and 3 inches.
- E. Admixtures: Do not use admixtures in concrete unless specified or approved in writing by the owner's representative.
- F. Selection of Proportions: Concrete proportions shall be established on the basis of previous field experience or laboratory trial batches, unless otherwise approved in writing by the owner's representative. Proportion mix with a minimum cement content of 611 pounds per cubic yard for 4000 psi concrete.
  - 1. Optional Material: Fly ash may be substituted for (Portland) cement in normal weight concrete up to a maximum of 15 percent by weight of the required minimum (Portland) cement. If fly ash is incorporated in a concrete design mix, make necessary adjustments to the design mix to compensate for the use of fly ash as a partial replacement for (Portland) cement.
    - a. Adjustments shall include the required increase in air-entraining admixture to provide the specified air content.
    - b. Lower early strength of the concrete shall be considered in deciding when to remove formwork.

2.3 REINFORCEMENT (Amendments to ACI 301, Chapter 5):

- A. Bar Reinforcement: ASTM A 615, Grade 60, deformed steel bars.
- B. Fabric Reinforcement: ASTM A 185, welded wire fabric, fabricated into flat sheets unless otherwise indicated.
- C. Bar Supports: Galvanized steel or AISI Type 430 stainless steel, and without plastic tips.
- D. Tie Wire: Black annealed wire, 16-1/2 gage or heavier.

2.4 JOINTS AND EMBEDDED ITEMS (Amendments to ACI 301, Chapter 6):

- A. Obtain bond at construction joints by the use of bonding agent (adhesive) or the use of cement grout.

2.5 PRODUCTION (Amendments to ACI 301, Chapter 7):

- A. Provide ready-mixed concrete, either central-mixed or truck-mixed.

## 2.6 FORMS

- A. Form Materials: Plywood, metal, metal-framed plywood, or other approved panel-type materials to provide full-depth, continuous, straight, smooth exposed surfaces. Use flexible or curved forms for curves of a radius 100 feet or less.
- B. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent treatments of concrete surfaces.

## PART 3 - EXECUTION

### 3.1 EXAMINATION AND PREPARATION

- A. Do not use items of aluminum for mixing, chuting, conveying, forming or finishing concrete, except magnesium alloy tools may be used for finishing.
- B. Keep excavations free of water. Do not deposit concrete in water.
- C. Hardened concrete, reinforcement, forms, and earth which will be in contact with fresh concrete shall be free from frost at the time of concrete placement.
- D. Prior to placement of concrete, remove all hardened concrete spillage and foreign materials from the space to be occupied by the concrete.

### 3.2 FORMWORK (Amendments to ACI 301, Chapter 4):

- A. Chamfer all exposed external corners of concrete.

### 3.3 PLACING REINFORCEMENT (Amendments to ACI 301, Chapter 5):

- A. At the time concrete is placed, reinforcement shall be free of mud, oil, loose rust, loose mill scale, and other materials or coatings that may adversely affect or reduce the bond.

### 3.4 PLACING CONCRETE (Amendments to ACI 301, Chapter 8):

- A. Operation of truck mixers and agitators and discharge limitations shall conform to the requirements of ASTM C 94.
- B. Do not allow concrete to free fall more than 4 feet.
- C. Protect concrete from exposure to salts for sixty (60) days.

### 3.5 FINISHING FORMED SURFACES (Amendments to ACI 301, Chapter 10):

- A. Finish Schedule: Except where indicated otherwise on the Drawings, provide the finishes below:
  - 1. Rough Form Finish for concrete surfaces not exposed to view.
  - 2. Smooth Form Finish for vertical concrete surfaces exposed to view.
  - 3. Broom Finish for gutters and horizontal surfaces exposed to view.
- B. Finishing, General: Provide monolithic finishes on concrete without the addition of mortar or other filler material. Finish surfaces in true planes, true to line, with particular care taken during screeding to maintain an excess of concrete in front of the screed so as to prevent low spots. Screed and darby concrete to true planes while plastic and before free water rises to the surface. Do not perform finishing operations during the time free water (bleeding) is on the surface.

### 3.6 JOINTS

- A. General: Construct construction, isolation, and contraction joints and tool edgings true to line with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline, unless otherwise indicated. When joining existing pavement, place transverse joints to align with previously placed joints, unless otherwise indicated.
- B. Construction Joints: Set construction joints at side and end terminations of pavement and at locations where pavement operations are stopped for more than one-half hour, unless pavement terminates at isolation joints.
  - 1. Continue reinforcement across construction joints, unless otherwise indicated. Do not continue reinforcement through sides of pavement strips, unless otherwise indicated.
- C. Use a bonding agent at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
- D. Isolation Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, walks, other fixed objects, and where indicated.
  - 1. Locate expansion joints at intervals of 20 feet, unless otherwise indicated.
  - 2. Extend joint fillers full width and depth of joint.
  - 3. Terminate joint filler less than 1/2 inch or more than 1 inch below finished surface if joint sealant is indicated.
  - 4. Place top of joint filler flush with finished concrete surface if joint sealant is not indicated.
  - 5. Furnish joint fillers in one-piece lengths. Where more than one length is required, lace or clip joint-filler sections together.
  - 6. Protect top edge of joint filler during concrete placement with metal, plastic, or other temporary preformed cap. Remove protective cap after concrete has been placed on both sides of joint.

- E. Contraction Joints: Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-half of the concrete thickness, as follows:
  - 1. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint with groover tool to the following radius. Repeat grooving of contraction joints after applying surface finishes. Eliminate groover marks on concrete surfaces. Radius shall be  $\frac{1}{4}$  inch.
  - 2. Sawn Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut  $\frac{1}{8}$ -inch wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before developing random contraction cracks.
- F. Edging: Tool edges of pavement, gutters, curbs, and joints in concrete after initial floating with an edging tool to the following radius. Repeat tooling of edges after applying surface finishes. Eliminate tool marks on concrete surfaces. Radius shall be  $\frac{1}{4}$  inch.

### 3.7 CURING AND PROTECTION (Amendments to ACI 301, Chapter 12):

- A. Maintain concrete surfaces in a moist condition for at least 7 days after placing, except where otherwise indicated. Do not use curing compound.
  - 1. For surfaces of exterior concrete, apply chemical curing and anti-spalling compound in accordance with the recommendations of the manufacturer.

### 3.8 FIELD QUALITY CONTROL (Amendments to ACI 301, Chapter 16):

- A. Make available to the Owner's Representative whatever test samples are required to make tests. Furnish shipping boxes for compression test cylinders. Provide field cure box as required.

### 3.9 TOLLERANCES

- A. Comply with tolerances of ACI 117 and as follows:
  - 1. Elevation:  $\frac{1}{4}$  inch.
  - 2. Thickness: Plus  $\frac{3}{8}$  inch, minus  $\frac{1}{4}$  inch
  - 3. Surface: Gap below 10 foot long, unlevelled straightedge not to exceed  $\frac{1}{4}$  inch.
  - 4. Joint Spacing: 3 inches.
  - 5. Contraction Joint Depth: Plus  $\frac{1}{4}$  inch, no minus.
  - 6. Joint Width: Plus  $\frac{1}{8}$  inch, no minus.

### 3.10 REPAIRS AND PROTECTION

- A. Remove and replace concrete that is broken, damaged, or defective, or does not meet requirements in this Section. Reasons for rejection of concrete include the following:
  - 1. Staining or discoloration of curb or gutter.

2. Curb is out of horizontal alignment more than 0.20'.
  3. Curb is out of vertical alignment more than 0.10'.
  4. Expansion joints are not perpendicular to roadway.
  5. Joints and surfaces are improperly finished.
  6. Expansion joints protrude from curb or gutter.
  7. Cracks, chips, or other damage occur in construction of maintenance period.
  8. Settlement of curb.
  9. Improper vibration of concrete.
  10. Vandalism during initial setup of concrete.
  11. Inspection of formwork not asked for by Contractor prior to pouring of curb, sidewalk or driveways.
- B. Drill test cores where directed by the Owner's Representative when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory pavement areas with portland cement concrete bonded to pavement with epoxy adhesive.
- C. Protect concrete from damage. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials as they occur.
- D. Maintain concrete pavement free of stains, discoloration, dirt, and other foreign material. Sweep concrete pavement not more than two days before date scheduled for Substantial Completion inspections.

END OF SECTION 321600

## **SECTION 321723 - PAVEMENT MARKINGS**

### **PART 1 - GENERAL**

#### **1.1 GENERAL REQUIREMENTS**

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
  - 1. Applying white, yellow or blue pavement stripes or markings to hot mix asphalt or Portland cement concrete surfaces.
  - 2. Removal of traffic stripes and markings consists of removing all stripes or solid areas, letters, arrows and other symbols (regardless of color) from hot mix asphalt and Portland cement concrete surfaces.
  - 3. The replacement of pavement stripes and markings damaged or impacted during construction.
  - 4. The provision, maintenance and removal of temporary striping and markings as required or as directed by the Owner's Representative.

#### **1.2 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications and Standard Sheets, as currently amended through the bid date for this project.
- C. FHWA MUTCD, latest revision, with the New York State Supplement, latest revision.

#### **1.3 SUBMITTALS**

- A. Written record of existing striping condition as outlined under Section 3.1A below.
- B. Quality Control Submittals:
  - 1. Certificates: Affidavit required under Quality Assurance Article.

#### **1.4 QUALITY ASSURANCE**

- A. Regulatory Requirements: Chapter III of Title 6 of the official compilation of Codes, Rules and Regulations of the State of New York (Title 6 NYCRR), Part 205 Architectural Surface Coatings.

- B. Certification: Affidavit by the paint applicator, certifying that the materials comply with the current regulatory requirements in effect at the time products were delivered and applied.

#### 1.5 PROJECT CONDITIONS

- A. Perform the painting operations after working hours, on weekends or at such time so as not to interfere with the flow of traffic. Provide temporary barriers to prevent vehicles from driving over newly painted areas.
- B. Apply paint on dry pavement surface when the air temperature is above 40 degrees F and rising.

#### 1.6 RELATED WORK SPECIFIED ELSEWHERE

- A. Flexible Paving: Section 321200.
- B. Rigid Paving: Section 321300.

### **PART 2 - PRODUCTS**

#### 2.1 MATERIALS

- A. Paint: NYS DOT Section 640-2, blue longitudinal striping and hatching, as indicated, or if not indicated, as directed. Delete all references to reflectorization and glass beads.
- B. Epoxy: NYS DOT Section 727-03, white or yellow longitudinal striping, as indicated, or if not indicated, as directed. Delete all references to reflectorization and glass beads.
- C. Thermoplastic: NYS DOT Section 727-01, white or yellow markings, lettering, symbols, and hatching, as indicated, or if not indicated, as directed. Delete all references to reflectorization and glass beads.

### **PART 3 - EXECUTION**

#### 3.1 PREPARATION

- A. Photograph, measure, dimension, and record in writing the existing configuration and characteristics of all striping within the project area. Submit a copy of the recorded configuration to the Owner's Representative for concurrence before proceeding.
- B. Completely remove prior striping or markings by surficial grinding. Obliteration is not permitted.
- C. Remove dust, dirt, and other foreign material detrimental to paint adhesion.

- D. Mark layout of stripes and lines with chalk or paint.

### 3.2 APPLYING PAVEMENT MARKINGS

- A. Apply paint in accordance with NYS DOT Section 640-3, except as follows:
  - 1. Delete references to reflectorization or glass beads.
- B. Apply epoxy in accordance with NYS DOT Section 685-3, except as follows:
  - 1. Delete references to reflectorization or glass beads.
- C. Apply thermoplastic in accordance with NYS DOT Section 687-3, except as follows:
  - 1. Delete references to reflectorization or glass beads.
- D. Allow markings to cure before removing traffic control and opening to traffic. Any damage to the installation shall be repaired by Contractor by grinding the damaged striping or markings and reapplying the striping or markings in accordance with the requirements provided above.

END OF SECTION 321723

## **SECTION 323113 - CHAIN LINK FENCES & GATES**

### **PART 1 - GENERAL**

#### **1.1 GENERAL REQUIREMENTS**

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
  - 1. Installation of fencing consisting of PVC coated hot-dipped galvanized steel chain link fabric and hot-dipped galvanized steel framework.
  - 2. Installation of gates consisting of PVC coated hot-dipped galvanized steel chain link fabric and hot-dipped galvanized steel framework at the locations shown on the plans.
- B. RELATED WORK SPECIFIED ELSEWHERE:
  - 1. Earth Moving: Section 312000.

#### **1.2 RELATED DOCUMENTS**

- A. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.

#### **1.3 SUBMITTALS**

- A. Product data in the form of manufacturer's technical data, specifications, and installation instructions for fence and gateposts, fabric, gates and accessories.
- B. Shop drawings showing location of fence, gates, each post, and details of post installation, extension arms, gate swing, hardware, and accessories. A licensed New York Professional Engineer shall prepare a structurally sound gate design and shop drawing. These materials shall be provided for review.

#### **1.4 QUALITY ASSURANCE**

- A. Chain Link Materials
  - 1. Installer Qualifications: Engage an experienced Installer who has at least three years experience and has completed at least five chain link fence projects with same material and of similar scope to that indicated for this Project with a successful construction record of in-service performance.
  - 2. Single-Source Responsibility: Obtain chain link fences and gates, including accessories, fittings, and fastenings, from a single source.

## 1.5 PROJECT CONDITIONS

- A. Field Measurements: Verify layout information for fences and gates shown on the Drawings in relation to the property survey and existing structures. Verify dimensions by field measurements.

## PART 2 - PRODUCTS

### 2.1 FABRIC

- A. Selvage: Knuckled on both selvages.
- B. Steel Chain-Link Fence Fabric: Fabricated in one-piece widths for fencing 12 feet and less in height to comply with Chain Link Fence Manufacturers Institute (CLFMI) "Product Manual" and with requirements indicated below:
1. Mesh and Wire Size:  
Chain Link Fence: 2-inch mesh, 0.148-inch diameter (9 gauge).  
Tennis Chain Link Fence: 1 ¾ inch mesh, 0.120" diameter (11 gauge).
  2. Coating: Hot-dipped galvanized, PVC Coating, Color shall be black

### 2.2 FRAMING

- A. Round member sizes are given in actual outside diameter (OD) to the nearest thousandth of inches. Round fence posts and rails are often referred to in ASTM standard specifications by nominal pipe sizes (NPS) or the equivalent trade sizes in inches. The following indicates these equivalents all measured in inches:

Actual OD	NPS Size	Trade Size
1.315	1	1⅜
1.660	1¼	1⅝
1.900	1½	2
2.375	2	2½
2.875	2½	3
3.500	3	3½
4.000	3½	4
6.625	6	6⅝
8.625	8	8⅝

- B. Fence: Galvanized-steel tubing posts and rails conforming to ASTM F 761 with a minimum outside protective coating of 0.6 oz. of zinc per sq. ft., a chromate conversion coating, and a clear polymer overcoat. Provide inside protective coating of 0.6 oz. of zinc per sq. ft. or 81 percent, 0.3-mil-thick zinc pigmented coating. Provide the following sizes of framing members with round galvanized-steel gate posts conforming to ASTM F 654.

1. Top Rail: 1-5/8" trade size.

- 2. Fence posts for fabric up to 6 feet high.
  - a. Line Posts: 2-1/2" trade size.
  - b. Terminal and Corner Posts: 3" trade size.
  
- C. Type I Round Posts: Standard weight (schedule 40) galvanized-steel pipe conforming to ASTM F 1083, according to heavy industrial requirements of ASTM F 669, Group IA, with minimum yield strength of 25,000 psi, not less than 1.8 oz. of zinc per sq. ft. Type A coating inside and outside according to ASTM F 1234, as determined by ASTM A 90, and weights per foot as follows:

Actual OD (lb/ft)	Weight Size	NPS
1.315 1.68	1	
1.660 2.27	1¼	
1.900 2.72	1½	
2.375 3.65	2	
2.875 5.79	2½	
3.500 7.58	3	
4.000 9.11	3½	
6.625 8.97	6	
8.625 28.55	8	

- D. Top Rail: Manufacturer's longest lengths (17 to 21 feet) with wedged-end or expansion-type coupling, approximately 6 inches long for joining. Provide rail ends or other means for attaching top rail securely to each gate corner, pull, and end post.

Round Steel: 1-5/8" trade size Type I steel pipe.

- E. Steel posts for fabric heights up to 6 feet:
  - 1. Round Line or Intermediate Posts: 2-1/2" trade size Type I steel pipe.
  - 2. Round End, Corner, and Pull Posts: 3" trade size Type I steel pipe.
  
- F. Coating:
  - 1. All framing shall be PVC-coated.
  - 2. Color shall be black.

### 2.3 FITTINGS AND ACCESSORIES

- A. Material: Comply with ASTM F 626. Galvanized steel to suit manufacturer's standards.
  - 1. Steel: Unless specified otherwise, hot-dip galvanize pressed steel fence, fittings and accessories with at least 1.2 oz. zinc per sq. ft. as determined by ASTM A 90.
  
- B. Post and Line Caps: Provide weathertight closure cap for each post. Provide line post caps with loop to receive tension wire or top rail.

- C. Post Brace Assembly: Manufacturer's standard adjustable brace. Use material specified below for brace, and truss to line posts with 3/8-inch-diameter rod and adjustable tightener. Provide manufacturer's standard galvanized-steel, cast-iron or cast-aluminum cap for each end.
  - 1. Round Steel: 1-5/8" trade size Type I steel pipe.
- D. Bottom and Center Rail: Same material as top rail. Provide manufacturer's standard galvanized-steel, cast-iron or cast-aluminum cap for each end.
- E. Tension or Stretcher Bars: Hot-dip galvanized steel with a minimum length 2 inches less than the full height of fabric, a minimum cross section of 1/4 inch by 3/4 inch, and a minimum of 1.2 oz. of zinc coating per sq. ft. Provide one bar for each gate and end post, and two for each corner and pull post, except where fabric is integrally woven into the post.
- F. Tension and Brace Bands: 3/4-inch-wide minimum hot-dip galvanized steel with a minimum of 1.2 oz. of zinc coating per sq. ft.
  - 1. Tension Bands: 0.074 inch thick (14 gage) minimum.
  - 2. Brace Bands: 0.105 inch thick (12 gage) minimum.
- G. Tension Wire: 0.177-inch-diameter metallic-coated steel marcelled tension wire conforming to ASTM A 824 with finish to match fabric.
  - 1. Coating Type I aluminum with a minimum coating weight of 0.40 oz. per sq. ft. as determined by ASTM A 428.
  - 2. Coating Type II zinc in the following class as determined by ASTM A 90.
    - a. Class 1, with a minimum coating weight of 0.80 oz. per sq. ft. of uncoated wire surface.
    - b. Class 2, with a minimum coating weight of 1.20 oz. per sq. ft. of uncoated wire surface.
    - c. Class 3, with a minimum coating weight of 2.00 oz. per sq. ft. of uncoated wire surface.
- H. Tie Wires: 0.106-inch-diameter (12-gage) galvanized steel with a minimum of 0.80 oz. per sq. ft. of zinc coating according to ASTM A 641, Class 3 or 0.148-inch-diameter (9-gage) aluminum wire alloy 1350-H19 or equal, to match fabric wire. Select and edit, if required, one of four subparagraphs below to suit Project. Verify local availability before selecting species and grade.
- I. Coating:
  - 1. All Fittings and accessories shall be PVC-coated.
  - 2. The color shall be black.

## 2.5 CONCRETE

- A. Concrete: Provide concrete consisting of portland cement per ASTM C 150, aggregates per ASTM C 33, and potable water. Mix materials to obtain 4000 psi concrete. Use at

least four sacks of cement per cu. yd., 1-inch maximum size aggregate, 3-inch maximum slump.

## 2.6 GATES

- A. Residential Fences: Fabricate gates according to ASTM F 654.
- B. Fabricate perimeter frames of gates from same material and finish as fence framework. Assemble gate frames by welding. Provide horizontal and vertical members to ensure proper gate operation and attachment of fabric, hardware, and accessories. Space frame members maximum of 8 feet apart unless otherwise indicated.
  - 1. Fabric: Same as for fence unless otherwise indicated. Secure fabric at vertical edges with tension bars and bands and to top and bottom of frame with tie wires.
  - 2. Bracing: Install diagonal cross-bracing consisting of 5/16-inch-diameter adjustable-length truss rods on gates to ensure frame rigidity without sag or twist.
- C. Swing Gates: Comply with ASTM F 900.
  - 1. Steel: Gates up to 8 feet wide:
    - a. Up to 6 Feet High: Fabricate perimeter frames of 1.660-inch minimum OD Type I steel pipe.
  - 2. Gate Hardware: Provide galvanized hardware and accessories for each gate according to the following:
    - a. Hinges: Size and material to suit gate size, non-lift-off type, offset to permit 180-degree gate opening. Provide 1-1/2 pair of hinges for each leaf over 6-foot nominal height.
    - b. Latch: Forked type or plunger-bar type to permit operation from either side of gate, with padlock eye as an integral part of latch.
    - c. Keeper: Provide a keeper for vehicle gates that automatically engages gate leaf and holds it in the open position until manually released.
    - d. Gate Stops: Provide gate stops for double gates consisting of mushroom-type flush plate with anchors, set in concrete, and designed to engage a center drop rod or plunger bar. Include a locking device and padlock eyes as an integral part of the latch, permitting both gate leaves to be locked with a single padlock.

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. General: Install fence to comply with ASTM F 567. Do not begin installation and erection before final grading is completed, unless otherwise permitted.
- B. Apply fabric to outside of framework.
- C. Excavation: Drill or hand-excavate (using post-hole digger) holes for posts to diameters and spacings indicated, in firm, undisturbed or compacted soil.

1. If not indicated on Drawings, excavate holes for each post to minimum diameter recommended by fence manufacturer, but not less than four times the largest cross section of post.
  2. Unless otherwise indicated, excavate hole depths approximately 6 inches lower than post bottom, with bottom of posts set not less than 36 inches below finish grade surface.
- D. Setting Posts: Center and align posts in holes 6 inches above bottom of excavation. Space a maximum of 10 feet o.c., unless otherwise indicated.
1. Protect portion of posts above ground from concrete splatter. Place concrete around posts and vibrate or tamp for consolidation. Check each post for vertical and top alignment, and hold in position during placement and finishing operations.
  2. Unless otherwise indicated, extend concrete footings 2 inches above grade and trowel to a crown to shed water.
- E. Top Rails: Run rail continuously through line post caps, bending to radius for curved runs and at other posts terminating into rail end attached to posts or post caps fabricated to receive rail. Provide expansion couplings as recommended by fencing manufacturer.
- F. Center Rails: Install center rails in one piece between posts and flush with post on fabric side, using rail ends and special offset fittings where necessary.
- G. Brace Assemblies: Install braces at end and gate posts and at both sides of corner and pull posts. Locate horizontal braces at midheight of fabric on fences with top rail. Install so posts are plumb when diagonal rod is under proper tension.
- H. Bottom Tension Wire: Install tension wire within 6 inches of bottom of fabric before stretching fabric and tie to each post with not less than same gage and type of wire. Pull wire taut, without sags. Fasten fabric to tension wire with 0.120-inch-diameter (11-gage) hog rings of same material and finish as fabric wire, spaced a maximum of 24 inches o.c.
- I. Top Tension Wire: Install tension wire through post cap loops before stretching fabric. Pull wire taut, without sags. Fasten fabric to tension wire with 0.120-inch-diameter (11-gage) hog rings of same material and finish as fabric wire, spaced a maximum of 24 inches o.c.
- J. Fabric: Leave approximately 2 inches between finish grade and bottom selvage unless otherwise indicated. Pull fabric taut and tie to posts, rails, and tension wires. Install fabric on security side of fence, and anchor to framework so that fabric remains under tension after pulling force is released.
- K. Tension or Stretcher Bars: Thread through fabric and secure to end, corner, pull, and gate posts with tension bands spaced not over 15 inches o.c.
- L. Tie Wires: Use wire of proper length to secure fabric firmly to posts and rails. Bend ends of wire to minimize hazard to persons or clothing.
1. Maximum Spacing: Tie fabric to line posts 12 inches o.c. and to rails and braces 24 inches o.c.

- M. Fasteners: Install nuts for tension bands and carriage bolts on the side of the fence opposite the fabric side. Peen ends of bolts or score threads to prevent removal of nuts for added security.

### 3.3 GATE INSTALLATION

- A. Install gates plumb, level, and secure for full opening without interference. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubricate where necessary. Install gates according to manufacturer's instructions, plumb, level, and secure.

END OF SECTION 323113

## **SECTION 323199 - ORNAMENTAL FENCES & GATES**

### **PART 1 - GENERAL**

#### **1.1 GENERAL REQUIREMENTS**

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
1. Installation of fencing consisting of fence, posts, framework, hardware, anchorage, fasteners, footings, and accessories.
  2. Installation of gates consisting of gates, posts, framework, hardware, anchorage, fasteners, footings, and accessories.
- B. RELATED WORK SPECIFIED ELSEWHERE:
1. Earth Moving: Section 312000.
  2. Segmental Retaining Walls: Section 323223.
  3. Cast-in-Place Concrete: Section 033000.

#### **1.2 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specifications Section, apply to this section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.
- C. ASTM International (ASTM):
1. ASTM B117 - Operating Salt Spray (Fog) Apparatus.
  2. ASTM B209 - Aluminum and Aluminum-Alloy Sheet and Plate.
  3. ASTM B221 - Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
  4. ASTM D822 - Filtered Open-Flame Carbon-Arc Exposures of Paint and Related Coatings.
  5. ASTM D2794 - Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact).
  6. ASTM D3363 - Test Method for Film Hardness by Pencil Test.

### 1.3 SUBMITTALS

- A. Product data in the form of manufacturer's technical data, specifications, and installation instructions for fence, fabric, components, and accessories.

### 1.4 Shop drawings showing location of fence, layout, dimensions, profiles, each post, and details of post installation, extension arms, hardware, anchorage details, and accessories. A licensed New York Professional Engineer shall prepare the retaining wall fence design including fall protection and shop drawing. These materials shall be provided for review.

- A. Provide 20-year warranty for factory finish against cracking, peeling, and blistering under normal use, acceptable to the Owner's Representative.

### 1.5 QUALITY ASSURANCE

#### A. Fence Materials

1. **Installer Qualifications:** Engage an experienced Installer who has at least three years' experience and has completed at least five fence projects with same material and of similar scope to that indicated for this Project with a successful construction record of in-service performance.
2. **Single-Source Responsibility:** Obtain fences, including accessories, fittings, and fastenings, from a single source where possible and as described in the Section 2 Products of this specification.

### 1.6 PROJECT CONDITIONS

- A. **Field Measurements:** Verify layout information for fences shown on the Drawings in relation to the property survey and existing structures. Verify dimensions by field measurements.

## **PART 2 - PRODUCTS**

### 2.1 ACCEPTABLE MANUFACTURERS

- A. Fence at police department parking lot fence and above retaining wall: Ametco Manufacturing Corporation, 4326 Hamann Parkway, P.O. Box 1210, Willoughby, Ohio 44096; 800-362-1360, models Galaxy and Sedona, as shown on plans.
- B. Fence at North property line: Illusions Vinyl Fence, manufactured and nationally distributed by Eastern Wholesale Fence, LLC, 266 Middle Island Road, Medford, NY 11763, model V300 Solid Vinyl Privacy Style fence system with Sweep 1 Rail Taper, as shown on the plans.

- C. Requests to use equivalent products of other manufacturers shall be submitted and must meet all requirements of this specification and must be acceptable to the Owner's Representative.

## 2.2 MATERIALS

- A. Extruded aluminum: ASTM B221, Alloy 6063, Temper T-6.
- B. Sheet aluminum: ASTM B209, Alloy 6063, Temper T-6.
- C. Vinyl Fence: Compliance with ASTM F964-13
- D. Grout: Non-shrink type, pre-mixed compound consisting of non-metallic aggregate, cement, and water-reducing and plasticizing additives.

## 2.3 FENCE SYSTEM

- A. Ametco Galaxy Fence System: 1/2 by 4-inch extruded aluminum tubular blades spaced vertically 3-1/2 inches on center. Fence weighs 1.75 psf.
  - 1. Type: System of extruded aluminum vertical blades with extruded aluminum frame to be field attached to aluminum posts; Galaxy Aluminum Fencing as manufactured by Ametco Manufacturing Corporation.
  - 2. Blades: Ridged, tubular aluminum sections equally spaced on 3-1/2 inch centers.
    - a. Size: 1/2 by 2 inch
    - b. Material thickness: 0.09 inch
  - 3. Fence height: as indicated on Drawings.
- B. Ametco Sedona Fence System: 1/2 by 2 inch and 1/2 by 4-inch extruded aluminum tubular alternating blades spaced either vertically or horizontally. Opening between blades can range from 1 to 4 inches. Fence weight with 1 inch opening space is 2 psf.
  - 1. Blades: Two widths of rigid, tubular aluminum section installed horizontally or vertically as directed by the Owner's Representative in an alternating pattern:
    - a. Size: 1/2 by 2 inch and 1/2 by 4 inch.
    - b. Material thickness: 0.09 inch.
  - 2. Fence height: as indicated on Drawings.
- C. V300 Solid Vinyl Privacy Style Fence System:
  - 1. Top Rail Size: 1-1/2 by 5-1/2 inch

2. Bottom Rail Size: 1-1/2 by 5-1/2 inch reinforced with a galvanized steel channel.
3. Picket Size: 7/8 by 6 inch tongue and groove.
4. Fence height: as indicated on Drawings.

## 2.4 GATES

- A. Provide gates of type and size indicated on Drawings. Equip gates with manufacturer's standard hardware as required for complete functional operation.
- B. Hinged swinging single man gate shall be installed as shown on the plans.
  1. Construction: Welded frame fabricated from extruded aluminum tubing with aluminum tubing with aluminum fixed blade panels to match fencing design and material.
  2. Nominal Size: 3' wide
  3. Hardware:
    - a. Hinges: Size and type shall be as determined by the manufacturer. Provide 2 hinges for each leaf up to 6 feet high and 1 additional hinge for each additional 24 inches in height above 6 feet.
    - b. Latch: 3/4 inch diameter slide bolt to accommodate padlock.

## 2.5 ACCESSORIES

- A. Fasteners: Stainless steel bolts of type, size, and spacing as recommended by fence manufacturer for specific condition.
- B. End caps: Provide aluminum caps for exposed open extruded aluminum sections and for attachment of components to posts.
- C. For exposed locations, provide anti-intruder bolts consisting of cup-head bolt and nut with clamping hexagon such that tightening shears hexagon and render bolt impossible to release.

## 2.6 FACTORY FINISH

- A. Color for fencing by Ametco shall be: Black or Dark Bronze for the Galaxy Fence System and custom color selected by Owner's Representative for the Sedona Fence System, as shown on the plans.
- B. Color for fencing by Illusions shall be as directed by the Owner's Representative.

## 2.7 CONCRETE

- A. Concrete: Provide concrete consisting of Portland cement per ASTM C 150, aggregates per ASTM C 33, and potable water. Mix materials to obtain 4000 psi concrete. Use at least four sacks of cement per cu. yd., 1-inch maximum size aggregate, 3-inch maximum slump.

## PART 3 - EXECUTION

### 3.1 PREPARATION

- A. Prior to fabrication, field verify required dimensions.

### 3.2 INSTALLATION

- A. Install fencing in accordance with manufacturer's installation instructions, approved shop drawings, and approved ASTM sections in Section 1.2, subsection C of this specification. Do not begin installation and erection before final grading is completed, unless otherwise permitted.
- B. Install fence posts plumb and level in accordance with manufacturer's installation instructions. Temporarily brace fence posts with wood supports until concrete and grout is set.
  - 1. Excavation: Drill or hand-excavate (using post-hole digger) holes for posts to diameters and spacings indicated, in firm, undisturbed or compacted soil.
    - a. If not indicated on Drawings, excavate holes for each post to minimum diameter recommended by fence manufacturer, but not less than four times the largest cross section of post.
    - b. Unless otherwise indicated, excavate hole depths approximately 6 inches lower than post bottom, with bottom of posts set not less than 36 inches below finish grade surface.
  - 2. Setting Posts: Center and align posts in holes 6 inches above bottom of excavation. Space a maximum of 10 feet o.c., unless otherwise indicated.
    - a. Protect portion of posts above ground from concrete splatter. Place concrete around posts and vibrate or tamp for consolidation. Check each post for vertical and top alignment and hold in position during placement and finishing operations.
    - b. Unless otherwise indicated, extend concrete footings 2 inches above grade and trowel to a crown to shed water.
- C. Do not install bent, bowed, or otherwise damaged components. Remove damaged components from site and replace.
- D. Secure fence panels and rails with standard stainless steel bolts to fence posts after posts have been set in footings.

- E. Install gates and adjust hardware for smooth operation. After installation, test gate. Open and close a minimum of five times. Correct deficiencies and adjust.
- F. Touch-up damaged finish with paint supplied by manufacturer and matching original coating.
- G. Fasteners: Install nuts for tension bands and carriage bolts on the side of the fence opposite the fabric side. Peen ends of bolts or score threads to prevent removal of nuts for added security.

END OF SECTION 323113

## **SECTION 323223 - SEGMENTAL RETAINING WALLS**

### **PART 1 - GENERAL**

#### **1.1 GENERAL REQUIREMENTS**

- A. This Section uses the term Architect. Change this term as necessary to match the actual term used to identify the design professional as defined in the General and Supplementary Conditions. GENERAL
- B. Work shall consist of furnishing and construction of a segmental retaining wall system in accordance with these specifications and in reasonably close conformity with the lines, grades, design, and dimensions shown on the plans.
- C. Work includes furnishing and installing geogrid soil reinforcement of the type, size, location, and lengths designated on the construction drawings.
- D. This section is to be in conformance with all requirements discussed in the New York State Department of Transportation's Standard Specifications, latest edition.

#### **1.2 RELATED WORK SPECIFIED ELSEWHERE**

- 1. Section 312000 "Earth Moving"

#### **1.3 RELATED DOCUMENTS**

- A. Engineering Design
  - 1. NCMA Design Manual for Segmental Retaining Walls, Second Edition.
  - 2. NCMA TEK 2-4 – Specifications for Segmental Retaining Wall Units.
  - 3. NCMA SRWU-1 – Determination of Connection Strength between Geosynthetics and Segmental Concrete Units.
  - 4. NCMA SRWU-2 – Determination of Shear Strength between Segmental Concrete Units.
- B. Segmental Retaining Wall Units
  - 1. ASTM C 140 – Sampling and Testing Concrete Masonry Units.
  - 2. ASTM C 1262 – Evaluating the Freeze-Thaw Durability of Manufactured Concrete Masonry Units and Related Concrete Units.
  - 3. ASTM C 33 – Specification for Concrete Aggregates.
  - 4. ASTM C 90 – Standard Specification for Load-Bearing Concrete masonry Units.
  - 5. ASTM C 150 – Specification for Portland Cement.
  - 6. ASTM C 595 – Specification for Blended Hydraulic Cements.

- C. Work includes preparing foundation soil, furnishing, and installing leveling base pad, drainage soil and retained soil to the lines and grades shown on the construction drawings.
- D. Geotextile Filter
  - 1. ASTM D 4751 – Standard Test Method for Apparent Opening Size
- E. Geosynthetic Reinforcement
  - 1. ASTM D 4595 – Test Method for Tensile Properties of Geotextiles by the Wide-Width Strip Method.
  - 2. ASTM D 5262 – Test Method for Evaluating the Unconfined Creep Behavior of Geosynthetics.
  - 3. GRI GG-1: Single Rib Geogrid Tensile Strength
  - 4. GRI GG-5: Geogrid Pullout
  - 5. GRI GG-6: Geotextile Pullout
- F. Soils
  - 1. ASTM D 1557 – Moisture Density Relationship for Soils, Modified Method
  - 2. ASTM D 422 – Gradation of Soils
  - 3. ASTM D 424 – Atterburg Limits of Soils
  - 4. ASTM D G51 – Soil pH
  - 5. ASTM D 3034 – Specification for Polyvinyl Chloride (PVC) Plastic Pipe
  - 6. ASTM D 1248 – Specification for Corrugated Plastic Pipe
- G. Where specification and reference documents conflict, the Owner's Representative shall make the final determination of applicable document.

#### 1.4 SUBMITTALS/CERTIFICATION

- A. Contractor shall submit a Manufacturer's certification, prior to start of work, that the retaining wall system components meet the requirements of this specification and the structure design.
- B. Contractor shall submit construction drawings and design calculations for retaining wall systems greater than 2 ½ feet of exposed height prepared and stamped by a Professional Engineer registered in the state of New York. The segmental retaining wall shall be designed in accordance with recommendations of the NCMA Design Manual for Segmental Retaining Walls, Second Edition. The Contractor shall submit four (4) original copies of all shop drawings for review (Two (2) copies for the Owner's representative and two (2) copies to be returned to the Contractor upon execution). Fax submissions of shop drawings for review and approval shall not be accepted.
  - 1. The following is a summary of the minimum factors of safety for the various modes of failure evaluated in the proposed design.
    - a. External Stability

- 1) Base Sliding 1.5
  - 2) Overturning 2.0
  - 3) Bearing Capacity 2.0
  - 4) Global Stability 1.3
  - b. Internal Stability
    - 1) Tensile Overstress 1.0
    - 2) Pullout 1.5
    - 3) Internal Sliding 1.5
  - c. Local Stability
    - 1) Facing Shear 1.5
    - 2) Connection 1.5
2. Slopes above and below all sections of the segmental retaining wall are detailed in the site grading plan.
3. The minimum wall embedment shall be the greater of:
- a. The height of a SRW unit,
  - b. 150 mm (0.5 ft) or,
  - c. The minimum embedment required because of the slope below the wall:
- | d. Slope Below Wall | Minimum Embedment |
|---------------------|-------------------|
| Level               | H/10              |
| 3 : 1 (18.4 deg)    | H/10              |
| 2 : 1 (26.5 deg)    | H/7               |
4. The following surcharge shall be applied to the top of each design cross section based on the following proposed use above the wall.
- | Use Above Wall | Minimum Surcharge      |
|----------------|------------------------|
| Light Duty     | 4.8 kPa (100 lb/sq.ft) |
5. State of Stress
- a. The lateral earth pressure to be resisted by the reinforcement at each reinforcement layer shall be calculated using Coulomb coefficient of earth pressure,  $K_a$ , times the vertical stress at each reinforcement layer.
  - b. The vertical soil stress at each reinforcement layer shall be taken equal to the unit weight of the soil times the depth to the reinforcement layer below the finished grade behind the facing units. A coefficient of active earth pressure,  $K_a$ , shall be used from the top to the bottom of the wall. The coefficient of active earth pressure,  $K_a$ , shall be assumed independent of all external loads except sloping fills. For sloping fills,

the coefficient of active earth pressure,  $K_a$ , appropriate for the sloping condition, using Coulomb earth pressure shall be used in the analysis.

6. Inclination of Failure Surface

- a. A coulomb failure surface passing through the base of the wall at the back of the reinforced zone up to the ground surface at or above the top of the wall shall be assumed in design of walls.

7. Geosynthetic Reinforcement

- a. The allowable reinforcement tension shall be determined in accordance with the method outlined in the NCMA Design Manual for Segmental retaining Walls, Second Edition. This method calculates the Long Term Design Strength (LTDS.) of the geosynthetic reinforcement by considering the time-temperature creep characteristics of the reinforcement, environmental degradation, construction induced damage and an overall factor of safety.

8. Geogrid Length

- a. The minimum soil reinforcement length shall be as required to achieve a minimum width of structure,  $B$ , measured from the front face of the wall to the end of the soil reinforcements.  $B$  must be greater than or equal to 60 percent of the total height,  $H$ . The length of the reinforcements at the top of the wall may be increased beyond the minimum length required to increase pullout resistance.

9. Global Stability

- a. The shop drawing submittal shall ensure adequate global/overall slope stability.

- C. Contractor shall submit a test report documenting strength of specific modular concrete unit and geogrid reinforcement connection. The maximum design tensile load of the geogrid shall be equal to the laboratory tested ultimate strength of geogrid / facing unit connection at a maximum normal force limited by the "Hinge Height" of the structure divided by a safety factor of 1.5. The connection strength evaluation shall be performed in accordance with NCMA test method SRWU-1.

1.5 QUALITY ASSURANCE

- A. Contractor shall submit certification, prior to start of work, that the retaining wall system (modular concrete units and specific geogrid):
  1. has been successfully utilized on a minimum of five (5) similar projects, i.e., height, soil fill types, erection tolerances, etc.; and
- B. Contractor shall submit a list of five (5) previously constructed projects of similar size and magnitude by the wall installer where the specific retaining wall system has been

constructed successfully. Contact names and telephone numbers shall be listed for each project.

- C. Contractor shall provide evidence that the design engineer has a minimum of five years of documentable experience in the design for reinforced soil structures.
- D. Soil testing and quality assurance inspection during earthwork and wall construction operations shall be provided in accordance with the requirements of Division 01. Owner's quality assurance program does not relieve the Contractor of responsibility for wall performance.

#### 1.6 DELIVERY, STORAGE AND HANDLING

- A. Contractor shall check all materials upon delivery to assure that the proper type, grade, color, and certification have been received.
- B. Contractor shall protect all materials from damage due to jobsite conditions and in accordance with manufacturer's recommendations. Damaged materials shall not be incorporated into the work.

#### 1.7 DEFINITIONS

- A. Modular Concrete Retaining Wall Units – dry-cast solid concrete units that form the external fascia of the modular unit retaining wall system.
- B. Infill Soil – specified material that is placed directly behind the drainage soil and within the reinforced zone, if applicable.
- C. Retained Soil – an in-situ soil or a specified soil that is placed behind the wall infill soil.
- D. Foundation Soil – the in-situ soil beneath the wall structure.
- E. Drainage Aggregate – a free draining soil with natural soil filtering capabilities, or a free draining soil encapsulated in a suitable geotextile, or a combination of free draining soil and perforated pipe all wrapped in a geotextile, placed directly behind the modular concrete units.
- F. Drainage Pipe – a perforated pipe used to carry water, collected at the base of the soil retaining wall, to outlets in order to prevent pore water pressures from building up behind the wall facing modules.
- G. Non-woven Geotextiles – permeable synthetic fabrics formed from a random arrangement of fibers in a planar structure. They allow the passage of water from one soil medium to another while preventing the migration of fine particles that might clog a drainage medium.
- H. Geogrid Reinforcement – a polymer grid structure having tensile strength and durability properties that are suitable for soil reinforcement applications.

1.8 SOIL PARAMETERS:

A. The Contractor shall obtain values for the following parameters for retained soil and foundation soil and submit same for review during the retaining wall construction drawing submittal process:

B. RETAINED SOIL

1. The retained soil shall be imported and select fill and approved by the Owner's Representative.
2. The effect of the retaining wall and retained soil on undisturbed native soil shall have a minimum allowable bearing pressure of 2 tsf, which the native soils can accommodate.
3. The following backfill soil parameters shall be used for the design:

<u>Soil Parameter</u>	<u>In-Situ Soils</u>
Angle of internal friction of backfill	34°
Active earth pressure coefficient (Ka) for horizontal backfill surface	0.28
At rest earth pressure coefficient (Ko) for horizontal backfill surface	0.44
Passive earth pressure coefficient	3.54
Coefficient of base friction	0.40
Total unit weight of soil (lb/ft <sup>3</sup> )	125

C. FOUNDATION SOIL

1. The foundation Soil shall be the native undisturbed on site soils. The foundation soil shall be examined and approved by the Engineer prior to the placement of the base material.
2. The effect of the retaining wall and retained soil on undisturbed native soil shall have a minimum allowable bearing pressure of 2 tsf, which the native soils can accommodate.
3. The following foundation soil parameters shall be used for the design:

<u>Soil Parameter</u>	<u>In-Situ Soils</u>
Angle of internal friction of backfill	38°
Active earth pressure coefficient (Ka) for horizontal backfill surface	0.24
At rest earth pressure coefficient (Ko) for horizontal backfill surface	0.38
Passive earth pressure coefficient	4.2
Coefficient of base friction	0.40

Total unit weight of soil (lb/ft<sup>3</sup>)

130

## **PART 2 - PRODUCTS**

### **2.1 MODULAR CONCRETE RETAINING WALL UNITS**

- A. Modular concrete units shall conform to the following architectural requirements:
1. Face Color - standard manufacturers' color to be specified by the Owner's representative.
  2. Bond Configuration - running with bonds nominally located at midpoint vertically adjacent units, in both straight and curved alignments.
  3. Exposed surfaces of units shall be free of chips, cracks or other imperfections when viewed from a distance of 10 feet under diffused lighting.
- B. Modular concrete units shall conform to the following structural and geometric requirements measured in accordance with appropriate references:
1. compressive strength = 5000 psi minimum for 28-day compressive strength as tested in accordance with ASTM C 140;
  2. absorption = 5 % maximum for the concrete to ensure adequate freeze-thaw protection;
  3. dimensional tolerances =  $\pm 1/8$ " from nominal unit dimension;
  4. unit size - 6" (H) x 8" (W) x 12" (D) minimum;
  5. unit weight - 45 lbs/solid unit minimum for the retaining wall modules;
- C. Manufacturer and System (or approved equal)
1. Unilock, 845-469-1230
  2. Pisa2

### **2.2 SHEAR CONNECTORS**

- A. Shear connectors shall be an integral shear key connection that shall be offset to permit a minimum wall batter of 1H:8V.
- B. Shear connectors shall be capable of holding the geogrid in the proper design position during grid pre-tensioning and backfilling.

### **2.3 INFILL SOIL**

- A. The infill soil shall consist of free draining sands or gravels with less than 5% passing the #200 sieve size. Select fill (as defined under 31 20 00 (2.1) (A)) may be used if the percent passing the #200 sieve does not exceed five (5) percent.

### **2.4 RETAINED SOIL**

- A. The retained soil shall be select fill approved by the Owner's representative.

## 2.5 FOUNDATION SOIL

- A. The foundation Soil shall be the native undisturbed on site soils. The foundation soil shall be examined and approved by the Owner's representative prior to the placement of the base material.

## 2.6 LEVELING BASE MATERIAL

- A. The footing material shall be non-frost susceptible, well graded compacted crushed stone (GW-Unified Soil Classification System), or a concrete leveling base, or as shown on the Construction Drawings.

## 2.7 DRAINAGE SOIL

- A. Unit drainage fill shall consist of clean 1" plus/minus crushed stone or crushed gravel meeting the following gradation tested in accordance with ASTM D-422:

<u>Sieve Size</u>	<u>Percent Passing</u>
1 inch	100
3/4 inch	75-100
No. 4	0 - 10
No. 50	0 - 5

- B. One cubic foot, minimum, of drainage fill shall be used for each square foot of wall face. Drainage fill shall be placed within cores of, between, and behind units to meet this requirement.
- C. No heavy compaction equipment shall be allowed within three (3) feet off the back of the wall fascia.

## 2.8 DRAINAGE PIPE

- A. The drainage pipe shall be perforated corrugated HDPE or PVC pipe, with a minimum diameter of 4 inches, protected by a geotextile filter to prevent the migration of soil particles into the pipe, or as specified on the construction drawings.

## 2.9 GEOTEXTILE FILTER

- A. The non-woven geotextile shall be installed as specified on the construction drawings. Although selection of the appropriate geotextile specification is site soil specific, a commonly used geotextile for filtration will have an Apparent Opening Size ranging between U.S. Sieve Sizes 100 to 70 (between 0.149 and 0.210 mm) and a minimum unit weight of 135 grams per square meter (4.0 oz / square yard). The coefficient of permeability will typically range between 0.1 and 0.3 cm/second.

## 2.10 GEOGRID REINFORCEMENT

- A. The design Engineer shall determine the type, strength, and placement location of the reinforcing geosynthetic. The design properties of the reinforcement shall be determined according to the procedures outlined in this specification.
- B. Detailed test data shall be submitted with the design calculations and shall include tensile strength (ASTM D 4595 or GGI GG-1), creep potential (ASTM D 5262), site damage and durability (GRI GG-4) and pullout resistance (GRI GG-5 or GRI-GT-6) and connection strength (NCMA SRWU-1).

## **PART 3 - EXECUTION**

### 3.1 INSPECTION

- A. The Contractor is responsible for meeting all the requirements of the specification. This includes the use of approved materials and their proper installation.

### 3.2 SITE PREPARATION

- A. The foundation soil shall be excavated or filled as required to the grades and dimensions on the Construction Drawing or as directed by the Owner's representative.
- B. The foundation soil shall be proof rolled and examined by the Owner's representative to ensure that it meets the minimum strength requirements according to the design assumptions. If unacceptable foundation soil is encountered, the contractor shall excavate the affected areas and replace with suitable quality material under the direction of the Owner's representative.
- C. In cut situations, the native soil shall be excavated to the lines and grades shown on the Construction Drawings and removed from the site or stockpiled for reuse as retained soil.
- D. All work shall be performed in accordance with the requirements of Section 02300, "Earthwork."

### 3.3 INSTALLING DRAINAGE SYSTEM

- A. The approved non-woven geotextile shall be set against the back of the first retaining wall unit, over the prepared foundation, and extend towards the back of the excavation, up the excavation face and back over the top of the infill soil to the retaining wall, or as shown in the Construction Drawings.
- B. The drainage pipe shall be placed behind the leveling base, or lower course of facing units as shown in the Construction Drawings or as directed by the Engineer. The pipe shall be laid at a minimum gradient of 2% to ensure adequate drainage to free outlets.
- C. T-Sections and outlet pipes shall be installed on the drainage pipe at 50 feet centers or as shown on the Construction Drawings.

- D. The remaining length of geotextile shall be pulled taut and pinned over the face of the retained soil. Geotextile overlaps shall be a minimum of one (1) foot and shall be shingled down the face of the excavation to prevent the infiltration of retained soil into the wall infill.

### 3.4 LEVELING BASE

- A. The leveling base material shall be crushed stone compacted to 95% Modified Proctor Density, or vibrated concrete along the grades and dimensions shown on the Construction Drawings.
- B. The minimum thickness of the leveling base shall be 6 inches.

### 3.5 INSTALLATION OF MODULAR CONCRETE RETAINING WALL UNITS

- A. The bottom row of retaining wall modules shall be placed in the prepared leveling base as shown on the Construction Drawings. Care shall be taken to ensure that the wall modules are aligned properly, leveled from side to side and front to back and are in complete contact with the base material.
- B. The wall modules above the bottom course shall be placed such that the tongue and groove arrangement provide the design batter (i.e., setback) of the wall face.
- C. Successive courses shall be placed to create a running bond pattern with the edge of all units being approximately aligned with the middle of the unit in the course below it.
- D. The wall modules shall be swept clean before placing additional levels to ensure that no dirt, concrete or other foreign materials become lodged between successive lifts of the wall modules.
- E. A maximum of 4 courses of the wall units can be placed above the level of the infill soil at any time.
- F. The contractor shall check the level of wall modules with each lift to ensure that no gaps are formed between successive lifts that may affect the pullout resistance of geogrid reinforcement, if applicable.
- G. Care shall be taken to ensure that the wall modules and geosynthetic reinforcement are not broken or damaged during handling and placement.
- H. Coordinate installation with proposed surface drainage system and associated penetrations, as well as with fence support system.

### 3.6 DRAINAGE SOIL

- A. The drainage soil will be placed behind the retaining wall modulus with a minimum width of one (1) foot and separates from other soils using the approved nonwoven geotextile.

- B. Drainage soil shall be placed behind the wall facing in maximum lifts of six (6) inches and compacted to a minimum density of 95% Modified Proctor.
- C. No heavy compaction equipment shall be allowed within three (3) feet or one (1) meter off the back of the wall fascia.

### 3.7 INFILL SOIL

- A. Wall infill soil shall be placed behind the first course of the wall facing units in maximum lifts of six (6) inches and compacted to a minimum density of 95% Modified Proctor. At the specified elevations, geogrid reinforcement shall be placed, as described in section 3.8. The fill shall be placed and compacted level with the top of the wall modules at the specified geogrid elevations prior to placing the geogrid reinforcements.
- B. Wall infill soil shall be placed on top of the geogrid reinforcement layers in maximum lifts of six (6) inches and compacted to a minimum of 95% Modified Proctor Density. Care shall be taken to ensure that the geogrid lays flat and taut during placement of the infill soil. This is best achieved by placing fill on top of the geogrid near the wall fascia and spreading towards the back of the infill soil zone.
- C. No tracked construction equipment shall be allowed to operate directly on top of the geogrid until a minimum thickness of six (6) inches of fill has been placed. Rubber tired equipment may drive on top of the geo grid at slow speed but should exercise care not to stop suddenly or make sharp turns. No heavy equipment shall be allowed within three (3) feet or one (1) meter off the back of the wall.

### 3.8 GEOGRID SOIL REINFORCEMENT

- A. Pre-cut sections of geogrid reinforcement shall be placed horizontally at the specified elevations and with longitudinal axis perpendicular to the wall face (i.e., machine direction), at the elevations shown on the Construction Drawings.
- B. The geogrid shall be placed over the compacted infill soil and the wall facing units with the outside edge extending over the tongue of the bottom unit and to within one (1) inch of the front facing unit. Care shall be taken to ensure that the wall modules are swept clean and that the geogrid is in complete contact with the top and bottom faces of the adjacent wall modules. The next course of wall modules shall be carefully placed on top of the lower modules to ensure that no pieces of concrete are chipped off and become lodged between unit layers.
- C. The geogrid shall be pulled taut away from the back wall modules during placement of infill soil. Alternatively, suitable anchoring pins or staples can be used to ensure that there are no wrinkles or slackness prior to placement of the infill soil.
- D. The geogrid shall lay perfectly flat when pulled back perpendicular to the back of the wall fascia.

### 3.9 RETAINED SOIL

- A. Retained soils shall be placed and compacted behind the infill soil or drainage soil if applicable, in maximum lift thickness of six (6) inches. The retained soils shall be undisturbed native material or engineering fill compacted to a minimum density of 95% Modified Proctor.
- B. No heavy compaction equipment shall be allowed within three (3) feet of one (1) meter off the back of the wall modulus.

### 3.10 FINISHING WALL

- A. Items 3.4 to 3.9 shall be repeated until the grades indicated on the Construction Drawings are achieved.
- B. Finish grading above the wall to direct surface runoff water away from the segmental retaining wall. Use a soil with a low permeability to restrict the rate of water infiltration into the retaining wall structure.

### 3.11 CAP INSTALLATION

- A. Cap units shall be glued to underlying units with an all-weather adhesive recommended by the manufacturer.

### 3.12 AS-BUILT CONSTRUCTION TOLERANCES

- A. Vertical Control:  $\pm 1.25$  inches over a ten (10) foot distance,  $\pm 3$  inches total;
- B. Horizontal Control:  $\pm 1.25$  inches over a ten (10) foot distance,  $\pm 3$  inches total;
- C. Rotation:  $\pm 2$  degrees from planned wall batter;
- D. Bulging: 1.0 inch over a ten (10) foot distance.
- E. Corners, bends, curves:  $\pm 1$  ft to theoretical location.
- F. Variation in Plan Position: For ends and faces of walls in relation to property lines, buildings, and other objects, do not vary from plan dimensions by more than 1 inch or from depicted plan relationship (scaled dimensions) by more than 3 inches.
- G. Variation in Linear Wall Line: For walls indicated as straight, do not exceed 1/4 inch in 10 feet or 1 inch in 40 feet or more from a straight line.
- H. Maximum horizontal gap between erected units shall be 1/2 inch.

### 3.13 FIELD QUALITY CONTROL

- A. Comply with requirements of Division 2 Section "Earthwork" for in-place soil density testing.

- B. Revise subparagraph below as required by soil report or retaining wall engineering design.
- C. In each compacted backfill layer, perform at least 1 field in-place density test for each 100 feet or less of retaining wall length, but no fewer than 2 tests along a wall face. The Contractor shall engage inspection and testing services, including independent laboratories, to provide quality assurance and testing services during construction. The Contractor's consultant shall prepare and submit reports attesting to the proper construction of the wall directly to the Owner's representative for review and approval.
- D. Testing and inspections services shall only be performed by qualified and experienced technicians and engineers.
- E. As a minimum, quality assurance testing should include foundation soil inspection, soil and backfill testing, verification of design parameters, and observation of construction for general compliance with design drawings and specifications.

### 3.14 ADJUSTING AND CLEANING

- A. Remove and replace segmental retaining walls of the following description:
  - 1. Broken, chipped, stained, or otherwise damaged units. Units may be repaired if methods and results are approved by the Owner's representative.
  - 2. Segmental retaining walls not matching approved samples and mockups.
  - 3. Segmental retaining walls not complying with other requirements indicated.
- B. Replace in a manner that results in segmental retaining wall's matching approved samples and mockups, complying with other requirements, and showing no evidence of replacement.

END OF SECTION 323223

## **SECTION 324000 - SIGNS**

### **PART 1 - GENERAL**

#### 1.1 GENERAL REQUIREMENTS

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
  - 1. Placement, erection, relocation, and/or resetting of traffic signs as indicated on the plans.
  - 2. The replacement of traffic signs damaged or impacted during construction.
  - 3. The provision, maintenance and removal of temporary traffic signs as required or as directed by the owner's representative.

#### 1.2 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.
- C. FHWA MUTCD, latest revision, with the New York State Supplement, latest revision.
- D. FHWA Standard Highway Signs, latest revision.

#### 1.3 SUBMITTALS

- A. Shop Drawings: Show shop drawings, not necessarily to scale, but sufficient enough in detail to show color, wording, lettering size and style, overall sign size, construction details and installation details for each type of sign.

#### 1.4 RELATED WORK SPECIFIED ELSEWHERE

- A. Earth Moving: Section 312000.

### **PART 2 - PRODUCTS**

#### 2.1 TRAFFIC SIGNS

- A. Construction Materials: Comply with the applicable requirements of NYS DOT Section 645.

B. Ground Mounted Sign Panels:

1. Posts: NYS DOT Item 645.81, 2.5 lb/ft spliced u-channel by Franklin Industries as shown on NYS DOT material detail sheets MD645E-FEZ-01 through 05, or approved equal.
2. Panel: Compliant with NYS DOT Section 645-2.02.
3. Retroreflectance: NYS DOT Section 730-05, Type III.

C. Street Sign Panels:

1. Footing: 4,000 psi concrete (min.), 38 inches (min.) embedment.
2. Posts: NYS DOT Item 645.81, 1.96 lb/ft Socket Round by Northwest Pipe Company as shown on NYS DOT material detail sheets MD645E-POZ-01 through 04, or approved equal.
3. Panel: NYS DOT Item 645.7301, Street Sign blade shall be 30 inches long to accommodate a maximum of twelve character spaces, 9 inches high, 0.080 inches (min.) thick, extruded reflective green aluminum with 6 inch high white legend (see plans for contents) by Pac Sign Company, or approved equal. Legends with more than twelve character spaces shall be provided with appropriate blade lengths increased above the 30 inch minimum in 6 inch increments to accommodate text in accordance with FHWA MUTCD standards.
4. Galvanized steel post-top bracket shall be provided with sign and be compatible with extruded aluminum blade and post diameter.
5. Retroreflectance: NYS DOT Section 730-05, Type III.

D. Temporary Traffic Control Signs

1. Posts: NYS DOT Item 645.81, 2.5 lb/ft spliced u-channel by Franklin Industries as shown on NYS DOT material detail sheets MD645E-FEZ-01 through 05, or approved equal.
2. Panel: Compliant with NYS DOT Section 645-2.02. Panels need not be reflectorized.

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION**

- A. Erect signs in their designated locations, as indicated and in accordance with the approved shop drawings and the applicable requirements of NYS DOT Section 645.
- B. Protect surfaces and finishes from abrasion and other damage during handling and installation.
- C. Replace damaged or faulty signs.

END OF SECTION 324000

## **SECTION 328000 – LANDSCAPE IRRIGATION**

### **PART 1-GENERAL**

#### **1.1 WORK INCLUDED**

- A. General Contractor shall develop and install a complete automatically controlled lawn irrigation system supplied by a rain-harvesting cistern (specified elsewhere) including, but not limited to PVC pipe, fittings, sprinkler heads, electric zone valves, isolation valves, ball valves, quick coupler valves, valve boxes, control wires, sleeves, level monitoring, controllers and all necessary equipment, testing, and materials as required to provide a complete and fully operational irrigation system in accordance with the performance standards herein. Subcontracting to a specialized irrigation subcontractor is acceptable to meet installers qualifications.
- B. Cooperation and interface with the other prime contractors.
  - 1. Electrical contractor will prepare interior space, conduit, and access for the irrigation contractor to install controls, wiring in the space allocated. Electrical connections from the controls to the building electrical system will be furnished and made by the electrical contractor.
  - 2. Furnishing and installing all associated irrigation electrical equipment and wiring outside the building five (5) feet from the point of exit. The electrical contractor shall be responsible for all penetrations and connections into the proposed building.
  - 3. Construction of all piping and specialties for irrigation services outside the building. No connections will be made into the proposed building or to a potable water source.

#### **1.2 REFERENCE SPECIFICATIONS**

- A. Manufacturer's Standard Materials Cut Sheets.
- B. Manufacturer's recommended installation standards
- C. New York State Department of Transportation Standard Specifications, as currently amended.

#### **1.3 SITE FEATURES AND UTILITIES**

The contractor shall verify all site features and utilities prior to installation of the irrigation system. The contractor shall call for mark out and notify the Owner's Agent four (4) days prior to his commencement of installation of the irrigation system. The contractor shall verify all site features and utilities to but limited to the items below.

- A. Existing Landscape Plantings
- B. All Site Utilities
- C. Plumbing

- D. Architectural
- E. Electrical
- F. Mechanical

#### 1.4 REQUIRED SYSTEM PARAMETERS

- A. Irrigation (cistern water source)
  - 1. 16,000 (min) square feet of irrigated area
  - 2. 4 zones (min)
  - 3. Delivery pressure at main control valve inlet: 50 psi (min)
  - 4. Delivery rate to furthest zone : 20 gpm (min)
  - 5. Automatic calendar controller (panel located within building)
  - 6. Remote rain sensor (panel located within building)
  - 7. Remote cistern level sensor (panel located within building)
  - 8. Rotor, spray, or drip application.
  - 9. 1 inch (min) distribution polyethylene tubing to connect each zone to a valve box adjacent to the cistern housing 4 automatic zone valves
  - 10. 1 inch (min) main pipe between cistern and distribution valve box
  - 11. Winterizing tee with threaded brass or stainless plug in cistern riser
  - 12. Main shut off ball valve
  - 13. Submersible pump with floating intake sleeve and controller, installed in most westerly cistern riser.
  - 14. Associated fittings, electrical and appurtenances
  
- B. On-Demand Water (cistern water source)
  - 1. Delivery pressure at furthest point: 40 psi (min)
  - 2. Delivery rate at furthest point: 12 gpm (min)
  - 3. 3 spigots (frost-free/freezeless yard hydrants) adjacent to west and south faces of building (approximate location shown on plans)
  - 4. 1.5 inch (min) distribution polyethylene tubing to connect each spigot to a valve box adjacent to the cistern housing 3 manual ball valves
  - 5. 1 inch (min) main pipe between cistern and distribution valve box
  - 6. Winterizing tee with threaded brass or stainless plug in cistern riser
  - 7. Main shut off ball valve
  - 8. 2-gallon (min) pressure tank
  - 9. Bottom suction cistern pump with floating intake sleeve and controller, installed in most westerly cistern riser.
  - 10. Associated fittings, electrical and appurtenances

#### 1.5 QUALITY ASSURANCE

- A. Manufacturer's Qualifications: Companies regularly engaged in manufacturing irrigation system materials and products, of types and sizes required as specified, whose products have been in satisfactory use in similar projects for not less than fifteen (15) years.
  
- B. Installer's Qualifications: Companies who have successfully designed and completed a minimum of five (5) contracts over a three (3) year period involving installation of irrigation and piping projects similar in size and scope to that required for this project. Such experiences and references shall be included in the shop drawings submitted for the project.

Codes and Standards:

1. Comply with all applicable State and Local ordinances and codes.
2. All materials and work shall meet the requirements of ASTM, AWWA, and UL.
3. Contractor shall be and experienced irrigation contractor. Include signed statement below:

I am a bona fide irrigation contractor with \_\_\_\_\_ years of installation experience and possess the equipment to complete this project within \_\_\_\_\_ days from starting the project.

\_\_\_\_\_  
Signature

\_\_\_\_\_  
Company name

1.6 SUBMITTALS

- A. Contractor shall develop a submittal package meeting the performance standards of this specification including: shop drawings, irrigation layout, zone configuration, catalog sheets for all equipment, manufacturers' data for materials to be used, and operation and maintenance information for a complete system. The Contractor shall submit legible PDF copies of the complete package with all selections clearly indicated. If providing paper copies, four (4) original binder copies of the package for review (Two (2) copies for the Owner's representative and two (2) copies to be returned to the Contractor upon execution). Fax submissions of shop drawings for review and approval shall not be accepted. Include:

1. Sprinkler Heads and spigots
2. Controllers
3. Electric Valves
4. Isolation Valves
5. Ball Valves
6. PVC Piping and SCH 40 Fittings
7. Valve Boxes
8. Control Wire
9. Wire Splices
10. Polyethylene Tubing
11. Quick Coupler Valves
12. Swing Joints
13. Level Sensors
14. Pumps

- B. Drawings of Record: At the project close a drawing of record shall be delivered to the Owner in both record mylar and digital format. Digital submissions shall be in AutoCAD, 2017 format on a compact disc in compatible format, or higher showing all the locations of the irrigation plan and any and all changes. The main elements of the drawing of record, i.e.; Main line fittings, Electric valves, gate valves, quick coupler, splice boxes and locations of ends of sleeves shall be shown on the drawing of record. All measurements shall be triangulated by means pf tape measurements, no wheel measurements will be

allowed. Contractor may use GPS. During the installation process the contractor shall keep a field copy of changes on site.

#### 1.10 INSPECTION OF SITE

- A. The contractor shall acquaint himself/herself with all site conditions. Should utilities not shown on the plans be found during excavations, the contractor shall promptly notify the owner site agent for instructions as to further action? Failure to do so will make the Contractor liable for any and all damage that arises from his neglect.
- B. The contractor shall take the necessary precautions to protect all existing site conditions, including plant materials. Should damage be incurred, the contractor shall repair or replace the damage to its original condition at his expense.

#### 1.11 PERMITS AND FEES

- A. Obtain all permits and pay required fees to any governmental agency having jurisdiction over the work including all inspection fees that may be required by local ordinances.

#### 1.12 DRAWINGS, SPECIFICATIONS AND DETAILS

- A. Scale and Dimensions:
  - 1. Consider drawings and specifications as being compatible and therefore work called for by one and not the other shall be furnished and installed as though called for by both. When discrepancies exist between scale and dimensions or between the works to be accomplished by each trade, they shall be called to the attention of the project manager immediately. The project manager decision regarding such discrepancies shall be final and binding.
  - 2. Where diagrams and details not to scale have been shown to piping connections and other accessories the contractor is cautioned that these are diagrammatic only and not to be used for obtaining lineal runs or numbers and types of fittings or materials used.
  - 3. All measurements shall be verified at the site; all pipe routing is for diagrammatic purposes and shall be staked out in the field prior to installation. And approved by the Owner's representative.

#### 1.13 PIPING ARRANGEMENTS

- A. The contractor shall make necessary adjustments in the layout of the irrigation system and the pipe routing. Should conflicts arise during installation the contractor shall obtain a change order for this adjustment to the plan. This change order shall not authorize an additional fee but shall resolve any existing site condition problems.
- B. The contractor shall not proceed with out the work order and shall provide in written assurance that such changes will not cause any extra costs due to these changes. Any work that does not receive a work order and is in conflict with existing site conditions shall be removed and reinstalled by the contractor at no expense to the owner or owner's agent.

#### 1.14 WORKMANSHIP

- A. The Contractor shall follow the manufacturer's recommendations for installing all pipe, fittings, valves, electric valves, sprinklers, controllers and all other appurtenances. The Contractor shall also follow all standards and installation practices which have been established by all related associations and local, state, and federal codes. The Contractor shall always perform his work in a professional and orderly manner. The Contractor at all times shall have a Project Superintendent on the site who is completely familiar with all installed materials and will be responsible for the installation of all materials.

#### 1.15 ACCURACY

- A. Lay out work as accurately as possible to the drawings. The drawings, though carefully drawn, are generally diagrammatic to the extent that swing joints, offsets, and all fittings are not shown.

#### 1.16 COVERAGE

- A. The Contractor shall be responsible for full and complete coverage of all irrigated areas and shall make any necessary minor adjustments at no additional cost to the Owner. If not specified on the plans, the Contractor shall be responsible for proper nozzle choice and arc adjustment to assure:
  - 1. Matched precipitation of all heads within each area and zone.
  - 2. Proper flow rates not to exceed 5.0 feet/second in any piping.

#### 1.17 REVISIONS

- A. Any major revisions to the irrigation system must be submitted and answered in written form, along with any negotiated change in contract price.

#### 1.18 COORDINATION

- A. All work shall be coordinated with other trades on the site; any conflicts shall be resolved by the project manager in order to proceed with the work as rapidly and efficiently as possible.

#### 1.19 GUARANTEE

- A. All work shall be guaranteed for one (1) year from date of acceptance of the completed installation against all defects in materials, equipment and workmanship. Guarantee shall cover the repair of damage to any part of the installation site resulting from leaks or other defects in materials, equipment and workmanship to the satisfaction of the owner. Repairs if required under the guarantee period shall be done at no costs to the owner. All manufacturers' extended warranties shall be transferred to owner with the caveat that any labor after the one year general contractor guarantee shall be billable by the contractor should the owner decide to use the contractor's service to install any manufacturer's equipment through extended warranty.
- B. Guarantee shall include system shut down for 1st winterization, spring start up, and 2nd winterization. The development of an approved water application schedule by the

contractor and approved by the Owner's representative. Winter damage due to improper winterizations will be the responsibility of the contractor and repairs to the irrigation system through both included winterizations shall be preformed at no cost to the Owner.

1.20 RELATED WORK SPECIFIED ELSEWHERE

Earth Moving	Section 312000
Erosion and Sediment Control	Section 312500
Turf and Grasses	Section 329200

**PART 2 - PRODUCTS**

2.1 ACCEPTABLE MANUFACTURERS

Subject to compliance with requirements, provide materials by the following irrigation manufacturers, or approved equal. Mixing manufacturers for single system elements is not acceptable, but multiple manufacturers for disparate elements may be submitted if operationally compatible.

## 2.2 MATERIALS

- A. Provide all irrigation materials and factory-fabricated products of size, types, pressure ratings and capacities as indicated. If there are any discrepancies in materials or interpretation or their use the contractor shall be responsible to obtain proper clarification before any materials are installed
- B. All materials throughout the irrigation system shall be new and undamaged and in perfect working condition.

## 2.3 PIPING AND FITTINGS

- A. All rigid piping 2 ½ inch and smaller shall be solvent weld SDR 21 class 200 PVC pipe, extruded from 100 percent virgin polyvinyl chloride conforming to ASTM D 2241 and shall be continuously and permanently marked with the manufacturers name, material, size and schedule or type. Pipe shall conform to all specifications form ASTM, Department of Commerce, NSF/TL (NSF) or the latest revisions.
  - 1. All fittings on 2 inch and smaller shall be SCH 40 PVC conforming to ASTM D-2466. No saddle or clamp type fittings shall be used
- B. All pipes under vehicular traffic shall be sleeved by SCH 40 PVC conforming to ASTM D-1785. Sleeve sizes shall be large enough to accommodate the bell housing of the ring tight pipe or the solvent weld belled end pipe. As a minimum, **the sleeve pipe ID shall be 1 ¼ times the irrigation pipe OD at the bell housing.**
- C. All flexible piping 2 ½ inch and smaller shall be polyethylene tubing conforming to ASTM F 771 or current, and shall be continuously and permanently marked with the manufacturers name, material, size and schedule or type. Pressure rating for 1 inch tubing shall be 100 psi. Pressure rating for 1.5 inch tubing shall be 160 psi. Tubing shall be rated for direct burial.

## 2.3 VALVES

- A. Ball valves shall be forged brass, 600W.O.G./150WSP two piece, full port, conforming to WWV 35, type II style with T-style handles
- B. Electric control valves for each zone of irrigated area shall be sized to match the connecting pipe with pressure regulation.
- C. All electric and line size isolation valves shall be in standard composite valve boxes with extensions and lids as required.
- D. Quick coupler valves shall be 1 inch brass with swing joint with top flange to prevent QCV from being unscrewed from swing joint. Swing joint shall accommodate brass nipple to connect the QCV all QCV shall be in 10 inch round composite valve boxes with a 6 inch PVC sleeve.

## 2.4 VOLT ELECTRICAL WIRE

- A. All 24-volt control wires from controller to the electric valves shall be #14/1 red wire for direct burial. All 24-volt common wire from the controller to the electric valves shall be #12/1 white wire for direct burial. Splices and connections to the electric valves shall be with 3M DBY and DBR connectors. There will be no tee splices allowed. The common wire will be one continuous run; more than one common run may be used and spliced at the controller. Spare wires shall be run from the controller a minimum of six (6) from each controller location to the last electric valve on the run. Spare wire shall be #14/1 blue wire for direct burial. No wire splices will be allowed in wire runs of less than 1000'.
- B. When control wires must go into the building the proper splice boxes must be used and the same size corresponding wire size shall be used at the splice box location. All wire shall conform to ASTM B3 or B-8 for soft drawn bare copper wire with polyethylene insulation.

## 2.5 SPRINKLER HEADS, SWING JOINTS, AND SPIGOTS

- A. Turf sprinklers shall be sized to produce the coverage required. The sprinklers shall have a swing joints. The lay on all swing joints shall not be less than 35 degrees nor greater than 55 degrees from the horizontal lateral zone pipe.
  - 1. The electric valve pressure setting shall be set at 40 PSI for all zones no sprinkler head shall be spaced greater than 35'-0". The contractor is required to provide 100% coverage in all areas.
- B. Spigots shall be free-standing freezeless/frost-free cast yard hydrants, 1 inch nominal diameter riser, buried 5 feet, with 1 CF pea stone drainage pocket around the 1/8 inch (min) drain hole. Provide manual lever operating handle. Outlet shall daylight 24 inches above finished grade. Woodford models Y1 or U100, or approved equal.

## 2.7 CONTROLLERS

- A. The controller shall be capable of twenty four (24) stations. The controller shall operate as a stand-alone controller. The controller shall have 16 total start times; the controller shall have 4 independent programs offer concurrent operation capability, with a 7 day calendar, odd/even or day interval options for one to 30 days. The Controller shall have excluded day option, when used with the odd/even day option, allows for no watering on specific days. The station run times shall be from one (1) minute to ten (10) hours with percent of adjust by program from ten (10) to two hundred fifty (200) percent.
- B. Zone valves shall be paired at the controller all paired zones shall be of similar sprinkler type or drip zones and of similar flows in zones. No zones shall be paired with greater than five (5) percent differences in zone flow. The contractor shall submit a controller zone pairing schedule to the Owner's representative for approval prior to starting of system. No more than two (2) zones will be on any controller station.
- C. Pump controller shall be compatible with furnished equipment.

## 2.8 VALVE BOXES

- A. All electric zone valves, isolation valves, drain valves, quick coupler valves, splices; air vent valves and flush valves shall be in composite valve boxes or approved equal. All electric zone valves shall be placed in standard valve boxes with the extensions required to provide the proper drainage and cover of the zone valve. The valve boxes and extensions shall extend to the bottom of the zone pipe feeding the zone and installed in accordance with the these and the manufacturer's specifications.
  - 1. All isolation valves, drain valves, splices and quick coupler valves shall be placed in ten inch (10") circular valve boxes, with a piece of six inch (6") PVC pipe reach wells.
  - 2. All valve box-lifting tools and unlocking tools shall be supplied to the owner after installation. The contractor shall provide three (3) sets of these tools.

## 2.9 PUMPS

- A. General
  - 1. 304 stainless steel construction
  - 2. Pumps shall be suspended by non-powered 1/8 inch diameter synthetic cables or stainless steel chains secured to the pump and riser by mechanical connections. Riser connection point shall be within 1 foot of finished grade.
  - 3. Pump discharge lines shall be flexible PEX tubing rated at least twice the pump operating discharge pressure and connected to the main discharge pipe.
  - 4. Include compatible synthetic floating intake sleeves
    - i. Float shall be bright orange or yellow, spherical
    - ii. Adjust to suspend intake 6 to 12 inches below cistern water surface
- B. Irrigation
  - 1. Submersible
  - 2. 1 HP (min)
  - 3. 2 wire, 60hz
  - 4. 115V, GFCI-protected circuit
  - 5. Strom 4SF25P series, or approved equal

- C. On-Demand Water
  - 1. Bottom suction with integral automatic pressure switch
  - 2. ¾ HP (min)
  - 3. 2 wire, 60 Hz
  - 4. 115V, GFCI-protected circuit
  - 5. Strom BSP007PF series, or approved equal
  - 6. Pressure tank:
    - i. 2 gallon, welded steel, painted
    - ii. 100 percent butyl rubber diaphragm with polypropylene liner
    - iii. 125 psi maximum pressure rating
    - iv. Install within cistern riser, above maximum water level

#### 2.10 RAIN & LEVEL SENSORS

- A. All controllers shall have separate rain and cistern level sensors that will shut the irrigation cycle off during periods of low storage, rain or rainfall accumulated amounts. The sensors shall interrupt the controller's common wire and be able to have a bypass switch for testing and to override the sensors. Rain Sensor location shall be located by Owner's representative. Cistern sensor shall be located in the most westerly riser. Wireless sensors are acceptable if the base station is wired to the building power and equipped with a sensor battery warning indicator on station.

#### 2.11 GROUNDING

- A. All controllers shall be grounded in accordance with the manufacturer's recommendations and shall be 10 Ohms or less.

### **PART 3 - INSTALLATION**

#### 3.1 STAKE OUT

- A. The Contractor shall stake out all proposed lines prior to trenching operations. The location of said lines shall conform in general with the locations shown on the approved submittals. The location of the stakes will be checked by the Owner's representative and approved prior to trenching.
- B. Of particular importance is the location of sprinkler heads where prevailing winds, surface slope and special ground conditions must be taken into consideration. The final location of all sprinklers must be approved by the Owner's representative.

#### 3.2 EXCAVATION

- A. Trench for pipe shall be wide enough to allow for proper tamping around the pipe in accordance with the manufacturer's recommendations. Trenches shall also be made wide enough to allow a minimum of 2 inches between parallel pipelines. Trenches for pipelines shall be made of sufficient depths to provide minimum cover from finish grade as follows:

1. 24" minimum cover over main lines.
2. 16" minimum cover over control wires from controller to valves (or as required by code).
3. 16" minimum cover over lateral lines to heads.

B. Maintain all warning signs, shoring, barricades, flares and red lanterns as required by OSHA, and any local ordinances. The bottom of the trench shall be clean and smooth, with all rock, loose soil, and organic matter removed. The Contractor shall insure that there are no conditions in the trench that could damage the pipe or the wires. Any deviations from the above must be approved by the Owner. Vibratory plowing of wire and solvent weld pipe will be acceptable subject to Owner approval of plowing equipment and procedures. Restore all surfaces, existing underground installations, etc., damaged or cut as a result of the excavations to their original condition and in a manner approved by the Owner.

### 3.3 ROCK REMOVAL

A. See Section 312000

### 3.4 DELETERIOUS MATERIAL

A. See Section 312000

### 3.5 PIPE LINE ASSEMBLY

A. Plastic pipe and fittings shall be solvent welded using solvents and methods as recommended by manufacturer of the pipe, except where screwed connections are required. Pipe and fittings shall be thoroughly cleaned of dirt, dust and moisture before applying solvent with a non-synthetic bristle brush. Pipe may be assembled and welded on the surface. Snake pipe from side to side of trench bottom to allow for expansion and contraction. Make all connections between plastic pipe and metal valves or steel pipe with threaded fittings using SCH 80 PVC.

### 3.6 THRUSTING

A. Install thrust blocks or anchoring for all isolation valves larger than 3", and all piping including changes in direction and reducers, in strict accordance with pipe manufacturer's recommendations. Construct thrust blocks of Sakrete or concrete of the following mix, having a compressive strength of 2000 PSI: 1 part concrete; 2.5 parts sand; 4 parts washed gravel. All thrust blocks must bear against undisturbed soil. In no case will fieldstone or wood of any form be acceptable for thrusting.

### 3.7 SPRINKLER HEADS

A. Install sprinklers as per manufacturer's recommended specifications. Install all sprinkler heads on specified swing joints.

### 3.8 CLOSING PIPE AND FLUSHING LINES

- A. Cap or plug all openings as lines have been installed to prevent the entrance of materials that would obstruct the pipe. Leave in place until removal is necessary for completion of installation. Thoroughly flush out all water lines before installing heads. Test in accordance with paragraph on Hydrostatic Tests. Upon completion of the testing, the Contractor shall complete assembly and adjust sprinkler heads for proper distribution.

### 3.9 HYDROSTATIC TESTS

- A. Request the presence of the Owner's Representative in writing at least 48 hours in advance of testing. Testing to be accomplished at the expense of the Contractor and in the presence of the Owner. Center load piping with small amount of backfill to prevent arching or slipping under pressure. Apply a continuous and static water pressure of 80 PSI when welded plastic joints have cured at least 24 hours and with the risers capped as follows:
  - 1. Main lines and sub mains to be tested for 3 hours.
  - 2. Lateral lines to be tested for 2 hours. (If laterals and individual sub-mains downstream of control valves have less than 45 PSI working pressure or less than 5 GPM flow, hydrostatic tests are waived for these laterals.)
- B. Repair leaks resulting from tests.

### 3.10 AUTOMATIC CONTROLLERS

- A. Connect sprinkler valve wires to controller in a logical sequence to correspond with specification. Controller wires shall not be connected until system is ready to be activated.

### 3.11 ELECTRIC ZONE VALVES

- A. All electric zone valves shall be installed as proposed on the approved submittal. The Contractor shall take extra caution to avoid over tightening the nipples on the inlet side or the discharge side of the electric valve. No pipe dope shall be used: only Teflon tape.
- B. The Contractor shall lower the electric zone valve assembly completely with valve boxes and extension to cover the PVC lateral pipe with the valve box. All brick supports shall be complete around the valve box and brick shall be placed on undisturbed soil.
- C. Prior to installation of zone valves all main line piping shall be flushed and free from contaminants.

### 3.12 WIRE AND WIRE SPLICING

- A. Do not yank, stretch, or pull wires during installation. Provide a minimum of one foot of slack, in an expansion loop, in each 100 feet of wire. Lay wire on a firm even bed in the trench, which shall support the entire length. At splice locations, provide sufficient slack to allow the splice to be raised a minimum of 24 inches above grade for inspection. Do not lay wire above, or on top of the pipe, except when wire and pipe are being plowed simultaneously. When power wire runs do not follow the pipe, lay them in a straight line which shall be carefully located on the as-built plan. Minimum 2.5" pipe shall be used as wire conduit for all sleeves.

- B. Splice all wires to requirements of local minimum regulations or to the following recommendations, whichever is more restrictive: Make all splices by baring a minimum of three-quarters of an inch of copper conductor, twisting the leads together, and soldering them with a non-acid core solder. Wire nuts are acceptable in lieu of soldering. Make the splice completely waterproof by using connector kits in strict accordance with the manufacturer's recommendations.

### 3.13 AUTOMATIC CONTROL WIRING

- A. Install control wires, sprinkler mains and laterals in common trenches wherever possible. Install control wires at least 12 inches below finish grade and lay to the side and below main line. Provide looped slack at valves and snake wires in trench to allow for contraction of wires. Tie wires in bundles at ten foot intervals. Control wire splices will be allowed only in runs more than 1000 feet. Any splices must be installed in an existing valve box or separate valve box installed flush with finished grade. On runs longer than 2500 feet contractor shall use 12/1 field and 10/1 common.
- B. All wire passing under existing or future paving, construction, etc., shall be encased in plastic or galvanized steel conduit extending at least 16 inches beyond edges of paving or construction.

### 3.14 VALVE BOXES

- A. All valve boxes shall be set at finished grade and supported by brick foundations on undisturbed soil. All valve box sizes shall include all special tools necessary for removal and unlocking of lids. Contractor shall clean out all sedimented materials from valve boxes and provide 1 CF pea gravel sumps. The Contractor shall maintain the valve boxes during the construction process to protect them from damage and excessive sedimentation.

### 3.16 BACKFILL AND COMPACTING

- A. After system is operating and required tests and inspections have been made, backfill excavations and trenches with clean soil, free of rubbish and deleterious material.
- B. See Section 312000

### 3.17 CLEAN-UP

- A. Remove from the site all debris resulting from work of this section.

END OF SECTION 328000

## **SECTION 329200 - TURF AND GRASSES**

### **PART 1 - GENERAL**

#### **1.1 GENERAL REQUIREMENTS**

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the Drawings and specified herein, including, but not limited to, the following:
  - 1. The preparation of the topsoil to receive stabilization.
  - 2. The seeding, establishment, watering and maintenance of lawns until the Owner accepts the project.
  - 3. The placement of fertilizers.
  - 4. The placement and maintenance of mulches.

#### **1.2 RELATED WORK SPECIFIED ELSEWHERE**

- A. Site Clearing: Section 311000.
- B. Earth Moving: Section 312000.
- C. Erosion and Sedimentation Controls: Section 312500.

#### **1.3 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.

#### **1.4 SUBMITTALS**

- A. The Contractor shall submit a schedule of his proposed methods and operations of Site Preparation.
- B. The Contractor shall provide material certifications and/or shop drawings for the materials stated herein.

#### **1.5 QUALITY ASSURANCE**

- A. The Contractor shall perform all his operations in accordance with the rules, regulations and ordinances of those governing bodies having jurisdiction.

## 1.6 JOB CONDITIONS

- A. General: The Contractor shall place all required topsoil, replace sod or provide seeding and mulching in accordance with the lines and grades shown on the Drawings and as specified herein. The Contractor shall provide all topsoil required from the approved stockpile accumulated from the Site stripping operations or from offsite sources where a deficiency exists in the stockpiled amount, within the Contract Sum for the Project. No additional cost to the Owner will be incurred for topsoil which must be provided from offsite sources.
- B. Time of Planting: The Contractor shall notify the Owner's Representative when sections of the Work have progressed sufficiently, to commence Work on lawns, including placing of topsoil to finished grade. Thereafter, planting operations shall be performed under favorable weather conditions during the next season or seasons which are normal for such work.
- C. Unless otherwise approved the seeding schedule shall be as follows:

### Seeding of Permanent Lawns

March 15 (if soil is frost-free and not excessively moist) to May 15.  
August 15 to October 15.

If the lawn areas are not ready for seeding between the time periods designated above, the areas shall be seeded immediately upon completion of topsoil operations, with ryegrass (annual or perennial) at a rate of thirty (30) lbs. per acre for a temporary lawn. Lawn work will not be permitted when the soil is frozen or excessively moist. If temporary lawn work has to be provided, the permanent lawn shall be installed during the next seeding season as specified.

- D. All areas within the limit of disturbance not required to be developed otherwise shall be planted with grass under the Contract Sum.

## 1.7 WARRANTY

- A. Maintenance shall begin immediately following each operation of installation for each portion of lawn and shall continue for the length of this Contract.
- B. Inspection of the Work to determine completion of Contract Work will be performed by the Owner's Representative at the conclusion of the maintenance period upon written notice requesting such inspection, submitted by the Contractor at least ten (10) days prior to the anticipated date. The condition of lawns will be noted and a determination made by the Owner's Representative whether maintenance shall continue in any part.
- C. Acceptance - After inspection, the Contractor will be notified in writing by the Owner's Representative of acceptance of all Work under this Section.
- D. Acceptance in Part - The Work may be accepted in part by the Owner's Representative upon written application by the Contractor, provided the Work offered for acceptance is completed in accordance with this Section.

- E. Any areas which fail to show a "catch" for any reason whatsoever, shall be reseeded at the Contractor's expense until a "catch" is obtained. Damage resulting from erosion, rills, gulleys, construction activity, washouts or other causes shall be repaired by filling with topsoil, tamping and reseeded by Contractor at his own expense, until final acceptance of the Work.

## **PART 2 - PRODUCTS**

### **2.1 MATERIALS**

#### **A. TOPSOIL**

- 1. The Contractor shall furnish, at his expense, any additional quantities of topsoil to properly install all work as specified herein and as shown on the Drawings.
- 2. Topsoil shall consist of natural loam topsoil, free from subsoil. Topsoil shall be of uniform quality, free from hard clods, stiff clay, hard pan, sods, partially disintegrated stone, or any other undesirable material.
- 3. Topsoil shall contain at least 6% and not more than 25% organic matter as determined by loss of ignition on a moisture-free sample dried in accordance with the current method of the Association of Official Agricultural Chemists. The acidity range shall be pH 5.5 to pH 7.5, inclusive. Largest object size shall be three (3) inches. Amend as necessary to achieve these standards using amendments specified herein. The mechanical gradation analysis of the soil shall be as follows:

<b>Sieve Size</b>	<b>Percent Passing by Weight</b>
2 inch	100
1 inch	85 to 100
¼ inch	65 to 90
No. 200	20 to 50

#### **B. COMMERCIAL FERTILIZER**

- 1. Shall be a complete fertilizer formula (5-10-10, or equivalent) and shall conform to the applicable State Fertilizer laws. It shall be uniform in composition, dry and free flowing, and shall be delivered to the Site in the original, unopened containers, each bearing the manufacturer's guaranteed analysis. Any fertilizer which becomes caked or otherwise damaged, making it unsuitable for use, will not be accepted.

#### **C. WATER**

- 1. The Contractor shall make, at his expense, whatever arrangements necessary to ensure an adequate supply of water to meet the needs of this Contract. He shall also furnish all necessary hose, equipment, attachments and accessories for the adequate

irrigation of lawns and planted areas as may be required to complete the Work as Specified.

D. SCREEN

1. Shall be one-half (1/2) inch mesh galvanized hardware cloth.

E. LAWN MATERIAL

1. Grass seed for mowed lawn areas shall be mixed and guaranteed by the Dealer as follows:
  - a. 65 lbs Kentucky Bluegrass per acre
  - b. 65 lbs. Perennial Ryegrass per acre
2. Grass seed for occasional mowing areas shall be mixed and guaranteed by the Dealer as follows:
  - a. 8 lbs Empire Birdsfoot, Trefoil or Dutch White Clover per acre
  - b. 20 lbs Tall Fescue per acre
  - c. 2 lbs Redtop or 5 lbs Perennial Ryegrass per acre
3. Grass seed for stabilization of steep slopes (including and exceeding 3:1) shall be mixed and guaranteed by Pennington Seed (800.285.SEED), or approved equal:
  - a. "Slopemaster"
  - b. 200 lbs. per acre
  - c. Mixture:
    - 1) 75% Turf Type Tall Fescue
    - 2) 11% Annual Ryegrass
    - 3) 9% Unhulled Serecia Lespedeza
    - 4) 5% Durana White Clover (low, spreading habit)
4. Total weed content shall not exceed 1.5% of the total seed mixture.
5. If the plans indicate a seed mixture other than as specified above, use the plan values.

F. EROSION CONTROL MATERIALS

1. Blankets: Biodegradable wood excelsior, straw, or coconut-fiber mat enclosed in a photodegradable plastic mesh. Include manufacturer's recommended steel wire staples, 6-inches long. North American Green (800.772.2040) or approved equal. See plan for type.
2. Fiber Mesh: Biodegradable twisted jute or spun-coir mesh, 0.92 lb per sq. yd. minimum, with 50 to 65 percent open area. Include manufacturer's recommended steel wire staples, 6-inches long.

G. SOIL AMENDMENTS

1. Lime: ASTM C 602, Class T, agricultural limestone containing a minimum 80 percent calcium carbonate equivalent, with a minimum 99 percent passing a No. 8 sieve and a minimum 75 percent passing a No. 60 sieve.
  - a. Provide lime in the form of dolomitic limestone.

2. Aluminum Sulfate: Commercial grade, unadulterated.
3. Sand: Clean, washed, natural or manufactured sand, free of toxic materials.
4. Perlite: Horticultural perlite, soil amendment grade.
5. Peat Humus: Finely divided or granular texture, with a pH range of 6 to 7.5, composed of partially decomposed moss peat (other than sphagnum), peat humus, or reed-sedge peat.
6. Select paragraph above or below or delete when not required. Sphagnum moss is too acid for many trees, shrubs, and plants.
7. Peat Humus: For acid-tolerant trees and shrubs, provide moss peat, with a pH range of 3.2 to 4.5, coarse fibrous texture, medium-divided sphagnum moss peat or reed-sedge peat.
8. Sawdust or Ground-Bark Humus: Decomposed, nitrogen-treated, of uniform texture, free of chips, stones, sticks, soil, or toxic materials.
  - a. When site treated, mix with at least 0.15 lb of ammonium nitrate or 0.25 lb of ammonium sulfate per cu. ft. of loose sawdust or ground bark.
9. Manure: Well-rotted, unleached stable or cattle manure containing not more than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, and material harmful to plant growth.
10. Herbicides: EPA registered and approved, of type recommended by manufacturer.
11. Water: Potable.

#### H. STRAW MULCH

1. Provide clean, seed-free salt hay or threshed straw of wheat, rye, oats, or barley.

#### I. TURFGRASS SOD

1. Turfgrass sod: Number 1 Quality/Premium, including limitations on thatch, weeds, diseases, nematodes, and insects, complying with TPI's "Specification for Turfgrass Sod Materials" in its "Guideline Specifications to Turfgrass Sodding." Furnish viable sod of uniform density, color, and texture, strongly rooted, and capable of vigorous growth and development when planted.
2. Turfgrass Species: Sod of grass species as follows, with not less than 95 percent germination, not less than 85 percent pure seed, and not less than 0.5 percent weed seed
  - a. Athletic Field proportioned by weight as follows:
    - 1) 80 percent turf type Tall Fescue
    - 2) 10 percent perennial Ryegrass
    - 3) 10 percent Kentucky Bluegrass

### PART 3 - EXECUTION

#### 3.1 LAWN PLANTING PREPARATION

- A. The contractor shall be responsible to restore all site disturbance generated as a direct result of this project with topsoil, fertilizing, seeding, and straw mulching in accordance with the requirements of this specification.
- B. Limit subgrade preparation to areas that will be planted in the immediate future.

- C. Loosen subgrade to a minimum depth of 4 inches. Remove stones larger than 1-1/2 inches in any dimension and sticks, roots, rubbish, and other extraneous materials.
- D. Spread planting soil mixture to depth required to meet thickness, grades, and elevations shown, after light rolling and natural settlement. Do not spread if planting soil or subgrade is frozen.
  - 1. Place approximately 1/2 the thickness of planting soil mixture required. Work into top of loosened subgrade to create a transition layer and then place remainder of planting soil mixture.
  - 2. Allow for sod thickness in areas to be sodded.
- E. Preparation of Unchanged Grades: Where lawns are to be planted in areas unaltered or undisturbed by excavating, grading, or surface soil stripping operations, prepare soil as follows:
  - 1. Remove and dispose of existing grass, vegetation, and turf. Do not turn over into soil being prepared for lawns.
  - 2. Till surface soil to a depth of at least 6 inches. Apply required soil amendments and initial fertilizers and mix thoroughly into top 4 inches of soil. Trim high areas and fill in depressions. Till soil to a homogenous mixture of fine texture.
  - 3. Clean surface soil of roots, plants, sods, stones, clay lumps, and other extraneous materials harmful to plant growth.
  - 4. Remove waste material, including grass, vegetation, and turf, and legally dispose of it off the Owner's property.
- F. Grade lawn and grass areas to a smooth, even surface with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades. Limit fine grading to areas that can be planted in the immediate future. Remove trash, debris, stones larger than 1-1/2 inches in any dimension, and other objects that may interfere with planting or maintenance operations.
- G. Moisten prepared lawn areas before planting when soil is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.
- H. Restore prepared areas if eroded or otherwise disturbed after fine grading and before planting.

### 3.2 INSTALLATION

#### A. TOPSOIL

- 1. Upon completion of grading operations for each respective area of Work, the Contractor shall place topsoil to a minimum depth of four (4) inches on all embankments and seed areas, first scarifying the subgrade for a depth of two (2) inches for the bonding of the topsoil with the subsoil. Where embankments are too steep for hand raking or tamping, topsoil may be compacted by mechanical means. Topsoil shall not be spread in a frozen or muddy condition. Topsoil from stockpile shall be raked to remove objectionable and oversized material as directed by the Owner's Representative.

B. LIME

1. Ground limestone shall be applied sufficiently to the lawn areas being prepared for seeding to attain a acidity pH of 6.0 to 7.0. Incorporate limestone into top three (3) inches of the soil at least three (3) days prior to seeding.

C. COMMERCIAL FERTILIZER

1. Commercial fertilizer shall be applied at the rate of 600-lbs per acre of lawn area.

D. EROSION CONTROL MATTING

1. Prepare location to receive matting as specified in subpart 3.1 above.
2. Install matting at locations indicated on the plans, as directed by the Owner's Representative, or at locations of surface erosion in accordance with manufacturer's recommendations.
3. Secure matting to ground in a manner and pattern that is in accordance with the manufacturer's recommendations and appropriate for the installation location.

E. SODDING

1. Lay sod within 24 hours of harvesting. Do not lay sod if dormant or if ground is frozen or muddy.
2. Lay sod to form a solid mass with tightly fitted joints. Butt ends and sides of sod; do not stretch or overlap. Stagger sod strips or pads to offset joints in adjacent courses. Avoid damage to subgrade or sod during installation. Tamp and roll lightly to ensure contact with subgrade, eliminate air pockets, and form a smooth surface. Work sifted soil or fine sand into minor cracks between pieces of sod; remove excess to avoid smothering sod and adjacent grass.
  - a. Lay sod across angle of slopes exceeding 1:3
3. Saturate sod with fine water spray within two hours of planting. During first week, water daily or more frequently as necessary to maintain moist soil to a minimum depth of 1-1/2 inches below sod.

3.3 HYDROSEEDING NEW LAWNS

A. Hydroseeding: Mix specified seed, fertilizer, and fiber mulch in water, using equipment specifically designed for hydroseed application. Continue mixing until uniformly blended into homogenous slurry suitable for hydraulic application.

1. Mix slurry with nonasphaltic tackifier.

B. Apply slurry uniformly to all areas to be seeded in a 1-step process. Apply mulch at the minimum rate of 1500 lb per acre (16.5 kg per 100 sq. m) dry weight but not less than the rate required to obtain specified seed-sowing rate.

C. Apply slurry uniformly to all areas to be seeded in a 2-step process. Apply first slurry application at the minimum rate of 500 lb per acre (5.5 kg per 100 sq. m) dry weight but not less than the rate required to obtain specified seed-sowing rate. Apply slurry cover coat of fiber mulch at a rate of 1000 lb per acre (11 kg per 100 sq. m).

### 3.4 RECONDITIONING LAWNS

- A. Recondition existing lawn areas damaged by Contractor's operations, including storage of materials or equipment and movement of vehicles. Also recondition lawn areas where settlement or washouts occur or where minor regrading is required.
  - 1. Recondition other existing lawn areas.
- B. Remove sod and vegetation from diseased or unsatisfactory lawn areas; do not bury into soil. Remove topsoil containing foreign materials resulting from Contractor's operations, including oil drippings, fuel spills, stone, gravel, and other construction materials, and replace with new topsoil.
- C. Where substantial lawn remains, mow, dethatch, core aerate, and rake. Remove weeds before seeding. Where weeds are extensive, apply selective herbicides as required. Do not use pre-emergence herbicides.
- D. Remove waste and foreign materials, including weeds, soil cores, grass, vegetation, and turf, and legally dispose of it off the Owner's property.
- E. Till stripped, bare, and compacted areas thoroughly to a depth of 6 inches.
- F. Apply required soil amendments and initial fertilizers and mix thoroughly into top 4 inches of soil. Provide new planting soil as required to fill low spots and meet new finish grades.
- G. Apply seed and protect with straw mulch as required for new lawns.
- H. Apply sod as required for new lawns.
- I. Water newly planted areas and keep moist until new grass is established.

### 3.5 MAINTENANCE

- A. The Contractor shall provide necessary watering, fertilizer, etc. as required to establish perennial vegetation cover with a minimum density of 80% over the entire pervious surface of the disturbed area, or until sufficient vegetation is established to prevent erosion, whichever is greater.
- B. The Contractor shall provide necessary watering, fertilizer, etc., required to establish and maintain seeded areas until same are accepted by the Owner.
- C. Begin maintenance of lawns immediately after each area is planted and continue until acceptable lawn is established, but for not less than the following periods:
  - 1. 60 days after date of Substantial Completion.
    - a. When full maintenance period has not elapsed before end of planting season, or if lawn is not fully established at that time, continue maintenance during next planting season.

- D. Maintain and establish lawns by watering, fertilizing, weeding, mowing, trimming, replanting, and other operations. Roll, regrade, and replant bare or eroded areas and mulch to produce a uniformly smooth lawn.
- E. Watering: Provide and maintain temporary piping, hoses, and lawn-watering equipment to convey water from sources and to keep lawns uniformly moist to a depth of 4 inches.
  - 1. Water lawn at the minimum rate of 1 inch per week.
- F. Mow lawns as soon as there is enough top growth to cut with mower set at specified height for principal species planted. Repeat mowing as required to maintain specified height without cutting more than 40 percent of the grass height. Remove no more than 40 percent of grass-leaf growth in initial or subsequent mowings. Do not delay mowing until grass blades bend over and become matted. Do not mow when grass is wet.
- G. Postfertilization: Apply fertilizer to lawn after first mowing and when grass is dry.
  - 1. Use fertilizer that will provide actual nitrogen of at least 1 lb per 1000 sq. ft. of lawn area.
- H. Repair of eroded areas:
  - 1. Restore soil and reseed
  - 2. If problem persists, install erosion control materials as directed by the Owner's Representative.
  - 3. All repair work shall be performed at no additional cost to the Owner.

### 3.6 CLEANUP AND PROTECTION

- A. During landscaping, keep pavements clean and work area in an orderly condition.
- B. Protect landscaping from damage due to landscape operations, operations by other contractors and trades, and trespassers. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged landscape work as directed.

### 3.7 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A. Disposal: Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of it off the Owner's property.

END OF SECTION 329200

## **SECTION 329300 - PLANTS**

### **PART 1 - GENERAL**

#### 1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 – General Requirements, apply to this Section.
- B. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
  - 1. Trees.
  - 2. Fertilizers and mulches.
  - 3. Stakes and guys.
- C. RELATED WORK SPECIFIED ELSEWHERE:
  - 1. Site Clearing Section 311000
  - 2. Earth Moving Section 312000
  - 3. Turf and Grasses Section 329200

#### 1.2 SUBMITTALS

- A. General: Submit each item in this Article according to the Conditions of the Contract and Division 1 – General Requirements.
- B. Product certificates signed by manufacturers certifying that their products comply with specified requirements. Label data substantiating that plants, trees, shrubs, and planting materials comply with specified requirements.
- C. Material test reports from qualified independent testing agency indicating and interpreting test results relative to compliance of the following materials with analysis of existing surface soil.
- D. Submit three (3) copies of planting schedule showing scheduled dates for planting in each area of site.
- E. Submit typewritten instructions recommending procedures to be established by the Owner for maintenance of lawn and grass work for one full year. Submit prior to expiration date of required maintenance period(s).
- F. All bags need to be saved for lime, fertilizer, seed, and liquid mulch binder (if used as mulch anchoring method). Such proofs may need to be submitted to the Owner's Representative for verification of materials and quantities used for all seedings.

#### 1.3 QUALITY ASSURANCE

- A. Installer Qualifications: Engage an experienced Installer who has completed landscaping work similar in material, design, and extent to that indicated for this Project and with a record of successful landscape establishment.
  - 1. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on the Project site during times that landscaping is in progress.
- B. Testing Agency Qualifications: To qualify for acceptance, an independent testing agency must demonstrate to Municipal Engineer's satisfaction, based on evaluation of agency-submitted criteria conforming to ASTM E 699, that it has the experience and capability to satisfactorily conduct the testing indicated without delaying the Work.
- C. Provide quality, size, genus, species, and variety of trees and shrubs indicated, complying with applicable requirements of ANSI Z60.1 "American Standard for Nursery Stock."

#### 1.4 DELIVERY, STORAGE, AND HANDLING

- A. Packaged Materials: Deliver packaged materials in containers showing weight, analysis, and name of manufacturer. Protect materials from deterioration during delivery and while stored at site.
- B. Trees and Shrubs: Deliver freshly dug trees and shrubs. Do not prune before delivery, except as approved by Construction Manager. Protect bark, branches, and root systems from sun scald, drying, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy natural shape. Provide protective covering during delivery. Do not drop trees and shrubs during delivery.
- C. Handle balled and burlapped stock by the root ball.
- D. Deliver trees, shrubs, ground covers, and plants after preparations for planting have been completed and install immediately. If planting is delayed more than 6 hours after delivery, set planting materials in shade, protect from weather and mechanical damage, and keep roots moist.
  - 1. Heel-in bare-root stock. Soak roots in water for 2 hours if dried out.
  - 2. Set balled stock on ground and cover ball with soil, peat moss, sawdust, or other acceptable material.
  - 3. Do not remove container-grown stock from containers before time of planting.
  - 4. Water root systems of trees and shrubs stored on site with a fine-mist spray. Water as often as necessary to maintain root systems in a moist condition.

#### 1.5 PROJECT CONDITIONS

- A. Utilities: Determine location of above grade and underground utilities and perform work in a manner that will avoid damage. Hand excavate, as required. Maintain grade stakes until removal is mutually agreed upon by parties concerned.
- B. Excavation: When conditions detrimental to plant growth are encountered, such as rubble fill, adverse drainage conditions, or obstructions, notify Construction Manager before planting.

#### 1.6 COORDINATION AND SCHEDULING

- A. Coordinate installation of planting materials during normal planting seasons for each type of plant material required.

#### 1.7 WARRANTY

- A. General Warranty: The special warranty specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.
- B. Special Warranty: Warrantee the following living planting materials for a period of one year after date of Substantial Completion, against defects including death and unsatisfactory growth, except for defects resulting from lack of adequate maintenance, neglect, or abuse by Owner, abnormal weather conditions unusual for warranty period, or incidents that are beyond Contractor's control.
  - 1. Trees.
- C. Remove and replace dead planting materials immediately unless required to plant in the succeeding planting season.
- D. Replace planting materials that are more than 25 percent dead or in an unhealthy condition at end of warranty period.
- E. A limit of one replacement of each plant material will be required, except for losses or replacements due to failure to comply with requirements.

#### 1.8 TREE AND SHRUB MAINTENANCE

- A. Maintain trees and shrubs by pruning, cultivating, watering, weeding, fertilizing, restoring planting saucers, tightening and repairing stakes and guy supports, and resetting to proper grades or vertical position, as required to establish healthy, viable plantings. Spray as required to keep trees and shrubs free of insects and disease. Restore or replace damaged tree wrappings. Maintain trees and shrubs for the following period:
  - 1. Maintenance Period: 12 months following Substantial Completion.

## **PART 2 - PRODUCTS**

### 2.1 TREE AND SHRUB MATERIAL

- A. General: Furnish nursery-grown trees and shrubs conforming to ANSI Z60.1, with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully-branched, healthy, vigorous stock free of disease, insects, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.
- B. Grade: Provide trees and shrubs of sizes and grades conforming to ANSI Z60.1 for type of trees and shrubs required. Trees and shrubs of a larger size may be used if acceptable to Construction Manager, with a proportionate increase in size of roots or balls.
- C. Label at least 1 tree and 1 shrub of each variety and caliper with a securely attached, waterproof tag bearing legible designation of botanical and common name.

## 2.2 FERTILIZER

- A. Bonemeal: Commercial, raw, finely ground; minimum of 4 percent nitrogen and 20 percent phosphoric acid.
- B. Superphosphate: Commercial, phosphate mixture, soluble; minimum of 20 percent available phosphoric acid.
- C. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea-form, phosphorous, and potassium in the following composition:
  - 1. Composition: 1 lb per 1000 sq. ft. (0.5 kg per 100 sq. m) of actual nitrogen, 4 percent phosphorous, and 2 percent potassium, by weight.
  - 2. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing agency.
- D. Slow-Release Fertilizer: Granular fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:
  - 1. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing agency.

## 2.3 MULCHES

- A. Organic Mulch: Organic mulch, free from deleterious materials and suitable as a top dressing of lawns, consisting of one of the following:
  - 1. Type: Unrotted pine straw, salt hay, or threshed straw.
- B. Peat Mulch: Provide peat moss in natural, shredded, or granulated form, of fine texture, with a pH range of 4 to 6 and a water-absorbing capacity of 1100 to 2000 percent.

- C. Asphalt Emulsion Tackifier: Asphalt emulsion, ASTM D 977, Grade SS-1, nontoxic shall not be permitted for use on this project.
- D. Nonasphaltic Tackifier: Colloidal tackifier recommended by fiber-mulch manufacturer for slurry application, nontoxic and free of plant growth- or germination-inhibitors.
- E. Shredded Wood Landscaping Mulch: shredded, uncolored, natural cedar bark from a source located within the United States suitable for placement under trees, shrub planting beds, and other locations indicated on the plans.

#### 2.4 WEED-CONTROL BARRIERS

- A. Sheet Polyethylene: Black, 0.006-inch (0.15-mm) minimum thickness.
- B. Nonwoven Fabric: Polypropylene or polyester fabric, 3 oz. per sq. yd. (100 g per sq. m) minimum.
- C. Composite Fabric: Woven, needle-punched polypropylene substrate bonded to a nonwoven polypropylene fabric, 4.8 oz. per sq. yd. (160 g per sq. m).

#### 2.5 STAKES AND GUYS

- A. Upright and Guy Stakes: Rough-sawn, sound, new hardwood, redwood, or pressure-preservative-treated softwood, free of knots, holes, cross grain, and other defects, 2 by 2 inches (50 by 50 mm) by length indicated, pointed at one end.
- B. Guy and Tie Wire: ASTM A 641 (ASTM A 641M), Class 1, galvanized-steel wire, 2-strand, twisted, 0.106 inch (2.7 mm) in diameter.
- C. Guy Cable: 5-strand, 3/16-inch (4.8-mm) diameter, galvanized-steel cable, with zinc-coated turn buckles, 3-inch- (75-mm-) long minimum, with two 3/8-inch- (10-mm-) galvanized eyebolts.
- D. Hose Chafing Guard: Reinforced rubber or plastic hose at least 1/2 inch (13 mm) in diameter, black, cut to lengths required to protect tree trunks from damage.
- E. Flags: Standard surveyor's plastic flagging tape, white, 6 inches (150 mm) long.

#### 2.6 MISCELLANEOUS MATERIALS

- A. Antidesiccant: Water-insoluble emulsion, permeable moisture retarder, film forming, for trees and shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's instructions.
- B. Anti-Erosion Mulch: Provide clean, seed-free salt hay or threshed straw of wheat, rye, oats, or barley.

## **PART 3 - EXECUTION**

### 3.1 EXAMINATION

- A. Examine areas to receive landscaping for compliance with requirements and for conditions affecting performance of work of this Section. Do not proceed with installation until unsatisfactory conditions have been corrected.

### 3.2 PREPARATION

- A. Lay out individual tree locations and areas for multiple plantings. Stake locations, outline areas, and secure Owner's acceptance before the start of planting work. Make minor adjustments as may be required.
- B. Finish grading for areas to be seeded shall be done with previously stockpiled (if any) and supplementary topsoil. Do not complete topsoil work until the installation of all underground utilities, sewers, storm drainage systems, etc. have been completed.
- C. Apply fertilizers by mechanical rotary or drop type distributor and thoroughly and evenly incorporate with soil to a depth of 3" by discing or other approved method. Fertilize areas inaccessible to power equipment with hand tools and incorporate into soil.

### 3.3 PLANTING SOIL PREPARATION

- A. Before mixing, clean topsoil of roots, plants, sods, stones, clay lumps, and other extraneous materials harmful to plant growth.
- B. Mix soil amendments and fertilizers with topsoil at rates indicated. Delay mixing fertilizer if planting does not follow placing of planting soil within a few days.
  - 1. A "Planting Soil Amendments Schedule" is included at the end of this Section.
- C. For tree pit or trench backfill, mix planting soil before backfilling and stockpile at site.
- D. For planting beds and lawns, mix planting soil either prior to planting or apply on surface of topsoil and mix thoroughly before planting.
  - 1. Mix lime with dry soil prior to mixing fertilizer. Prevent lime from contacting roots of acid-tolerant plants.
  - 2. Apply phosphoric acid fertilizer, other than that constituting a portion of complete fertilizers, directly to subgrade before applying planting soil and tilling.

### 3.4 EXCAVATION FOR TREES AND SHRUBS

- A. Pits and Trenches: Excavate with vertical sides and with bottom of excavation slightly raised at center to assist drainage. Loosen hard subsoil in bottom of excavation.
  - 1. Bare-Root Trees and Shrubs: Excavate at least 12 inches (300 mm) wider than root spread and deep enough to allow setting of roots on a layer of planting soil and with collar set at same grade as in nursery, but 1 inch (25 mm) below finish grade, unless otherwise indicated.
    - a. Setting Layer: Allow 3 inches (75 mm) of planting soil.
  - 2. Balled and Burlapped Trees and Shrubs: Excavate approximately 1-1/2 times as wide as ball diameter and equal to ball depth, plus the following setting layer depth:
    - a. Setting Layer: Allow 3 inches (75 mm) of planting soil.
  - 3. Container-Grown Trees and Shrubs: Excavate to container width and depth, plus the following setting-layer depth:
    - a. Setting Layer: Allow 3 inches (75 mm) of planting soil.
- B. Dispose of subsoil removed from landscape excavations. Do not mix with planting soil or use as backfill.
- C. Obstructions: Notify Construction Manager if unexpected rock or obstructions detrimental to trees or shrubs are encountered in excavations.
  - 1. Hardpan Layer: Drill 6-inch- (150-mm-) diameter holes into free-draining strata or to a depth of 10 feet (3 m), whichever is less, and backfill with free-draining material.
- D. Drainage: Notify Construction Manager if subsoil conditions evidence unexpected water seepage or retention in tree or shrub pits.
- E. Fill excavations with water and allow to percolate out, before placing setting layer and positioning trees and shrubs.

### 3.5 PLANTING TREES AND SHRUBS

- A. Set balled and burlapped stock plumb and in center of pit or trench with top of ball raised above adjacent finish grades as indicated.
  - 1. Place stock on setting layer of compacted planting soil.
  - 2. Remove burlap and wire baskets from tops of balls and partially from sides, but do not remove from under balls. Remove pallets, if any, before setting. Do not use planting stock if ball is cracked or broken before or during planting operation.
  - 3. Place backfill around ball in layers, tamping to settle backfill and eliminate voids and air pockets. When pit is approximately 1/2 backfilled, water

thoroughly before placing remainder of backfill. Repeat watering until no more is absorbed. Water again after placing and tamping final layer of backfill.

- B. Set container-grown stock plumb and in center of pit or trench with top of ball raised above adjacent finish grades as indicated.
  - 1. Carefully remove containers so as not to damage root balls.
  - 2. Place stock on setting layer of compacted planting soil.
  - 3. Place backfill around ball in layers, tamping to settle backfill and eliminate voids and air pockets. When pit is approximately 1/2 backfilled, water thoroughly before placing remainder of backfill. Repeat watering until no more is absorbed. Water again after placing and tamping final layer of backfill.
- C. Dish and tamp top of backfill to form a 3-inch- (75-mm-) high mound around the rim of the pit. Do not cover top of root ball with backfill. Place mulch 4" thick.

### 3.6 TREE AND SHRUB PRUNING

- A. Prune, thin, and shape trees and shrubs as directed by Construction Manager.
- B. Prune, thin, and shape trees and shrubs according to standard horticultural practice. Prune trees to retain required height and spread. Unless otherwise directed by Construction Manager, do not cut tree leaders; remove only injured or dead branches from flowering trees. Prune shrubs to retain natural character. Shrub sizes indicated are size after pruning.

### 3.7 TREE AND SHRUB GUYING AND STAKING

- A. Upright Staking and Tying: Stake trees of 2- through 5-inch (50- through 125-mm) caliper. Stake trees of less than 2-inch (50-mm) caliper only as required to prevent wind tip-out. Use a minimum of 2 stakes of length required to penetrate at least 18 inches (450 mm) below bottom of backfilled excavation and to extend at least 72 inches (1800 mm) above grade. Set vertical stakes and space to avoid penetrating balls or root masses. Support trees with 2 strands of tie wire encased in hose sections at contact points with tree trunk. Allow enough slack to avoid rigid restraint of tree.
- B. Guying and Staking: Guy and stake trees exceeding 14 feet (4.2 m) and more than 3-inch (75-mm) caliper unless otherwise indicated. Securely attach no fewer than 3 guys to stakes 30 inches (760 mm) long, driven to grade. Attach flags to each guy wire, 30 inches (760 mm) above finish grade.

### 3.8 MULCHING

- A. Mulch backfilled surfaces of pits, trenches, planted areas, and other areas indicated.

- B. Weed-Control Barriers: Install the following weed-control barriers according to manufacturer's recommendations, before mulching. Completely cover area to be mulched, lapping edges a minimum of 6 inches (150 mm).
  - 1. Material and Seam Treatment: Sheet polyethylene with seams taped.
  - 2. Material and Seam Treatment: Nonwoven fabric with seams pinned.
  - 3. Material and Seam Treatment: Composite fabric with seams pinned.
- C. Organic Mulch: Apply the following average thickness of organic mulch and finish level with adjacent finish grades. Do not place mulch against trunks or stems.
  - 1. Thickness: 4 inches.

### 3.9 INSTALLATION OF MISCELLANEOUS MATERIALS

- A. Apply antidesiccant using power spray to provide an adequate film over trunks, branches, stems, twigs, and foliage.
  - 1. When deciduous trees or shrubs are moved in full-leaf, spray with antidesiccant at nursery before moving and again 2 weeks after planting.

### 3.10 CLEANUP AND PROTECTION

- A. During landscaping, keep pavements clean and work area in an orderly condition.
- B. Protect landscaping from damage due to landscape operations, operations by other contractors and trades, and trespassers. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged landscape work as directed.

### 3.11 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A. Disposal: Remove surplus soil and waste material, including excess subsoil, unsuitable soil, trash, and debris, and legally dispose of it off the Owner's property.

### 3.12 PLANTING SOIL AMENDMENTS SCHEDULE

- A. Tree Pits or Trenches: Provide soil amendments in not less than the recommended quantities as determined by the independent testing laboratory. The cost of all testing, fertilizer and amendments are the responsibility of the contractor, and shall be included as part of the price bid for each item.
- B. Ground Cover and Planting Beds:
  - 1. Provide soil amendments in not less than the recommended quantities as determined by the independent testing laboratory. The cost of all testing, fertilizer and amendments are the responsibility of the contractor, and shall be included as part of the price bid for each item.

END OF SECTION 32 93 00

## **SECTION 331000 - WATER UTILITIES**

### **PART 1 - GENERAL**

#### **1.1 GENERAL REQUIREMENTS**

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
1. Construction of all piping and specialties for both potable water and fire protection services outside the building five (5) feet from the point of exit.
  2. The general contractor shall be responsible for coordinating all horizontal and vertical locations of connections into the building line with the plumbing contractor.
  3. All water distribution improvements shall be also constructed in accordance with the "Recommended Standards for Water Works (Ten States Standards)", 2018 edition.
  4. All water distribution improvements shall be also constructed in accordance with all standards and specifications as required by the Municipality and/or Authority having jurisdiction over the project.
  5. The general contractor shall be responsible for closing and sealing all existing water connections that are no longer required by the proposed configuration.
  6. Pressure, leakage, and disinfection testing of the piping installed under this project.
  7. The general contractor shall be responsible for fire and potable connections to existing on-site facilities and/or Local Water Utility (LWU) installed facilities within the roadway. The general contractor shall maintain the serviceability of the water supply system to the facility at all times.
  8. The LWU must be notified seventy-two (72) hours in advance of any work being performed on the Municipal Water System. Inspections by departments having jurisdiction will be scheduled at that time.
  9. Suez retains the right to supersede the material specifications.
  10. All existing utility laterals not in service are to be capped and sealed in accordance with the applicable utility requirements.
  11. General contractor shall make any/all tap requests to Suez and coordinate all construction.
  12. Unless otherwise noted, general contractor shall be responsible for all excavation, trenching, and backfill operations.
- B. Cooperation and interface with the other prime contractors.
1. The plumbing contractor shall be responsible for all penetrations and connections into the proposed building.
  2. Installation of the backflow prevention devices and metering shall be performed by the building plumbing contractor. See plumbing specifications for installation.

1.2 RELATED WORK SPECIFIED ELSEWHERE

- A. Earth Moving Section 312000.
- B. Flexible Paving Section 321200.

1.3 RELATED DOCUMENTS

- A. Local Water Utility (hereafter “LWU”) standards, specifications, materials, and practices  
  
Frank McGlynn (contact)  
New Business Manager  
New York Operations  
Suez  
162 Old Mill Road  
West Nyack, NY 10994  
Phone: (845) 620-6215  
Fax: (845) 620-3347
- B. New York State Department of Transportation Standard Specifications, 2008 as currently amended.

1.4 SYSTEM PERFORMANCE REQUIREMENTS

- A. Minimum Working Pressures: The following are minimum pressure requirements for piping and specialties, unless otherwise indicated:
  - 1. Potable-Water Service: 200 psig
  - 2. Fire-Protection Water Service: 150 psig

1.5 SUBMITTALS

- A. Product Data: Product data shall be provided for Pipe and Fittings, Valves, Fire Hydrants, and Fire department connections in the form of shop drawings.
- B. Coordination Drawings: For piping and specialties including relation to other services in same area. Show piping and specialty sizes and valves, and specialty locations, and elevations.
- C. Record Drawings in accordance with Division 01 Section “Contract Close-Out”.
  - 1. These drawings shall show the following information:
    - a. As-built location of water line in plan
    - b. Invert elevation
    - c. Rim elevation
    - d. Pipe diameter, material, length and grade

- e. Locations and size of valves (by triangulation)
  - f. Utility crossing locations
  - g. Backflow preventer assembly and water meter within protective enclosure
2. These drawing shall comply with the following standards:
    - a. Clearly marked and easily readable
    - b. A scale identical to the construction plans
    - c. Horizontal datum: North American Datum (NAD) 1983
    - d. Vertical datum: North American Vertical Datum (NAVD) 1988
    - e. Signed and sealed by a Licensed Professional Surveyor
  3. As-builts shall be delivered to the Owner in both record mylar and digital format. Digital submissions shall be in AutoCAD, Release 2000 format on a compact disc in IBM-PC compatible format.
- D. Shop Drawings: Include plans, elevations, details, and attachments as required. The Contractor shall also submit construction drawings and a jacking procedure for the jacking of water pipe below a existing structure prior to commencement of work in accordance with the requirements of NYSDOT Subsection 650-3.01A.
- E. Test Reports: As specified in Part C of this section.
- F. Purging and Disinfecting Reports: As specified in "Cleaning" Article in Part C.
- G. Operation and Maintenance Data: For specialties to include in the maintenance manuals specified in Division 01. Include data for the following:
1. Water meters.
  2. Valves.
  3. Backflow preventers.
  4. Protective enclosures.

## 1.6 QUALITY ASSURANCE

- A. Product Options: Drawings indicate size, profiles, and dimensional requirements of water-service piping specialties and are based on specific types and models indicated. Other manufacturers' products with equal performance characteristics may be considered. Refer to Division 01.
- B. Comply with standards of authorities having jurisdiction for potable water-service piping. Include materials, installation, testing, disinfection and tapping of water mains and backflow prevention.

Comply with NSF 61, "Drinking Water System Components--Health Effects," for materials for potable water.

- C. Comply with standards of authorities having jurisdiction for fire-protection water-service piping. Include materials, hose threads, installation, and testing.
- D. Comply with NFPA 24, "Installation of Private Fire Service Mains and Their Appurtenances," for materials, installations, tests, flushing, and valve and hydrant supervision.
- E. Comply with NFPA 70, "National Electrical Code," for electrical connections between wiring and electrically operated devices.
- F. Provide listing/approval stamp, label, or other marking on piping and specialties made to specified standards.
- G. Listing and Labeling: Provide electrically operated specialties and devices specified in this Section that are listed and labeled.
- H. The Terms "Listed" and "Labeled": As defined in NFPA 70, Article 100.

Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" as defined in OSHA Regulation 1910.7.

#### 1.7 DELIVERY, STORAGE, AND HANDLING

- A. Preparation for Transport: Prepare valves, including fire hydrants, according to the following:
  - 1. Ensure that valves are dry and internally protected against rust and corrosion.
  - 2. Protect valves against damage to threaded ends and flange faces.
  - 3. Set valves in best position for handling. Set valves closed to prevent rattling.
- B. During Storage: Use precautions for valves, including fire hydrants, according to the following:
  - 1. Do not remove end protectors, unless necessary for inspection; then reinstall for storage.
  - 2. Protect from weather. Store indoors and maintain temperature higher than ambient dew-point temperature. Support off the ground or pavement in watertight enclosures when outdoor storage is necessary.
- C. Handling: Use sling to handle valves and fire hydrants whose size requires handling by crane or lift. Rig valves to avoid damage to exposed valve parts. Do not use handwheels or stems as lifting or rigging points.

- D. Deliver piping with factory-applied end-caps. Maintain end-caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.
- E. Protect stored piping from moisture and dirt. Elevate above grade. Do not exceed structural capacity of floor when storing inside.
- F. Protect flanges, fittings, and specialties from moisture and dirt.

## 1.8 PROJECT CONDITIONS

- A. Perform site survey, research public utility records, and verify existing utility locations. Contact utility-locating service for area where Project is located
- B. Verify water-service piping may be installed to comply with original design and referenced standards.
- C. Site Information: Reports on subsurface condition investigations made during design of Project are available for informational purposes only; data in reports are not intended as representations or warranties of accuracy or continuity of conditions between soil borings. Owner assumes no responsibility for interpretations or conclusions drawn from this information.

## 1.9 SEQUENCING AND SCHEDULING

- A. Coordinate connection to water main with LWU.
- B. Coordinate piping materials, sizes, entry locations, and pressure requirements with building water distribution piping.
- C. Coordinate piping materials, sizes, entry locations, and pressure requirements with building fire-protection water piping.
- D. Coordinate with other utility work.

## **PART 2 - PRODUCTS**

### 2.1 PIPES AND VALVES

- A. Pipe shall be Ductile Iron, Class 52, cement lined, and shall have push on joints. (ANSI/AWWA 151/A21.51)
- B. Valves shall be Mueller 2360 Series Resilient Wedge Gate Valve for Water Systems, 250 psi Operating Pressure, 500 psi Test Pressure, 2 inch square operating nut, mechanical joint ends, Non-Rising stem and shall open right (clockwise), or approved equal. They shall conform to or exceed the requirements of AWWA C509 and AWWA C500. The size range is between 3 inches and 30 inches inclusive.

- C. Fittings shall be ductile iron pressure rating 350, cement lined and shall have mechanical end joints. (ANSI/AWWA C110/A21.10).

## 2.2 SERVICES

- A. Corporations shall be Mueller copper service thread connection, (catalog #H15008), or approved equal, 3/4 inch or 1 inch size, and shall have an inlet with Mueller CC thread and an outlet with a flared CTS straight connection suitable for “K” copper service tubing. Corporations for 1-1/2 inch or 2 inch shall be Mueller H15013.
- B. The copper flare nut end would be removed and the following service fitting would be added. The Mueller 110 Compression Connection, (catalog #H15071), or approved equal, 1-1/2 inch or 2 inch size, and shall have an inlet with Mueller CC thread and an outlet with a Mueller 110 Conductive Compression Connection for CTS O.D. PE tubing by Female Copper Flare Thread.
- C. Curb stops for 3/4 inch through 2 inch shall be Mueller #15219 Conductor Compression, with Drain
- D. Curb boxes shall be Mueller Iron Boxes – Improved Extension Type – Arch Pattern, with pentagonal plug, or approved equal. Box extension shall be 38.5 inches to 60 inches fully extended. Curb box shall fit 1-1/2 inch or 2 inch size, Mark II Oriseal Mueller 110 Compression, or approved equal.
  - 1. Connection curb valve. Mueller (catalog #H 10386), or approved equal. Curb valve rods shall be Mueller (catalog #84233) 27 inches long. Service tubing shall be 1-1/2 inch or 2 inch size CTS (OD ASTM D-2737) polyethylene with a maximum working pressure of 200 psi., a dimension ratio of 9.0, and a standard PE material code designation PE 3406/3408(AWWA C901) or ASTM B88 type “K” copper.

## 2.3 VALVE BOXES

- A. Top sections shall be Opelika (Bingham & Taylor) catalog #55-S, or approved equal, 15 inches long. or catalog #56.S, 24 inches long, and shall have the additional support flanges 6 inches from the top of the top section, and shall have lids marked with “Water”. Shaft diameter shall be 5-1/4”.
- B. Bottom sections shall be Opelika (Bingham & Taylor) catalog # 64-S, or approved equal, and shall be 36 inches long.

## 2.4 STEEL COUPLING DEVICES

- A. Steel Coupling Devices shall be Smith-Blair style 441 or Dresser Style 38 or Powerseal style 3501, or approved equal.

1. Sleeve: Ductile iron ASTM A-536. Ends shall have smooth inside taper for uniform gasket seating.
2. Gaskets: Grade 30-standard-specially compounded rubber with ingredients to produce superior storage characteristics, performance and resistance to set after installation. Temperature range  $-40^{\circ}$  F to  $+150^{\circ}$ F.
3. Follower Flanges: ductile Iron ASTM A-536. Designed for high strength/weight ratio. Thickness determined by coupling size.
4. Bolts and Nuts: High strength low alloy steel with heavy, semi-finished hexagon nuts to AWWA C111 (ANSI-A21.11) standards.
5. Finish: Blue shop coat enamel.

## 2.5 REPAIR CLAMP COUPLINGS

- A. Repair Clamp Couplings shall be Smith-Blair Style 226 or Dresser Style 360, or approved equal
  1. Band: Stainless Steel.
  2. Lugs: High Strength Ductile Iron ASTM A536.
  3. Gasket: Grade 30 specially compounded rubber of all new materials with ingredients to produce superior storage characteristics, performance and resistance to set after installation. Temperature range  $-40^{\circ}$  F to  $+150^{\circ}$  F.

## 2.6 TAPPING SLEEVES AND TAPPING VALVES

- A. Tapping Sleeves and Tapping Valves shall meet AWWA approved standards and all LWU approved standards.
- B. The sleeve shall be Mueller H615 Mechanical Joint Tapping Sleeve (flanged tapping end) with AB/CD gaskets compatible with the pipe material being tapped (e.g. ductile iron, cast iron, transite, steel, plastic, etc.)
- C. The tapping sleeve shall meet the following performance standards:
  1. Body: 3/8" Carbon Steel ASTM A285 Grade A PVQ.
  2. Flanges: AWWA C207 Class D, ANSI 150 lb. Drilling.
  3. Gasket: Grade 60 Concave Wedge Gasket-compounded to resist-oil, acids, alkalis, most (aliphatic) hydro-carbon fluids, water and many compounds. Temperature up to  $212^{\circ}$  F.
  4. Bolts and Nuts: High strength low alloy steel with heavy semi-finished hexagon nuts to AWWA C111 (ANSI A21.11) standards. Optional-type 304 stainless steel bolts and nuts. Nuts are Teflon coated to prevent galling.
  5. Finish: Blue shop coat enamel. Optional-fusion bonded epoxy, coated to an average of 12 mil thickness.
- D. The valve shall be Mueller T2360 Resilient Wedge Tapping Valve, open right (clockwise), flanged by mechanical joint.

- E. The tapping valve shall meet the following performance standards:
1. Valve: AWWA C509-87 and AWWA C500-86, 250 psi working pressure except 20" valves. 20" and 24" valves 150 psi working pressure.
  2. Body: D.I., Full shell Thickness
  3. Exterior: D.I., Protective coatings per AWWA C550-81.
  4. Interior: Free of pockets or ledges.
  5. Bonnet: D.I., Protective coatings per AWWA C550-81.
  6. Gate: It shall be completely covered with rubber over all interior and exterior ferrous surfaces.
  7. "O" Ring Steam: It shall be replaceable with the valve under pressure in the full-open position.
  8. Tapping Sleeve Flange: It shall be in accordance with MSS SP60.
- F. The Mueller H615 shall apply with regards to the various sizes of tapping sleeves and tapping valves with the exception of a size on size cut.

## 2.7 THREADED RODS

- A. All rods used for clamping shall be  $\frac{3}{4}$ " rolled thread and conform to ASTM A242-81.

## 2.8 90° BEND EYE BOLT

- A. All 90° Bend Eye Bolts shall be Corrosion Resistant High Strength Tensile 70,000 psi minimum; yield point 50,000 psi minimum, Low Alloy with the eye welded closed rolled thread  $\frac{3}{4}$ " diameter 10 threads UNC 2.

## 2.9 UNDERGROUND PIPE CLAMPS

- A. All underground pipe clamps shall be formed from  $\frac{1}{2}$ " x 2-1/2" steel with two  $\frac{1}{2}$ " x 2-1/2" washers with 9/16" holes. All parts shall be corrosion resistant high strength, tensile 70,000 psi minimum, yield point 50,000 psi minimum Low Alloy and shall conform to ASTM A242-81.

## 2.10 FIRE HYDRANTS

- A. Mueller Super Centurion Model A-423 AWWA C502 dry barrel fire hydrant, or approved equal.
1. Left opening.
  2. Dry top traffic model design with breakaway coupling.
  3. Valve opening sizes shall be 5" nominal.
  4. The minimum working pressure shall be 250 psi.

5. The fire hydrant nozzle shall be (NST) National Standard Thread (as per NFPA 1963 Standard for fire hose connections) consisting of two 2-1/2" butts and one 4-1/2" butt.
6. Anti-freezing and equipped with automatic drip valves.
7. Bronze mounted working parts and bronze valve seats.
8. An "arrow" and the work "Open" cast in relief on top of hydrant.
9. Paint: Hydrant manufacturer's standard primer and 2 finish coats of rust inhibitive, high gloss alkyd enamel. Color shall be per municipality and/or LWU.
10. Tools: Furnish 2 wrenches to fit hydrants. Deliver wrenches to the Owner's Representative.

## 2.11 RESTRAINTS

- A. Ductile iron pipe bell restraint consists of a wedge action restraint ring on the spigot joined to a split ductile iron ring behind the bell. The restraint ring consist have individually actuated wedges that increase their resistance to pull-out as pressure or external forces increase. Restraints shall be used with the standardized mechanical joint bell or push-on bell. Restraint must be capable of full mechanical joint deflection during assembly, and must be capable of joint deflection after assembly. The restraint ring and its wedging components shall be made of a minimum grade of 60-42-10 ductile iron conforming to ASTM A536. The wedges shall be heat treated to a minimum hardness of 370 BHN. Torque limiting twist off nuts shall be used to insure proper actuation of the restraining wedges.. The split ring shall be made of a minimum grade of 60-42-10 ductile iron conforming to ASTM A536. The connecting tie rods that join the two rings shall be made of low alloy steel that conforms to ANSI/AWWA C111/A21.11. The assembly shall have a rated pressure, with a minimum two to one safety factor of 350 psi in sizes sixteen inch and below 250 psi in the sizes eighteen inch through thirty-six inch. The product shall be the appropriate 1100 or 1700 series Megalug restraint harness manufactured by EBAA Iron, Inc., or approved equal.

## 2.12 PIPING SPECIALTIES

- A. Dielectric Fittings: Assembly or fitting with insulating material isolating joined dissimilar metals to prevent galvanic action and corrosion.
  1. Description: Combination of copper alloy and ferrous; threaded, solder, plain, and weld-neck end types and matching piping system materials.
  2. Dielectric Unions: Factory-fabricated union assembly, designed for 250-psig (1725-kPa) minimum working pressure at 180 deg F (82 deg C). Include insulating material isolating dissimilar metals and ends with inside threads according to ASME B1.20.1.
  3. Dielectric Flanges: Factory-fabricated companion-flange assembly, for 150- or 300-psig (1035- or 2070-kPa) minimum pressure to suit system pressures.
  4. Dielectric-Flange Insulation Kits: Field-assembled companion-flange assembly, full-face or ring type. Components include neoprene or phenolic gasket, phenolic or polyethylene bolt sleeves, phenolic washers, and steel backing washers. Provide separate companion flanges and steel bolts and nuts for 150- or

300-psig (1035- or 2070-kPa) minimum working pressure to suit system pressures.

5. Dielectric Couplings: Galvanized-steel couplings with inert and noncorrosive thermoplastic lining, with threaded ends and 300-psig (2070-kPa) minimum working pressure at 225 deg F (107 deg C).
6. Dielectric Nipples: Electroplated steel nipples with inert and noncorrosive thermoplastic lining, with combination of plain, threaded, or grooved end types and 300-psig (2070-kPa) working pressure at 225 deg F (107 deg C).

B. Materials for thrust blocks shall comply with the following standards:

1. Cement: ASTM C 150, Type I.
2. Fine Aggregate: ASTM C 33, sand.
3. Coarse Aggregate: ASTM C 33, crushed gravel.
4. Water: Potable.

## 2.13 IDENTIFICATION

- A. Install metallic warning tapes made of solid blue film with continuously printed black-letter caption "CAUTION--WATER LINE BURIED BELOW."

## 2.14 WATER METERS AND ACCESSORIES

- A. SEE MEP PLANS AND SPECIFICATIONS

## 2.15 BACKFLOW PREVENTERS AND ASSEMBLIES

- A. SEE MEP PLANS AND SPECIFICATIONS

## 2.16 PROTECTIVE ENCLOSURES

- A. SEE MEP PLANS AND SPECIFICATIONS

## 2.17 BACKFLOW PREVENTION ASSEMBLY

- A. Model: Watts Regulator,  $\frac{3}{4}$  inch, Series 909, Reduced Pressure Zone Assemblies, 909NRS; or approved alternative.
- B. Manufacturer: WATTS®, Backflow Prevention Products:

815 Chestnut Street  
No. Andover, MA 01845-6098  
[www.wattsreg.com](http://www.wattsreg.com)

2.18 BACKFLOW PREVENTION ENCLOSURE

- A. Model: WattsBox Insulated Enclosure, Model #WB N8; or approved alternative.
- B. Dimensions: aluminum box, 118" x 40" x 58"; mounting pad, 130" x 52"
- C. Manufacturer: WATTS®, Backflow Prevention Products:  
815 Chestnut Street  
No. Andover, MA 01845-6098  
www.wattsreg.com

2.19 METER

- A. Meter shall be as specified by LWU. Contractor to supply and install.

**PART 3 - EXECUTION**

3.1 EARTHWORK

- A. Refer to Division 31 Section "Earth Moving" for excavation, trenching, and backfilling to be performed by the general contractor unless otherwise specified.
- B. Refer to Division 32 Section "Flexible Paving" for cutting and patching of existing paving to be performed by the general contractor unless otherwise specified.

3.2 GENERAL

- A. It is the intent of this procedure to secure the best workmanship consistent with the job conditions and the contractor's skill. No provision in this procedure shall be construed by the contractor as an excuse for poor workmanship or results. The contractor shall guarantee that the material, equipment, and apparatus required for the development shall be free from all defects in the material, design, and the workmanship. The contractor shall give satisfactory and continuous service under all conditions of service required and specified or which may be reasonably inferred from the submitted mark-up plans, procedures, and specifications and that all work performed by him/her shall be perfect in material and workmanship. The contractor shall agree to repair or replace, at his own expense, any part of the material, apparatus, or workmanship proving defective in inspection prior to the Owner's takeover of the new water distribution facilities.

3.3 PIPING SYSTEMS - COMMON REQUIREMENTS

- A. General Locations and Arrangements: Drawings indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations.

Install piping as indicated, unless deviations to layout are approved on Coordination Drawings.

- B. Install piping at indicated slope.
- C. Install components with pressure rating equal to or greater than system operating pressure.
- D. Install piping free of sags and bends.
- E. Locate groups of pipes parallel to each other, spaced to permit valve servicing.
- F. Install fittings for changes in direction and branch connections.
- G. Piping Connections: Unless otherwise indicated, make piping connections as specified below:
  - 1. Install unions, in piping 2-inch NPS and smaller, adjacent to each valve and at final connection to each piece of equipment with 2-inch NPS or smaller threaded pipe connection.
  - 2. Install flanges, in piping 2-1/2-inch NPS and larger, adjacent to flanged valves and at final connection to each piece of equipment with flanged pipe connection.
  - 3. Install dielectric fittings to connect piping of dissimilar metals.

### 3.4 PIPING APPLICATIONS

- A. General: Use pipe, fittings, and joining methods for piping systems according to the following applications:
- B. Transition couplings and special fittings with pressure ratings at least equal to piping pressure rating may be used in applications below, unless otherwise indicated.
- C. Potable Water-Service Piping: Use the following:
  - 1. 2-1/2-Inch ASTM B88 Type “K” copper
- D. Fire-Protection Water-Service Piping: Use the following:
  - 1. 4-Inch NPS: Ductile-iron, push-on-joint pipe; ductile-iron, mechanical joint fittings; gasketed joints, and approved restraining system.

### 3.5 JOINT CONSTRUCTION

- A. Ductile-Iron Piping, Gasketed Joints: According to AWWA C600.
- B. Ductile-Iron Piping, Gasketed Joints for Fire-Service Piping: According to UL 194 and AWWA C600.
- C. Flanged Joints: Align flanges and install gaskets. Assemble joints by sequencing bolt tightening. Use lubricant on bolt threads.

- D. Dissimilar Materials Piping Joints: Use adapters compatible with piping materials, OD, and system working pressure. Refer to "Piping Systems - Common Requirements" Article for joining piping of dissimilar metals.

### 3.6 VALVE BOXES

- A. See details for additional valve box installation requirements.
- B. Both sections of the valve box shall be plumb, and the bottom of the valve box shall be situated so that the valve nut is centered and can be operated with the valve key.
- C. Valve boxes shall also be free of dirt, asphalt, stones, rocks, sand, or any other material, or debris.
- D. No Adapters shall be used to raise the valve boxes to finished grade.

### 3.7 MECHANICAL JOINT END (M.J.E.) GATE VALVES

- A. See standard valve replacement detail for additional Mechanical Joint End (M.J.E.) Gate Valves
- B. The appropriate M.J.E. gate valve from the Resilient Wedge Series, open right, made by Mueller, or approved equal.
- C. All valves shall open clockwise (open right). The Owner shall not accept any counter-clockwise (left-handed) to open valves.
- D. All gate valves in the project must be fully open when the project's final inspection is performed unless indicated by the Owner or the appropriate representative of the LWU.

### 3.8 FIRE HYDRANTS

- A. See details for additional requirements regarding fire hydrant installation.
- B. The Contractor shall provide all hydrants for this project.
- C. Hydrants shall be installed plumb and have a distance of no more than 5 inches between the top of the curb and the bottom of the breakaway coupling. **NO HYDRANT ADAPTORS SHALL BE ALLOWED.**
- D. If a Mechanical Joint Tee is used, the hydrant shall be rodded back to the gate valve and the gate valve must be rodded back to the Mechanical Joint Tee. All hydrants shall have a concrete thrust block below the location of where the drip hole is on the hydrant.

- E. Stone (clean gravel) shall be placed around the area below the hydrant barrel for a distance of 18" and 6" above the Hydrant Lateral to allow for adequate drainage from the hydrant.
- F. A minimum distance of 18 inches shall exist between the street side of the curb to the front of the 4 ½" steamer cap.

### 3.9 CURB BOXES

- A. See Service Line Installation Detail for additional requirements regarding curb box installation.
- B. The curb stop lid shall be visible and flush with the surrounding ground. The pentagonal insert shall be intact and free of dirt, cement, etc.
- C. The curb stop box shall be at a distance of approximately 18 inches from the street side of the curb to the center of the curb box.
- D. Services to curb stops from the main shall be perpendicular to the main. If for any reason this is not possible, the deviation must be noted on as-built sketches.

### 3.10 WATER MAIN

- A. The top of the water main shall be installed with 4.5 feet of cover. This is the distance from the top of the pipe to the top of grade.
- B. The water main shall be installed at the locations shown on the plans.
- C. Comply with NFPA 24 for fire-protection water-service piping materials and installation.
- D. Install ductile-iron piping according to AWWA C600. Encase piping with PE film according to ASTM A 674 or AWWA C105.
- E. Install disinfection in accordance with this specification.
- F. Bury all piping with depth of cover over top at least 54 inches with top at least 12 inches below level of maximum frost penetration, and according to the following:
  - 1. Under Driveways: With at least 48 inches cover over top.
  - 2. Under Railroad Tracks: With at least 48 inches (1200 mm) cover over top.
  - 3. In Loose Gravelly Soil and Rock: With at least 12 inches (300 mm) additional cover.
- G. Install piping under streets and other obstructions that cannot be disturbed, by tunneling, jacking, or combination of both.

### 3.11 TAPPING SLEEVES AND TAPPING VALVES

- A. Before the wet cut can be made, the appropriate water meter(s), backflow prevention device(s), and street opening permit(s) must be obtained and installed following the approved specifications with approval from the LWU.
- B. The plumbing contractor shall make a construction tap request prior making the watermain connection wet cut in the LWU distribution system off Dutch Hill Road to Frank McGlynn of Suez Water, contact information is provided in Section 1.3, subsection A of this specification.

### 3.12 SERVICE ENTRANCE PIPING

- A. The contractor shall be responsible to connect the services to the Owner's distribution system. Before the connection can be made, the appropriate water meter(s), backflow prevention device(s), and street opening permit(s) must be obtained and the LWU must be notified 48 hours in advance to allow the scheduling of a representative to observe the making of the cut.
- B. Extend water-service piping and connect to building water-piping systems at outside face of building wall in locations and pipe sizes indicated.
- C. Terminate water-service piping at building wall until building water piping systems are installed. Terminate piping with caps, plugs, or flanges as required for piping material. Make connections to building water-piping systems when those systems are installed.
- D. Install underground piping with restrained joints at horizontal and vertical changes in direction. Use restrained-joint piping, thrust blocks, anchors, tie-rods and clamps, and other supports.

### 3.13 THRUST BLOCKS AND RODDING OF MECHANICAL JOINT FITTINGS

- A. It is the responsibility of the contractor to assure that all mechanical joint fittings are properly restrained.
- B. At a minimum, Retainer glands or the U.S. Pipe M.J. Gripper Gland with ¾" threaded rods shall be used on ALL JOINTS within 20 feet from a Mechanical Joint Fitting.
- C. All plugs, caps, tees, flushers, and bends, unless otherwise specified, shall be provided with thrust blocks or suitably restrained joints as shown or directed the Owner or LWU. Refer to the detail drawings showing thrust and anchoring blocks.
- D. All thrust restraints shall be designed to withstand the test pressure, working pressure, and any potential surge pressure of the pipe.
- E. Concrete thrust blocks of both the vertical and horizontal orientation shall be made of concrete having a compressive strength of not less than 4000 psi after 28 days. Thrust blocks shall be placed between solid ground and the fitting to be anchored. Each instance shall be as shown in the details or as directed by LWU.

3.14 RESTRAINTS

- A. All restrained joints shall be installed in accordance with the manufacturer's recommendations. All valves, bends or other fittings shall be provided with at least eight (8) inches of dense graded aggregate placed below and surrounding the fittings.

3.15 BACKFLOW PREVENTION ASSEMBLY

- A. Install as indicated by the manufacturer's specifications.

3.16 BACKFLOW PREVENTION ENCLOSURE

- A. Install as indicated by the manufacturer's specifications.

3.17 JACKING

- A. Where required, the Contractor shall install by jacking, pipe of the size and at the locations shown on the plans. All work shall be performed in accordance with the applicable requirements of NYSDOT Subsections 650-3.01, 650-3.02 and 650-3.03 of the standard specifications. The Contractor is responsible for surface subsidence and pressure grouting in accordance with the requirements of NYSDOT Subsection 650-3.03.

3.18 IDENTIFICATION INSTALLATION

- A. Install continuous plastic underground warning tape with metallic locator strip during back-filling of trench for underground water-service piping. Locate 6 to 8 inches below finished grade, directly over piping.

3.19 CLOSURE OF UNUSED FACILITIES

- A. The contractor shall be responsible for closing and sealing all existing water connections to the tract that are no longer required by the proposed configuration. All work shall be performed to the standards and satisfaction of both the Owner and LWU.

3.20 FIELD QUALITY CONTROL

- A. Piping Tests: Conduct piping tests before joints are covered and after thrust blocks have hardened sufficiently.
- B. Upon written notice from the contractor to the effect that he/she has performed all the work required by the specifications, marked up plans, and requirements, LWU will inspect the job promptly to see if everything is Satisfactory. Most of what has been previously inspected and accepted by the LWU need not be re-examined in great detail, but if something needing correction is discovered in the work that had been approved

earlier, the former acceptance shall not prevent the Owner from requiring that it be remedied by the contractor.

3.21 DISINFECTION OF MAINS:

- A. During construction, the pipe and appurtenances shall be kept clean and dry.
- B. When installation has been completed, the water main shall be flushed with water at a minimum velocity of 2.5 fps. The main shall then be charged with a solution of Chlorine-bearing compound in water, and disinfected in accordance with AWWA Standard C651-05: Disinfection of water mains, excluding Section 4.4.2 for the tablet method and the optional section 4.6 for the final connection into existing mains.
- C. After the required contact period, the Contractor shall determine the residual chlorine concentration remaining.
- D. The main shall not be flushed until after the hydrostatic test has been performed by the Contractor and approved by LWU, the County Health Department and the Owner.
- E. During the performance of the test, all valves and appurtenances shall be charged to ensure maximum chlorine contact.
- F. Prepare reports for disinfection activities and submit to Owner, the County Health Department and the LWU.

3.22 HYDROSTATIC TESTING OF NEW MAINS

- A. Upon installation of the water main facilities, hydrostatic testing shall be performed in accordance with AWWA Standard C600-05 Section 5.2 and shall be performed under the supervision of the LWU and the Owner.
- B. The contractor shall subject the water main, services (corporation to curbstop), valves, hydrants and appurtenances to a water pressure applied in the amount of 1.5 times the stated working pressure of the test section or 150 pounds per square inch (psi), whichever is greater, for a two (2) hour duration. The test pressure shall not vary by more than  $\pm 5$  psi for the duration of the test.
- C. The Contractor shall be required to perform leakage tests, the test pressure shall be run on every section prior to acceptance and shall meet the following testing allowance (allowable makeup water) over a two (2) hour duration:

$$L = \frac{SD(P^{0.5})}{148,000} \quad \text{equation (1)}$$

Where: L = leakage (makeup water), GPH; S = length of pipe tested, feet; D = nominal diameter, inches; and P = average test pressure, psi.

- D. All pipes shall be tested in sections between gate valves except in cases of practical difficulty or where conditions make it necessary to test in shorter sections. The length to be tested will be determined by the Engineer. Leakage tests shall not be performed until the pressure is stabilized in the pipe for a period of not less than two (2) hours. Any leaks or breaks developing under this test shall be repaired immediately at the expense of the Contractor.
- E. The contractor shall provide the hydraulic pump with an “in line” check valve to prevent backflow through the pump during testing.
- F. Prepare reports for hydrostatic testing activities and submit to the LWU, the County Health Department and the Owner.

### 3.23 BACTERIOLOGICAL AND TURBIDITY TESTING

- A. After the Hydrostatic test has passed and has been accepted by the LWU, the County Health Department and the Owner, the water main and all valves and appurtenances shall be flushed and refilled with water from the existing water supply to remove the heavily chlorinated water and to scour the interior of the pipe. The duration of the flushing shall be determined in the field by the Owner or the duly authorized representative of the LWU.
- B. Once flushing is completed, the Contractor shall perform a Bacteriological and a Turbidity analysis in accordance with NYSDOH Standards, with the LWU standards and with a LWU representative on-site. Laboratory tests on two (2) successive days shall indicate that the water supply is equal in quality to that specified in Part 72 of the State Sanitary Code. Repetition of charging the pipes and appurtenances will be required if laboratory testing fails to indicate water of equal or greater quality. Water must meet acceptable bacteriological tests for drinking water.
- C. Prepare reports for purging and disinfecting activities and submit to Owner, County Health Department, and the LWU.

### 3.24 CERTIFICATION

- A. The Contractor shall supply a New York State Licensed Engineer’s Certificate of Construction Compliance attesting to the proper installation and testing of the water main and all other requirements of the County Department of Health and Suez.

END OF SECTION 331000

## SECTION 333000 - SANITARY SEWERAGE UTILITIES

### PART 1 - GENERAL

#### 1.1 GENERAL REQUIREMENTS

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
1. Construction of all sanitary sewerage outside the building five (5) feet from the point of exit.
  2. The general contractor shall be responsible for coordinating all horizontal and vertical locations of connections into the building line with the plumbing contractor.
  3. All sanitary sewer improvements shall be also constructed in accordance with the "Recommended Standards for Wastewater Facilities (Ten States Standards)", latest edition.
  4. All sanitary sewer improvements shall be also constructed in accordance with all standards and specifications as required by the Municipality and/or Authority having jurisdiction over the project.
  5. The general contractor shall be responsible for closing and sealing all existing sanitary connections that are no longer required by the proposed configuration.
  6. Low pressure and deflection testing of the sanitary sewer piping installed under this project.
  7. Work on sewer laterals and connection is to be performed by licensed plumber and requires a plumbing permit.
  8. Unless otherwise noted, general contractor shall be responsible for all excavation, trenching, and backfill operations.
- B. Cooperation and interface with the other prime contractors.
1. The plumbing contractor shall be responsible for all penetrations and connections into the proposed building.

#### 1.2 Related work specified elsewhere:

- |                    |                 |
|--------------------|-----------------|
| A. Earthwork       | Section 312000  |
| B. Flexible Paving | Section 321200. |

#### 1.3 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.
- C. Municipal standards, specifications, materials, and practices.
- D. “Recommended Standards for Wastewater Facilities (Ten States Standards)”, latest edition.

#### 1.4 DEFINITIONS

- A. PVC: Polyvinyl chloride plastic.

#### 1.5 PERFORMANCE REQUIREMENTS

- A. Gravity-Flow, Non-pressure Piping Pressure Ratings: At least equal to system test pressure.

#### 1.6 SUBMITTALS

- A. Shop Drawings: Include plans, elevations, details, and attachments as required for all structures, pipe, fittings, and castings.
- B. Coordination Drawings: Show manholes and other structures, pipe sizes, locations, and elevations. Include details of underground structures and connections. Show other piping in same trench and clearances from sewerage system piping. Indicate interface and spatial relationship between piping and approximate structures.
- C. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.
- D. Record Drawings in accordance with Division 1 Section “Contract Close-Out”.
  - 1. These drawings shall show the following information:
    - a. As-built locations of sanitary sewer line in plan
    - b. Invert elevations
    - c. Rim elevations
    - d. Pipe diameters, materials, length and grades
    - e. Locations of lateral cleanouts (by triangulation)
    - f. Utility crossing locations
  - 2. These drawings shall comply with the following standards:
    - a. Clearly marked and easily readable
    - b. A scale identical to the construction plans
    - c. Horizontal datum: North American Datum (NAD) 1929
    - d. Vertical datum: North American Vertical Datum (NAVD) 1929
    - e. Signed and sealed by a Licensed New York Professional Land Surveyor

3. As-builts shall be delivered to the Owner in both record mylar and digital format. Digital submissions shall be in AutoCAD, 2017 format on a compact disc in compatible format.

#### 1.7 DELIVERY, STORAGE, AND HANDLING

- A. Do not store plastic structures, pipe, and fittings in direct sunlight.
- B. Protect pipe, pipe fittings, and seals from dirt and damage.

#### 1.8 PROJECT CONDITIONS

- A. Site Information: Perform site survey, research public utility records, and verify existing utility locations.
- B. Locate existing structures and piping to be closed and abandoned.
- C. Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:
  1. Notify Owner not less than three (3) working days in advance of proposed utility interruptions.
  2. Do not proceed with utility interruptions without Owner's written permission.

### **PART 2 - PRODUCTS**

#### 2.1 MANUFACTURERS

- A. Manufacturers: Manufacturers shall be submitted for approval during the shop drawing review.

#### 2.2 PIPES AND FITTINGS

- A. PVC Sewer Pipe and Fittings, NPS 4 to NPS 15: ASTM D-3034, bell and spigot for gasketed joints. Pipe shall be PVC SDR 35.
  1. Gaskets: ASTM F 477, elastomeric seals; or other watertight joint construction methods acceptable to the owner.

#### 2.3 SPECIAL PIPE COUPLINGS AND FITTINGS

- A. Sleeve-type and bushing-type pipe couplings ('Fernco') shall not be permitted.
- B. Pipe Couplings shall be DIP, PVC, HDPE or other approved rigid connectors for joining existing and dissimilar piping materials as manufactured by Dresser (814) 362-9200, Genco (800) 345-6454, Harco (502) 366-4596 or other approved equal.

## 2.4 CLEANOUTS

- A. PVC Cleanouts: PVC body with PVC threaded plug. Include PVC sewer pipe fitting and riser to cleanout of same material as sewer piping. Include brass cap with recessed key.

## 2.5 MANHOLES

- A. Normal-Traffic Precast or cast-in-place Concrete Manholes: ASTM C 478 precast, reinforced concrete, of depth indicated, with provision for rubber gasketed joints.
  - 1. Diameter: 48 inches minimum, unless otherwise indicated.
  - 2. Ballast: Increase thickness of precast concrete sections or add concrete to base section, as required to prevent flotation.
  - 3. Base Section: 8-inch minimum thickness for floor slab and 5-inch minimum thickness for walls and base riser section, and having separate base slab or base section with integral floor.
  - 4. Precast Riser Sections: 5-inch minimum thickness, and lengths to provide depth indicated.
  - 5. Cast-in-place Riser Sections: 8-inch minimum block thickness up to a depth of 8 feet below finished grade; 12-inch minimum block thickness below 8 feet deep.
  - 6. Top Section: Eccentric-cone type, unless concentric-cone or flat-slab-top type is indicated. Top of cone of size that matches grade rings.
  - 7. Gaskets: ASTM C 443, rubber.
  - 8. Grade Rings: Reinforced-concrete rings, of 6- to 9-inch total thickness, that matches the frame diameter and cover.
  - 9. Steps: Polypropylene, individual steps or ladder. Include width that allows worker to place both feet on one step and is designed to prevent lateral slippage off step. Cast or anchor into base, riser, and top section sidewalls with steps at 12-inch intervals.
  - 10. Pipe Connectors: ASTM C 923, resilient, of size required, for each pipe connecting to base section.
  - 11. Cast-in-place finish: mortar parge a minimum uniform thickness of 1/4".
- B. Manhole Frames and Covers: Manhole frame and cover shall be round Model 1012B as produced by Campbell Foundry.

## 2.6 CONCRETE

- C. General: Cast-in-place concrete according to ACI 318, ACI 350R, and the following:
  - 1. Cement: ASTM C 150, Type II.
  - 2. Fine Aggregate: ASTM C 33, sand.
  - 3. Coarse Aggregate: ASTM C 33, crushed gravel.
  - 4. Water: Potable.
- D. Portland Cement Design Mix: 4000 psi minimum, with 0.45 maximum water-cementitious ratio.
  - 1. Reinforcement Fabric: ASTM A 185, steel, welded wire fabric, plain.

2. Reinforcement Bars: ASTM A 615/A 615M, Grade 60 deformed steel.
- E. Structure Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 4000 psi minimum, with 0.45 maximum water-cementitious ratio. Include channels and benches in manholes.
1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope. Invert slope shall be one (1) percent through manhole.
  2. Benches: Concrete, sloped to drain into channel. Slope shall be four (4) percent.
- F. Ballast and Pipe Supports: Portland cement design mix, 3000 psi minimum, with 0.58 maximum water-cementitious ratio.
1. Reinforcement Fabric: ASTM A 185, steel, welded wire fabric, plain.
  2. Reinforcement Bars: ASTM A 615/A 615M, Grade 60 deformed steel.

## 2.7 PROTECTIVE COATINGS

- A. Description: Two-coat, high-build epoxy; 15-mil minimum thickness, unless otherwise indicated; factory applied to the following surfaces:
1. Concrete Manholes: On exterior and interior surfaces.

## PART 3 - EXECUTION

### 3.1 EARTHWORK

- A. Excavation, trenching, and backfill materials are specified in Section 31 20 00 "Earth Moving." and shall be performed by the general contractor unless otherwise specified.

### 3.2 IDENTIFICATION

- A. Contractor shall install green warning tape directly over piping and at outside edges of underground structures.
1. Use detectable warning tape over ferrous piping.
  2. Use detectable warning tape over nonferrous piping and over edges of underground structures.
  3. Install detectable warning tape 6-inches to 12-inches below finished grade.

### 3.3 SPECIAL PIPE COUPLING AND FITTING APPLICATIONS

- A. Special Pipe Couplings: Use where required to join piping and no other appropriate method is specified. Do not use instead of specified joining methods. Use the following pipe couplings for non-pressure applications:
1. Rigid connection fittings

- B. Encase all dissimilar connections or connections to existing piping materials located under proposed structures (buildings, roadways, etc.) with concrete.

### 3.4 ABANDONMENT

- A. Locate all existing sanitary disposal lines servicing the existing site.
- B. Remove all on-site existing sanitary facilities as required. Disposal of same shall be in accordance with Section 31 10 00 "Site Clearing".
- C. Abandon remaining connection points at right of way line with 3000 psi concrete, with provisions not to permit concrete to enter the main trunk sewerage line.

### 3.5 GENERAL INSTALLATION

- A. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of underground sanitary sewerage piping.
- B. Notify the Owner seventy-two (72) hours in advance of all sewer work.
- C. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for using lubricants, cements, and other installation requirements. Maintain swab or drag in line, and pull past each joint as it is completed.
- D. Use proper size increasers, reducers, and couplings where different sizes or materials of pipes and fittings are connected. Reducing size of piping in direction of flow is prohibited.
- E. Install gravity-flow piping and connect to building's sanitary drains, of sizes and in locations indicated. Terminate piping as indicated. Install piping pitched down in direction of flow, at minimum slope of 1 percent, unless otherwise indicated. Install piping with three (3) foot minimum cover.

### 3.6 PIPE JOINT CONSTRUCTION AND INSTALLATION

- A. PVC Sewer Pipe and Fittings: As follows:
  - 1. Join pipe and gasketed fittings with gaskets according to ASTM D 2321 manufacturer's written instructions.
  - 2. Join profile sewer pipe fittings with gaskets according to ASTM D 2321 and manufacturer's written instructions.
  - 3. Install according to ASTM D 2321.

### 3.7 CLEANOUT INSTALLATION

- A. Install cleanouts and riser extension from sewer pipe to cleanout at grade. Use PVC fittings in sewer pipes at branches for cleanouts and PVC for riser extensions to cleanouts. Install piping so cleanouts open in direction of flow in sewer pipe.

- B. Set cleanout frames and covers in earth in cast-in-place concrete block, 18 by 18 by 12 inches deep. Set with tops 1 inch above surrounding grade.
- C. In roadway traffic areas, enclose top of the cleanout stack in a cast iron casting set in concrete.

### 3.8 MANHOLE INSTALLATION

- B. General: Install manholes, complete with appurtenances and accessories indicated.
- C. Form continuous concrete channels and benches between inlets and outlet.
- D. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops 2 inches above finished surface elsewhere, unless otherwise indicated.
- E. Install precast concrete manhole sections with gaskets according to ASTM C 891.
- F. Construct cast-in-place manholes as indicated.

### 3.9 TAP CONNECTIONS

- A. Make connections to existing piping and underground structures so finished Work complies as nearly as practical with requirements specified for new Work.
- B. Core drill when making connection to existing structures.
- C. Make branch connections from side into existing piping, NPS 21 or larger, or to underground structures by cutting opening into existing unit large enough to allow 3 inches of concrete to be packed around entering connection. Cut end of connection pipe passing through pipe or structure wall to conform to shape of and be flush with inside wall, unless otherwise indicated. On outside of pipe or structure wall, encase entering connection in 6 inches of concrete for minimum length of 12 inches to provide additional support of collar from connection to undisturbed ground.
- D. Use concrete that will attain minimum 28-day compressive strength of 3000 psi, unless otherwise indicated.
- E. Use epoxy-bonding compound as interface between new and existing concrete and piping materials.
- F. Protect existing piping and structures to prevent concrete or debris from entering while making tap connections. Remove debris or other extraneous material that may accumulate.

### 3.10 FIELD QUALITY CONTROL

- A. Clear interior of piping and structures of dirt and superfluous material as work progresses. Maintain swab or drag in piping, and pull past each joint as it is completed.

1. Place plug in end of incomplete piping at end of day and when work stops.
  2. Flush piping between manholes and other structures to remove collected debris.
- B. Inspect interior of piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches of backfill is in place, and again at completion of the Work.
1. Coordinate and meet inspection requirements and standards of Town of Orangetown Sewer Department and/or NYSDOH.
  2. Submit separate reports for each system inspection.
  3. Defects requiring correction include the following:
    - a. Alignment: Less than full diameter of inside of pipe is visible between structures.
    - b. Deflection: Flexible piping with deflection that prevents passage of mandrel of size not less than 95 percent of piping diameter.
    - c. Crushed, broken, cracked, or otherwise damaged piping.
    - d. Infiltration: Water/air leakage into piping.
    - e. Exfiltration: Water/air leakage from or around piping.
- C. Replace defective piping using new materials, and repeat inspections until defects are within allowances specified.
- D. Reinspect and repeat procedure until results are satisfactory.
- E. Test new piping systems, and parts of existing systems that have been altered, relocated, extended, or repaired, for leaks and defects. Do not enclose, cover, or put into service before inspection and approval.
1. Test completed piping systems according to authorities having jurisdiction.
  2. Schedule tests and inspections by authorities having jurisdiction with at least seventy-two (72) hours advance notice.
  3. Submit separate reports for each test.
  4. If authorities having jurisdiction do not have published procedures, perform tests as follows:
    - a. Air Pressure Test
      - i. Pressurize line to 5 psi.
      - ii. Maintain pressure for 5 minutes.
      - iii. Allowable leakage equals zero psi.
    - b. Deflection Test
      - i. Pull mandrel capable of measuring a minimum allowable deflection of 5 percent.
- F. Leaks and loss in test pressure constitute defects that must be repaired.
- G. Replace leaking piping using new materials, and repeat testing until leakage is within allowances specified.

END OF SECTION 333000

## **SECTION 334000 - STORM DRAINAGE UTILITIES**

### **PART 1 - GENERAL**

#### 1.1 GENERAL REQUIREMENTS

- A. Work of this Section includes all labor, materials, equipment, and services necessary to complete the work of this section as shown on the drawings and specified herein, including, but not limited to, the following:
  - 1. Installation of all exterior storm drainage elements outside of the building five (5) feet from the point of exit.
  - 2. The general contractor shall be responsible for coordinating all horizontal and vertical locations of connections into the building line with the plumbing contractor.
  - 3. The general contractor shall be responsible for closing and sealing all existing storm sewer connections that are no longer required by the proposed configuration.
  - 4. Facilitating the Owner's visual inspection of the storm sewer piping installed under this project.
- B. Cooperation and interface with the other prime contractors.
  - 1. The plumbing contractor shall be responsible for all penetrations and connections into the proposed building.

#### 1.2 RELATED WORK SPECIFIED ELSEWHERE

- A. Earth Moving: Section 312000.
- B. Flexible Paving Section 321200.

#### 1.3 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- B. New York State Department of Transportation Standard Specifications, as currently amended through the bid date for this project.

#### 1.4 DEFINITIONS

- A. HDPE: High Density Polyethylene plastic.
- B. PVC: Polyvinyl chloride plastic.
- C. DIP: Ductile Iron Pipe

## 1.5 PERFORMANCE REQUIREMENTS

- A. Gravity-Flow, Nonpressure-Piping Pressure Ratings: At least equal to system test pressure.

## 1.6 SUBMITTALS

- A. Shop Drawings: Include plans, elevations, details, and attachments for the following:
  - 1. Precast concrete manholes, inlets and other structures, including frames, covers, and grates.
  - 2. Perimeter drain, grates, catch basins, layout, and manufacturer installation instructions.
  - 3. Cast-in-place concrete manholes, inlets and other structures, including frames, covers, and grates.
  - 4. Signed by a Licensed New York Professional Engineer specializing in structural design.
  - 5. Product specifications for pipes, clean-outs, connections and gaskets.
- B. Coordination Drawings: Show manholes and other structures, pipe sizes, locations, and elevations. Include details of underground structures and connections. Show other piping in same trench and clearances from sewerage system piping. Indicate interface and spatial relationship between piping and proximate structures.
- C. Design Mix Reports and Calculations: For each class of cast-in-place concrete.
- D. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.
- E. Record Drawings in accordance with Division 01 Section "Contract Close-Out".
  - 1. These drawings shall show the following information:
    - a. As-built location of storm sewer line in plan
    - b. Invert elevation
    - c. Rim elevation
    - d. Pipe diameter, material, length and percent slope
    - e. Locations of lateral cleanouts (by triangulation)
    - f. Above-ground Detention pond structures and earthworks (if indicated on plans)
    - g. Under-ground Detention pond structures and earthworks (if indicated on plans)
    - h. Utility crossing locations
  - 2. These drawing shall comply with the following standards:
    - a. Clearly marked and easily readable
    - b. A scale identical to the construction plans
    - c. Horizontal datum: North American Datum (NAD) 1983
    - d. Vertical datum: North American Vertical Datum (NAVD) 1988
    - e. Signed and sealed by a Licensed New York Professional Land Surveyor

3. As-builts shall be delivered to the Owner in both record mylar and digital format. Digital submissions shall be in AutoCAD, 2017 format on a compact disc in compatible format.

#### 1.7 DELIVERY, STORAGE, AND HANDLING

- A. Do not store plastic structures, pipe, and fittings in direct sunlight.
- B. If piping and structures are to be stored on site prior to placement in accordance with the construction documents, the following shall be required:
  1. All pipes shall be stored on grade. Stacking is not permitted.
  2. Sufficient barricades shall be provided around piping and structures to prevent unauthorized access to the storage area.
- C. Protect pipe, pipe fittings, and seals from dirt and damage.
- D. Handle precast concrete manholes, inlets and other structures according to manufacturer's written rigging instructions.

#### 1.8 PROJECT CONDITIONS

- A. Site Information: Perform site survey, research public utility records, and verify existing utility locations.
- B. Locate existing structures and piping to be closed and abandoned.
- C. Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:
  1. Notify Owner not less than two days in advance of proposed utility interruptions.
  2. Do not proceed with utility interruptions without Owner's written permission.

### **PART 2 - PRODUCTS**

#### 2.1 MANUFACTURERS

- A. Proposed material manufacturers shall be supplied and approved at the time of shop drawing submission.

#### 2.2 PIPING MATERIALS

- A. Refer to Part C "Piping Applications" Article for applications of pipe and fitting materials.

## 2.3 PIPES AND FITTINGS

- A. Drainage Pipe and Fittings, NPS 8 and Smaller:
  - 1. ASTM D1785 Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe, Schedule 40
  - 2. Solvent-cemented joints.
- B. Sewer Pipe and Fittings, NPS 8 and Smaller:
  - 1. ASTM D 3034, SDR 35
  - 2. Solvent-cemented or gasketed joints.
    - a. Gaskets: ASTM F 477, elastomeric seals.
- C. Reinforced-Concrete Sewer Pipe and Fittings: ASTM C 76, Class III, Wall B, for gasketed joints.
  - 1. Gaskets: ASTM C 443, rubber.
- D. HDPE storm sewer pipe shall comply with the requirements for test methods, dimensions and markings found in AASHTO Designations M252, and M294. Pipe and fittings shall be made from virgin PE compounds which conform to the applicable current edition of the AASHTO Material Specifications for cell classification as defined and described in ASTM D3350.
  - 1. Storm sewer piping greater than eight (8) inch in diameter shall be smooth interior/corrugated exterior pipe fitted with watertight joints meeting or exceeding ASTM 3212 lab test and ASTM 1417 watertight field test. N-12 IB WT® Product as manufactured by Advanced Drainage Systems, Inc. (ADS), Columbus, OH, (614) 457-3051 or approved equal.
  - 2. Underdrain piping less than or equal to eight (8) inch in diameter shall be perforated single-wall pipe fitted with soil-tight joints meeting ASTM standards F405 and F606 as manufactured by Advanced Drainage Systems, Inc. (ADS), Columbus, OH, (614) 457-3051 or approved equal.
- E. Ductile Iron pipe (DIP), Class 52, cement lined, and shall have push on joints. (ANSI/AWWA 151/A21.51)
- F. Underground Stormwater Vault ACF Model UD-Double-Mini, or approved equal.
- G. Hydrodynamic Separator: Contech CS-4 Unit, or approved equal.
- H. Yard Drains: As specified on plans, or approved equal.

## 2.4 SPECIAL PIPE COUPLINGS AND FITTINGS

- A. Sleeve-type and bushing-type pipe couplings ('Fernco') shall not be permitted.

- B. Pipe Couplings shall be DIP, PVC, HDPE or other approved rigid connectors for joining existing and dissimilar piping materials as manufactured by Dresser (814) 362-9200, Genco (800) 345-6454, Harco (502) 366-4596 or other approved equal.

## 2.5 MANHOLES

- A. Normal-Traffic Precast or cast-in-place Concrete Manholes: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for rubber gasketed joints.
  - 1. Diameter: 48 inches minimum, unless otherwise indicated.
  - 2. Ballast: Increase thickness of precast concrete sections or add concrete to base section, as required to prevent flotation.
  - 3. Base Section: 8-inch minimum thickness for floor slab and 5-inch minimum thickness for walls and base riser section, and having separate base slab or base section with integral floor.
  - 4. Precast Riser Sections: 5-inch minimum thickness, and lengths to provide depth indicated.
  - 5. Cast-in-place Riser Sections: 8-inch minimum block thickness up to a depth of 8 feet below finished grade; 12-inch minimum block thickness below 8 feet deep.
  - 6. Top Section: Eccentric-cone type, unless concentric-cone or flat-slab-top type is indicated. Top of cone of size that matches grade rings.
  - 7. Gaskets: ASTM C 443, rubber.
  - 8. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match 30-inch- diameter frame and cover.
  - 9. Steps: Polypropylene, individual steps or ladder. Include width that allows worker to place both feet on one step and is designed to prevent lateral slippage off step. Cast or anchor into base, riser, and top section sidewalls with steps at 12-inch
  - 10. Pipe Connectors: ASTM C 923, resilient, of size required, for each pipe connecting to base section.
  - 11. Cast-in-place finish: mortar parge a minimum uniform thickness of 1/4".
- B. Cast-in-Place Concrete Manhole (Doghouse): Construct of reinforced-concrete bottom, walls, and top; designed according to ASTM C 890 for A-16, heavy-traffic, structural loading; of depth, shape, dimensions, and appurtenances indicated.
  - 1. Ballast: Increase thickness of concrete, as required to prevent flotation.
  - 2. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match 30-inch diameter frame and cover.
  - 3. Cast-in-place Riser Sections: 8-inch minimum block thickness up to a depth of 8 feet below finished grade; 12-inch minimum block thickness below 8 feet deep.
  - 4. Steps: Polypropylene, individual steps or ladder. Include width that allows worker to place both feet on one step and is designed to prevent lateral slippage off step. Cast or anchor into sidewalls with steps at 12-inch intervals.
  - 5. Cast-in-place finish: mortar parge a minimum uniform thickness of 1/4".
- C. Manhole Frames and Covers: ASTM A 536, Grade 60 ID by 4- to 10-inch riser with 4-inch minimum width flange, and 30-inch- diameter cover. Include indented top design with lettering per Owner requirements cast into cover

## 2.6 CATCH BASINS

- A. Normal-Traffic, Precast or Cast-in-place Concrete Catch Basins: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for rubber gasketed joints.
1. Base Section: 10-inch minimum thickness for floor slab and 6-inch minimum thickness for walls and base riser section, and having separate base slab or base section with integral floor.
  2. Riser Sections: 6-inch minimum thickness, 48-inch diameter, and lengths to provide depth indicated.
  3. Cast-in-place Riser Sections: 8-inch minimum block thickness up to a depth of 8 feet below finished grade; 12-inch minimum block thickness below 8 feet deep.
  4. Top Section: Eccentric-cone type, unless concentric-cone or flat-slab-top type is indicated. Top of cone of size that matches grade rings.
  5. Gaskets: ASTM C 443, rubber.
  6. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match 24-inch diameter frame and grate.
  7. Steps: Polypropylene, individual steps or ladder. Include width that allows worker to place both feet on one step and is designed to prevent lateral slippage off step. Cast steps or anchor ladder into base, riser, and top section sidewalls at 12-inch intervals. Pipe Connectors: ASTM C 923M, resilient, of size required, for each pipe connecting to base section.
  8. Cast-in-place finish: mortar parge a minimum uniform thickness of ¼".
  9. Channels and Benches: Concrete.
- B. Cast-in-Place Concrete Structure (Doghouse): Construct of reinforced-concrete bottom, walls, and top; designed according to ASTM C 890 for A-16, heavy-traffic, structural loading; of depth, shape, dimensions, and appurtenances indicated.
1. Ballast: Increase thickness of concrete, as required to prevent flotation.
  2. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match inlet dimensions of frame and cover.
  3. Cast-in-place Riser Sections: 8-inch minimum block thickness up to a depth of 8 feet below finished grade; 12-inch minimum block thickness below 8 feet deep.
  4. Steps: Polypropylene, individual steps or ladder. Include width that allows worker to place both feet on one step and is designed to prevent lateral slippage off step. Cast or anchor into sidewalls with steps at 12-inch intervals.
  5. Cast-in-place finish: mortar parge a minimum uniform thickness of ¼".

## 2.7 STORMWATER INLETS

- A. Curb Inlets: Made with vertical curb opening, of materials and dimensions according to local standards.
- B. Gutter Inlets: Made with horizontal gutter opening, of materials and dimensions according to local standards. Include heavy-duty frames and grates.
- C. Combination Inlets: Made with vertical curb and horizontal gutter openings, of materials and dimensions according to local standards. Include heavy-duty frames and grates.

- D. Frames and Grates: Heavy-duty cast iron frames and grates according to local standards with bicycle-safe grate patterns.
- E. Yard Inlets: As specified on plans or approved equal.

## 2.8 FILTER FABRIC

- A. Filter fabric shall be AASHTO M288 class 2 non-woven, TC Mirafi 140N or approved equal.
- B. Filter fabric in high-scour applications (e.g. riprap aprons) shall be AASHTO M288 class 1 woven, TC Mirafi FW500 or approved equal.
- C. See Plans for specified locations/USGS.

## 2.9 CONCRETE

- A. General: Cast-in-place concrete according to ACI 318, ACI 350R, and the following:
  - 1. Cement: ASTM C 150, Type II.
  - 2. Fine Aggregate: ASTM C 33, sand.
  - 3. Coarse Aggregate: ASTM C 33, crushed gravel.
  - 4. Water: Potable.
- B. Portland Cement Design Mix: 4000 psi minimum, with 0.45 maximum water-cementitious ratio.
  - 1. Reinforcement Fabric: ASTM A 185, steel, welded wire fabric, plain.
  - 2. Reinforcement Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), deformed steel.
- C. Structure Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 4000 psi minimum, with 0.45 maximum water-cementitious ratio. Include channels and benches in manholes.
  - 1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope. Invert slope shall be one (1) percent through manhole.
  - 2. Benches: Concrete, sloped to drain into channel. Slope shall be four (4) percent.
- D. Include channels in catch basins.
  - 1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope. Invert Slope: shall be one (1) percent through catch basin.
- E. Ballast and Pipe Supports: Portland cement design mix, 3000 psi minimum, with 0.58 maximum water-cementitious ratio.

1. Reinforcement Fabric: ASTM A 185, steel, welded wire fabric, plain.
2. Reinforcement Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), deformed steel.

## 2.10 PROTECTIVE COATINGS

- A. Description: One- or two-coat, coal-tar epoxy; 15-mil minimum thickness, unless otherwise indicated; factory or field applied to the following surfaces:
1. Concrete Manholes: On exterior and interior surfaces.
  2. Catch Basins: On exterior and interior surfaces.
  3. Stormwater Inlets: On exterior and interior surfaces.

## 2.11 CLEANOUTS

- A. PVC Cleanouts: PVC body with PVC threaded plug. Include PVC sewer pipe fitting and riser to cleanout of same material as sewer piping.

## 2.12 UNDERGROUND STORMWATER VAULT

- A. Injection molded plastic tank plates assembled to form a 95% void modular structure of predesigned height and envelope shown on plans.
- B. Units shall meet the following Physical Characteristics:
- a. Void Area: 95%
  - b. Comprehensive Strength: 134.2 psi
  - c. HS-20 Minimum Cover: 12" (Stone Backfill)
- C. Supplier: ACF Environmental 2831 Cardwell Road Richmond, VA 23234 (T): 800-448-3636; (F): 804-743-7779 [www.acfenvironmental.com](http://www.acfenvironmental.com), or approved equal.
- D. Bedding Materials: Stone (angular and smaller than 1.5" in diameter) or soil (GW, GP, SW, or SP as classified by the Unified Soil Classification System) shall be used below the system (3" minimum). Material must be free from lumps, debris, and any sharp objects that could cut the geotextile. Material shall be within 3 percent of the optimum moisture content as determined by ASTM D698 at the time of installation. For infiltration applications bedding material shall be free draining.
- E. Side and Top Backfill: Free draining material shall be used adjacent to (24" minimum) and above (for the first 12") the system. Material must be free from lumps, debris and any sharp objects that could cut the geotextile. Material shall be within 3 percent of the optimum moisture content as determined by ASTM D698 at the time of installation.
- F. For UD modules in traffic loaded (HS-20) applications with less than 14" of top cover, backfill materials shall be free draining stone (angular and smaller than 1.5" in diameter). The use of soil backfill on the sides and top of the UD module is not permitted unless the modules are installed outside of traffic areas or with cover depths of 14" or more. Top

backfill material (from top of module to bottom of pavement base or 12" maximum) must be consistent with side backfill.

- G. System shall provide 3,524 cf of storage at a depth of 3.35 feet.

## 2.13 STORMWATER TREATMENT DEVICE (SWTD): HYDRODYNAMIC SEPARATOR

- A. This item shall govern the furnishing and installation of the SWTD, complete and operable as shown and as specified herein, in accordance with the requirements of the plans and contract documents.
- B. The manufacturer of the SWTD shall be one that is regularly engaged in the engineering design and production of systems deployed for the treatment of storm water runoff for at least five (5) years and which have a history of successful production, acceptable to the Engineer. In accordance with the Drawings, the SWTD(s) shall be a hydrodynamic separation device manufactured by:

Contech Engineered Solutions LLC  
9025 Centre Pointe Drive  
West Chester, OH, 45069  
Tel: 1 800 338 1122

- C. The manufacturer shall guarantee the SWTD components against all manufacturer originated defects in materials or workmanship for a period of twelve (12) months from the date the components are delivered to the owner for installation. The manufacturer shall upon its determination repair, correct or replace any manufacturer originated defects advised in writing to the manufacturer within the referenced warranty period at the cost to the manufacturer. The use of SWTD components shall be limited to the application for which it was specifically designed.
- D. The SWTD manufacturer shall submit to the Engineer of Record a "Manufacturer's Performance Certification" certifying that the SWTD is capable of achieving the specified removal efficiencies listed in these specifications. The certification shall be supported by independent third-party research.
- E. No product substitutions shall be accepted unless submitted 10 days prior to project bid date, or as directed by the Engineer of Record. Submissions for substitutions require review and approval by the Engineer of Record, for hydraulic performance, impact to project designs, equivalent treatment performance, and any required project plan and report (hydrology/hydraulic, water quality, stormwater pollution) modifications that would be required by the approving jurisdictions/agencies. Contractor to coordinate with the Engineer of Record any applicable modifications to the project estimates of cost, bonding amount determinations, plan check fees for changes to approved documents, and/or any other regulatory requirements resulting from the product substitution.
- F. Performance
1. The SWTD shall be sized to either achieve an 80 percent average annual reduction in the total suspended solid load or treat a flow rate designated by the jurisdiction in which the project is located. Both methods should be sized using the OK-110 particle distribution having particles ranging from 53 microns to 212 microns with a d50 of around 110 microns.

2. The SWTD shall be designed with a sump chamber for the storage of captured sediments and other negatively buoyant pollutants in between maintenance cycles. The minimum storage capacity provided by the sump chamber shall be in accordance with the following requirements: Minimum Sump Storage Capacity of 0.70 cubic yards and Minimum Oil Storage Capacity of 141.0 gallons. The boundaries of the sump chamber shall be limited to that which do not degrade the SWTD's treatment efficiency as captured pollutants accumulate. In order to not restrict the Owner's ability to maintain the SWTD, the minimum dimension providing access from the ground surface to the sump chamber shall be 16 inches in diameter.
3. The SWTD shall be designed to capture and retain Total Petroleum Hydrocarbons generated by wet-weather flow and dry-weather gross spills and have a capacity as discussed in Section 2 of the Performance Specifications for the unit.
4. The SWTD shall convey the flow from the peak storm event of the drainage network, in accordance with required hydraulic upstream conditions as defined by the Engineer. If a substitute SWTD is proposed, supporting documentation shall be submitted that demonstrates equal or better upstream hydraulic conditions compared to that specified herein. This documentation shall be signed and sealed by a Professional Engineer registered in the State of New York. All costs associated with preparing and certifying this documentation shall be born solely by the Contractor.

#### 2.14 STORMWATER TREATMENT DEVICE: CISTERN

- A. This item shall govern the furnishing and installation of a cistern for rainwater harvesting and other underground water storage for nominal diameters 30" (750mm) through 120" (3000mm).
- B. A stormwater treatment device upstream of the cistern is recommended as the appropriate means of pretreating for the purpose of extending the maintenance interval on the cistern system and reducing the life cycle cost. Both engineered solutions shall be provided by a single supplier/manufacturer.
- C. Site layout drawings, product specifications, materials, hydraulic storage data and supported calculations of proposed alternatives shall be submitted to the Engineer of Record (EOR) for review at a minimum of 10 working days prior to bid closing.
- D. The cistern system proposal shall be sized in accordance with the design provided and approved by the Engineer of Record (EOR). Any Contractor deviating from the design shown on the plans, to include: material, footprint, etc., shall provide to the Engineer of Record (EOR) a summary report on stage-storage curves, design calculations, system modeling and engineering drawings.
- E. Shop drawings shall be annotated to indicate all materials to be furnished and installed under this section, and all applicable standards for materials, required tests of materials and design assumptions for structural analysis.
- F. Virgin high density polyethylene stress-rated resins are used to manufacture the cistern and complimentary fabricated fittings. Resins shall conform to the minimum requirements of cell classification 345464C as defined and described in the latest version of ASTM D3350
- G. Performance

1. All tanks must be leak tested and results documented using a positive pressure air test prior to shipment from the manufacturing location. Testing documentation shall include test air pressure and hold time. A copy of the leak test report must be provided to the Engineer of Record as requested.
2. Bulkheads shall be constructed of material in conformance with Section 2.14 F and designed for H-20/HS-25 final live loading conditions.
3. All cistern inlets shall be equipped with an inlet calming device that they may introduce water to the tank with little to no turbulence.
4. The cistern shall provide a minimum of one 36 inch diameter access riser.
5. Cistern tank spacing, and stone base thickness cannot be altered with consultation from the manufacturer.
6. The cistern shall be designed for a minimum HS-20/HS-25 final live loading conditions. The cistern shall meet HS-20/HS-25 loading requirements with a minimum cover of 1.5 ft. and a maximum cover of 8' measured from the top of tank to the bottom of flexible pavement. The cistern shall have a unit weight of 65.6 lbs./ft. and a minimum wall thickness of 0.220 in.

#### 2.15 SWTD – PERFORMANCE

- A. The SWTD shall be sized to either achieve an 80 percent average annual reduction in the total suspended solid load or treat a flow rate designated by the jurisdiction in which the project is located. Both methods should be sized using the OK-110 particle distribution having particles ranging from 53 microns to 212 microns with a d50 of around 110 microns.
- B. The SWTD shall be designed with a sump chamber for the storage of captured sediments and other negatively buoyant pollutants in between maintenance cycles. The minimum storage capacity provided by the sump chamber shall be in accordance with the volume listed in Table 1. The boundaries of the sump chamber shall be limited to that which do not degrade the SWTD's treatment efficiency as captured pollutants accumulate. In order to not restrict the Owner's ability to maintain the SWTD, the minimum dimension providing access from the ground surface to the sump chamber shall be 16 inches in diameter.
- C. The SWTD shall be designed to capture and retain Total Petroleum Hydrocarbons generated by wet-weather flow and dry-weather gross spills and have a capacity listed in Table 1 of the required unit.
- D. The SWTD shall convey the flow from the peak storm event of the drainage network, in accordance with required hydraulic upstream conditions as defined by the Engineer. If a substitute SWTD is proposed, supporting documentation shall be submitted that demonstrates equal or better upstream hydraulic conditions compared to that specified herein. This documentation shall be signed and sealed by a Professional Engineer registered in the State of the work. All costs associated with preparing and certifying this documentation shall be born solely by the Contractor.

### **PART 3 - EXECUTION**

### 3.1 EARTHWORK

- A. Excavating, trenching, and backfilling are specified in Division 31 Section "Earth Moving."

### 3.2 IDENTIFICATION

- A. Materials and their installation are specified in Division 31 Section "Earth Moving." Arrange for installing green warning tapes directly over piping and at outside edges of underground structures.
  - 1. Use detectable warning tape over ferrous piping.
  - 2. Use detectable warning tape over nonferrous piping and over edges of underground structures.
  - 3. Install detectable warning tape 6-inches to 12-inches below finished grade.

### 3.3 PIPING APPLICATIONS

- A. General: Include watertight or soil-tight joints as specified.
- B. Refer to Part B of this Section for detailed specifications for pipe and fitting products. Use pipe, fittings, and joining methods according to applications indicated.

### 3.4 SPECIAL PIPE COUPLING AND FITTING APPLICATIONS

- A. Special Pipe Couplings: Use where required to join piping and no other appropriate method is specified. Do not use instead of specified joining methods. Use the following pipe couplings for nonpressure applications:
  - 1. Rigid connection fittings
- B. Encase all dissimilar connections or connections to existing piping materials located under proposed structures (buildings, roadways, etc.) with concrete.

### 3.5 INSTALLATION, GENERAL

- A. Unloading and Handling
  - 1. Follow all Occupational Safety and Health Administration (OSHA) safety requirements.
  - 2. When the truckload of pipe is initially received, it should be inspected for damage and quantities should be verified with shipping papers. Any damage or discrepancies should be noted on the delivery receipt and the supplier notified. The Owner shall not be responsible for acceptance and installation of defective materials.
- B. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of underground storm drainage piping. Location and arrangement of

pipng layout take design considerations into account. Install piping as indicated, to extent practical.

- C. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab or drag in line, and pull past each joint as it is completed.
- D. Use manholes for changes in direction, unless fittings are indicated. Use fittings for branch connections, unless direct tap into existing sewer is indicated.
- E. Install gravity-flow piping and connect to building's storm drains, of sizes and in locations indicated. Terminate piping as indicated.
  - 1. Install piping pitched down in direction of flow, at minimum slope of 0.25 percent, unless otherwise indicated.
- F. Tunneling: Install pipe under streets or other obstructions that cannot be disturbed by tunneling, jacking, or a combination of both.

### 3.6 INSTALLATION REQUIREMENTS, HDPE OR PVC

- A. Unloading and Handling
  - 1. HDPE pipe is designed to withstand normal field handling and can be easily unloaded by hand or with equipment. To avoid damage, the pipe should not be dropped. When using equipment to unload or move the pipe, a fork extension can be used. When unloading by hand, gloves should be worn.
  - 2. Do not use chains or wire rope to lift the pipe. Use nylon slings and do not pick up 20-foot lengths from only one place on pipe.
- B. Trenching
  - 1. Excessive groundwater necessitates dewatering. Plastic pipe will float in standing water, requiring immediate haunching and initial backfill to hold line and grade. If the contractor encounters this condition. Dewatering shall be employed.
  - 2. An unstable trench bottom must be stabilized with gravel or stone bedding materials.
  - 3. Excavation from 0 to 12 inches below the pipe should be filled with acceptable bedding material and compacted to a minimum 95 percent Proctor density in accordance with ASTM D 1557. Fill area of over-excavation beyond 12 inches with processed stone or gravel.
  - 4. Before installing pipe, bring bedding material to grade along the entire length of the pipe.
  - 5. When excavating in Class IV materials (silt, silty clays, and clays), provide a uniform, improved trench bottom in accordance with the plan details.
- C. Field cutting

1. Use a handsaw or power pipe cutoff saw.
2. For ribbed pipe, cut in the valley of a corrugation. Do not cut into the sidewall of an annular corrugation. For pipe with external spiral corrugations, place a split coupling around it and use the coupling edge as a cutting guide.
3. It is not necessary to bevel the cut pipe edge prior to installing an o-ring gasket joint system.
4. Skew or bevel cuts shall not be permitted.

D. Laying plastic pipe

1. Curvilinear installation shall not be permitted.
2. Plastic pipe can be easily carried to the trench and in sizes below 24 inches, installed by hand without the use of special equipment. Do not drop the pipe into the trench.

E. Embedment for bedding, haunching and initial backfill

1. Embedment materials are those used for bedding, haunching and initial backfill. ASTM D-2321 classifies soil materials as:
  - a. Class I: Angular crushed stone or rock, dense or open-graded, with little or no fines (1/4 inch to 1-1/2 inches in size).
  - b. Class II: Clean, coarse-grained materials, such as gravel, coarse sands, and gravel/sand mixtures (1-1/2 inches in size).
  - c. Class III: Coarse-grained material with fines including silty or clayey gravels or sands. Gravel or sand must comprise more than 50 percent of Class III: materials (1-1/2 inches maximum size.)
  - d. Class IV: Fine-grained materials, such as fine sand and soils, containing 50 percent or more clay or silt. Soils classified as Class IVa (ML or CL) have medium to low plasticity and are not recommended in the embedment zone. Soils classified as Class IVb (MH or CH) have high plasticity and are not recommended for embedment materials.
  - e. Class V: These materials include organic silts and clays, peat, and other organic materials. They are not recommended for embedment materials.
2. Do not place lumps of frozen soil or ice in the embedment zone.

F. Bedding

1. The contractor shall place bedding material providing uniform support to hold the pipe on line and grade in accordance with the plan details. Bedding materials under pipe shall be Class I, II or III.

G. Haunching

1. Proper haunching provides a major portion of the pipe's strength and stability. Poor workmanship will lead to excessive pipe deflection and grade and alignment problems. Haunching materials shall be Class I, II or III and must be compacted to minimum 90 percent standard Proctor.
2. Haunching Requirements

- a. Work enough material under the haunch of the pipe to provide proper compaction and side support.
- b. Where trench walls are unstable, prevent loss of side support by controlling sloughing, etc.
- c. Do not allow the pipe move when placing material under the haunch of the pipe.
- d. Take care not to damage the smaller size pipe with shovels or tamping equipment.
- e. Haunching shall be in 6-inch lifts.
- f. Controlled low strength material (CLSM) slurry is suitable for embedment. Trench width may be narrower if allowed by the Owner. Prevent floating with stakes or other methods.

#### H. Initial Backfill

1. Initial backfill materials extend from the spring line to 6 inches to 12 inches above the pipe to provide the remainder of the pipe support and protect the pipe from stones or cobbles in the final backfill. Class I, II, III materials shall be used. However:
  - a. Class I materials shall be used in wet trenches if Class I bedding and haunching materials are used.
  - b. Class II materials shall be compacted in 6-inch lifts to 95 percent modified Proctor density in accordance with ASTM D 1557.
  - c. Class III materials shall be compacted in 6-inch lifts to 95 percent modified Proctor density in accordance with ASTM D 1557.

#### I. Construction Loads

1. During construction, avoid heavy equipment wheel loads over the pipe or place additional cover at vehicle crossings. If a hydro-hammer or hoe-pak is to be used to compact the trench at least 48 inches of cover must be provided.
2. When connections to structures, laterals, deep laterals, risers, or drop manholes are required, the installation must be designed to ensure that the pipe and fittings are not damaged by loads generated due to soil settlement, dragdown, and/or poor installation practices.
3. When removing sheeting or other trench protection, do not disturb the embedment material. If sheeting or trench protection must be used below the top of the pipe, bracing shall be cut at the top of pipe elevation and left in place.
4. If any damage occurs due to construction loading of the pipes, contractor shall bear entire expense for repair and/or replacement.

### 3.7 PIPE JOINT CONSTRUCTION AND INSTALLATION

- A. General: Join and install pipe and fittings according to installations indicated.
- B. PVC Sewer Pipe and Fittings: As follows:
  1. Join pipe and gasketed fittings with gaskets according to ASTM D 2321.

2. Install according to ASTM D 2321.
- C. Concrete Pipe and Fittings: Install according to ACPA's "Concrete Pipe Installation Manual." Use the following seals:
  1. Round Pipe and Fittings: ASTM C 443, rubber gaskets.
- D. HDPE Pipe and Fittings: Install split couplings as follows:
  1. Split Couplings: This joint system is used where a soil-tight system is required.
  2. The sides of these split couplings are "hinged" so they easily open up to accept each end of adjacent pipe sections. There are matching holes at the split in the top of the coupling that are secured for a tight fit with nylon ties.
- E. System Piping Joints: Make joints using system manufacturer's couplings, unless otherwise indicated.
- F. Join piping made of different materials or dimensions with couplings made for this application. Use couplings that are compatible with and that fit both systems' materials and dimensions.
- G. All labor, materials, and equipment required to join and provide fittings for all pipe joints shall be included in the price bid for the proposal.

### 3.8 MANHOLE INSTALLATION

- A. General: Install manholes, complete with appurtenances and accessories indicated in accordance with manufacturer's guidelines and recommendations.
- B. Form continuous concrete channels and benches between inlets and outlet.
- C. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops 2 inches above finished surface elsewhere, unless otherwise indicated.
- D. Install precast concrete manhole sections with gaskets according to ASTM C 891.
- E. Construct cast-in-place manholes as indicated.

### 3.9 STORMWATER CATCH BASIN/INLET INSTALLATION

- A. Construct catch basins/inlets to sizes and shapes indicated.
- B. Set frames and grates to elevations indicated.

### 3.10 UNDERDRAIN

- A. General: Install filter fabric, stone, piping and backfill as indicated.

### 3.11 CONCRETE PLACEMENT

- A. Place cast-in-place concrete according to ACI 318 and ACI 350R.

### 3.12 PIPE BENEATH BUILDING SLABS AND FOUNDATIONS

- A. All pipe shall be Ductile Iron, Class 52.
- B. Reinforced pipe material shall extend from structure to structure. Material changes shall not be permitted mid-run.
- C. Pipe shall be cement-lined where used to sleeve PVC/HDPE principal conduit material.
  - 1. Principal conduit shall be aligned along the central axis of the sleeve pipe, braced into position utilizing cement or HDPE shims, and the annular space filled with pea gravel (1/2" maximum particle size).
- D. Pipe backfill shall be 3/4" quarry process clean stone placed in 1 foot lifts and compacted in place in accordance with Division 31 section "Earth Moving". Stone backfill shall extend from the pipe springline to finished grade.

### 3.13 CONNECTION TO EXISTING STRUCTURES

- A. Where connection into an existing storm sewer structure is required, the Contractor shall be responsible for maintaining the integrity of the existing structure. No separate payment shall be made for repair work required to correct damage to the structure because of the connection work.
- B. All cuts into the existing structure walls shall be made with an approved power saw.
- C. All joints and excess wall surface removed to facilitate pipe installation shall be sealed water-tight with masonry block and grout.
- D. All backfill shall be in accordance with Section 31 20 00 Earth Moving.

### 3.14 CLEANOUT INSTALLATION

- A. Install cleanouts and riser extension from sewer pipe to cleanout at grade. Use HDPE/PVC pipe fittings in sewer pipes at branches for cleanouts and HDPE/PVC pipe for riser extensions to cleanouts. Install piping so cleanouts open in direction of flow in sewer pipe.
- B. Set cleanout frames and covers in earth in cast-in-place concrete block, 18 by 18 by 12 inches deep. Set with tops 1/4 inch below surrounding earth grade.
- C. In roadway traffic areas, enclosed top of cleanout stack in a cast iron casting set in concrete to prevent crushing of the stack.

- D. All labor, materials, and equipment required to join and provide fittings for all cleanout assemblies shall be included in the price bid for the proposal.

3.15 UNDERGROUND STORMWATER VAULT

- A. Install in accordance with manufacturer specifications and requirements.

3.16 STORM WATER TREATMENT DEVICE

- A. Install in accordance with manufacturer specifications and requirements.

3.17 REHABILITATE EXISTING STRUCTURES

- A. This work shall consist of removing and cleaning the existing castings, replacement of any damaged block and/or brick, replacement of any loose or missing mortar, parging of the inlet interior, resetting of any loose ladder rings, resetting of the existing castings to the final grade and any work necessary as directed by the Owner.

3.18 CLOSING ABANDONED STORM DRAINAGE SYSTEMS

- A. Abandoned Piping: Close open ends of abandoned underground piping indicated to remain in place. Include closures strong enough to withstand hydrostatic and earth pressures that may result after ends of abandoned piping have been closed. Use either procedure below as appropriate:
  - 1. Close open ends of piping with at least 8-inch thick, brick masonry bulkheads.
  - 2. Close open ends of piping with threaded metal caps, plastic plugs, or other acceptable methods suitable for size and type of material being closed. Do not use wood plugs.
  - 3. Fill with flowable fill where indicated on the plans.
- B. Abandoned Structures: Excavate around structure as required and remove structure and close open ends of remaining piping.

3.19 ADJUSTMENTS TO GRATE RIM ELVATIONS

- A. Raise or lower the existing frames, covers and gratings of manholes, and drainage structures to the grades shown on the plans or directed by the Owner.
- B. Parge exterior surface with mortar when brick or masonry units are added or when the exterior surface is disturbed.
- C. Replace frames, covers or gratings damaged during the Work of the Contract

3.20 FIELD QUALITY CONTROL

- A. Clear interior of piping and structures of dirt and superfluous material as work progresses. Maintain swab or drag in piping, and pull past each joint as it is completed.
  - 1. In large, accessible piping, brushes and brooms may be used for cleaning.
  - 2. Place plug in end of incomplete piping at end of day and when work stops.
  - 3. Flush piping between manholes and other structures to remove collected debris, if required by authorities having jurisdiction.
  
- B. Inspect interior of piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches of backfill is in place, and again at completion of Project.
  - 1. Submit separate reports for each system inspection.
  - 2. Defects requiring correction include the following:
    - a. Alignment: Less than full diameter of inside of pipe is visible between structures.
    - b. Deflection: Flexible piping with deflection that prevents passage of ball or cylinder of size not less than 92.5 percent of piping diameter.
    - c. Crushed, broken, cracked, or otherwise damaged piping.
    - d. Infiltration: Water leakage into piping.
    - e. Exfiltration: Water leakage from or around piping.
  - 3. Replace defective piping using new materials, and repeat inspections until defects are within allowances specified.
  - 4. Reinspect and repeat procedure until results are satisfactory.
  
- C. Upon completion of storm sewer installation, the contractor shall schedule a final acceptance inspection with the Owner's Representative. The contractor shall furnish at his expense, labor and equipment to inspect all pipe runs (i.e. lights, mirrors, pry-bars, laborers, etc.)
  - 1. Do not enclose, cover, or put into service before inspection and approval.
  - 2. Test completed piping systems according to authorities having jurisdiction.
  - 3. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours' advance notice.
  - 4. Submit separate reports for each test.
  
- D. Leaks constitute defects that must be repaired.
  
- E. Replace leaking piping using new materials.
